1. The system administrator shall ensure that the organization's security policy is enforced.
2. Key recovery procedures shall be in place to ensure that users can recover their data if they lose their authentication information (password, token data, etc). A method for data recovery personnel to authenticate these users should be in place prior to the recovery of the user's keys or files.
3. If the EFS includes a master administrator password for use in data recovery by the system administrator, the system administrator shall utilize a strong password.
4. System administrators shall provide training and security guidance to the end users of the system that, at a minimum, focuses on passwords, data-recovery procedures, and user configuration of their system to utilize the authentication features within the system.

One commenter recommended that both the sharing of CUI and the decision to apply a CMMC compliance assessment should only be considered for contracts of sufficient contract value and performance period to make the expense of safeguarding CUI worthwhile. This commenter asserted that small businesses are selected for SBIR contract award not based on ability to protect information, but instead on the unique product or service they offer. Some commenters expressed concern that CMMC could result in state-funded universities incurring costs to comply with CMMC level 2, while even the costs for implementing required FCI safeguarding requirements is a significant financial burden. These commenters speculated that applying FCI or CUI markings to fundamental research information negatively impact academic institutions by requiring them to remove such data from the public domain. This commenter cited DFARS clause 252.204-7000 as rationale to modify the CMMC rule to exclude fundamental research. One commenter requested that when contracting for fundamental research, the Government include a CMMC requirement based only on whether information shared is currently FCI or (printed page 83114) CUI, and not whether the effort might lead to development of FCI or CUI. Another commenter requested that DoD issue policies clearly describing how to recognize or identify circumstances that could result in fundamental research becoming FCI or CUI such that it would require being processed, stored, or transmitted on CMMC compliant information systems. The commenter expressed concern that absent such policies, research institutions may house all DoD-related project activities in CUI enclaves ·out of an abundance of caution·, thereby unnecessarily expanding CUI applicability at significant cost. They asked that DoD Instruction 5200.48, ·Controlled Unclassified Information·, and a related DoD policy memorandum ·Clarifying Guidance for Marking and Handling Controlled Technical Information in accordance with Department of Defense Instruction 5200.48, `Controlled Unclassified Information· be incorporated into the rule by reference. One commenter questioned whether and how CMMC requirements may apply to non-contract efforts, including grants, or efforts conducted under Other Transactional Authorities. Response: One of the main purposes of the CMMC Program is to ensure that DoD contracts that require contractors to safeguard CUI will be awarded to contractors with the ability to protect that information. All contractor-owned information systems that process, store, or transmit CUI are subject to the requirements of NIST SP 800-171 when DFARS clause 252.204-7012 is included in the contract. This is the case whether or not the contractor is engaged in fundamental research.

Under the right of access, an individual who is the subject of PHI has the right to inspect and request a copy of PHI about them in a designated record set, subject to certain exceptions. A regulated entity is required to provide such access in the form and format requested by the individual, if it is readily producible in such form and format. Thus, if an individual requests that the regulated entity provide them access in a manner that does not support encryption, a regulated entity is generally required to do so if it does not jeopardize the security of the regulated entity's information systems. For the exception to apply, a regulated entity would be required to have informed the individual of the risks associated with the transmission, receipt, and storage of unencrypted ePHI when the individual requests unencrypted access and to document that the individual has been informed of such risks. [738] Consistent with the information blocking regulations, the information provided by regulated entities that are also actors must: focus on any current privacy and/or security risks posed by the technology or the third-party developer of the technology; be factually accurate, unbiased, objective, and not unfair or deceptive; and be provided in a non-discriminatory manner. [739] For example, a regulated entity that is an actor must provide information to individuals about the privacy and security risks of all mobile health applications in the same manner. We are not proposing to require that the documentation be in any particular form or format. Rather, the required information could be on a standard form, chart note, or checkbox, as examples. The Department does not propose to apply this exception to ePHI transmitted in other forms or formats, such as on a CD or other physical device used to maintain and transmit ePHI. The proposal would not absolve a regulated entity from compliance with other applicable laws or regulations, including the information blocking regulations. [740] We recognize that emergencies or other occurrences may render it infeasible to encrypt ePHI. Thus, the third proposed exception at 45 CFR 164.312(b)(3)(iii) would apply to certain circumstances in which encryption is infeasible. Such circumstances would be limited to when there is emergency or other occurrence that adversely affects a regulated entity's relevant electronic information systems. For the proposed exception to apply, a regulated entity would be required to implement reasonable and appropriate compensating controls in accordance with and determined by its contingency plan. [741]

Appendix A to Part 170-Guidance Authority: 5 U.S.C. 301 ; Sec. 1648, Pub. L. 116-92 , 133 Stat. 1198. Subpart A-General Information. §170.1 Purpose. (a) This part describes the Cybersecurity Maturity Model Certification (CMMC) Program of the Department of Defense (DoD) and establishes policy for requiring defense contractors and subcontractors to implement prescribed cybersecurity standards for safeguarding: Federal Contract Information (FCI), and Controlled Unclassified Information (CUI), as well as conduct an assessment of contractor information systems that process, store, or transmit FCI or CUI; provide security protections for such CUI systems; or are not logically or physically isolated from all such CUI systems, for compliance with the applicable prescribed cybersecurity standard. (b) The CMMC Program is designed to enhance protection of FCI and CUI when it is processed, stored, or transmitted on defense contractor information systems to meet evolving threats and safeguard the sensitive unclassified information that supports and enables the warfighter. The CMMC Program provides a consistent methodology to assess a defense contractor's implementation of required cybersecurity requirements. The CMMC Program utilizes the security standards set forth in the Federal Acquisition Regulation (FAR) clause 52.204-21; National Institute of Standards and Technology (NIST) Special Publication (SP) 800-171 Rev 2; and selected requirements from the NIST SP 800-172, as applicable (see table 1 to §170.14(c)(4) CMMC Level 3 Requirements). (c) The CMMC Program provides DoD with a viable means of conducting the volume of assessments necessary to verify contractor and subcontractor implementation of required cybersecurity requirements.

The results of a risk analysis, performed in accordance with the proposed standard for risk analysis, generally provide the regulated entity with a list of applicable threat/vulnerability pairs as well as the overall risk rating of each pair to the confidentiality, integrity, and availability of ePHI. [504] For example, some threat/vulnerability pairs may result in a risk rating of moderate or high level of risk to ePHI, while other pairs may result in a risk rating of low level of risk. The regulated entity would need to determine what risk rating poses an unacceptable level of risk to ePHI and address any threat/vulnerability pairs that indicate a risk rating above the organization's risk tolerance. [505] Under this proposed standard, the regulated entity would be required to reduce the risks to its ePHI to a level that is reasonable and appropriate for its specific circumstances. Ultimately, the regulated entity's risk assessment processes should inform its decisions about the manner in which it will implement security measures to comply with the Security Rule's standards and implementation specifications. [506] Additionally, each regulated entity would be required to document the security controls it has implemented because it has determined them to be reasonable and appropriate, including analyses, decisions, and the rationale for decisions made to refine or adjust the security controls. [507] As stated by NIST, the documentation and retention of risk assessment and risk management activities is important for future risk management efforts. [508] In general, risk management activities should be performed with regular frequency to examine past decisions, reevaluate risk likelihood and impact levels, and assess the effectiveness of past remediation efforts. [509] Risk management plans should address risk appetite, risk tolerance, workforce duties, responsible parties, the frequency of risk management, and required documentation. [510] h. Section 164.308(a)(6)(i)-Standard: Sanction Policy Consistent with other proposals to elevate certain critical implementation specifications to standards, we propose to elevate the implementation specification for sanction policy at 45 CFR 164.308(a)(ii)(C) to a standard for sanction policy at proposed 45 CFR 164.308(a)(6)(i) . We propose this standard because applying appropriate sanctions against workforce members who fail to comply with security requirements, and thus imperil the (printed page 945) security of ePHI, serves as an important tool for improving compliance by other workforce members with the regulated entity's safeguards for ePHI. While the Department does not propose to modify the language of the standard, we are proposing three

implementation specifications that are consistent with guidance that was previously issued by the Department. Specifically, under the proposed implementation specification for policies and procedures at proposed 45 CFR 164.308(a)(6)(ii)(A)

One comment asks for clarification on the contents of the System Security Plan when documenting the use of an ESP. Two comments ask how to assess an OSA that is using a CSP to store CUI that does not meet the FedRAMP requirements. One comment asks how C3PAOs can check on the assessment status of an ESP. Three comments ask how to avoid redundant assessments of ESPs. One comment asks to clarify how to handle ESPs at Level 3 with respect to requirement AC.L3-3.1.2e that restricts access to systems that are owned, provisioned, or issued by the organization. One comment recommends DoD exempt CSPs that provide service with end-to-end encryption from CMMC requirements, similar to a common carrier. Several comments inquired about guidelines and practices for obtaining Customer Responsibility Matrices (CRM) from CSPs and suggest the rule be modified to also require them from ESPs. One comment asks about how to obtain a CSP's System Security Plan. Response: Implications for OSAs and C3PAOs for using non-compliant ESPs are adequately addressed in the rule. The CMMC compliance of an ESP, including a CSP, falls under the OSA's assessment. If an ESP is used to meet any of the CMMC requirements for the OSA, then the ESP is part of the scope of the OSA's assessment, and the compliance of the ESP will be verified. An ESP that is seeking CMMC assessment will need to obtain a CAGE code and an account in SPRS to enable the reporting of its assessment results via CMMC eMASS. A SPRS account is required to complete the CMMC annual affirmation requirement included in DoD contracts that include a CMMC certification requirement. An ESP that processes, stores, or transmits CUI, is an extension of the OSA's environment. As part of that environment, the ESP will be assessed against all requirements and accountable for all users who have access to CUI as part of the ESP's service, not just OSA employees. The government cannot comment on specific implementation or documentation choices of an OSA, including the use of an ESP. The C3PAO can only give credit to a FedRAMP Moderate Authorized or equivalent CSP. Any requirements dependent on contributions from a CSP in any other stage of compliance are considered NOT MET. The requirements in the rule for FedRAMP Moderate equivalency have been updated to reflect DoD policy. OSAs can consider CSPs in the FedRAMP process for equivalency if they meet the requirements in DoD policy. An ESP that is a CSP will be listed on the FedRAMP Marketplace. An ESP that is not a CSP and processes, stores, or transmits CUI will be within the OSA's assessment scope. An ESP can also volunteer to have a C3PAO assessment and could make that information available to the OSA.

Develop a written inventory of the covered entity's or business associate's technology assets that contains the identification, version, person accountable, and location of each technology asset. (B) Network map. Develop a network map that illustrates the movement of electronic protected health information throughout the covered entity's or business associate's electronic information systems, including but not limited to how electronic protected health information enters and exits such information systems, and is accessed from outside of such information systems. (C) Maintenance. Review and update the written inventory of technology assets required by paragraph (a)(1)(ii)(A) of this section and the network map required by paragraph (a)(1)(ii)(B) of this section in the following circumstances: (1) On an ongoing basis, but at least once every 12 months. (2) When there is a change in the covered entity's or business associate's environment or operations that may affect electronic protected health information, including but not limited to the adoption of new technology assets; the upgrading, updating, or patching of technology assets; newly recognized threats to the confidentiality, integrity, or availability of electronic protected health information; a sale, transfer, merger, or consolidation of all or part of the covered entity or business associate with another person; a security incident that affects the confidentiality, integrity, and availability of electronic protected health information; and relevant changes in Federal, State, Tribal, or territorial law. (2) Standard: Risk analysis ·(i) General. Conduct an accurate and comprehensive written assessment of the potential risks and vulnerabilities to the confidentiality, integrity, and availability of all electronic protected health information created, received, maintained, or transmitted by the covered entity or business associate. (ii) Implementation specifications ·(A) Assessment. The written assessment must include, at a minimum, all of the following: (1) A review of the technology asset inventory required by paragraph (a)(1)(ii)(A) of this section and the network map required by paragraph (a)(1)(ii)(B) of this section to identify where electronic protected health information may be created, received, maintained, or transmitted within the covered entity's or business associate's electronic information systems. (2) Identification of all reasonably anticipated threats to the confidentiality, integrity, and availability of electronic protected health information that the

covered entity or business associate creates, receives, maintains, or transmits. (3)
Identification of potential vulnerabilities and predisposing conditions to the covered entity's or
business associate's relevant electronic information systems. (4

(2) Performed to support research or statistical projects. Personally identifying data can be used
for purposes of conducting the match and the match results may contain identifying data about
individuals. However, the match results shall not be used to make a decision that affects the
rights, benefits, or privileges of specific individuals. (3) Performed by an agency, or a component
thereof, whose principal function is the enforcement of criminal laws, subsequent to the initiation
of a specific criminal or civil law enforcement investigation of a named individual or individuals.
(i) The match must flow from an investigation already underway which focuses on a named person or
persons. ·Fishing expeditions· in which the subjects are generically identified, such as ·program
beneficiaries· are not covered. (ii) The match must be for the purpose of gathering evidence
against the named individual or individuals. (4) Performed for tax information-related purposes.
(5) Performed for routine administrative purposes using records relating to Federal personnel. (i)
The records to be used in the match must predominantly relate to Federal personnel (i.e., the
percentage of records in the system of records that are about Federal personnel must be greater than
of any other category). (ii) The purpose of the match must not be for purposes of taking any
adverse financial, personnel, disciplinary, or other unfavorable action against an individual. (6)
Performed using only records from systems of records maintained by an agency. (i) The purpose of
the match must not be for purposes of taking any adverse financial, personnel, disciplinary, or
other unfavorable action against an individual. (ii) A match of DoD personnel using records in a
system of records for purposes of identifying fraud, waste, and abuse is not covered. (7) Performed
to produce background checks for security clearances of Federal or contractor personnel or performed
for foreign counter-intelligence purposes. §-310.52 Computer matching publication and review
requirements. (a) DoD Components shall identify the systems of records that will be used in the

match to ensure the publication requirements of subpart G have been satisfied. If the match will require disclosure of records outside the Department of Defense, Components shall ensure a routine use has been established, and that the publication (printed page 18782) and review requirements have been met, before any disclosures are made (see subpart G of this part). (b) If a computer matching program is contemplated, the DoD Component shall contact the DPO and provide information regarding the contemplated match. The DoD DPO shall ensure that any proposed computer matching program satisfies the requirements of the Privacy Act (5 U.S.C. 552a) and OMB Matching Guidelines (54 FR 25818 (June 19, 1989)).

Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons. (A) From subsections (c)(3) and (d) when access to accounting disclosure and access to or amendment of records would cause the identity of a confidential source to be revealed. Disclosure of the source's identity not only will result in the Department breaching the promise of confidentiality made to the source but it will impair the Department's future ability to compile investigatory material for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, Federal contracts, or access to classified information. Unless sources can be assured that a promise of confidentiality will be honored, they will be less likely to provide information considered essential to the Department in making the required determinations. (B) From subsection (e)(1) because in the collection of information for investigatory purposes, it is not always possible to determine the relevance and necessity of particular information in the early stages of the investigation. It is only after the information is evaluated in light of other information that its relevance and necessity becomes clear. Such information permits more informed decision-making by the Department when making required suitability, eligibility, and qualification determinations. Dated: February 28, 2019. Shelly E. Finke, Alternate OSD Federal Register Liaison Officer, Department of Defense. [FR Doc. 2019-03971 Filed 4-10-19; 8:45 am] BILLING CODE 5001-06-P

No edits were made to reference CCAs in § 170.7, which covers responsibilities for only the DIBCAC, and not CCAs. § 170.11 covers responsibilities for CCAs. DoD declined to add verbiage to address the potential revision or cancellation of an ISO/IEC standard because § 170.8 adequately reflects that the Accreditation Body shall achieve full compliance with revised ISO/IEC 17011:2017(E) standards. Standards are not effective until published as final. The DoD declined to adopt one commenter's suggestion to submit all appeals investigation materials with the final decision into eMASS, however, an updated assessment result, if any, will be input into eMASS. In addition, C3PAOs are required to retain assessment artifacts for 6 years. DoD did not agree with one commenter's assertion that the preamble description of the CMMC Program is incomplete or inaccurate, or that the rule makes implicit changes to DFARS clause 252.204-7010 reporting requirements for activities subject to the U.S.-International Atomic Energy Agency Additional Protocol. The referenced paragraph, which appears both in the preamble background section and in an overview paragraph of the supplemental documents, accurately portrays the CMMC Program as a compliance assessment model to assist in DoD's enforcement of FCI and CUI safeguarding requirements. No change has been made in either location. The DoD also declines to specify in the rule the DoD offices that review Tier 3 background investigations or equivalency determinations. No language related to Cloud Service Offerings (CSO) was added in § 170.19 column two. Assets that process, store, or transmit CUI are handled the same way regardless of whether they are from a CSO or otherwise. Therefore, there is no need to call out CSOs in the table. The DoD minimized use of the passive voice to an extent in this final rule; however, in some places the passive voice is used to emphasize the action occurring rather than the individual or entity performing the action. There is no version number in the title of the CMMC Program. Terms such as versions 1.0 or 2.0 have previously been used in DoD's public engagements as a colloquial way to communicate differences in content as the program has evolved. This final rule codifies the program and does include changes from the proposed rule. Only those public comments received during the 60-day comment period following the December 26, 2023 publication (88 FR 89058) are addressed in this final rule. 34. Error Corrections Comment: Numerous administrative comments were received that addressed formatting grammar, punctuation, and typographical errors as well as word usage and acronym errors: Wording discrepancies, redundancies, and inaccuracies were also reported by multiple comments.

1007] and employers with 0-1 employees are unlikely to sponsor a group health plan. Accordingly, the Department believes that this proposed rule, if adopted, would be unlikely to affect a substantial (printed page 1008) number of small entities that meet the RFA threshold. Thus, this analysis concludes, and the Secretary proposes to certify, that the NPRM would not result in a

significant economic effect on a substantial number of small entities. HIPAA requires the Department to consider the needs and capabilities of small and rural health care providers. [1008] As we explained in our 2003 analysis of the effect of the Security Rule on small and rural health care providers, the scalability provisions preclude the need to precisely define those categories. [1009] We have long considered the effect of our rules on small businesses in the Small Entity Analysis discussed above. However, because of the breadth of changes proposed in this NPRM, the Department has considered more closely how it would affect rural health care providers. There are approximately 2,000 rural hospitals, [1010] comprising nearly 30 percent of all hospitals [= 2,057/7,465], [1011] and the Department estimates approximately 7 to 8 percent of all health care providers operate in rural areas (counties or micropolitan areas with fewer than 50,000 inhabitants). See Regulated Entities Affected in Section V.A.2. Baseline Conditions, above. Because rural health care providers are more likely to be small businesses, they would be affected in a manner similar to small entities, as demonstrated in the Small Entity Analysis above. Likewise, to the extent that Tribal health care providers are in rural areas, which many are, [1012] our analysis of the effects on rural health care providers generally also applies. However, Tribal health providers have the benefit of access to centralized supportive services for health IT and EHR adoption, which other rural providers may lack. [1013] A primary barrier to both adoption of health information technology (health IT) and deployment of cybersecurity safeguards in rural communities is limited access to high-speed internet. Rural health care providers, such as hospitals, have adopted EHRs at a lower rate than non-rural hospitals, [1014] and thus may also have fewer electronic information systems that are subject to the Security Rule requirements, which could ease some burdens of compliance. However, as EHR adoption has increased in rural hospitals, [1015] so too have the risks of cybersecurity attacks. [1016]

4. Trust relationships - Trust relationships between systems and organizations need to be evaluated, established, and maintained based on the risk presented to the interfacing systems, the functions they support, and the grid as a whole; accounting for potential impact as the data may subsequently be directly or indirectly passed "deeper" into more protected levels. The potential impact is the basis for deciding on the wisdom of the connection, the security services selected, and the audit of attached system security services and related management processes. Roles and responsibilities need to be defined for the trusted partners, for example who will patch updates and on what schedule, who has system privileges, or who will purchase components from which suppliers. 1. Ensures external suppliers and contractors that have an impact on the security of smart grid information systems must meet the organization's policy and procedures; and 2. Establishes procedures to remove external supplier and contractor access to smart grid

on NIST standards and guidelines; and - Continued the development of a preliminary draft of SP 800-18 Revision 2, Guide for Developing Security Plans for Federal Information Systems and Organizations. - Finalize SP 800-53A Revision 4, Assessing Security and Privacy Controls in Federal Information Systems and Organizations; - Publish an errata update to SP 800-53 Revision 4; - Begin the automation of the SP 800-53 revision and public comment process in support of more timely updates to counter threats and keep up with technological advancements; - Finalize SP 800-16, A Role-Based Model for Federal Information Technology / CyberSecurity Training; - Finalize SP 800-160, Systems Security Engineering: An Integrated Approach to Building Trustworthy Resilient Systems; - Publish the IPD of SP 800-171, Protecting Controlled Unclassified Information in Nonfederal Information Systems and Organizations; - Begin the development of SP 800-60 Revision 2, Guide for Mapping Types of Information and Information Systems to Security Categories; - Finalize SP 800-18 Revision 2, Guide for Developing Security Plans for Federal Information Systems and Organizations; - Expand cybersecurity outreach to include additional state, local, and tribal governments, as well as private sector organizations and academic institutions; and - Continue to support federal agencies in the effective implementation of the NIST RMF.

DoD contractors impacted is 80,000. DoD estimates that approximately 1% of the newly eligible population (800 defense contractors) will elect to join the program each year with program growth plateauing at approximately 10% of the population by Year 9. Each year, approximately 10% of participating companies will report changes to company contacts. If 10% of the pre-existing companies (2,580 in year 2) submit updates to the POC information and 800 new companies join, by year 3 this would result in 1,058 annual updates. Projected Responses per Participant: Initial collection is one per company with updates on a case-by-case basis. Annual Total Responses: 1,058. Average Burden per Response: 20 minutes. Annual Total Burden Hours: 353 hours for all

participants. Needs and Uses: Defense contractors complete a program application and sign the DIB CS Program Framework to initiate participation. The Government will collect business POC information from all DIB CS Program participants on a one-time basis, with updates as necessary, to facilitate communications and the sharing of share unclassified and classified cyber threat information. Affected Public: Business or other for-profit and not-for-profit institutions. Frequency: On occasion. Respondent's Obligation: Voluntary. F. Executive Order 13132 , ·Federalism· Executive Order 13132 establishes certain requirements that an agency must meet when it promulgates a proposed rule (and subsequent final rule) that imposes substantial direct requirement costs on State and local governments, preempts State law, or otherwise has federalism implications. This proposed rule will not have a substantial effect on State and local governments. G. Executive Order 13175 , ·Consultation and Coordination With Indian Tribal Governments· Executive Order 13175 establishes certain requirements that an agency must meet when it promulgates a proposed rule (and subsequent final rule) that imposes substantial direct compliance costs on one or more Indian tribes, preempts tribal law, or effects the distribution of power and responsibilities between the Federal Government and Indian tribes. This proposed rule will not have a substantial effect on Indian tribal governments. List of Subjects in 32 CFR Part 236 Government contracts Security measures Accordingly, DoD proposes to amend 32 CFR part 236 as follows: PART 236-DEPARTMENT OF DEFENSE (DoD) DEFENSE INDUSTRIAL BASE (DIB) CYBERSECURITY (CS) ACTIVITIES 1. The authority citation for 32 CFR part 236 continues to read as follows: Authority: 10 U.S.C. 391 , 393 , and 2224 ; 44 U.S.C. 3506 and 3544 ; 50 U.S.C. 3330 . 2. Revise the heading of 32 CFR part 236 to read as set forth above. §-236.1 [Amended] 3. Amend §-236.1 by: a. Removing ·eligible DIB participants· and adding in its place ·eligible DoD contractors·. b. Removing ·DIB CS program· and adding in its place ·DIB CS Program· wherever it appears. c. Removing ·DIB CS participants· and adding in its place ·DIB CS Program participants·. d.

(A) From subsection (d) because access to the records contained in this system would inform the subject of an investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection, and would present a serious impediment to law enforcement. In addition, granting individuals access to information collected while an Equal Opportunity and Treatment clarification/investigation is in progress conflicts with the just, thorough, and timely completion of the complaint, and could possibly enable individuals to interfere, obstruct, or mislead those clarifying/investigating the complaint. (B) From subsection (e)(4)(H) because this system of records is exempt from individual access pursuant to subsection (k) of the Privacy Act of 1974. (C) From subsection (f) because this system of records has been exempted from the access provisions of subsection (d). (18) System identifier and name. F051 AF JA I, Commander Directed Inquiries. (i) Exemption. Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information except to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (f)(18)(i). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. Any portion of this system of records which falls within the provisions of 5 U.S.C. 552a(k)(2) may be exempt from the following subsections of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (H), and (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) . (iii) Reasons. (A) From subsection (c)(3) because to grant access to the accounting for each disclosure as required by the Privacy Act, including the date, nature, and purpose of each disclosure and the identity of the recipient, could alert the subject to the existence of the investigation. This could seriously compromise case preparation by prematurely revealing its existence and nature; compromise or interfere with witnesses or make witnesses reluctant to cooperate; and lead to suppression, alteration, or destruction of evidence.

To maintain the candor and integrity of comments needed to evaluate an Air Force Academy cadet for commissioning in the Air Force. (4) System identifier and name. F036 AETC I, Cadet Records. (i) Exemption. Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(5) (Detachment

Professional Officer Course Selection Rating Sheets; Air Force Reserve Officer Training Corps Form 0-24-Disenrollment Review; Memoranda for Record and Staff Papers with Staff Advice, Opinions, or Suggestions) may be exempt from the following subsections of 5 U.S.C. 552a(c)(3), (d), (e)(4)(G) and (H), and (f). (ii) Authority. 5 U.S.C. 552a(k)(5). (iii) Reasons. To protect the identity of a confidential source who furnishes information necessary to make determinations about the qualifications, eligibility, and suitability of cadets for graduation and commissioning in the Air Force. (5) System identifier and name. F044 AF SG Q, Family Advocacy Program Records. (i) Exemption. (A) Investigative material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2), may be exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (f)(5)(i)(A). When claimed, this exemption allows limited (printed page 14740) protection of investigative reports maintained in a system of records used in personnel or administrative actions. (B) Investigative material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5), but only to the extent that such material would reveal the identity of a confidential source. (C) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(2) and (k)(5) from the following subsections of 5 U.S.C. 552a(c)(3) and (d). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5). (iii) Reasons.

means Government data or a Federal information system that is designated as a high value asset pursuant to OMB Memorandum M-19-03, Strengthening the Cybersecurity of Federal Agencies by enhancing the High Value Asset Program. Information means any communication or representation of knowledge, such as facts, data, or opinions, in any medium or form, including textual, numerical, graphic, cartographic, narrative, electronic, or audiovisual forms (see Office of Management and Budget (OMB) Circular No. A-130, Managing Information as a Strategic Resource). Information and communications technology (ICT) means information technology and other equipment, systems, technologies, or processes, for which the principal function is the creation, manipulation, storage, display, receipt, or transmission of electronic data and information, as well as any associated content. Examples of ICT include but are not limited to the following: computers and peripheral equipment; information kiosks and transaction machines; telecommunications equipment; telecommunications services; customer premises equipment; multifunction office machines; computer software; applications; websites; electronic media; electronic documents; Internet of Things (IoT) devices; and operational technology. Information system means a discrete set of information resources organized for the collection, processing, maintenance, use, sharing, dissemination, or disposition of information (44 U.S.C. 3502(8)). Information resources, as used in this definition, includes any ICT. Information technology means any equipment, or interconnected system(s) or subsystem(s) of equipment, that is used in the automatic acquisition, storage, analysis, evaluation, manipulation, management, movement, control, display, switching, interchange, transmission, or reception of data or information by the agency. (1) For purposes of this definition, equipment is used by an agency if the equipment is used by the agency directly or is used by a contractor under a contract with the agency that requires- (i) Its use; or (ii) To a significant extent, its use in the performance of a service or the furnishing of a product. (2) The term information technology includes computers, ancillary equipment (including imaging peripherals, input, output, and storage devices necessary for security and surveillance), peripheral equipment designed to be controlled by the central processing unit of a computer, software, firmware and similar procedures, services (including support services), and related resources. (3) The term information technology does not include any equipment that- (i) Is acquired by a contractor incidental to a contract; or (ii) Is operational technology. Internet of Things (IoT) devices means, consistent with section 2 paragraph 4 of Public Law 116-207, devices that- (printed page 68420)

rather, it is a tool used to monitor and audit enterprise and inter-enterprise activity. Communications between the actors and this overarching director occur on a management channel that is separate from the data networks in each of the enterprises. Using a separate backchannel ensures that the tool being used to monitor and verify the various ZTA architectures does not itself impact those architectures. Enabling the overarching MSV director to control the actor VMs via a backchannel requires each of the actor VMs to have two network interface cards (NICs), one for

enterprise data and one for MSV tool interoperation. The use of a separate backchannel ensures that enterprise ZTA policies and firewalls don't need to be modified to accommodate the overarching MSV testing by permitting traffic between the overarching director and the actors that would not normally be expected to transit any of the enterprise networks.

Internet of Things; IoT products; manufacturing; risk assessment; product lifecycle; securable products; security requirements; software development; threat modelling . | 1. | There is broad support for expanding the discussion of IoT products in NIST IR 8259 to make products more central to the IoT cybersecurity baseline and allow further exploration of the cybersecurity considerations of other IoT product components beyond the device. | |-----|-----|

-----| | 2 | Many cybersecurity challenges are aggravated by the limited visibility each role in the IoT ecosystem (e.g., manufacturer, integrator, customer) has into the cybersecurity of the whole system . | | 3 | Performing risk analysis for IoT products remains a challenge due to the potential for unintended use or unexpected environments of use. | | 4 | In understanding the magnitude of a risk, it is important to understand the scale of the potential impact from a threat. | | 5 | Communicating effectively throughout IoT pre-market and post-market activities involves bridging gaps between manufacturer knowledge and customer ability to use the information. | | 6 | Transparency and traceability are foundational to maintaining product cybersecurity throughout the IoT product lifecycle. | | 7 | Discussions throughout the workshop highlighted challenges in IoT product lifecycle management emphasizing IoT product risks, vulnerabilities, and evolving ecosystem demands. |

3.2.4 Identify Potential Integrators or Suppliers and/or Perform Market Analysis Once the requirements are defined, the acquirer mission/business owner should initiate a market review for potential suppliers.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Office of the Secretary 32 CFR Part 236 [Docket ID: DOD-2019-OS-0112] RIN 0790-AK86 AGENCY: Office of the DoD Chief Information Officer, Department of Defense (DoD). ACTION: Proposed rule. SUMMARY: The DoD is proposing revisions to the eligibility criteria for the voluntary Defense Industrial Base (DIB) Cybersecurity (CS) Program. These revisions will allow a broader community of defense contractors to benefit from bilateral information sharing as when this proposed rule is finalized all defense contractors who are subject to mandatory cyber incident reporting will be able to participate. DoD is also proposing changes to definitions and some technical corrections for readability. DATES: Comments must be received by June 20, 2023. ADDRESSES: Please submit comments on this proposed rule, identified by 32 CFR part 236 , Docket ID: DOD-2019-OS-0112 and/or by Regulatory Information Number (RIN) 0790-AK86, by any of the following methods: Federal Rulemaking Portal: <https://www.regulations.gov> . Follow the instructions for submitting comments. Mail: Department of Defense, Office of the Assistant to the Secretary of Defense for Privacy, Civil Liberties, and Transparency, Regulatory Directorate, 4800 Mark Center Drive, Mailbox #24, Suite 08D09, Alexandria, VA 22350-1700. Instructions: The general policy for comments is to make these submissions available for public viewing as they are received without change, including any personal identifiers or contact information provided by the commenter. FOR FURTHER INFORMATION CONTACT: Stacy Bostjanick, Chief Defense Industrial Base Cybersecurity, Office: 703-604-3167. DIB CS Program Management Office: OSD.DIBCSIA@mail.mil . Instructions: DO NOT submit comments to this email address. SUPPLEMENTARY INFORMATION: Background and Authority

(D) From subsections (e)(4)(G), (e)(4)(H), and (e)(4)(I) (Agency Requirements) and (f) (Agency Rules), because portions of this system are exempt from the individual access provisions of subsection (d) for the reasons noted above, and therefore NGA is not required to establish requirements, rules, or procedures with respect to such access. Providing notice to individuals with respect to existence of records pertaining to them in the system of records or otherwise setting up procedures pursuant to which individuals may access and view records pertaining to themselves in the system would undermine investigative efforts and reveal the identities of witnesses, and potential

witnesses, and confidential informants. §-310.25 National Guard Bureau (NGB) exemptions. (a) General information. There are two types of exemptions, general and specific. The general exemption authorizes the exemption of a SOR from all but a few requirements of 5 U.S.C. 552a . The specific exemption authorizes exemption of a SOR or portion thereof, from only a few specific requirements. If a new SOR originates for which an exemption is proposed, or an additional or new exemption for an existing SOR is proposed, the exemption shall be submitted with the SORN. No exemption of a SOR shall be considered automatic for all records in the system. The System Manager shall review each requested records and apply the exemptions only when this will serve significant and legitimate purpose of the Federal Government. (b) Exemption for classified material. All SOR maintained by the NGB shall be exempt under section (k)(1) of 5 U.S.C. 552a to the extent that the systems contain any information properly classified under Executive Order 13526 and that is required by that Executive Order to be kept secret in the interest of national defense or foreign policy. This exemption is applicable to parts of all systems of records including those not otherwise specifically designated for exemptions herein which contain isolated items of properly classified information. (c) Exemption for anticipation of a civil action or proceeding. All systems of records maintained by the NGB shall be exempt under section (d)(5) of 5 U.S.C. 552a , to the extent that the record is compiled in reasonable anticipation of a civil action or proceeding. (d) General exemptions. No SOR within the NGB shall be considered exempt under subsection (j) or (k) of 5 U.S.C. 552a until the exemption rule for the SOR has been published as a final rule in the FR. (e) Specific exemptions. (1) System identifier and name. INGB 001, Freedom of Information Act (5 U.S.C.) and Privacy Act (5 U.S.C. 552a) Case Files. (i) Exemption. During the course of a 5 U.S.C. 552 or 5 U.S.C. 552a action, exempt materials from other systems of records may, in turn, become part of the case records in this system. To the extent that copies of exempt records from those other systems of records are entered into this 5 U.S.C. 552 or 5 U.S.C. 552a

From the NIST SP 800-172 Rev 3 Final Public Draft: Statements used to provide additional explanatory information for security controls or security control enhancements. disinformation The process of providing deliberately deceptive information to adversaries to mislead or confuse them regarding the security posture of the system or organization or the state of cyber preparedness. dual authorization The system of storage and handling designed to prohibit individual access to certain resources by requiring the presence and actions of at least two authorized persons, each capable of detecting incorrect or unauthorized security procedures with respect to the task being performed. [16, adapted] enhanced security requirements Security requirements that can be implemented in addition to the requirements in NIST Special Publication 800

Concealment and misdirection techniques may provide additional time to perform NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 core mission and business functions. The implementation of concealment and 1808

A person or persons outside of the Government providing commercial or financial information or trade secrets to the Government. Submitter notice. The process required by E.O. 12600 whereby when a Component receives a FOIA request for confidential commercial information, it asks the submitter of the information to advise the Component as to the information it considers exempt from release. §-286.3 Public access to DoD information. (a) The public has a right to information concerning the activities of its Government. DoD policy (32 CFR part 285) is to conduct DoD activities in an open manner and to provide the public a maximum of accurate and timely information concerning DoD activities, consistent with the need for security, public and private interests of the American people, and adherence to other requirements of law and regulation. A record requested by a member of

the public who follows rules established by proper authority in the Department of Defense shall not be withheld in whole or in part unless the record is exempt from mandatory, partial or total disclosure under the FOIA. The existence of a sound legal basis to withhold information does not preclude the DoD Component from making a discretionary release if release of that information would serve the public interest. Records requested through public affairs channels by news media representatives that would not be withheld if requested under the FOIA should be released promptly upon request. Similarly, requests from other members of the public for information that would not be withheld under the FOIA should continue to be honored through appropriate means without requiring the requester to invoke the FOIA. (b) The DoD FOIA Program Components shall prepare, in addition to normal FOIA regulations, a guide, or handbook for the use of the public in obtaining information from their Components as required by 5 U.S.C. 552(g) and section 2(b)(v) of E.O. 13392. This guide should be a short, simple explanation of what the FOIA is designed to do and how the public can use it to access Government records. Within OSD, DFOIPO is responsible for preparing this guide. Each guide shall be available on paper and electronically and shall include: (1) An index of all major information systems and a description of major information and record locator systems. (2) The types and categories of records that can be obtained through FOIA requests. (3) A concise description of the FOIA exemptions and how the Component determines whether the record can be released. (4) An explanation of how to make a FOIA request, how long the requester can expect to wait for a reply, and the right of appeal. (5) The location of the FOIA reading rooms(s) within the Component. (6) The location of the Component's Web site. (7) A reference to the Component's FOIA regulation and how to obtain a copy. § 286.4 Procedures. (a) Compliance with the FOIA. DoD personnel shall comply with the FOIA, this part, and DoD FOIA policy (32 CFR part 285

IR.L2-3.6.3 · Incident Response Testing CMMC Assessment Guide · Level 2 | Version 2.13 143 who is responsible for incident management; what tasks are assigned within the IT organization; what support is needed from legal, public affairs, or other business components; how resources are added if needed during the incident ; and how law enforcement is involved. Any negative impacts to the normal day -to-day operations when responding to an incident should also be identified and documented. Example You decide to conduct an incident response table top exercise that simulates an attacker gaining access to the network through a compromised server. You include relevant IT staff such as security, database, network, and system administrators as participants. You also request representatives from legal, human resources, and communications. You provide a scenario to the group and have prepared key questions aligned with the response plans to guide the exercise. During the exercise, you focus on how the team executes the incident response plan. Afterward, you conduct a debrief with everyone that was involved to provide feedback and develop improvements to the incident response plan [a]. Potential Assessment Considerations · Does the incident response policy outline requirements for regular incident response plan testing and reviews of incident response capabilities [a]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.6.3

The term CMMC Accreditation Body is a generic term for whichever accreditation body is supporting the DoD at a given time. The rule has been updated to remove reference to any specific accreditation body. There is only one Accreditation Body for the DoD CMMC Program at any given time, and its primary mission is to authorize and accredit the C3PAOs. The Accreditation Body does not issue certifications. The current CMMC AB is under a no-cost contract that has followed normal DoD contracting procedures. The DoD declines to delete the section outlining requirements for the CMMC AB, which are enduring and apply irrespective of which entity the DoD has currently approved to serve in that capacity. This rule identifies the requirements for the Accreditation Body's role in the CMMC Ecosystem. The DoD has a variety of options available to address the commenter's concern should the current CMMC AB not be able to fulfill this role. These include but are not limited to, contracting with a new/replacement Accreditation Body. And authorized and accredited C3PAOs would be able to continue conducting CMMC assessments. § 170.8(b)(6) requires the CMMC AB to complete a CMMC Level 2 assessment conducted by DCMA DIBCAC that must meet all CMMC Final Level 2 certification assessment requirements and will not result in a CMMC Level 2 certification. This requirement for an assessment is based on the potential compilation of sensitive information on the CMMC AB's information systems. After the CMMC AB's successful completion of this Level 2 assessment, the DoD reserves the right to send CUI to the CMMC AB, as appropriate. Requirements for the CMMC AB, detailed in § 170.8(b) of this rule, include DoD requirements to comply with Conflict of Interest, Code of Professional Conduct and Ethics policies as set forth in the DoD contract with the AB. § 170.8(b)(3) details the ISO/IEC requirements the CMMC AB must meet and the timeline for meeting them. § 170.8(b)(3)(i) and (ii) further detail the requirements for the CMMC AB to authorize and

accredit C3PAOs. The CMMC AB is under contract with the DoD and must fully comply with the contract requirements. The CMMC rule was updated to clarify that the CMMC AB must be a U.S.-based signatory to the International Laboratory Accreditation Cooperation Mutual Recognition Arrangement within 24 months of DoD approval and must operate in accordance with ISO/IEC 17011:2017(E). The rule was also updated to clarify that a disqualifying eligibility determination may result in the CMMC AB losing its authorization or accreditation under the CMMC Program.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. It is expected that the guidance and applicable recommendations in this publication will be incorporated into the security plans and operational processes of federal enterprise networks. Likewise, it is expected that applicable recommendations will be incorporated into the service agreements for federal contracts for hosted application services and internet transit services. Likewise, it is expected that applicable recommendations will be incorporated into the service agreements for federal contracts for hosted application services and internet transit services. ·is document also contributes to the ongoing efforts by NIST and NTIA [DOC -Botnet] [BotnetRoadmap] to respond to Presidential Executive Order 13800 [PEO-13800].

According to ISCMA_ An Information Security Continuous Monitoring Program Assessment, Executive

Summary: s. At each risk management level, an ISCMA unique to that level is conducted. Judgments are made about assessment elements, which are statements that should be true for a wellimplemented ISCM program. Under ISCMA, an assessment with the maximum breadth and depth consists of 128 assessment elements. The results for each risk management level are then merged into a single overall result. 1 ISCM is defined in NIST Special Publication (SP) 800-137 [SP800-137], Information Security Continuous Monitoring (ISCM) for Federal Information Systems and Organizations, as maintaining ongoing awareness of information security, vulnerabilities, and threats to support organizational risk management decisions. 2 Risk management levels are described in NIST SP 800-39 [SP800-39], Managing Information Security Risk: Organization, Mission, and Information System View . The ISCMA process proceeds according to the following steps: - Plan the approach - Conduct: Evaluate the elements - Conduct: Score the judgments - Report: Analyze the results - Report and Follow-on: Formulate actions Part of the 'Plan the Approach' step is to determine how to organize the selected participants at each risk management level. For example, all participants from Level 2 could conduct a single ISCMA as a group with judgments made by consensus. Alternatively, participants from each mission or business process could conduct individual assessments in parallel and allow [ISCMAx] to assemble and merge those assessments. In the latter case, the most common judgment of all the individual assessments is the overall judgment for a risk management level. ISCMAx produces a detailed scorecard and associated graphical output. It also automatically reports conditions that may warrant further analysis, such as: - Elements where the overall organizational judgment is weakest - Elements where different risk management levels have widely divergent judgments

3.3.7 | Endpoint Security Controls... 3.3.7 Endpoint Security Controls Some SSL VPNs provide endpoint security controls that include host integrity checking and security protection mechanisms.

by collapsing the separate paragraphs into one paragraph (c) to address both standards and implementation specifications and to remove the distinction between ·addressable· and ·required· implementation specifications. Instead, proposed paragraph (c), if adopted, would require regulated entities to comply with both the standards and implementation specifications. The Department believes that eliminating the distinction would make clear to regulated entities what has always been a requirement that the Security Rule sets a floor for cybersecurity protections and that its flexibility is in allowing them to choose the manner in which they meet the standards and implementation specifications, not whether they meet them. The proposed change also would be consistent with NCVHS' recommendation to require regulated entities to meet certain minimum cybersecurity hygiene requirements. [432] The Department acknowledges that proposing to remove the addressability distinction is a change from the approach adopted in the 2003 Final Rule. At that time, we explained that the decision to include addressable implementation specifications was made to provide additional flexibility to (printed page 934) covered entities. [433] In this rulemaking, the Department proposes to strengthen protections and address evolving cybersecurity threats. While we acknowledge that this proposal would reduce the Security Rule's flexibility, we believe that it is necessary to do so to achieve HIPAA's purpose of an efficient and effective health care system that relies on the secure electronic exchange of ePHI. Importantly, removing the distinction between required and addressable would not eliminate all of the Security Rule's flexibility and scalability. Instead, it would simply clarify for regulated entities where the floor of protection must lie, and regulated entities must implement solutions that meet that floor, taking into consideration their needs and capabilities. For example, a small or rural health care provider must implement a solution that ensures the protection of ePHI in the manner required by the Security Rule, but the specific solution that it chooses would reflect consideration of its particular circumstances, including available resources. In some cases, a small or rural health care provider might opt to implement a cloud-based EHR or other software solution that could reduce the health care provider's need to separately invest in data storage, backup systems, and IT personnel. And in other circumstances, a small or rural health care provider might choose to contract with a third party to provide IT support, rather than hiring its own workforce members to perform such functions. The Department also proposes to delete the maintenance provision at 45 CFR 164.306(e)

Building upon NISTIR 8074 Volume 2, this report describes 12 cybersecurity core areas and provides examples of relevant standards. The analysis is based on the information in Annex D, which maps cybersecurity standards that may be relevant for IoT systems to the dozen cybersecurity core areas. The annotated standards listings in Annex D are not exhaustive, but they represent an extensive effort to identify presently relevant IoT cybersecurity standards. The market impacts of existing standards are noted; possible gaps in standards are identified in Section 8. While the Annex D

listing is a onetime snapshot, it should prove useful as a point of departure for maintaining awareness of the evolving standards landscape. A summary of the status of cybersecurity standardization for the five specific examples of IoT applications is provided in Table 4. Smart manufacturing includes software and sensors that allow for precise predictions of maintenance needs, material demand, overtime, and other factors, based on data captured through all points of production. However, the volume of unstructured data (e.g., emails, blogs, webpages) that could be consumed in big-data projects creates new kinds of security challenges and requires a new mindset toward data-centric security measures. Big data is too new for security personnel to understand what constitutes normal behavior. Security professionals need to comprehend the analytics and automation being applied to determine how best to protect a big-data enterprise, because there is currently no practical way to fully maintain situational awareness of the data at the accelerated rates of acquisition and change. With that level of Combining the advantages of big data and mobile devices, augmented reality (AR) is being used with increasing frequency on the shop floor, including as a training aid, maintenance aid, and operational dashboard.

NIST Special Publication 800 NIST SP 800-172r3 fpd Enhanced Security Requirements for Protecting Controlled Unclassified Information Final Public Draft Ron Ross Victoria Pillitteri This publication is available free of charge from: <https://doi.org/10.6028/NIST.SP.800-172r3.fpd> NIST Special Publication 800 NIST SP 800-172r3 fpd Enhanced Security Requirements for Protecting Controlled Unclassified Information Final Public Draft Ron Ross Victoria Pillitteri Computer Security Division Information Technology Laboratory This publication is available free of charge from: <https://doi.org/10.6028/NIST.SP.800-172r3.fpd> September 2025 U.S. Department of Commerce Howard Lutnick, Secretary National Institute of Standards and Technology Craig Burkhardt, Acting Under Secretary of Commerce for Standards and Technology and Acting NIST Director

) to make it a prohibited act to refuse to permit access to, or copying of, any record as required by section 414 or 704(a) of the FD&C Act; or to fail to establish or maintain any record as required by section 414(b) of the FD&C Act; or to refuse to permit access to, or verification or copying of, any such required record; or for any person to use to his own advantage, or to reveal, other than to the Secretary or officers or employees of the Department of Health and Human Services, or to the courts when relevant in any judicial proceeding under the FD&C Act, any information acquired under authority of section 414 of the FD&C Act. To implement these provisions, on May 9, 2003 (68 FR 25188), FDA issued a proposed rule to require the establishment and maintenance of records to identify the immediate previous sources and immediate subsequent recipients of food. In addition to section 306 of the Bioterrorism Act, which amends the FD&C Act as described previously, FDA is relying on section 701(a) of the FD&C Act (21 U.S.C. 371(a)) in issuing this final rule. Section 701(a) authorizes the agency to issue regulations for the efficient enforcement of the FD&C Act.

II. Highlights of the Final Rule and Summary of the Significant Changes Made to the Proposed Rule

A. Highlights of this Final Rule The highlights of this final rule are described briefly in the following paragraphs, and are discussed in more detail later in the preamble of this document: Persons who manufacture, process, pack, transport, distribute, receive, hold, or import food in the United States are subject to the regulations in part 1 (21 CFR part 1) subpart J of this final rule (i.e., recordkeeping and access requirements); The following persons or facilities are excluded from all of the regulations in subpart J of this final rule: Farms; restaurants; those performing covered activities when the food is subject to the exclusive jurisdiction of the U.S. Department of Agriculture (USDA) under the Federal Meat Inspection Act (FMIA) (21 U.S.C. 601 et seq.), the Poultry Products Inspection Act (PPIA) (21 U.S.C. 451 et seq.), or the Egg Products Inspection Act (EPIA) (21 U.S.C. 1031 et seq.); and foreign persons, except foreign persons who transport food in the United States. The following persons or facilities are excluded from the requirement to establish and maintain records in §§ 1.337 and 1.345 of subpart J of this final rule, but are subject to the record availability requirements in §§ 1.361 and 1.363 for existing records: (1) Fishing vessels not engaged in processing as defined in § 123.3(k) (21 CFR part 123.3(k)

(4) Require all CCPs, who are not eligible to obtain a Tier 3 background investigation, to meet the equivalent of a favorably adjudicated Tier 3 background investigation. DoD will determine the Tier 3 background investigation equivalence for use with the CMMC Program only. (5) Provide all documentation and records in English. (6) Not share any CMMC assessment-related outcomes or advance information with any person not assigned to that specific assessment, except as otherwise required by law. Subpart D-Key Elements of the CMMC Program § 170.14 CMMC Model. (a) Overview. The CMMC

Model incorporates the security requirements from: (1) FAR 52.204-21 (48 CFR 52.204-21) Basic Safeguarding of Covered Contractor Information Systems; (2) NIST SP 800-171 Rev 2, Protecting Controlled Unclassified Information in Nonfederal Systems and Organizations (incorporated by reference, see § 170.2); and (3) Selected requirements from NIST SP 800-172, Enhanced Security Requirements for Protecting Controlled (printed page 89128) Unclassified Information: A Supplement to NIST Special Publication 800-171 Rev 2, (incorporated by reference, see § 170.2).

(b) CMMC domains. The CMMC Model consists of domains that map to the Security Requirement Families defined in NIST SP 800-171 Rev 2. (c) CMMC level requirements. CMMC Levels 1-3 utilize the safeguarding requirements and security requirements specified in FAR clause 52.204-21 (Level 1), NIST SP 800-171 Rev 2 (Level 2), and selected security requirements from NIST SP 800-172 (Level 3). This paragraph discusses the numbering scheme and the security requirements for each level. (1) Numbering. Each security requirement has an identification number in the format-DD.L#-REQ-where: (i) DD is the two-letter domain abbreviation; (ii) L# is the CMMC level number; and (iii) REQ is the FAR clause 52.204-21 paragraph number, NIST SP 800-171 Rev 2, or NIST SP 800-172 requirement number. (2) CMMC Level 1 requirements. The security requirements in CMMC Level 1 are those set forth in FAR clause 52.204-21(b)(1)(i) through (b)(1)(xv). (3) CMMC Level 2 requirements. The security requirements in CMMC Level 2 are identical to the requirements in NIST SP 800-171 Rev 2. (4) CMMC Level 3 requirements. The security requirements in CMMC Level 3 are selected from NIST SP 800-172, and where applicable, Organization-Defined Parameters (ODPs) are assigned. Table 1 to this paragraph identifies the selected requirements and applicable ODPs that represent the CMMC Level 3 security requirements. ODPs for the NIST SP 800-172 requirements are italicized, where applicable: Table 1 to § 170.14(c)(4) Security requirement No. 1 CMMC level 3 security requirements (Selected NIST SP 800-172 Requirement with DoD ODPs italicized) (i) AC.L3-3.1.2e Restrict access to systems and system components to only those information resources that are owned, provisioned, or issued by the organization. (ii) AC.L3-3.1.3e Employ secure information transfer solutions

The food security benefits of recordkeeping come from mitigating a terrorist attack on the food supply, and preventing unnecessary expense in the event of a hoax or a small terrorist event. While we are unable to estimate the benefits from such scenarios, we can point to investigative speed as a principal mechanism for mitigating their costs. The first benefit-mitigating the effects of an attack-is similar to the food safety benefit. Investigations will be quicker because of better records. Investigation speed may be crucial in the early period after a terrorist attack to more quickly determine the likely scope and scale of the contamination. With quicker investigations, the government can act sooner to reduce the public health and other effects of a terrorist attack on the food supply. These benefits should be qualitatively the same as in the case of an accidental outbreak of food-related illness, but we expect them to be potentially larger for a terrorist attack on the food supply. The second counterterrorism benefit from recordkeeping is also difficult to quantify but may be important: the ability to identify quickly a potential food security hoax. The hoax could be completely false, or it could be a small event masquerading as a large event. For example, a terrorist could contaminate a single container of some food and send out an Internet message stating that the entire national stock of that food was contaminated. If the goal is to spread terror rather than to cause mass illness, then a small attack or even an Internet announcement with no contaminated products could persuade consumers that the risk is real. With a sufficiently plausible background story implicating a widely-consumed food, the hoax might lead to (printed page 71615) extensive protective efforts by businesses and consumers. Consumers might take costly preventive actions, such as throwing away food, stopping their consumption of the suspect food item, or visiting physicians or emergency rooms to determine if they have been exposed to some hazard. Producers and distributors might destroy inventories of the suspect food as a preventive measure. If there is widespread uncertainty about the extent of contamination, this protective behavior could easily generate high costs. If the terrorist attack on a food is a small-scale event masquerading as a national event, a full system of records will allow the agency to trace the suspect foods through the food chain to determine the extent of contamination. The government could quickly narrow down the range of suspect foods and, if the risk is absent, reassure the public that the suspect foods are indeed free of contamination by terrorists. The ability to move quickly and authoritatively will possibly generate real benefits by preventing costly defensive actions by businesses and consumers. 2. Benefits: Model Framework

(2) Rank, position, or title alone does not authorize access to personal information about others.

(b) Disclosures required by the FOIA. (1) All records must be disclosed if their release is required by FOIA (5 U.S.C. 552), as implemented by 32 CFR part 286 . The FOIA requires records

be made available to the public unless withholding is authorized pursuant to one of nine exemptions or one of three law enforcement exclusions under the Act. (i) The DoD Component must be in receipt of a FOIA request and a determination made that the records are not withholdable pursuant to a FOIA exemption or exclusion before the records may be disclosed. (ii) Records that have traditionally been released to the public by the Components may be disclosed whether or not a FOIA request has been received. (2) The standard for exempting most personal records, such as personnel, medical, and similar records, is FOIA Exemption 6 (32 CFR part 286.12(e)). Under that exemption, records can be withheld when disclosure, if other than to the individual about whom the information pertains, would result in a clearly unwarranted invasion of the individual's personal privacy. (3) The standard for exempting personal records compiled for law enforcement purposes, including personnel security investigation records, is FOIA Exemption 7(C) (32 CFR part 286.12(g)). Under that exemption, records can be withheld when disclosure, if other than to the individual about whom the information pertains, would result in an unwarranted invasion of the individual's personal privacy. (4) If records or information are exempt from disclosure pursuant to the standards set forth in paragraphs (b)(2) and/or (b)(3) of this section, and the records are contained in a system of records (See § 310.10(a) of subpart B, the Privacy Act (5 U.S.C. 552a) prohibits release. (5) Personal information that is normally releasable. (i) DoD civilian employees. (A) Some examples of personal information regarding DoD civilian employees that normally may be released without a clearly unwarranted invasion of personal privacy include: (1) Name. (2) Present and past position titles. (3) Present and past grades. (4) Present and past annual salary rates. (5) Present and past duty stations. (6) Office and duty telephone numbers. (7) Position descriptions. (B) All disclosures of personal information regarding Federal civilian employees shall be made in accordance with OPM release policies (see 5 CFR part 293.311). (ii) Military members. (A) While it is not possible to identify categorically information that must be released or withheld from military personnel records in every instance, the following items of personal information regarding military members normally may be disclosed without a clearly unwarranted invasion of their personal privacy: (1) Full name. (2) Rank. (3) Date of rank. (4) Gross salary. (5) Past duty assignments. (6) Present duty assignment. (7) Future assignments that are officially established. (8) Office or duty telephone numbers. (9) Source of commission. (10)

Information may be referred to other government agencies or to non-government agencies or to non-government personnel (including contractors or prospective contractors) having an identified interest in a particular invention and the Government's rights therein. The DoD 'Blanket Routine Uses' set forth at the beginning of DLA's compilation of systems of records notices apply to this system. Policies and practices for storing, retrieving, accessing, retaining, and disposing of records in the system: Storage: Records are maintained in paper and computerized form. Retrieval: Filed by names of inventors. Safeguards: Access is limited to those individuals who require the records for the performance of their official duties. Paper records are maintained in buildings with controlled or monitored access. During non-duty hours, records are secured in locked or guarded buildings, locked offices, or guarded cabinets. The electronic records systems (printed page 18788) employ user identification and password or smart card technology protocols. Retention and disposal: Records maintained by the HQ and field Offices of Counsel are destroyed 26 years after file is closed. Records maintained by field level Offices of Counsel where patent applications are not prepared are destroyed 7 years after closure. System manager(s) and address: Office of the General Counsel, Headquarters, Defense Logistics Agency, ATTN: DG, 8725 John J. Kingman Road, Stop 2533, Fort Belvoir, VA 22060-6221. Notification procedure: Individuals seeking to determine whether information about themselves is contained in this system should address written inquiries to the Privacy Officer, Headquarters, Defense Logistics Agency, ATTN: DSS-B, 8725 John J. Kingman Road, Stop 6220, Fort Belvoir, VA 22060-6221, or the Privacy Officers at DLA field activities. Official mailing addresses are published as an appendix to DLA's compilation of systems of records notices. Record access procedures: Individuals seeking access to information about themselves contained in this system should address written inquiries to the Privacy Officer, Headquarters, Defense Logistics Agency, ATTN: DSS-B, 8725 John J. Kingman Road, Stop 6220, Fort Belvoir, VA 22060-6221, or the Privacy Officers at the DLA field activities. Official mailing addresses are published as an appendix to DLA's compilation of systems of records notices. Individuals should provide information that contains full name, current address and telephone numbers of requester. For personal visits, each individual shall provide acceptable identification, e.g., driver's license or identification card. Contesting record procedures: The DLA rules for accessing records, contesting contents, and appealing initial agency determinations are contained in

32 CFR part 323, or may be obtained from the Privacy Act Officer, Headquarters, Defense Logistics Agency, ATTN: DSS-B, 8725 John J. Kingman Road, Stop 6220, Fort Belvoir, VA 22060-6221. Record source categories:

This document leverages the ISO/IEC standards as much as possible in forming vulnerability disclosure guidelines for the Federal Government. Federal vulnerability disclosure programs should follow, to the extent possible, the terminology used in this document to facilitate interoperability in communications (e.g., using the same names for the various actors), as well as for internal efforts of identification, assessment, and the minimization or elimination of vulnerabilities. When a needed term is not defined in this document but does exist in the ISO/IEC standards, the term from the standards should be used. A glossary of the major terms used in this document is provided in Appendix B. Each FCB member should develop the ability to receive source vulnerability reports from reporters, maintain a database of received reports, and engage in secure communications (e.g., using a report tracking system). 2 The expectation for communication with the reporter should be established, including the initial acknowledgment, status updates, and agreed-upon method of communication. The actual receipt of a source vulnerability report may take multiple forms (e.g., email, web forms, or a phone hotline) and should be stated in a public policy. It is also Prior to the receipt of any vulnerabilities, each FCB member will determine which government VDPOs fall within the scope of their services. The FCB member will then obtain and maintain a list of VDPO contacts within the relevant government agencies that receive and handle source vulnerability reports. Each FCB member should develop the capability to forward reports to VDPOs and to engage in ongoing communications to enable coordination. Lastly, FCB members may engage with industry-tied vulnerability coordination entities (e.g., CERT/CC 3) to facilitate coordination with non-government software and/or service providers.

From the NIST SP 800-172 Rev 3 Final Public Draft: Threat literacy training includes educating individuals on the various ways that APTs can infiltrate the organization (e.g., through websites, emails, pop-ups, articles, and social engineering) and describes techniques for recognizing suspicious emails, the NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 use of removable systems in non-secure settings, and the potential targeting of 772

% of establishments That Are Very Small % of Food Industry Revenue From Very Small Establishments
Manufacturers 77 15 Wholesalers 81 14 Transporters 90 16 Grocery outlets 88 18
Convenience outlets 73 18 Importers 82 14 Mixed-type facilities 82 15 Moreover, many of our failures in a typical trace back investigation (i.e., unclassified scenarios) have been at the wholesaler (distributor) level. As noted in the table A of this document, 81 percent of the wholesalers are considered very small. We also would have significant concerns if 90 percent of the transporters (as very small entities) were excluded from the requirements to establish and maintain records. In light of the previous information, FDA does not believe we would have an effective recordkeeping system if we were to exempt all very small entities from the rule. Unlike the very small retailers who are at the end of the distribution chain only, a full exemption by size would create holes throughout the distribution chain and would not provide FDA adequate assurances that, in the event of a threat of serious adverse health consequences or death, FDA would be able to conduct an efficient and effective tracing investigation. However, individual direct sellers as described in the comment who qualify as retail food establishments that employ 10 or fewer full-time equivalent employees are excluded from all of the requirements of subpart J in this final rule, except the record access provisions for existing records under §§ 1.361 and 1.363. (See response to comment 38 of this document for a further discussion of FDA's rationale underlying this exclusion.) In addition, FDA has considered the size of a business in establishing compliance dates for this final rule. Further, the final rule exempts direct sellers who are otherwise subject to the recordkeeping requirements of this rule and who sell food products directly to consumers from keeping records of the immediate subsequent recipients of that food. (Comment 52) Several comments state FDA should interpret the exemption from maintaining records for immediate subsequent recipients of food to expressly include retail farm supply and feed stores that sell finished product directly to consumers and final purchasers. For instance, the comments note that many small rural feed manufacturers also have a retail outlet in their facilities that sell bagged feed, pet food, and feed ingredients/additives over-the-counter directly to consumers and to final purchasers for their own animals. These products are not resold by the purchaser-customer. Maintaining records of these sales is not common practice today, would represent a costly burden to such enterprises,

many of which are small businesses, and would not demonstrably enhance human or animal protection from bioterrorism-related threats.

3.1.10 Logging and Auditing Vulnerability (CWE-778 and CWE-779) Description Logging and auditing are common system and security functions aiding in system management, event identification, and event reconstruction.

(a) The need for customary progress payments in accordance with subpart 32.5 of the Federal Acquisition Regulation (FAR) or performance-based payments in accordance with FAR subpart 32.10 will not be considered as a handicap or adverse factor in the award of the contract. (b) This solicitation includes a FAR and Defense Federal Acquisition Regulation Supplement (DFARS) clause for performance-based payments and a FAR clause for progress payments. The resultant contract will include either performance-based payments or progress payments, not both, except as may be authorized on separate orders subject to FAR 32.1003(c). (1) The performance-based payments clauses will be included in the contract if: (i) The Offeror has provided positive representation in response to DFARS 252.232-7015, Performance-Based Payments-Representation; (ii) The Offeror proposes a performance-based payment arrangement in accordance with FAR 52.232-28, Invitation to Propose Performance-Based Payments, including proposed events and timing, event completion criteria, event values, and expected expenditure profile; and (iii) The Offeror and the Government reach agreement on all aspects of the arrangement. (2) If performance-based payments clauses are not included in the resultant contract, the progress payments clause included in this solicitation will be included in any resultant contract, modified or altered if necessary in accordance with FAR 52.232-16 and its Alternate I. Even though the progress payments clause is included in the contract, the clause shall be inoperative during any time the contractor's accounting system and controls are determined by the Government to be inadequate for segregation and accumulation of contract costs. (End of provision) [FR Doc. 2020-06728 Filed 4-7-20; 8:45 am] BILLING CODE 5001-06-P

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft)
Enhanced Security Requirements for Protecting CUI September 2025 · Implementing dual authorization controls for critical or sensitive operations 337

Establish and deploy technical controls for securing the covered entity's or business associate's relevant electronic information systems and technology assets in its relevant electronic information systems, including workstations, in a consistent manner, and maintain such electronic information systems and technology assets according to the covered entity's or business associate's established secure baselines. (2) Implementation specifications ·(i) Anti-malware protection. Deploy technology assets and/or technical controls that protect all of the covered entity's or business associate's technology assets in its relevant electronic information systems against malicious software, including but not limited to viruses and ransomware. (ii) Software removal. Remove extraneous software from the covered entity's or business associate's relevant electronic information systems. (iii) Configuration. Configure and secure operating system(s) and software consistent with the covered entity's or business associate's risk analysis under § 164.308(a)(2). (iv) Network ports. Disable network ports in accordance with the covered entity's or business associate's risk analysis under § 164.308(a)(2). (v) Maintenance. Review and test the effectiveness of the technical controls required by this paragraph (c) at least once every 12 months or in response to environmental or operational changes, whichever is more frequent, and modify as reasonable and appropriate. (d) Standard: Audit trail and system log controls ·(1) General. Deploy technology assets and/or technical controls that record and identify activity in the covered entity's or business associate's relevant electronic information systems. (2) Implementation specifications ·(i) Monitor and identify. The covered entity or business associate must deploy technology assets and/or technical controls that monitor in real-time all activity in its relevant electronic information systems, identify indications of unauthorized persons or unauthorized activity as determined by the covered entity's or business associate's risk analysis under § 164.308(a)(2), and alert workforce members of such indications in accordance with the policies and procedures required by § 164.308(a)(7). (ii) Record. The covered entity or business associate must deploy technology assets and/or technical controls that record in real-time all activity in its relevant electronic information systems. (iii) Retain. The covered entity or business associate must deploy technology assets and/or technical controls to retain records of all activity in its relevant electronic information systems as determined by the covered entity's or business associate's policies and procedures for information system activity review at

§ 164.308(a)(7)(ii)(A). (iv) Scope. Activity includes creating, accessing, receiving, transmitting, modifying, copying, or deleting any of the following: (A) Electronic protected health information. (B) Relevant electronic information systems and the information therein. (v)

3.2.4 | Web Server and Network Administrators ... 3.2.4 Web Server and Network Administrators Web server administrators are system architects responsible for the overall design, implementation, and maintenance of a Web server.

- Prohibit DISA access from being activated except for test purposes. - Use the following precautions when the DISA is activated for testing purposes: - Activate the feature only for the duration of the test. - Make the access code at least eight (8) characters long. - Change the access code at the conclusion of the test session. - Deactivate the feature at the conclusion of the test. When a user dials 9 to place an outside call, the call is routed over a randomly selected trunk. Dial Access Codes (DACs) are used to allow access to a specific trunk, such as a WATS (Wide Area Telecommunication Services) trunk. DACs should not be provided to the user except for paging trunks. Trunk group DACs shall be no less than 3 digits in length. DACs should be disabled except for testing purposes. - Access to user trunks should be through ARS only. - Use the following precautions if DACs are activated for testing purposes: - Activate the feature only for the duration of the test. - Make the code a three digit number. - Change the code at the conclusion of the test session. - Deactivate the feature at the conclusion of the test.

Andrew Witty, UnitedHealth Group Chief Executive Officer, in his testimony to Congress, estimated that the breach of Change Healthcare may involve the PHI of one-third of Americans. · Hacking America's Health Care: Assessing the Change Healthcare Cyber Attack and What's Next, · Subcommittee on Oversight and Investigations of the Committee on Energy and Commerce, Hearing Before the Committee on Finance (May 1, 2024), <https://www.finance.senate.gov/hearings/hacking-americas->

Firewall devices at the edge of a network are sometimes required to do more than block unwanted traffic. A common requirement for these firewalls is to encrypt and decrypt specific network traffic flows between the protected network and external networks. This nearly always involves virtual private networks (VPN), which use additional protocols to encrypt traffic and provide user authentication and integrity checking. VPNs are most often used to provide secure network communications across untrusted networks. For example, VPN technology is widely used to extend the protected network of a multi-site . The planning phase for choosing and implementing a firewall should begin only after an organization has determined that a firewall is needed to enforce the organization's security policy. This typically occurs following a risk assessment of the overall system. A risk assessment includes (1) the identification of threats and vulnerabilities in the information system; (2) the potential impact or magnitude of harm that a loss of confidentiality, integrity, or availability would have on the organization's assets or operations (including mission, function, image, or reputation) in the event of a threat exploitation of identified vulnerabilities; and (3) the identification and analysis of security controls for the information system 20 .

Public Law 115-232 . As provided for in the law, the Under Secretary of Defense for Intelligence and Security, on behalf of the Secretary, granted waivers of NIDs for those categories of proscribed information under the control of the Secretary of Defense, to 20 contractors that met the criteria in summer 2019 with the waivers expiring as of October 1, 2020, since the statute went into effect. Those contractors, pursuant to Section 842 of Public Law 115-232 had to meet the following criteria as part of the waiver determination: (1) A demonstrated successful record of compliance with the NISP assessed by the CSA; and (2) previously been approved for access to proscribed information as indicated in CSA FCL records. The law is limited to ·a person that is a subsidiary located in the United States· (A) for which the ultimate parent entity and any intermediate parent entities of such subsidiary are located in a country that is part of the national technology and industrial base (as defined in section 2500 of title 10, United States Code); and (B) that is subject to the FOCI requirements of the NISP. · Legal Authority for the NISP In addition to E.O. 12829 , which, establishes the NISP and requires the Secretary of Defense to issue and maintain the NISPOM, the following are other relevant authorities for the program. E.O. 10865 ·Safeguarding Classified Information within Industry,· February 20, 1960, as amended (available at <https://www.archives.gov/federal-register/codification/executive-order/10865.html>), addresses the protection of classified information that is disclosed to, or developed by contractors. E.O.

12968 , ·Access to Classified Information,· August 2, 1995, as amended (available at <https://www.govinfo.gov/·content/·pkg/·FR-1995-08-07/·pdf/·95-19654.pdf>), establishes a uniform personnel security program for individuals who will be considered for initial or continued access to classified information. E.O. 13526 , ·Classified National Security Information,· December 29, 2009 (available at <https://www.archives.gov/·files/·isoo/·pdf/·cnsi-eo.pdf>), prescribes a uniform system for classifying, safeguarding and declassifying national security information. E.O. 13587 , ·Structural Reforms to Improve the Security of Classified Networks and the Responsible Sharing and Safeguarding of Classified Information,· October 7, 2011 (available at <https://www.govinfo.gov/·app/·details/·CFR-2012-title3-vol1/·CFR-2012-title3-vol1-eo13587>), directs structural reforms to ensure responsible sharing and safeguarding of classified information on computer networks consistent with (printed page 83304) appropriate protection for privacy and civil liberties. E.O. 13691 ; Promoting Private Sector Cybersecurity Information Sharing,· February 13, 2015 (available at <https://obamawhitehouse.archives.gov/·the-press-office/·2015/·02/·13/·executive-order-promoting-private-sector-cybersecurity-information-sharing>

which happens frequently. This is because a ping in and of itself generally does not adversely affect relevant electronic information systems when it is blocked by firewall policies, and thus does not require activation of the regulated entity's contingency plan. Instead, the business associate would be required to provide such notice in instances where internet commands received by the business associate indicate potential malicious activity, such as a denial of service attack, leading to activation of its contingency plan because of an event that adversely affects the business associate's relevant electronic information systems that create, receive, maintain, or transmit ePHI or adversely affects the confidentiality, integrity, or availability of its ePHI. However, in both such instances, a business associate would still be required to provide notice to the covered entity of the ping as a security incident in accordance with the business associate agreement. [843] The proposal itself would only require that the business associate notify the covered entity of its activation of the contingency plan; it does not include any specific requirements with respect to the form, content, or manner of the notice. Instead, we propose to permit the covered entity and business associate to negotiate such terms and include them in their business associate agreement if they so choose. We recognize that when such an emergency or other occurrence transpires, the focus of the affected regulated entity must be on activating its contingency plan and restoring access to ePHI and the affected relevant electronic information systems. Similarly, when the contingency plan activation is in response to a successful security incident, [844] it may take some time to investigate and determine the cause of the security incident. Thus, this proposal would not require reporting on the cause of the contingency plan activation; it would require reporting solely on the fact that it has activated the plan. Accordingly, we believe that 24 hours would provide a business associate with sufficient time to do all of the following: determine that there is an emergency or other occurrence adversely affecting the business associate's relevant electronic information systems; determine that it needs to activate its contingency plan; identify any covered entities that need to be notified; and notify such covered entities. This proposed requirement to provide notice without unreasonable delay, but no later than 24 hours after a (printed page 983) contingency plan is activated, would also apply when a business associate that is a governmental entity enters into an arrangement with a covered entity that is also a governmental entity where such arrangement meets the requirements of the Privacy Rule at 45 CFR 164.504(e)(3) in accordance with 45 CFR 164.314(a)(2)(ii) and when a business associate enters into a business associate agreement with a subcontractor in accordance with 45 CFR 164.314(a)(2)(iii)

Appropriately scoping security requirements is an important factor in determining protection-234 related investment decisions and managing security risks for nonfederal organizations. If nonfederal organizations designate specific system components to process, store, or transmit CUI associated with a critical program or a high value asset, those organizations may limit the scope of the security requirements by isolating the system components in a separate CUI security domain. Isolation can be achieved by applying architectural and design concepts (e.g., implementing subnetworks with firewalls, software-defined perimeters, micro-segmentation, zero trust network architectures, and information flow control mechanisms). Security domains may employ physical separation, logical separation, or a combination of both. This approach can provide adequate security for CUI and avoid increasing the organization's security posture beyond what it requires to protect its missions, functions, operations, and assets. This publication does not provide guidance on which organizational programs or assets are determined to be critical or of high value.

Those determinations are made by the federal agencies mandating the use of the security requirements for additional protection and can be guided and informed by laws, Executive Orders, directives, regulations, or policies. Additionally, this publication does not provide guidance on specific types of threats or attack scenarios that justify the use of the security requirements. Finally, there is no expectation that all of the security requirements will be needed in every situation. Rather, requirements are selected by federal agencies based on mission needs and risk.

1.2. Organization of This Publication The remainder of this publication is organized as follows: · Section 2 describes the assumptions and methodology used to develop the enhanced security requirements and the organization and structure of the requirements. · Section 3 lists the enhanced security requirements for protecting the confidentiality, integrity, and availability of CUI in nonfederal systems and organizations. The following sections provide additional information to support the protection of CUI: · References · Appendix A: Acronyms · Appendix B: Glossary · Appendix C: Summary of Enhanced Security Requirements · Appendix D: Adversary Effects · Appendix E: Organization-Defined Parameters · Appendix F: Change Log

(iii) Requesters who seek records about themselves that are not contained in a Privacy Act system of records, and who cite or imply only the Privacy Act, will have their requests processed under the provisions of the FOIA (32 CFR part 286), because the access provisions of this part do not apply. Appeals shall be processed under the FOIA. (iv) Requesters who seek records about themselves that are contained in a Privacy Act system of records, and who cite or imply the FOIA or both Acts, will have their requests processed under the provisions of this part and the FOIA (32 CFR part 286). If the system of records is exempt from the access provisions of this part, and if the records, or any portion thereof, are exempt under the FOIA, the requester shall be advised and informed of the appropriate Privacy and FOIA exemption. Appeals shall be processed under both Acts. (v) Requesters who seek records about themselves that are not contained in a Privacy Act system of records, and who cite or imply the Privacy Act and FOIA, will have their requests processed under the FOIA (32 CFR part 286), because the access provisions of this part do not apply. Appeals shall be processed under the FOIA. (2) Do not deny individuals' access to personal information concerning themselves that would otherwise be releasable to them under either Act solely because they fail to cite or imply either Act or cite the wrong Act or part. (3) Explain to the requester which Act(s) was(were) used when granting or denying access under either Act. (j) Time limits. DoD Components normally shall acknowledge requests for access within 10 working days after receipt and provide access within 30 working days. (k) Privacy case file. Establish a Privacy Act case file when required. (See paragraph (p) of §-310.19.) §-310.18 Denial of individual access. (a) Denying individual access. (1) An individual may be denied access to a record pertaining to him or her only if the record: (i) Was compiled in reasonable anticipation of a civil action or proceeding (see §-310.27). (ii) Is in a system of records that has been exempted from the access provisions of this part under one of the permitted exemptions. (See §-310.28 and §-310.29.) (iii) Contains classified information that has been exempted from the access provision of this part under the blanket exemption for such material claimed for all DoD records systems. (See §-310.26(c).). (iv) Is contained in a system of records for which access may be denied under some other Federal statute that excludes the record from coverage of the Privacy Act (5 U.S.C. 552a). (2) Where a basis for denial exists, do not deny the record, or portions of the record, if denial does not serve a legitimate governmental purpose. (b) Other reasons to refuse access: (1) An individual may be refused access if: (i) The record is not described well enough to enable it to be located with a reasonable amount of effort on the part of an employee familiar with the file; or

b. Is an individual appointed to implement the Privacy Act requirements? c. Are provisions of AR 25-71 concerning protection of OPSEC sensitive information regularly brought to the attention of managers responsible for responding to Privacy Act requests and those responsible for control of the Army's records? d. When more than twenty working days are required to respond, is the Privacy Act requester informed, explaining the circumstance requiring the delay and provided an appropriate date for completion. e. Are Accounting Disclosures Logs being maintained? Comments: Assist in making this a better tool for evaluating management controls. Submit comments to the Department of Army, Freedom of Information and Privacy Division. Appendix H to Part 505-Definitions Function (a) Access. Review or copying a record or parts thereof contained in a Privacy Act system of records by an individual. (b) Agency. For the purposes of disclosing records subject to the Privacy Act, Components of the Department of Defense are considered a single agency. For other purposes including access, amendment, appeals from denials of access or amendment, exempting systems of records, and recordkeeping for release to non-DOD agencies, the Department of the Army is considered its own

agency. (c) Amendment. The process of adding, deleting, or changing information in a system of records to make the data accurate, relevant, timely, or complete. (d) Computer Matching Agreement. An agreement to conduct a computerized comparison of two or more automated systems of records to verify eligibility for payments under Federal benefit programs or to recover delinquent debts for these programs. (e) Confidential Source. A person or organization who has furnished information to the Federal Government under an express promise that the person's or the organization's identity would be held in confidence or under an implied promise of such confidentiality if this implied promise was made before September 27, 1975. (f) Cookie. A mechanism that allows the server to store its own information about a user on the user's own computer. Cookies are embedded in the HTML information flowing back and forth between the user's computer and the servers. They allow user-side customization of Web information. Normally, cookies will expire after a single session. (g) Defense Data Integrity Board. The Board oversees and coordinates all computer matching programs involving personal records contained in systems of records maintained by the DOD Component; reviews and approves all computer matching agreements between the Department of Defense (DOD) and other Federal, State, and local governmental agencies, as well as memoranda of understanding when the match is internal to the DOD. (h) Disclosure.

The electronic content generated or transmitted during a telemedicine visit constitutes ePHI, so the increase in telemedicine further increases the amount of PHI that is also ePHI. It is not only the ePHI maintained in EHRs and other electronic recordkeeping systems that faces security risks. Medical equipment and devices are increasingly connected through one or more networks, which means that any issues affecting the network likely will affect the medical equipment and devices. [177] And some medical equipment and devices rely on off-the-shelf operating systems, such as Windows, Linux, and similar third-party software; [178] thus, the medical equipment and devices can experience the same vulnerabilities as personal computing devices. Generally, the U.S. Food & Drug Administration (FDA) does not need to review software patches or configuration updates for off-the-shelf software before a device manufacturer puts them in place because the FDA views most patches and configuration updates as design changes that can be made without prior discussion. [179] Cybercriminals may use or target technology assets, such as software or medical devices used for treating individuals. For example, in 2021, a cyberattack on cloud-based systems supplied by a particular company compromised the ePHI of more than 200,000 individuals and affected the software for linear accelerators used in radiotherapy, leading to disruptions to cancer treatment. [180] Thus, to protect technology assets used for treatment, the information systems that create, receive, maintain, and transmit ePHI also must be protected. As another example, in 2013, the Mayo Clinic [181] hired a group of ethical hackers [182] to identify vulnerabilities in 40 different medical devices. [183] The hackers were able to gain access to all of the devices, meaning that the devices could all be vulnerable to a cyberattack. [184] Such attacks may create an opening for a subsequent attack on the device itself or on the regulated entity's information systems that create, receive, maintain, or transmit ePHI, compromising those information systems and the ePHI itself. [185] It also may lead, intentionally or not, to a loss of device integrity, which could result in the corruption of the device's functionality or the ePHI on the device. [186] A cyberattack on a medical device may also reduce the ability of the authorized person to use the device (e.g., a denial of service attack, which is a type of cyberattack that overloads the device by flooding the network with traffic). [187] Depending on the device and its use, the result of cyberattacks on a medical device could range from little or no effect to serious injury or death. [188] According to researchers at Brown University, medical devices are a prime target for cybercriminals. In fact, they believe, "More than just technically feasible, the widespread takedown of medical devices is an imminent threat." [189]

This standard specifies the stateless hash-based digital signature algorithm (SLH-DSA). Digital signatures are used to detect unauthorized modifications to data and to authenticate the identity of the signatory. In addition, the recipient of signed data can use a digital signature as evidence in demonstrating to a third party that the signature was, in fact, generated by the claimed signatory. This is known as non-repudiation since the signatory cannot easily repudiate the signature at a later time. SLH-DSA is based on SPHINCS + , which was selected for standardization as part of the NIST Post-Quantum Cryptography Standardization process.

1. Name of Standard. Stateless Hash-Based Digital Signature Standard (FIPS 205).
2. Category of Standard. Computer Security. Subcategory. Cryptography.
3. Explanation. This standard specifies a stateless hash-based digital signature scheme (SLHDSA) for applications that require a digital signature rather than a written signature. Additional digital signature schemes are specified and approved in other NIST Special Publications

We characterize the uncertainty in the estimate of the time for preventive action as a Beta-Pert distribution with the most likely value of 78 and the minimum and maximum values (taken from the data) of 6 days and 150 days. The Beta-Pert distribution is a Beta distribution that has been re-scaled to run between values other than 0 and 1. The Beta-Pert uses a minimum, maximum, and most likely value to generate a distribution running from the minimum to the maximum, with a mean equal to (minimum + (4 times the most likely) + maximum) divided by 6. We use the Beta-Pert distribution since it is less sensitive to extreme values and generates more outcomes close to the mean than a Triangular distribution. We assume that the average duration of outbreaks that persist beyond the time for preventive action is distributed normally with a mean of 121 minus the time for preventive action, and a standard deviation (computed from the data) of 17. We assume a uniform distribution with a range between 0.15 and 0.18 in the estimate in the portion of annual illnesses that potentially could be averted by faster preventive action.

11. Estimating the Impact on Traceback Performance for Options With Different Coverage

Our framework for estimating the impact on baseline traceback speeds and completion rates for policy options with alternative levels of coverage uses the number of facilities in each sector to weight the sectoral contribution to baseline traceback performance. We adjusted the weights of the transportation, warehouse, and mixed-type facilities sectors to account for special considerations related to their contributions to traceback speeds and completion rates. For options that distinguish between very small and large facility coverage, we also adjusted (printed page 71626) the contributions to traceback performance by facility size. We estimated that options with the most comprehensive coverage will lead to the greatest decrease in times for preventive action, and eliminate the largest number of investigations that are prematurely terminated for reasons of poor records quality or nonexistent records. Options with more limited coverage will have a more limited impact on traceback speeds and completion rates. The factors used to scale baseline traceback speeds and rates of premature terminations are described by the following expression: Total baseline performance = contribution by grocery outlets, given that contamination occurred further up the supply chain + contribution by wholesalers and importers, given that contamination occurred further up the supply chain + contribution by warehouses, given that contamination occurred further up the supply chain + contribution by manufacturers, given that contamination occurred further up the supply chain + contribution by transporters, given that contamination occurred further up the supply chain + contribution by mixed-type facilities.

[illegible]

) Escorts are responsible for ensuring that the classified material being shipped is safeguarded in the event of an emergency stop en route, re-routing of the aircraft, or in the event that the recipient government's representative fails to meet the shipment at its destination. (4) The contractor does not have to provide escorts if: (i) The classified material is shipped by the Defense Transportation System or a U.S. military carrier. (ii) The recipient government DGR has signed for the receipt of the classified material within the United States. (iii) The classified material is shipped via a military carrier of the recipient government or a carrier owned by or registered to the recipient government. (iv) The classified material is shipped via a cleared U.S. commercial freight carrier, so long as the contractor has a written agreement from the U.S. commercial freight carrier to provide an escort who is eligible for access to classified information and has access to classified information at the classification level of the material being shipped. (v) There are exceptional circumstances, and procedures have been approved by both the USG and the recipient government. (3) Secure communications plan. (i) The contractor is required to meet all requirements outlined in this section, as applicable, for the secure communications plan. (ii) The secure communications plan may be approved within a program security instruction, SSP, or a government to government agreement by the designated security authorities. A separate memorandum of understanding or memorandum of agreement is not required. (iii) Additionally, an SSP must be authorized in accordance with §.117.18 and the CSA provided guidance. (4) Return of material for repair, modification, or maintenance. (i) A foreign government or foreign contractor may return classified material to a U.S. contractor for repair, modification, or maintenance. (ii) The approved methods of return will be specified in either the GCA sales arrangement, the security requirements section of a direct commercial sales arrangement or, in the case of material transferred as freight, in the original TP. (iii) The contractor, on receipt of notification that classified material is to be received, will notify the applicable CSA. (5) Use of freight forwarders. (i) A commercial freight forwarder may be used to arrange for the international transfer of classified material as freight. (A) The freight forwarder must be under contract to a USG agency, U.S. contractor, or the recipient foreign government. (B) The contract will describe the specific functions to be performed by the freight forwarder. (C) The responsibility for security and control of the classified material that is processed by freight forwarders remains with the USG until the freight is transferred to a DGR of the recipient government.

) OSAs must have a System Security Plan (SSP) (CMMC security requirement CA.L2-3.12.4) in place at the time of assessment to describe each information system within the CMMC Assessment Scope. The absence of an up to date SSP at the time of the assessment would result in a finding that ` an assessment could not be completed due to incomplete information and noncompliance with 48 CFR 252.204-7012 . ' (6) For each NOT MET security requirement the OSA must have a POA&M in place. A POA&M addressing NOT MET security requirements is not a substitute for a completed requirement. Security requirements not implemented, whether described in a POA&M or not, is assessed as `NOT MET.' (7) Specialized Assets must be evaluated for their asset category per the CMMC scoping guidance for the level in question and handled accordingly as set forth in §.170.19. (8) If an OSC previously received a favorable adjudication from the DoD CIO indicating that a security requirement is not applicable or that an alternative security measure is equally effective (in accordance with 48 CFR 252.204-7008 or 48 CFR 252.204-7012), the DoD CIO adjudication must be included in the system security plan to receive consideration during an assessment. A security requirement for which implemented security measures have been adjudicated by the DoD CIO as equally effective is assessed as MET if there have been no changes in the environment. (ii) CMMC Level 2 Scoring Table. CMMC Level 2 scoring has been assigned based on the methodology set forth in table 1 to this paragraph (c)(2)(ii). Table 7 to §.170.24 (c)(2)(ii) -CMMC Level 2 Scoring Table CMMC Level 2 requirement categories Point value subtracted from maximum score Basic Security Requirements: If not implemented, could lead to significant exploitation of the network, or exfiltration of CUI 5 If not implemented, has specific and confined effect on the security of the network and its data 3 Derived Security Requirements: If not implemented, could lead to significant exploitation of the network, or exfiltration of CUI 5 If not completely or properly

implemented, could be partially effective and points adjusted depending on how the security requirement is implemented: 3 or 5 ·Partially effective implementation·3 points. ·Non-effective (not implemented at all)·5 points. If not implemented, has specific and confined effect on the security of the network and its data 3 If not implemented, has a limited or indirect effect on the security of the network and its data 1 (3) CMMC Level 3 assessment scoring methodology.

CMMC Program rule to the supplemental documents, which are not codified. As such, the supplemental documents are provided for optional use, and the regulatory text takes precedence. The CMMC Assessment Process (CAP) guidance is a product of the Accreditation Body and is not codified in the CFR as part of the CMMC rule, and the regulatory text in part 170 takes precedence. Comments on the CMMC Supplemental Guidance were received as part of the public comment period review. Final versions of these documents were published with this rule. Other supplemental materials published by the Accreditation Body do not convey government direction and are therefore do not require rulemaking. Supplemental documents (e.g., CMMC assessment and scoping guides) are not codified in the CFR as part of the regulatory text. To codify CMMC program requirements, content must be included in the 32 CFR part 170 CMMC Program rule text. DoD developed the CMMC Assessment Guides to provide supplemental information to the public offering added clarity on the intent of the NIST SP 800-171A Jun2018 and NIST SP 800-172A Mar2022 guides. The CMMC Assessment Guides are particularly important for security requirements with organization-defined parameters (ODPs) (e.g., CMMC Level 3). There is no requirement to use the supplemental guidance documents. Office of the Federal Register (OFR) regulations, at 1 CFR part 51 , govern the IBR process. IBR is only available if the applicable regulations are published in the Federal Register and codified in the CFR. When incorporated by reference, this material has the force and effect of law, as do all regulations published in the Federal Register and codified in the CFR. 1 CFR part 51 requires the specification of a revision to a standard, for example NIST SP 800-171, Protecting Controlled Unclassified Information in Nonfederal Systems and Organizations, Revision 2, February 2020 (includes updates as of January 28, 2021), which is incorporated by reference in this rule. The DoD will determine when to update this rule after documents incorporated by reference have been revised. Per OFR guidance, § 170.4 points to other sections of part 170 where applicable and repeats definitions for terms incorporated by reference. Contractors complying with CMMC requirements need to be familiar with those documents that are incorporated (printed page 83161) by reference. The definition of subcontractor is not incorporated by reference, but rather points to a definition codified in 48 CFR 3.502-1 , as recommended in OMB guidelines for formal rulemaking. DoD has determined that the Defense Information Systems Agency's Cloud Security Technical Reference Architecture does not meet the criteria for approved IBR material. However, the rule has been updated to use a different definition for Cloud Service Provider. The requirements of NARA's CUI program (32 CFR part 2002) and DoD's implementing policies for identifying and managing CUI are beyond the scope of the CMMC rule.

Amendment of records. (a) Amended records. (1) Individuals are encouraged to periodically review the information maintained about them in Privacy Act systems of records and to familiarize themselves with the amendment procedures established by this part. (2) An individual may request to amend records that are retrieved by his or her name or personal identifier from a system of records unless the system has been exempted from the amendment provisions of the Act. The standard for amendment is that the records are inaccurate as a matter of fact rather than judgment, irrelevant, untimely, or incomplete. The burden of proof is on the requester. (3) The system manager or custodian must review Privacy Act records for accuracy, relevance, timeliness, and completeness. (4) Amendment procedures are not intended to permit individuals to challenge events in records that have actually occurred. Amendment procedures only allow individuals to amend those items that are factually inaccurate and not matters of official judgment (e.g. , performance ratings, promotion potential, and job performance appraisals). In addition, an individual is not permitted to amend records for events that have been the subject of judicial or quasi-judicial actions/proceedings. (b) Proper amendment requests. (1) Amendment requests, except for routine administrative changes, will be in writing. (2) When acting on behalf of a first party requester, an individual must provide written documentation of the first party requester's consent to allow the individual to view his or her records. (3) Amendment is appropriate if it can be shown that: (i) Circumstances leading up to the recorded event were found to be inaccurately reflected in the document; (ii) The record is not identical to the individual's copy; or (iii) The document was not constructed in accordance with the applicable recordkeeping requirements prescribed in AR 25-400-2, The Army Records Information Management System (ARIMS). (4) Under the amendment provisions, an individual may not challenge the merits of an adverse determination. (5) U.S. Army Criminal Investigation

Command (USACIDC) reports of investigations (PA system of records notice A0195-2a USACIDC, Source Register; A0195-2b USACIDC, Criminal Investigation and Crime Laboratory Files) have been exempted from the amendment provisions of the Privacy Act. Requests to amend these reports will be considered under AR 195-2. Actions taken by the Commander of U.S. Army Criminal Investigation Command will constitute final action on behalf of the Secretary of the Army under that regulation. (6) Records placed in the National Archives are exempt from the Privacy Act provision allowing individuals to request amendment of records. Most provisions of the Privacy Act apply only to those systems of records that are under the legal control of the originating agency; for example, an agency's current operating files or records stored at a Federal Records Center.

(2) The agency may release outside the Government Contractor bid or proposal information, Contractor proprietary business information, and contractor-attributional information that is not created by or for the Government, but that is related to a CUI incident: (i) To entities with missions that may be affected by such information; (ii) To entities that may be called upon to assist in the diagnosis, detection, or mitigation of CUI incidents; or (iii) For national security purposes, including cyber situational awareness. (3) The Government may use and release Contractor bid or proposal information, Contractor proprietary business information, and contractor-attributional information, created by or for the Government and related to a CUI incident, outside of the Government for purposes and activities associated with responding to a CUI incident and for any other lawful Government purpose or activity. (4) In any authorized release, the Government will include the Contractor proprietary business information or contractor-attributional information only to the extent necessary, as determined by the Government, to advance a lawful Government purpose or activity. (e) Subcontracts. The Contractor shall include this clause, including this paragraph (e) and without alteration except to identify the parties, in all subcontracts and other contractual instruments. The Contractor shall require subcontractors to notify the prime Contractor or next higher tier subcontractor within 8 hours of discovery of a suspected or confirmed CUI incident. (End of clause) 42. Amend section 52.212-5 by: a. Revising the date of the clause; b. Redesignating paragraphs (b)(12) through (65) as paragraphs (b)(14) through (67) and adding new paragraphs (b)(12) and (13); c. Redesignating paragraphs (e)(1)(viii) through (xxvii) as paragraphs (e)(1)(x) through (xxix) and adding new paragraphs (e)(1)(viii) and (ix); d. In Alternate II: i. Revising the date of the alternate; and ii. Redesignating paragraphs (e)(1)(ii)(H) through (Z) as paragraphs (e)(1)(ii)(J) through (BB); and iii. Adding new paragraphs (H) and (I). The revisions read as follows: (printed page 4301) 52.212-5 Contract Terms and Conditions Required To Implement Statutes or Executive Orders-Commercial Products and Commercial Services. * * * * * Contract Terms and Conditions Required To Implement Statutes or Executive Orders-Commercial Products and Commercial Services (DATE) * * * * * (b) * * * (12) 52.204-XX, Controlled Unclassified Information (DATE) (E.O. 13556). (13) 52.204-YY, Identifying and Reporting Information That Is Potentially Controlled Unclassified Information (DATE). * * * * * (e)(1) * * * (viii) 52.204-XX, Controlled Unclassified Information (DATE) (E.O. 13556). (ix) 52.204-YY, Identifying and Reporting Information That Is Potentially Controlled Unclassified Information (DATE). * * * * * Alternate II (DATE) * * * (e)(1) * * * (ii) * * * (H) 52.204-XX, Controlled Unclassified Information (DATE) (E.O. 13556).

3.1.3 | The acct File | 26 | | 3. 3.1.3 The acct File The file /usriadmiacct [Sun88a, 1344-1345] records each execution of a command on the system, who executed it, when, and how long it took.

Some comments received lacked relevance to the rule's content, which is limited to specific CMMC Program requirements. The DoD declines to respond to speculative or editorial comments about private citizens or entities, all of which are not within the scope of this rule. Personnel actions taken by the CMMC AB and comments regarding filing of IRS forms are not within the scope of this rule. §170.8(b) of this final rule provides requirements of the CMMC AB. CMMC Program requirements as described in this rule requires the CMMC Accreditation Body and the CAICO to have and abide by ethics and conflicts of interest rules and to have and maintain a Code of Professional Conduct (CoPC). §170.8(b)(3) describes the ISO/IEC requirements and the timeline in which the CMMC AB needs to meet those requirements. The DoD declines to comment on business decisions made by the current CMMC AB in the performance of its CMMC related roles, responsibilities, and requirements. Based on information currently known to DoD, the CMMC AB is currently performing as defined in this final rule and the terms of the contract. The ANSI National Accreditation Body is performing the function of accrediting the CAICO, which is appropriate given its status as a subsidiary of the CMMC AB. The DoD defined CMMC Conflict of Interest requirements to reduce the possibility that a member of the

CMMC Ecosystem acting in one capacity may bias, or be biased by, clients that are paying them to perform another CMMC related service. The rule text includes ethics requirements for members of the CMMC ecosystem, to include the CMMC AB (§ 170.8). The DoD concurred with some comments and has increased the cooling off period from six months to one year in § 170.8(b)(17)(i)(C). DoD considered many alternatives before deciding upon the current CMMC structure. The DoD has established requirements for a CMMC Accreditation Body, and this accreditation body will administer the CMMC Ecosystem. The phased CMMC implementation plan provides time to train the necessary number of assessors and, the rule has been updated to add an additional six months to the Phase 1 timeline. (printed page 83126) The DoD requires that the Accreditation Body must achieve and maintain compliance with the ISO/IEC 17011:2017(E) standard (the international benchmark used in demonstrating an accreditation body's impartiality, technical competency, and resources) and the requirements set forth in § 170.8. The CMMC Proposed rule also requires compliance with ISO/IEC 17020:2012(E) for conformity assessments. § 170.12(b)(5) was revised to indicate that a CMMC instructor, subject to the Code of Professional Ethics and Conflict of Interest policies, may serve on an assessment team but cannot consult. CCIs are not permitted to develop or proctor exams to avoid participating in any activity, practice, or transaction that could result in an actual or perceived conflict of interest.

DoD considered many alternatives before deciding upon the current CMMC structure. The DoD established requirements for a CMMC Accreditation Body, and this accreditation body will administer the CMMC Ecosystem. The DoD reviewed and assessed the whitepapers that were submitted by RFI respondents and determined that no single respondents could meet all the broad facets required to serve as the CMMC Accreditation Body. Based on this assessment, the DoD published notice of a planned meeting in November 2019 to allow the respondents and other members of the public to hear the senior DoD leadership address DoD perspectives regarding the notional CMMC implementation flow; the notional program structure; the notional CMMC Accreditation Body activities, structure, and relationship with the DoD; and the notional CMMC implementation schedule. The DoD also provided information regarding the Department's planned way forward. The result of the November 2019 meeting was the establishment of the current CMMC Accreditation Body. The relationship between the current CMMC Accreditation Body and the DoD was formalized through a Memorandum of Understanding and then a No-Cost Contract. The DoD cannot assume the risk or the workload of directly managing the CMMC Ecosystem or the other alternatives suggested. The current CMMC Accreditation Body is aligned to the DoD through contractual arrangements. 31. Rulemaking Process Comment: Some comments were submitted to identify problems with using the Federal eRulemaking Portal (at www.regulations.gov) or the Federal Register website and did not address content of the proposed rule. One commenter was confused by the identification of the rule as 'Proposed' rather than final. Another asked whether the rule could be republished with page numbers. Many comments critiqued the format, heading and section numbering, use of incorporation by reference, or sections contained within the rule, rather than the substance of the content. For example, some comments described the CMMC rule as overly repetitive or containing duplicative sections. Some comments recommended deleting specific sections to shorten or simplify the rule, including 'History of the Program'. Some commenters perceived the preamble to the rule as unnecessary and recommended deleting or shortening that section. In addition, one commenter noted that responses to public comments received against an earlier CMMC rule publication ought to be published with the 48 CFR part 204 CMMC Acquisition rule rather than this 32 CFR part 170 CMMC Program rule. Several commenters simply thought the rule text too verbose and recommended rewriting the content with fewer words and simpler language or using tables to shorten the content. One comment criticized the organization of the documents.

the entity is under U.S. control), but the foreign interest is entitled to representation on the entity's governing board, an SCA may be adequate. At least one cleared U.S. citizen must serve as an outside director on the entity's governing board. There are no access limitations under an SCA. (iii) SSA. When a foreign interest effectively owns or controls an entity, an SSA may be adequate. An SSA is an arrangement that, based upon an assessment of the source and nature of FOCI and FOCI factors, imposes various industrial security measures within an institutionalized set of entity practices and procedures. The SSA preserves the foreign owner's right to be represented on the entity's board or governing body with a direct voice in the entity's business management, while denying the foreign owner majority representation and unauthorized access to classified information. (A) Requirement for a National Interest Determination (NID). Unless otherwise prohibited by law or regulation (e.g., Section 842 of Pub. L. 115-232), the applicable CSA must determine whether allowing an entity access to proscribed information under an SSA is consistent with national

security interests of the U.S. with concurrence from controlling agencies, as applicable. Such NIDs will be made as part of an entity eligibility determination or because of a changed condition when a GCA requires an entity to have access to proscribed information and the CSA proposes an SSA as the mitigation measure. The NID can be program, project, or contract specific. (B) NID process: (1) The CSA makes a NID for TOP SECRET or SAP information to which the entity requires access. Contractors should be aware that DOE Order 470.4B provides additional information and requirements for processing NID requests for access to RD. (2) In cases in which any category of the proscribed information is controlled by another agency (ODNI for SCI, DOE for RD, the National Security Agency (NSA) for COMSEC), the CSA asks that controlling agency to concur or non-concur on the NID for that category of information. (3) The CSA informs the GCA and the entity when the NID is complete. In cases involving SCI, RD, or COMSEC, the CSA also informs the GCA and the entity when a controlling agency concurs or non-concurs on that agency's category of proscribed information. The entity may begin accessing a category of proscribed information once the CSA informs the GCA and the entity that the controlling agency concurs, even if other categories of proscribed information are pending concurrence. (4) An entity's access to SCI, RD, or COMSEC remains in effect so long as the entity remains eligible for access to classified information and the contract or agreement (or program or project) which imposes the requirement for access to those categories of proscribed information remains in effect, except under any of the following circumstances: (i

The DoD has designed CMMC Program requirements to apply to those contractors that bid for DoD work which will require access to process, store, or transmit FCI or CUI in a contractor owned information system. A CMMC certification assessment is portable in the sense that it provides confidence that the holder has been assessed by an authorized third party for compliance with the applicable security standards (e.g., NIST SP 800-171 R2 or NIST SP 800-172 Feb2021). Once attained, CMMC certification assessment status may be presented for consideration by any entity as an indicator that they have implemented security requirements associated with the certificate level (e.g., NIST SP 800-171 R2 or NIST SP 800-172 Feb2021). Section 170.20 delineates the only existing bases for accepting alternate standards in this rule.- It is beyond the scope of this rule to provide a specific set of directions or guidance on recognition for alternate cybersecurity standards. Deviations from DFARS clauses are also beyond the scope of this rule. Section 170.20 has been modified to state that an OSC with a perfect score from a prior DCMA DIBCAC High Assessment aligned with the same CMMC Level 2 Scoping may meet CMMC Final Level 2 certification assessment requirements via acceptance of the prior DIBCAC assessment in lieu of a C3PAO assessment. Standards Acceptance does not refer to international standards acceptance, which is not described within the rule. c. C3PAO, CCP, and CCA Requirements Comment: In addition to the interest in international agreements, some commenters expressed concern about CMMC ecosystem capacity to meet demand for Level 2 certification. They advocated support for accreditation of non-U.S. based C3PAOs. One commenter suggested that FOCI requirements be deleted from the rule and managed via DoD's oversight of the CMMC AB. One commenter speculated the phased CMMC implementation plan would require all non-U.S. firms to comply simultaneously and recommended that foreign contractors be allowed additional time to comply. Another recommended that foreign companies be permitted to simply self-assess in lieu of obtaining a CMMC Level 2 certification assessment. Several commenters asked about foreign nationals participating in the CMMC ecosystem and noted discrepancies between qualifications identified in the rule and content on the CMMC AB's website at the time of rule publication. These commenters expressed interest in the ability for foreign citizens to become CCAs, CCPs, and LTPs (a term no longer used in the rule).

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 204, 208, 209, 212, 213, 215, 216, and 252 [Docket DARS-2020-0027] RIN 0750-AK44 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Final rule. SUMMARY: DoD is issuing a final rule amending the Defense Federal Acquisition Regulation Supplement (DFARS) to update the policy and procedures for use of the Supplier Performance Risk System and to require contracting officers to consider SPRS risk assessments, if available, in the evaluation of a supplier's quotation or offer and to consider SPRS supplier risk assessments when determining

contractor responsibility. DATES: Effective March 22, 2023. FOR FURTHER INFORMATION CONTACT: Heather Kitchens, telephone 571-296-7152. SUPPLEMENTARY INFORMATION: I. Background DoD published a proposed rule in the Federal Register at 85 FR 53748 on August 31, 2020, to amend the DFARS to require contracting officers to consider Supplier Performance Risk System (SPRS) risk assessments during evaluation of quotations or offers and to consider the SPRS supplier risk assessment in the evaluation of contractor responsibility. Two respondents submitted public comments in response to the proposed rule. II. Discussion and Analysis DoD reviewed the public comments in the development of the final rule. A discussion of the comments and the changes made to the rule as a result of those comments is provided, as follows. A. Summary of Significant Changes From the Proposed Rule As a result of public comments, there are changes from the proposed rule in the final rule to clarify applicability of the rule. Additionally, editorial and clarifying changes were made in the final rule as discussed in paragraph C of this preamble. B. Analysis of Public Comments a. Solicitation Provision Applicability Comment: One respondent commented that the prescription for solicitation provision 252.204-70XX, Notice to Prospective Suppliers on the Use of the Supplier Performance Risk System in Performance Evaluations, should be updated at DFARS 204.7X04 to state that the provision is for use in solicitations using FAR part 13 simplified acquisition procedures, including solicitations for supplies and services using FAR part 12 procedures for the acquisition of commercial items, to align with DFARS 204.7X02, Applicability. Response:

All CMMC ecosystem members are required to abide by the appropriate ethics and conflicts of interest policies established by the CMMC AB and CAICO. Rule content pertaining to ethics, quality assurance functions, record keeping, data encryption, security, etc. functions across the ecosystem are tailored to reflect the role each entity fills in the ecosystem. The CMMC AB is not an agency of the Federal government; it is a private sector organization operating under contract with the DoD. As described in § 170.6(a), the Office of the Department of Defense Chief Information Officer (DoD CIO) provides oversight of the CMMC Program and is responsible for establishing CMMC assessment, accreditation, and training requirements as well as developing and updating CMMC Program implementing guidance. The Accreditation Body must be under contract with the DoD. The rule has been modified to include additional CMMC AB oversight responsibilities for the CMMC PMO. The Department declines to incorporate CMMC AB generated artifacts into the rule by reference. The responsibilities of the DoD CIO and CMMC PMO are outlined in § 170.6 and the responsibilities of the Accreditation Body are outlined in § 170.8. The DoD acknowledges that the CMMC AB may not offer both accreditation services and certification services. DoD declines to make edits to these sections as they are in alignment with the roles and responsibilities of the CMMC AB. The DoD has revised § 170.8(b)(17)(i)(C) in the rule to clarify that the ‘CMMC activities’ which former Accreditation Body members are prohibited from include any or all responsibilities described in Subpart C of this rule. The rule was updated to indicate that C3PAOs must also meet administrative requirements as determined by the CMMC AB. It was also updated to clarify that the term ‘independent assessor staff’ in § 170.8(b)(4) refers to independent CMMC Certified Assessor staff, and to clarify the meaning of the term ‘members’ at § 170.8(b)(17)(i)(B). DoD declines to modify § 170.8(b)(15) to include the phrase ‘technical accuracy and alignment with all applicable legal, regulatory, and policy requirements’, as this does not result in a substantive change to the requirements as currently specified. c. C3PAOs Comment:

may wish to closely follow the development of these new publications by NIST. Organizations are encouraged to review all draft publications during public comment periods and provide feedback to NIST. Many NIST cybersecurity publications, other than the ones noted above, are available at <https://csrc.nist.gov/publications>. ## Authority This publication has been developed by NIST in accordance with its statutory responsibilities under the Federal Information Security Modernization Act (FISMA) of 2014, 44 U.S.C. § 3551 et seq., Public Law (P.L.) 113-283. NIST is responsible for developing information security standards and guidelines, including minimum requirements for federal information systems, but such standards and guidelines shall not apply to national security systems without the express approval of appropriate federal officials exercising policy authority over such systems. This guideline is consistent with the requirements of the Office of Management and Budget (OMB) Circular A-130. Nothing in this publication should be taken to contradict the standards and guidelines made mandatory and binding on federal agencies by the Secretary of Commerce under statutory authority. Nor should these guidelines be interpreted as altering or superseding the existing authorities of the Secretary of Commerce, Director of the OMB, or any other federal official. This publication may be used by nongovernmental organizations on a voluntary basis and is not subject to copyright in the United States. Attribution would, however, be appreciated by NIST.

d. The cost of the safeguard under consideration. 2. Label or designate media products containing personal information that do not contain classified material in such a manner as to alert those using or handling the information of the need for special protection. Designating products ·For Official Use Only· in accordance with the requirements of DoD 5200.1-R satisfies this requirement. 3. Mark and protect all computer products containing classified data in accordance with the requirements of DoD 5200.1-R and DoD Directive 8500.1. 4. Mark and protect all computer products containing ·For Official Use Only· material in accordance with the requirements of DoD 5200.1-R. 5. Ensure that safeguards for protected information stored at secondary sites are appropriate. 6. If there is a computer failure, restore all protected information being processed at the time of the failure using proper recovery procedures to ensure data integrity. 7. Train personnel involved in processing information subject to this Regulation in proper safeguarding procedures. D. Physical Safeguards 1. For all unclassified facilities, areas, and devices that process information subject to this Regulation, establish physical safeguards that protect the information against reasonably identifiable threats that could result in unauthorized access or alteration. 2. Develop access procedures for unclassified computer rooms, tape libraries, micrographic facilities, decollating shops, product distribution areas, or other direct support areas that process or contain personal information subject to this Regulation that control adequately access to these areas. 3. Safeguard on-line devices directly coupled to IT systems that contain or process information from systems of records to prevent unauthorized disclosure, use, or alteration. 4. Dispose of paper records following appropriate record destruction procedures. (See §.310.13(c) and DoD 5200.1-R.) E. Technical Safeguards 1. Components are to ensure that all PII not explicitly cleared for public release is protected according to Confidentiality Level Sensitive, as established in DoD Instruction 8500.2. In addition, all DoD information and data owners shall conduct risk assessments of compilations of PII and identify those needing more stringent protection for remote access or mobile computing. 2. Encrypt unclassified personal information in accordance with current Information Assurance (IA) policies and procedures, as issued. 3. Remove personal data stored on magnetic storage media by methods that preclude reconstruction of the data. 4. Ensure that personal information is not inadvertently disclosed as residue when transferring magnetic media between activities. 5. Only DoD authorized devices shall be used for remote access. Any remote access, whether for user or privileged functions, must conform to IA controls specified in DoD Instruction 8500.2. 6. Remote access for processing PII should comply with the latest IA policies and procedures.

(B) Penetration testing must be performed at least once every 12 months or in accordance with the covered entity's or business associate's risk analysis required by §.164.308(a)(2), whichever is more frequent. (iv) Patch and update installation. Deploy technical controls in accordance with the covered entity's or business associate's patch management program under §.164.308(a)(4) to ensure timely installation of software patches and critical updates as reasonable and appropriate. (i) Standard: Data backup and recovery ·(1) General. Deploy technical controls to create and maintain exact retrievable copies of electronic protected health information. (2) Implementation specifications ·(i) Data backup. Create backups of electronic protected health information in accordance with the policies and procedures required by §.164.308(a)(13)(ii)(B) and with such frequency to ensure retrievable copies of electronic protected health information are no more than 48 hours older than the electronic protected health information maintained in the covered entity or business associate's relevant electronic information systems. (ii) Monitor and identify. Deploy technical controls that, in real-time, monitor, and alert workforce members about, any failures and error conditions of the backups required by paragraph (i)(2)(i) of this section. (iii) Record. Deploy technical controls that record the success, failure, and any error conditions of backups required by paragraph (i)(2)(i) of this section. (iv) Testing. Restore a representative sample of electronic protected health information backed up as required by paragraph (i)(2)(i) of this section, and document the results of such test restorations at least monthly. (j) Standard: Information systems backup and recovery. Deploy technical controls to create and maintain backups of relevant electronic information systems; and review and test the effectiveness of such technical controls at least once every six months or in response to environmental or operational changes,

whichever is more frequent, and modify as reasonable and appropriate. § 164.314 Organizational requirements. (a)(1) Standard: Business associate contracts or other arrangements. The contract or other arrangement required by § 164.308(b)(2) must meet the requirements of paragraph (a)(2)(i), (ii), or (iii) of this section, as applicable. (2) Implementation specifications ·(i) Business associate contracts. The contract must provide that the business associate will do all of the following: (A) Comply with the applicable requirements of this subpart. (B) In accordance with § 164.308(b)(1)(ii), ensure that any subcontractors that create, receive, maintain, or transmit electronic protected health information on behalf of the business associate agree to comply with the applicable requirements of this subpart by entering into a contract or other arrangement that complies with this section.

that the Secretary of Defense issue and maintain this rule and changes to it. The USD(I&S) does so in consultation with all affected agencies (E.O. 12829 section 201), with the concurrence of the Secretary of Energy, the Chairman of the NRC, the DNI, and the Secretary of Homeland Security (E.O.12829 section 201), and in consultation with the ISOO Director (E.O. 12829 section 102). (2) Acts as the CSA for DoD. (3) Provides policy and management of the NISP for non-DoD executive branch agencies who enter into inter-agency security agreements with DoD to provide industrial security services required when classified information is disclosed to contractors in accordance with E.O. 12829 , as amended. (b) Director, DCSA. Under the authority, direction, and control of the USD(I&S), and in accordance with DoDI 5220.22 and DoD Directive (DoDD) 5105.42, ·Defense Security Service (DSS)· [1] (available at: <https://www.esd.whs.mil/Portals/54/Documents/DD/issuances/dodd/510542p.pdf?ver=2019-01-14-090012-283>) the Director, DCSA: (1) Oversees and manages DCSA, which serves as the DoD CSO. (2) Administers the NISP as a separate program element on behalf of DoD GCAs and those agencies with agreements with DoD for security services. (3) Provides security oversight of the NISP as the DoD CSO on behalf of DoD components and those non-DoD executive branch agencies who enter into agreements with DoD as noted in paragraph (a)(3) of this section. The Director, DCSA, will be relieved of this oversight function for DoD special access programs (SAPs) when the Secretary of Defense or the Deputy Secretary of Defense approves a carve-out provision in accordance with DoDD 5205.07, ·DoD SAP Policy· (available at: <https://www.esd.whs.mil/Portals/54/Documents/DD/issuances/dodd/520507p.pdf?ver=2020-02-04-142942-827>). (c) Secretary of Energy. In addition to the responsibilities in paragraph (h) of this section, the Secretary of Energy: (1) Prescribes procedures for the portions of this rule pertaining to information classified under the AEA (i.e., RD, FRD, and TFNI), as nothing in the rule shall be construed to supersede the authority of the Secretary of Energy under the AEA. (2) Retains authority over access to information classified under the AEA. (3) Inspects and monitors contractor, licensee, certificate holder, and grantee programs and facilities that involve access to information classified under the AEA, as necessary. (d) Chairman of the NRC. In addition to the responsibilities in paragraph (h) of this section, the Chairman of the NRC: (1) Prescribes procedures for the portions of this rule that pertain to information under NRC programs classified under the AEA, other federal statutes, and executive orders. (2) Retains authority over access to information under NRC programs classified under the AEA, other federal statutes, and executive orders.

. This would be a one-time, first-year burden that includes an average of 30 minutes for a regulated entity to select an MFA solution that allows them to meet the requirements of the proposal without creating workflow disruptions or delays. This estimate would vary depending on how prevalent MFA is in the industry when and if the requirements of the NPRM are finalized. As a widely accepted information security practice, the Department believes that many large entities have already deployed MFA and the costs range from zero to only a few dollars per user. The low estimate would be 01 hours on average (assuming that many entities already have some form of MFA), and the high estimate would be 1.75 hours (assuming that few entities have MFA). At the loaded wage rate of an information security analyst, the total estimated cost would be \$327,903,966 [= 1,822,600 regulated entities × 1.5 hours × \$119.94], with a low estimated total of \$218,602,644 [= 1,822,600 regulated entities × 1 hour × \$119.94] and a high estimated total of \$382,554,627 [= 1,822,600 regulated entities × 1.75 hours × \$119.94]. The Department applies this cost in the first year only because minimal additional labor is needed to maintain this safeguard once it has been deployed. f. Costs Related to Network Segmentation The Department believes that most large regulated entities and many medium-sized regulated entities have segmented their information networks to some degree; however, additional actions may be needed to more fully protect ePHI as required under proposed 45 CFR 164.312(a)(2)(vi) . Further, small entities may not have been aware of the importance of segmenting

networks or taken steps to segment their networks. The Department estimates that each regulated entity would spend an average of 4.5 hours to set up network segmentation in the first year of compliance with a final rule (with a low estimate of 4 hours and a high estimate of 5 hours) at the hourly wage of an information security analyst. The Department further assumes that in the following years, the burden to maintain the segmented network would be minimal and incorporated into the maintenance requirements. The total first year estimated cost of the network segmentation requirement would be \$983,711,898 [= 1,822,600 regulated entities × 4.5 hours × \$119.94] with a low estimated total of \$874,410,576 [= 1,822,600 regulated entities × 4 hours × (printed page 999) \$119.94] and a high estimate of \$1,093,013,220 [= 1,822,600 regulated entities × 5 hours × \$119.94].

g. Cost Related to Disabling Ports and Removing Extraneous Software The Department believes that large regulated entities have already disabled unused network ports and removed extraneous software as part of existing configuration requirements. However, the Department believes that small and medium-sized regulated entities are less likely to have performed these actions and thus would incur a new burden to implement these aspects of configuration management proposed at

MA.L2-3.7.4 · Media Inspection CMMC Assessment Guide · Level 2 | Version 2.13 151 from malicious code, and MA.L2 -3.7.4 extends this requirement to diagnostic and testing tools. Example You have recently been experiencing performance issues on one of your servers. After troubleshooting for much of the morning , the vendor has asked to install a utility that will collect more data from the server. The file is stored on the vendor-s FTP server. The support technician gives you the FTP site so you can anonymously download the utility file. You also ask him for a hash of the utility file. As you download the file to your local computer , you realize it is compressed. You unzip the file and perform a manual antivirus scan, which reports no issues [a]. To verify the utility file has not been altered, you run an application to see that the hash from the vendor matches.

Potential Assessment Considerations · Are media containing diagnostic and test programs (e.g., downloaded or copied utilities or tools from manufacturer, third -party, or in -house support

teams) checked for malicious code (e.g., using antivirus or antimalware scans) before the media are used on organizational systems [a]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.7.4

Shift the requirement to post award. Re-evaluate the program to reduce requirements to make it easier. Stay with only the DCMA DIBCAC performing assessments on the DIB. DoD Response: DoD considered many alternatives before deciding upon the current CMMC structure. To date, alternative methods of assessment have proven inadequate and necessitated the establishment of CMMC. The DoD determined the requirements for a CMMC Accreditation Body, and this accreditation body will administer the CMMC Ecosystem. DoD must enforce CMMC requirements uniformly across the DIB for all contractors and subcontractors who process, store, or transmit CUI. The value of information and the impact of its loss does not diminish when the information moves to contractors and subcontractors. The DoD notes with interest the commenter's reference to initiatives in a report to Congress describing the breadth of cybersecurity related initiatives within the Department. While the CMMC Program is an important initiative, it is by no means the Department's only effort to improve DIB cybersecurity. The CMMC Program addresses the adequate safeguarding of contractor owned information systems which process, store, or transmit FCI or CUI. Other DoD initiatives related to secure cloud or software development environments are beyond the scope of the CMMC Program. The DoD declined to accept the recommended alternative of relying exclusively on self-assessment with the potential to require a DIBCAC assessment for only a sampling of DoD contractors, which is essentially the status quo. Both GAO reporting and other DoD analysis have shown that the DIB has not consistently implemented the NIST SP 800-171 requirements needed to comply with DFARS clause 252.204-7012, notwithstanding DoD's stated objective in this clause is for compliance as soon as practical, but not later than December 31, 2017. The DoD declined to accept the risk associated with implementing CMMC as a post-award requirement. When contracts require contractors to process, store, or transmit CUI, DoD requires that they be compliant with DFARS clause 252.204-7012 and competent to adequately safeguard CUI from the beginning of the period of performance. DoD declined the recommendation to require primes to assume the cost of CMMC compliance for their subcontractors. The aggregated SPRS reporting and scoring is CUI. The DoD does not plan to make this information public at this time, as it may aid adversaries in coordinating their attacks. (printed page 83201) The Department declined to adopt the recommendation to allow DIB members to assist in designing the DoD's mechanism for assessing DIB compliance with DoD's contractual requirements. In developing the CMMC program, the DoD sought and considered DIB input.

From the NIST SP 800-172 Rev 3 Final Public Draft: to resist it, and is determined to maintain the level of interaction needed to execute its 204 objectives. C UI associated with critical programs or high value assets is at increased risk and requires additional protection because the APT is likely to target such information. The APT is dangerous to the national and economic security interests of the United States since organizations depend on systems^{7 7} The term 'system' is used to represent the people, processes, and technologies involved in the processing, storage, or transmission of CUI. of all types, including information technology (IT) systems, operational technology (OT) systems, and (3) Internet of Things (IoT) devices. The convergence of these types of systems and devices has brought forth a new class of systems known a

With regard to the comment's statement that records be retained from the time of manufacture, FDA does not agree. The record retention periods begin at the time the food is received and released. Under § 1.360(a) of this final rule, you must create the required records at the times you receive and release food, except to the extent that the information is contained in existing records. (Comment 132) One comment suggests that retaining records for 6 months after the product expiration date should be more than adequate for investigations for potential threats associated with the food. The comment indicates that expanding system capacity to accommodate much longer record retention is a major cost associated with implementing the proposed regulation and that FDA should either justify the value for longer record retention periods against the increased burden being placed on the industry or substantially decrease the number of records that must be retained for longer duration. (Response) As previously noted in response to comment number 129, FDA has considered various options and has chosen to require record retention based on criteria similar to the NIST definitions for perishable, semiperishable and long shelf-life food. FDA is convinced such an approach is the most efficient and effective because the food industry already is familiar with classification of foods into these three categories due to existing regulations and practices; and it will mitigate the problem raised by some comments of inadequate infrastructure for long term storage of records for the shorter shelf life foods. FDA notes that a traceback may not begin until well past the time the

food has been consumed, as explained in the response to the following comments. (Comment 133) A few comments contend that a shorter record retention time, such as 3 to 6 months, should be sufficient time for retention of records because any harmful effect directly related to a perishable food would be detected well within the life expectancy of the food. (Response) FDA does not agree that harmful effects directly relating to perishable foods always can be detected within the shelflife of the food. FDA has experienced some situations in which the health hazard was not immediately apparent, but only emerged several months after the food was consumed. Also, FDA recognizes the potential for serious adverse health consequences caused by novel contaminants or novel food sources for known contaminants. In such situations, it may take months to identify the source of contamination, or the contaminant itself.

- To provide a basis for testing tools to ensure they comply with SCAP 1.3 - To reduce the burden on SCAP 1.3 tool and content developers by clearly defining all SCAP 1.3 extensions in a single place

(Comment 118) Several comments state that the identity of the transporter is known to the shipper but is not typically known to the receiver. The comments assert that it is unreasonable to expect the receiver to have, seek, or maintain information on the identity and related contact information for the transporter that delivered the product, especially if multiple transporters may have been involved. The comments state (printed page 71601) that such information would be available from the shipper that arranged the transport. One comment states that it is not usual business practice for distributors to keep records about the transporter who delivers food. (Response) FDA believes that excluding a source from keeping records on the immediate previous source if that immediate previous source is a transporter would hinder a traceback investigation. The proposed and final rule require nontransporters to identify the name of the firm, address, telephone number and, if available, the fax number and e-mail address of the transporter who transported the food to and from them. See §§ 1.337(a)(6) and 1.345(a)(6) of this final rule. These provisions however, do not require the nontransporter to record transactions to which they were not a party, e.g., where multiple transporters are involved. I. Comments on Who is Required to Establish and Maintain Records for Tracing the Transportation of All Food? (Proposed § 1.351) (Comment 119) Several comments stated that foreign transporters are not included in the definition of foreign facilities and that the final rule should be applied to foreign transporters as it is to domestic transporters. (Response) FDA has excluded all foreign persons, except foreign persons who transport food in the United States, from all of the regulations in subpart J of this final rule. Therefore, foreign transporters are subject to the same requirements as domestic transporters when transporting food in the United States. (Comment 120) A number of comments noted that many nontransporters own trucks or other vehicles and transport food or feed as an incidental part of their operations. They express concern that they would be required to keep two sets of records, one as a nontransporter, and the other as a transporter. One comment recommends that the final rule be applicable to both private and for-hire transporters.

materials that are separated from edible food by a functional barrier. In other words, at a minimum, any materials that are separated from edible food by a functional barrier should be regarded as a type of outer packaging for which recordkeeping is not required. The comment states that FDA has long recognized the use of a functional barrier in determining what types of materials can be used in a packaging product. If a functional barrier (such as aluminum foil) is present in a packaging laminate, there is no expectation of migration of any material through the functional barrier. Therefore, the comment strongly requests that any materials on the exterior side of a functional barrier be excluded from the recordkeeping regulation. Because there is no expectation of migration of any material through a functional barrier, the likelihood that such materials could be used to adulterate food is extremely remote. One comment states the reference to packaging does not mandate recordkeeping by packaging suppliers or transporters. Indeed, the reference to packaging, in addition to food, indicates a distinction between the two terms in the view of the drafters. The law and Congressional intent would be satisfied by a food processor maintaining records identifying the source of the finished packaging for the food product. In the unlikely event that food packaging is the target of terrorists, records in the hands of food processors regarding their packaging suppliers will allow FDA to follow the history of the packaging and its components. The regulation as proposed by FDA extends far beyond what was intended by Congress. To follow Congressional intent, the comment states FDA needs to revise the proposed regulation to provide only that food processors have records identifying the suppliers of their packaging.

CIS Control 11 · Data Recovery Establish and maintain data recovery practices sufficient to restore in-scope enterprise assets to a pre-incident and trusted state. In the cybersecurity triad · Confidentiality, Integrity, and Availability (CIA) · the availability of data is, in some cases, more critical than its confidentiality. Enterprises need many types of data to make business decisions, and when that data is not available or is untrusted, then it could impact the enterprise. An easy example is weather information to a transportation enterprise. When attackers compromise assets, they make changes to configurations, add accounts, and often add software or scripts. These changes are not always easy to identify, as attackers might have corrupted or replaced trusted applications with malicious versions, or the changes might appear to be standard-looking account names. Configuration changes can include adding or changing registry entries, opening ports, turning off security services, deleting logs, or other malicious actions that make a system insecure. These actions do not have to be malicious; human error can cause each of these as well. Therefore, it is important to have an ability to have recent backups or mirrors to recover enterprise assets and data back to a known trusted state. There has been an exponential rise in ransomware over the last few years. It is not a new threat, though it has become more commercialized and organized as a reliable method for attackers to make money. If an attacker encrypts an enterprise's data and demands ransom for its restoration, having a recent backup to recover to a known, trusted state can be helpful. However, as ransomware has evolved, it has also become an extortion technique, where data is exfiltrated before being encrypted, and the attacker asks for payment to restore the enterprise's data, as well as to keep it from being sold or publicized. In this case, restoration would only solve the issue of restoring systems to a trusted state and continuing operations. Leveraging the guidance within the CIS Controls will help reduce the risk of ransomware through improved cyber hygiene, as attackers usually use older or basic exploits on insecure systems.

The cost estimates and assumptions referenced by the commenters pertain to CMMC 1.0 and are not reflective of the changes in CMMC, though public comment feedback has been incorporated into the cost estimation process for the CMMC Program where appropriate. The Department limited estimates for CMMC to those costs associated with preparing for, attaining, and publishing results of: (a) CMMC compliance via self-assessment for CMMC Levels 1 and 2, and (b) certification at CMMC Level 2 through a C3PAO and Level 3 through the DoD. Costs for companies to implement information security protections to comply with the existing FAR subpart 4.19 to achieve CMMC Level 1, and DFARS subpart 204.73 to achieve CMMC Level 2, are distinct from costs associated with CMMC assessment processes to verify and attest to the corresponding implementation of existing rules. Cost estimates were developed for companies to implement security requirements for CMMC Level 3. CMMC Level 3 security requirements are defined in table 1 to § 170.14(c)(4) CMMC Level 3 Requirements. For the vast majority of the DIB, CMMC does not levy additional information security protection requirements but is designed to provide increased assurance that defense contractors are contract compliant and can adequately protect FCI and CUI at a level commensurate with risk, accounting for information flow down to its subcontractors in a multi-tier supply chain. There is no recognized duplication of assessments for small companies that support many primes, because once assessed, an organization need only provide evidence of compliance or certification to prospective primes in order to satisfy the CMMC requirement in a solicitation. When information system or network boundaries differ, an additional assessment may apply. b. CMMC Cost Burden Comment: Several commenters suggested that costs were underestimated, particularly for small businesses who were perceived to be at risk of decreased participation in the (printed page 89074) marketplace due to the cost prohibitive nature of the CMMC requirement. Multiple commenters requested additional strategies to mitigate costs, including the promotion of new technologies. Response: CMMC Levels 1 and 2, which represent the majority of the anticipated requirements, does not levy any additional information security protection requirements. To address assessment cost concerns, CMMC eliminates the third-party assessment requirement at CMMC Level 1 and permits self-assessment for certain contracts containing a CMMC Level 2 requirement. The DoD Office of Small Business Programs, available at <https://business.defense.gov/>, has informational resources that may help defray cybersecurity implementation costs by helping organizations stay up-to-date with the latest cybersecurity compliance and policy best practices. c. CMMC Cost Effectiveness and Alternatives Comment:

· Because the presence of labels do not preclude reading of the labels of any PDU, the labels themselves may need be protected against being read by unauthorized readers (label secrecy protection). This could be provided through the use of encryption or through physical protection of the media. · The PDU's data portion, which is associated with the label, may also need to be

protected against integrity and secrecy attacks. This could again be provided through use of encryption or through physical protection of the media. | 1 . Introduction | 2 |

The use of health IT, including EHRs (certified or otherwise), has led to enormous advancements in the fields of medicine and public health, not only improving outcomes for individuals, but also assisting in addressing the social, economic, and environmental factors that affect health on an individual and community level. [113] And the electronic exchange of health information, spurred by HIPAA, the HITECH Act, and the 21st Century Cures Act (·Cures Act·), [114] has enabled regulated entities and others to more quickly and efficiently share individuals' health information, increasing the quality and efficiency of health care, increasing patient engagement, and reducing administrative burden. [115] However, the widespread use of health IT systems makes it even more critical for regulated entities, regardless of their size or location, to fully assess the risks and vulnerabilities to ePHI and their information systems and implement strong security measures to address those risks and vulnerabilities. Experts repeatedly have expressed concern regarding the state of cybersecurity in the health care industry. [116] For example, in a 2017 report to Congress, experts convened by the Department pronounced, ·Now more than ever, all health care delivery organizations [. . .] have a greater responsibility to secure their systems, medical devices, and patient data.· [117] This responsibility has only increased as the delivery of health care and the exchange of PHI have increasingly shifted to cyberspace. Despite advancements in technology, including health IT, the core requirements of the Security Rule remain relevant and applicable today. In fact, they serve as a foundation for more recently promulgated cybersecurity guidelines, best practices, processes, and procedures. Security management, regular monitoring and review of information system activity, information access management, security awareness and training, contingency planning, encryption, and authentication all continue to be represented in the most well-known cybersecurity frameworks, including the NIST's Cybersecurity Framework, [118] the HHS 405(d) Program's ·Health Industry Cybersecurity Practices: Managing (printed page 907) Threats and Protecting Patients,· [119] and the Department's CPGs. [120] While these concepts remain highly relevant and applicable, the Department has concerns regarding the sufficiency of the security measures implemented by regulated entities. OCR's experience investigating allegations of Security Rule violations, reports received by OCR of breaches of unsecured PHI, and the results of the audits conducted by OCR in 2016-2017 demonstrate that regulated entities are not consistently complying with the Security Rule's requirements. [121]

Multiple commenters commented on the cost impact of CMMC to small businesses, suggesting that the cost to become and remain compliant is too high. Several commenters added that small businesses limited by finances won't be able to compete, which could be detrimental to the supply chain and efforts to meet national defense goals, and that the rule fails to provide any consideration for the future loss of technology acquisition should small businesses be inadvertently precluded from participation. Other commenters suggested that the impact of CMMC will be a profound and significant obstacle to businesses due to their lack of resources as compared to their large business competitors, adding that the requirement to have the same measures in place for any company, regardless of size, incurs a higher percentage of indirect cost for small businesses. Multiple commenters remarked on the limited or lack of options for a small business to recover costs. Response: The estimated costs attributed to this rule do not include the costs associated with compliance with existing cybersecurity requirements under FAR clause 52.204-21 or associated with implementing NIST SP 800-171 requirements in accordance with DFARS clause 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting. To the extent that defense contractors or subcontractors have already been awarded DoD contracts or subcontracts that include these clauses, and process, store, or transmit FCI or CUI in support of the performance of those

contracts, costs for implementing those cybersecurity requirements should have already been incurred and are not attributed to this rule. Those costs are distinct from costs associated with undergoing a CMMC assessment to verify implementation of those security requirements. The CMMC Program does not levy additional information security protection requirements for CMMC Levels 1 and 2. The value of DoD's sensitive information (and impact of its loss to the Department) does not diminish when it moves to contractors prime or sub, large or small. A Regulatory Flexibility Analysis was conducted. In comparison to CMMC 1.0, DoD has now eliminated the requirement for organizations to hire a third-party assessment organization to comply with CMMC Level 1. The CMMC Program requirements further address cost concerns by permitting self-assessment at Level 1 and at Level 2 for some contracts that are not designated to require the added assurance of C3PAO assessment. In addition, resources available through the DoD Office of Small Business Programs (OSBP) may help defray cybersecurity costs by helping companies stay up to date with the latest cybersecurity policies and best practices. The OSBP also partners with the NIST and its Manufacturing Extension Partnership (MEP) programs (<https://www.nist.gov/mep>), which operate across the U.S. to provide resource and funding assistance options.

The OSA is responsible for determining its CMMC Assessment Scope and its relationship to security domains. Assets are out-of-scope when they are physically or logically separated from the assessment scope. Contractor Risk Managed Assets are only applicable within the OSA's assessment scope. Table 3 to § 170.19(c)(1) is used to identify the asset categories within the assessment scope and the associated requirements for each asset category. Contractor's risk-based security policies, procedures, and practices are not used to define the scope of the assessment, they are descriptive of the types of documents an assessor will use to meet the CMMC assessment requirements. It is beyond the scope of the CMMC rule to provide a detailed explanation of the usage of risk-based terminology when implementing or assessing CMMC requirements. DoD declines to speculate and clarify the relationship between any NIST SP 800-171 R2 definitions and any pending NIST SP 800-171 Revision 3 definitions. The DoD has defined the effort allowed during a limited check in table 1 to 170.19(c)(1). A limited check may require submission of evidence. The DoD cannot anticipate how an OSC will scope its CMMC Level 3 assessment with respect to its CMMC Level 2 environment. As specified in table 5 to § 170.19(d)(1), Level 2 Contractor Risk Managed Assets are categorized as CUI Assets at Level 3. The rule has been updated to clarify that ESPs do not require a Level 3 certification unless they process, store, or transmit CUI in the performance of a contract with a CMMC Level 3 requirement. As stated in table 1 to § 170.19(c)(1), CRMA assets must be prepared to be assessed against CMMC requirements. The SSP must provide sufficient documentation describing how security requirements are met to allow the assessor to follow the instruction in table 1 to not assess against other requirements. The assessor will then decide if a limited spot check is warranted. The results of the limited spot check can result in a requirement being scored as NOT MET. The rule does not create two classes of Contractor Risk Managed Assets as one commenter asserts. Contractor Risk Managed Assets are only those assets that are owned by the OSC and within the assessment scope. ESP assets are subject to the ESP requirements of the rule. All assets within the OSA defined assessment boundary have access to CUI and can process, store, or transmit CUI, and are therefore subject to DFARS clause 252.204-7012 and required to meet NIST SP 800-171 requirements. This is the authority for including CRMAs within CMMC assessments. For Level 2, DoD has decided to assume some risk and lessen the assurance burden for a class of these assets called Contractor Risk Managed Assets, as specified in table 3 to § 170.19(c)(1). DoD does not assume this risk at Level 3. Contractor Risk Managed Assets are subject to assessment against all CMMC requirements as specified in table 5 to § 170.19(d)(1).

Control OA-3: In indirect verification architecture, the user authenticates to a Verifier that is not the Relying Party, after which the Verifier provides the Relying Party with an assertion that the user's identity has been verified. As described in Section 9 of NIST SP 800-63 [2], which provides detailed requirements for use of assertions, some assertion mechanisms can provide e-authentication level 4 assurance to the Relying Party (e.g., Kerberos), and such mechanisms are preferred and should be employed whenever possible, if the indirect verification architecture is used. 15 The Kerberos Network Authentication Protocol [16] is commonly used to implement indirect verification, and it can be implemented in such a way that it provides e-authentication level 4 assurance to the Relying Party. The assertions created by the Verifier in Kerberos are called Kerberos tickets, and they include symmetric session keys that allow the Relying Party to perform a strong cryptographic authentication of the Claimant. The overall authentication process must ensure that the Claimant uses a PIV credential to authenticate to the Verifier before access is granted by the Relying Party. This

requirement is satisfied if the Verifier is configured to only accept PIV authentication. Security Assertion Markup Language (SAML) bearer assertions [17] are also commonly used to implement indirect verification. Unlike Kerberos, with bearer assertions the Claimant authenticates to the Relying Party by simply providing a copy of the assertion that it got from the Verifier. So, unlike Kerberos, an attacker could defeat the authentication mechanism by 14 See Section 6.2.3.1 of FIPS 201-2 [5] for an example of PKI-based authentication using the PIV Authentication certificate.

(6) Any CUI training requirements the contractor must adhere to in order to comply with 32 CFR 2002.30 ; and (7) Any CUI incident reporting instructions required by the agency, to include the agency website or single point of contact. PART 12-ACQUISITION OF COMMERCIAL PRODUCTS AND COMMERCIAL SERVICES 25. Amend section 12.202 by adding paragraph (f) to read as follows: 12.202 Market research and description of agency need. * * * * (f) Requirements documents for acquisitions involving controlled unclassified information (CUI) shall: (1) Comply with 32 CFR part 2002 ; and (2) Incorporate all applicable handling and compliance instructions included in the SF XXX, Controlled Unclassified Information (CUI) Requirements (see 4.403 and 11.002(i)). 26. Amend section 12.301 by revising paragraph (d)(5) to read as follows: 12.301 Solicitation provisions and contract clauses for the acquisition of commercial products and commercial services. * * * * (d) * * * (5) Insert the clause at 52.204-21, Basic Safeguarding of Covered Contractor Information Systems, in solicitations and contracts (except solicitations and contracts solely for the acquisition of COTS items), as prescribed in 4.404-3. * * * * PART 15-CONTRACTING BY NEGOTIATION 15.407-1 [Amended] 27. Amend section 15.407-1 by removing from the introductory text of paragraph (f) the phrase 'improper disclosure.' and adding 'improper disclosure such as requirements for controlled unclassified information or classified information.' in its place. 28. Amend section 15.604 by: a. Removing from paragraph (a) introductory text the phrase 'proprietary information' and adding 'contractor proprietary business information' in its place; and b. Revising paragraph (a)(7). The revision reads as follows: 15.604 Agency points of contact. * * * * (a) * * * (7) Instructions for identifying and marking contractor proprietary business information so that it is protected and administrative markings conform to 15.609. * * * * 15.606-2 [Amended] 29. Amend section 15.606-2 by removing from paragraph (a) introductory text the phrase 'the legend' and adding 'the administrative marking' in its place. 30. Amend section 15.609 by: a. Removing from paragraphs (a) and (b) the phrase 'the following legend' and adding the phrase 'the following administrative marking' in its place; b. Revising paragraph (c); c. Removing from paragraph (d) the phrase 'clearly mark' and adding the phrase 'clearly administratively mark' in its place; d. Removing from paragraph (e) the phrase 'and privileged or confidential information to the Government' and adding 'privileged or confidential information, or other controlled unclassified information' in its place; e. Revising paragraph (f); and f. Removing from paragraphs (g), (h) introductory text and (h)(1) the term 'legend' and adding 'administrative marking' in its place. The revisions read as follows: 15.609 Limited use of data. * * * * *

s [SecureByDesign] applied to consumer-grade routers should guide manufacturers to minimize the number of interfaces, both logical and physical and general functionality provided by the router device. The primary functionality of the home router is to provide access to the Internet for devices within the home. Extraneous functions should not be included in this component. For example, configuration may be better managed by another product component (e.g., mobile application). This is not to suggest a product composed of only a router device is necessarily less secure than those that can offload functions to other components.. - Robust network onboarding support from consumer-grade router products. Cybersecurity when provisioning new devices to the network connected to a consumergrade router can go beyond a single password. When a router product is composed of components such as mobile applications or backends, those components can be used as part of a more robust onboarding mechanism. For example, when a device is attempting to connect to the router device with (or without) the password, the mobile application can notify the owner and ask for explicit approval for the device to onboard. Though reliability needs to be considered to ensure individuals can always access and use their routers, onboarding mechanisms for consumer-grade routers that give individuals more access control over their networks is generally beneficial. For additional recommendations on consumer IoT onboarding and device credentialing see Trusted Internet of Things (IoT) Device Network-Layer Onboarding and Lifecycle Management: Enhancing Internet Protocol-Based IoT Device and Network [SP1800-36].

J. Comments on What Information is Required in the Transportation Records? (Proposed §.1.352)

(Comment 122) Several comments recommend that FDA exempt transporters from all recordkeeping elements except the immediate source and immediate subsequent recipient. They note that the cost of complying is not proportional to the risk. (Response) FDA disagrees with this comment. FDA, however, has taken steps to minimize the burden on transporters by including five alternatives to meet their obligations to establish and maintain records under this final rule. FDA notes that transporters also are subject to the records access requirements in §§ 1.361 and 1.363 of this final rule. This will ensure that FDA has access to all applicable records that will enable FDA to perform a tracing investigation quickly and effectively. Additionally, to ensure there are no gaps in transporter coverage in a traceback investigation, the final rule applies to both interstate and intrastate transporters of food. (Comment 123) Comments arguing for exemption of transporters state that it is difficult or impossible for the crew of the transporter to open each container of food, contaminate it, repackage it, replace seals, and arrive on time without leaving any trace of their intervention. Other comments suggest that a known and trustworthy transport company will not risk their business by doing something of this nature. (Response) FDA disagrees that the transportation process is any less vulnerable to attacks on the food supply than any other part of the food industry. FDA believes that recordkeeping requirements are necessary for transporters, but, as discussed previously, it has taken steps to minimize the burden on transporters. (Comment 124) A number of comments state that the transporter has no access to detailed information about the shipment and is dependent on the information listed on the bill of lading provided by the shipper. Therefore, the information required of transporters should be limited to the information on the bill of lading. One comment states that a bulk shipper, for example, has a 5,000 gal shipment of orange juice and has access to only this information, and detailed descriptive information such as brand names, specific variety, and package types are not applicable to bulk loads. Several comments state that transporters are frequently provided with preloaded and/or sealed vehicles for transport, and the transporter does not have knowledge of the contents (printed page 71602) other than what is on the bill of lading prepared by the shipper. They argue that they cannot access the sealed cargo to obtain specific information to confirm or supplement the bill of lading information. Similarly, other comments advise that they cannot verify bill of lading information for food contained in shrink-wrapped pallets. These comments believe that the carriers responsibility should be limited to the description provided by the shipper.

IT systems used to provide these functions face a variety of threats. If IT systems are not selected, configured and managed using security practices commensurate with the importance of the services they provide and the sensitivity of the data they handle, a security compromise could carry consequences for the integrity of the election and the confidentiality of sensitive voter information. Failure to adequately address threats to these systems could prevent voters from casting ballots, expose individuals to identity fraud, or even compromise the results of an election. This document follows NISTIR 7551, A Threat Analysis on UOCAVA Voting Systems , which documents the threats to UOCAVA voting systems using electronic technologies for all aspects of the remote voting process. While NISTIR 7551 discusses high-level security controls capable of mitigating threats, the focus of that report was identifying technologies and associated risks. This document complements NIST 7551 by providing security best practices to help jurisdictions create UOCAVA voting systems based on security practices used in other IT applications. There are many different ways to support UOCAVA voters, and each jurisdiction must put together its own system for such support. This document covers some common parts of UOCAVA system architectures, and shows how to secure those parts against both normal and extraordinary threats. The two components that are covered in most detail are Internet-based or Internet-assisted delivery of blank ballots and voter registration.

(8) Access to SCI, SAP, FRD, and RD information is a determination made by the granting authority by the applicable USG granting authority for each category of information. (b) Investigative requirements. E.O. 13467 , as amended, Reforming Processes Related to Suitability for Government Employment, Fitness for Contractor Employees, and Eligibility for Access to Classified National Security Information, designates the Security and Suitability Executive Agents responsible for establishing the standards for investigative requirements that apply to contractors. (1) Investigative tiers. The standards established in accordance with E.O. 13467 , as amended, designate specific investigative tiers that are acceptable for access to classified information. An investigative tier is for positions designated as moderate risk, non-critical sensitive, and allow access to information classified at the L, CONFIDENTIAL, and SECRET levels. Another investigative tier is for positions designated as high risk, critical sensitive, special sensitive, and allow

access to information classified at the Q, TOP SECRET, and SCI levels. (2) Investigative coverage.

(i) Automated sources. Investigative providers will use automation whenever possible to collect, verify, corroborate, or discover information about an individual, as documented on the request for investigation or developed from other sources, i.e., automated record checks and inquiries. (ii) Interviews. Interviews, if required, will cover areas of adjudicative concern. (iii) Information Covered in Previous Investigations. Information validated in a prior investigation, the results of which are not expected to change (e.g., verification of education degree), will not be repeated as part of subsequent investigations. (3) Polygraph. Agencies with policies authorizing the use of the polygraph for purposes of determining eligibility for access to classified information may require polygraph examinations when necessary. If adjudicatively relevant information arises during the investigation or the polygraph examination, the investigation may be expanded to resolve the adjudicative concerns. (4) Financial disclosure. When a GCA requires that a contractor employee complete a financial disclosure form, the contractor will ensure that the employee has the opportunity to complete and submit the form in accordance with the Privacy Act of 1974, as amended, and other applicable provisions of law. (5) Reinvestigation and Continuous Evaluation. Contractor employees (printed page 83329) determined eligible for access to classified information will follow CSA guidance to complete reinvestigation and continuous evaluation or continuous vetting requirements. The contractor will validate that the employee requires continued eligibility for access to classified information before initiating the reinvestigation. (c) Verification of U.S. citizenship.

Two commentors recommended the elimination of separate assessments when the FCI and CUI environments are the same. One of these comments requested clarification regarding the scenario of an OSC having one assessment scope environment for both FCI and CUI that meets Level 2 requirements. Response: CMMC Level 2 is required when CUI will be processed, stored, or transmitted on contractor information systems. Successful completion of a CMMC Level 2 self-assessment or CMMC Level 2 certification assessment will suffice to meet the CMMC Level 1 requirement for FCI if/when the scope is identical. The CMMC Level 2 Scoping Guide reflects this language. e. Recommendations and Scenarios Comment: One comment recommended removing CMMC Level 2 self-assessment, changing the CUI Program, or creating a new type of CUI to distinguish between CMMC Level 2 self-assessment and CMMC Level 2 Certification. Another comment noted that the requirements for CMMC Level 2 certification assessment are almost identical to requirements for CMMC Level 2 self-assessment. One comment expressed concern that DoD's designation of CMMC Level 2 self- (printed page 83116) assessment and certification assessment runs contrary to FCI (FAR requirements) and the CUI Program. One comment asked if the designation of information as FCI or CUI changes the scope of CMMC. One comment asked for clarification on which contracts will have sensitive unclassified DoD information but will not require CMMC assessment. One comment recommended removing the option for CMMC Level 2 self-assessments to reduce complexity. One comment posed multiple questions about what DoD will do if contracting officers assign CMMC Level 2 or CMMC Level 3 Certification requirements at a rate substantially higher than projected. Response: The DoD CIO looked at CUI from a risk-based perspective and determined that different approaches to assessments could be implemented to address risk and help lower the burden for the DIB. The security requirements for a CMMC Level 2 self-assessment and a CMMC Level 2 certification assessment are the same, the only difference in these assessments is whether it is performed by the OSA or by an independent C3PAO. The decision to rely upon self-assessment in lieu of certification assessment is a Government risk-based decision based upon the nature of the effort to be performed and CUI to be shared. The size of the company with access to the CUI is not a basis for this determination. The value of information (and impact of its loss) does not diminish when the information moves to contractors of smaller size. The DoD declines to modify the rule to include its internal decision process.

- f The person or process identified as sending the transaction is actually the originator (nonrepudiation) - f The person or process receiving the transaction is the intended recipient (identification and authentication) - f Data integrity has not been compromised (integrity). 10 This section on PKI is drawn extensively from NIST SP 800-32, Introduction to Public Key Technology and the Federal PKI and NIST SP 800-25, Federal Agency Use of Public Key Technology for Digital Signatures and Authentication. - f Key Recovery -organizations must be able to recover data that the employee has encrypted, which can only be done by recovering the encryption key when the key is unavailable. 11 - f Privilege/Authorization -certificates can be used to vouch for a user's identity and also specify privileges the user has been granted.

Under the proposed implementation specification for network ports at proposed 45 CFR 164.312(c)(2)(iv), a regulated entity would be required to disable network ports in accordance with the regulated entity's risk analysis. [758] Successful ransomware deployment often depends on the exploitation of technical vulnerabilities such as unsecured ports. [759] The proposal to require network ports to be disabled in accordance with the risk analysis would reduce exploitable vulnerabilities. [760] Lastly, the proposed implementation specification for maintenance at proposed 45 CFR 164.312(c)(2)(v) would expressly require a regulated entity to review and test the effectiveness of the technical controls required by the other implementation specifications associated with the standard for configuration management at least once every 12 months or in response to environmental or operational changes, whichever is more frequent, and modify as reasonable and appropriate. e. Section 164.312(d)(1) Standard: Audit Trail and System Log Controls Audit controls are crucial technical safeguards that are useful for recording and examining activity in electronic information systems, especially when determining whether a security violation occurred. [761] A regulated entity must consider its risk analysis and organizational factors, such as current technical infrastructure, hardware, and software security capabilities, to determine reasonable and appropriate audit controls. [762] However, based on OCR's enforcement experience, we believe that regulated entities' understanding of and compliance with this standard could be improved by providing more specificity. Accordingly, the Department proposes to redesignate the standard for audit controls at 45 CFR 164.312(b) as proposed 45 CFR 164.312(d)(1), rename it as the standard for audit trail and system log controls, and to add a paragraph heading to clarify the organization of the regulatory text. We also propose to modify it to require a regulated entity to deploy either or both technology assets and technical controls that record and identify activity in the regulated entity's relevant electronic information systems. The proposal would replace procedural mechanisms with technical controls, to match the general focus on technical controls in 45 CFR 164.312 and would recognize that a regulated entity may be able to meet the requirements of the standard by deploying either or both technology assets (e.g.,

(i) The Treaties provide a comprehensive framework for exports and transfers to the UK or AUS of certain classified and unclassified defense articles without a license or other written authorization. (ii) The ITAR part 126, supplement no. 1 identifies those defense articles and services that are not eligible for export via treaty exemptions. (iii) This exemption applies to contractors registered with the DDTC and eligible to export defense articles. (2) Defense articles. Defense articles fall under the scope of the Treaties when they are in support of: (i) U.S. and UK or U.S. and AUS combined military or counter-terrorism operations. (ii) U.S. and UK or U.S. and AUS cooperative security and defense research, development, production, and support programs. (iii) Mutually agreed specific security and defense projects where the government of the UK or AUS is the end-user. (iv) USG end-use. (3) Marking requirements. Contractors are required to mark defense articles that fall under the scope of the treaty prior to transferring from the U.S. to the UK in accordance with the provisions of this paragraph. All other standard classification marking in accordance with § 117.14 also apply. When defense articles are returned from the UK or AUS to the United States, any defense articles marked as RESTRICTED in the manner shown in Table 4 purely for the purposes of the treaties will be considered to be unclassified and such marking will be removed. Table 3 to Paragraph (i)(3) Classified U.S. Defense Article Markings UNCLASSIFIED: CLASSIFICATION MARKINGS FOR ILLUSTRATION PURPOSES ONLY Treaty with: Marking Example (for SECRET classified defense articles) Government of UK //CLASSIFICATION LEVEL USML/REL GBR AND USA TREATY COMMUNITY// //SECRET USML//REL GBR AND USA TREATY COMMUNITY// Government of AUS //CLASSIFICATION LEVEL USML/REL AUS AND USA TREATY COMMUNITY// //SECRET USML//REL AUS AND USA TREATY COMMUNITY// Table 4 to Paragraph (i)(3) Unclassified U.S. Defense Article Markings UNCLASSIFIED: CLASSIFICATION MARKINGS FOR ILLUSTRATION PURPOSES ONLY Treaty with: Marking Government of UK //RESTRICTED-USML//REL GBR AND USA TREATY COMMUNITY// Government of AUS //RESTRICTED-USML//REL AUS AND USA TREATY COMMUNITY// (4) Notice. A notice will be included (e.g., as part of the bill of lading) whenever defense articles are exported in accordance with the provisions of these treaties and the ITAR. (printed page 83358) Table 5 to Paragraph (i)(4) Notice Text for Exported Defense Articles Notice text

(B) Urgently needed means the information has a particular value that will be lost if not disseminated quickly, such as a breaking story of general public interest. Information of historical interest only, or information sought for litigation or commercial activities, would not qualify as urgently needed, nor would a news media publication or broadcast deadline unrelated to the news-breaking nature of the information. The burden of demonstrating that the requested information has a

particular value that will be lost if not disseminated quickly is on the requester. (ii) A demonstration of compelling need means a statement certified to be true and correct to the best of the requester's knowledge. This statement must accompany the request in order to be considered and responded to within the 10 calendar days required for decisions on expedited access. (2) Imminent loss of due process rights. Expedited processing shall also be granted to a requester if loss of substantial due process rights is imminent. A demonstration of imminent loss of substantial due process rights by the requester shall include a description of the due process rights that would be lost and a statement certified to be true and correct to the best of the requester's knowledge. This statement must accompany the request in order to be considered and responded to within the 10 calendar days required for decisions on expedited access. If the DoD Component decides to expedite the request for this reason, the request may be processed in the expedited track behind those requests qualifying for compelling need. (d) Consultation and referrals. The DoD Component shall take appropriate action as described in § 286.4(h)(2) when the record is not under its release authority because it requires consultation with another DoD Component or non-DoD agency, because the record was not originated by the Component, or because the record is not in the Component's system of records but is likely to be held by another DoD Component or non-DoD agency. The following actions are necessary when the record was originated by a non-Government source: (1) When a request is received for a record that arguably contains information exempt from release under Exemption 4, the provisions of E.O. 12600 apply. (i) When a FOIA request is received for records that may contain confidential commercial information (e.g., government contracts), the submitter shall be notified promptly of that request and afforded reasonable time (e.g., 20 calendar days) to present any objections concerning release. This practice of giving submitter notice is required by E.O. 12600

payment fraud, identity theft, credit card fraud) are collected and reported to various government and private entities. However, data that describe the economic impact of cybersecurity incidents more fully and completely, either at the firm or sector level, are not readily available. Not only are losses difficult to quantify with today's tools, but it appears to be difficult to assess in economic terms the return on investments achieved via security measures. Measures of business and consumer investment in security-related activities lack a common reporting entity or information aggregating mechanism. The availability of authoritative, aggregated data on cybersecurity investments and losses from cyber incidents might yield a quantitative picture of the economic impact of cyber intrusions and attacks. Such data would enable industry and the government to evaluate the severity of cybersecurity threats and emerging trends and to make informed decisions about the trade-offs of different cybersecurity strategies and investment options. We seek comment on the following questions: How should a data gathering and analysis system (or systems) be fashioned to facilitate the collection of well-defined, consistent metrics to measure the financial impact of cybersecurity incidents and investments in cybersecurity protection? What would be the implementation challenges? Are there adequate incentives for businesses to provide information about security breaches, data security losses, and cybersecurity investments? It would be beneficial from a national perspective to have a greater understanding of the financial costs and benefits of different cybersecurity practices. Does the private sector, however, lack incentives to share information at the firm level? What are reasonable means to acquire the data necessary for greater understanding? At what level of granularity should data be collected and analyzed? What would be the appropriate entity to perform collection and analysis of the data? Aside from assessing the known costs of cyber intrusions and attacks and of cybersecurity measures, what other data would be helpful to better understand the question of whether at the firm, sector and national levels enough is being done to adequately protect the nation's information and communications systems? Can the opportunity costs associated with inadequate security be estimated in some way? 2. Raising Awareness

AT.L2-3.2.3 · Insider Threat Awareness CMMC Assessment Guide · Level 2 | Version 2.13 71 FURTHER DISCUSSION An insider threat is the threat that an insider will use their authorized access, wittingly or unwittingly, to do harm. Insider threat security awareness training focuses on recognizing employee behaviors and characteristics that might be indicators of an insider threat and the guidelines and procedures to handle and report it. Training for managers will provide guidance on observing team members to identify all potential threat indicators, while training for general employees will provide guidance for focusing on a smaller number of indicators. Employee behaviors will vary depending on roles, team membership, and associated information needs. The person responsible for specifying insider threat indicators must be cognizant of these factors.

Because of this, organizations may choose to tailor the training for specific roles. This requirement does not require separate training regarding insider threat. Organizations may choose to integrate these topics into their standard security awareness training programs. Example You are responsible for training all employees on the awareness of high-risk behaviors that can indicate a potential insider threat [b]. You educate yourself on the latest research on insider threat indicators by reviewing a number of law enforcement bulletins [a]. You then add the following example to the training package: A baseline of normal behavior for work schedules has been created. One employee's normal work schedule is 8:00 AM-5:00 PM, but another employee noticed that the employee has been working until 9:00 PM every day even though no projects requiring additional hours have been assigned [b]. The observing employee reports the abnormal work schedule using the established reporting guidelines. Potential Assessment Considerations · Do training materials include potential indicators associated with insider threats (e.g., repeated security violations, unusual work hours, unexpected significant transfers of data, suspicious contacts, concerning behaviors outside the workplace) [a,b]? · Do training materials include methods of reporting potential indicators of insider threats to management or responsible security personnel [b]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.2.3

, Controlled Unclassified Information, in Federal solicitations and contracts. The objective of the rule is to implement uniform, Governmentwide policies and procedures for Federal agencies and contractors regarding handling of CUI. Since CUI requires protection regardless of dollar value or commerciality of the product or service, this rule will apply to contracts at or below the SAT and to commercial products and commercial services. The rule does not apply to contracts that are solely for the acquisition of COTS items. IV. Expected Impact of the Rule A. General Compliance Requirements Under the terms of this proposed rule, contractors will be required to safeguard CUI that the Government identifies in the standard form (SF) XXX, Controlled Unclassified Information (CUI) Requirements, and ensure handling consistent with 32 CFR part 2002 . This includes CUI that the agency provides to the contractor, or CUI that the contractor collects, develops, receives, transmits, uses, handles, or stores in performance of the contract. CUI is defined at FAR 2.101 as information that the Government creates or possesses, or that an entity creates or possesses for or on behalf of the Government, that a law, regulation, or Governmentwide policy requires or permits an agency to handle using safeguarding or dissemination controls. The contractor shall permit access to CUI only as described in the SF XXX. A contractor will need to review the SF XXX to determine what information under the contract is considered CUI and how to properly safeguard the CUI. If the contractor intends to flow CUI down to a subcontractor, then the contractor will also be required to prepare an SF XXX and distribute it to the subcontractor to ensure the subcontractor properly safeguards CUI. Any contractor or subcontractor employee that handles CUI will be required to complete training on safeguarding CUI, as specified on the SF XXX. Identification of CUI on the SF XXX triggers compliance requirements as specified in the new contract clause at FAR 52.204-XX, Controlled Unclassified Information, e.g., security requirements in NIST SP 800-171, Revision 2, or controls in NIST SP 800-53 depending on the type of information systems that process, store, or transmit CUI. The compliance requirements are discussed in more detail in section IV.C. of this preamble and will vary depending on the organizational Index Grouping and category of CUI being handled under the contract and how the information is being collected, developed, received, transmitted, used, handled, or stored. Prime contractors that flow down CUI to subcontractors will also be required to flow down the compliance requirements of the clause at FAR 52.204-XX; a requirement that applies at all subcontract tiers. The new clause at FAR 52.204-YY also flows down to subcontracts.

Responses per Respondent: Approximately 5.57. Annual Responses: 3,036. Average Burden per Response: Approximately 3 hours. Annual Burden Hours: 9,108. Reporting Frequency: On occasion. Needs and Uses: DFARS 204.404-70(a) prescribes use of DFARS Clause 252.204-7000, Disclosure of Information, in contracts that require the contractor to access or generate unclassified information that may be sensitive and inappropriate for release to the public. The clause requires the contractor to obtain approval of the contracting officer before release of any unclassified contract-related information outside the contractor's organization, unless the information is already in the public domain. In requesting this approval, the contractor must identify the specific information to be released, the medium to be used, and the purpose for the release. Upon receipt of a contractor's request, the Government reviews the information provided by the contractor to determine if it is sensitive or otherwise inappropriate for release for the stated purpose. Jennifer Lee Hawes, Regulatory Control Officer, Defense Acquisition Regulations System. [FR Doc.

3.5.6 Record Retention Information Type... 3.5.6 Record Retention Information Type Records Retention involves the operations surrounding the management of the official documents and records for an agency.

CMMC Program requirements in this rule are designed to improve compliance with requirements for safeguarding of FCI and CUI. DoD has privity of contract to enforce these requirements and CISA does not. OSAs are free to choose CISA services as part of their implementation of DoD requirements. FISMA is for Federal systems that are used by Government personnel or the public and is therefore an unsuitable surrogate for CMMC requirements. If a contractor provides outsourced IT services to a Federal agency, the system is considered a Federal system and FISMA applies. In contrast, CMMC requirements apply to nonfederal systems that are used internally by contractor personnel. The DoD disagreed with the commenter's assertions about NIST SP 800-171 R2 and the available assessment methods. DoD's DIBCAC currently performs assessments using the procedures in NIST SP 800-171A Jun2018, and these documents explicitly identify the target audience to include individuals with security assessment responsibilities, such as auditors, assessors, and independent verifiers. The aggregated SPRS reporting and scoring is CUI. The DoD does not wish to make this information public, which might aid adversaries in coordinating their attacks. The CMMC Program does not alleviate or supersede any existing requirements of the Adaptive Acquisition Framework, nor does CMMC alter any statutory or regulatory requirement for acquisition program documentation or deliverables. One commenter referenced assessments required during the acquisition process for DoD systems. DoD's policies governing acquisition programs require that Independent Technical Risk Assessments be conducted on Major Defense Acquisition Programs. These assessments provide a view of program technical risk and are not well-suited to the assessment of contractor owned information systems against standards for safeguarding CUI. CMMC assessments are conducted on contractor owned information systems to gauge compliance with FAR and DFARS requirements for safeguarding FCI and CUI that is processed, stored, or transmitted within those contractor-owned information systems. One commenter incorrectly asserts that the CMMC Scoring Methodology does not parallel existing scoring methods, however the CMMC methodology is based on the DoDAM. The DoD declined to accept the recommended alternative of self-assessment with the potential to require DIBCAC assessment for a sampling of DoD contractors, which is essentially the status quo. Both GAO reporting and other DoD analysis have shown that the DIB has not consistently implemented the NIST SP 800-171 requirements needed to comply with DFARS clause 252.204-7012, even though DoD's objective was for the contractor to implement NIST SP 800-171 as soon as practical, but not later than December 31, 2017.

14. CMMC Assessment Timeline Comment: Several comments requested details about CMMC assessment timelines, including how long an assessment would take, how long after an assessment was completed would the assessment report be ready, and when SPRS content would be updated. One commenter wanted to know how soon after a failed assessment a subsequent assessment could be scheduled. One commenter wanted details about the remediation period. Response: The actual length of time it takes for an OSA to prepare for, and assessors to conduct an assessment and prepare the assessment report depends on many factors, including the number of systems and networks in the CMMC Assessment Scope, the level of assessment being conducted, staff preparedness for assessor questions, and the number of assessors conducting the assessment. For CMMC assessments, C3PAOs will upload the results of the assessment and the signed CMMC certificate into the CMMC instantiation of eMASS. Certification is automatically posted to SPRS. There is no minimum time to wait after a failed assessment before scheduling another assessment. A NOT MET requirement may be re-evaluated during the course of the assessment and for 10 business days following the active assessment period under certain conditions, as set forth in § 170.17(c)(2) and § 170.18(c)(2). A Level 2 or Level 3 conditional assessment and associated POA&M must be closed out within 180 days. 15. Assessment Delays and Award Impact Comment: Several commenters expressed concerns about the impact that delays in the assessment process would have on contract award. For example, if an assessment is held up, by no fault of the contractor, such that the results will not be available until after the award date, will the contractor be ineligible to receive the award or is there a process for delaying the award? Would the answer be the same for a reassessment of a contractor whose three-year assessment or certificate is expiring? On a related issue, one comment asked about the timing of reassessment/recertification and whether work on an existing contract can continue after an assessment/certificate has expired if the reassessment is scheduled but delayed. Response: The CMMC Program rule does not provide mitigations for assessment delays that may impact timeliness of certification or recertification

with regard to the closing date of a particular solicitation. Offerors will be required to attain CMMC certification, when applicable, at or (printed page 89073) above the level in the solicitation, by the time of award (or option period exercise) and must maintain their CMMC status throughout the life of the contract, task order, or delivery order. The three-year validity period should provide adequate time to prepare for and schedule subsequent assessments for certification. Timelines for meeting CMMC requirements for Level 1 or 2 self-assessment are within the control of the contractor. 16. Defense Contractor and Subcontractor Engagement Comment:

ocker or Pods). Many cybersecurity vulnerability scanners are not optimized for scanning containers, resulting in an inability to identify certain vulnerabilities and a high number of false positives.

- In the healthcare of a patient, the nature and size of genomic data present a challenge with incorporating it into EHR workflows. Fast Healthcare Interoperability Resources (FHIR) as a genomic cybersecurity solution provides important security features, such as tracking provenance and consent as well as providing encryption for privacy. However, additional work is needed to scale up for genomic data size files. - Exploiting variant calling solutions is one example of how third-party tools can be compromised. Most of these tools are open source and may not have been vetted using best security practices or may not have been assessed for data consistency and reliability. Protecting computational technologies used in variant calling requires considering the security of the entire equipment, software, and application chain, as well as the

3.1.1 | General... 3.1.1 Local Vulnerability Prevalence (LVP) The Local Vulnerability Prevalence metric measures the prevalence of vulnerable systems in a specific environment. 3.1.1 General SCORING TIP #1: Configuration issue scoring should not take into account any interaction with other configuration issues, software flaws, or vulnerabilities.

All filers using the portal should use the name of the person or entity submitting comments as the

name of their files, in accordance with the instructions below. Anyone submitting business confidential/proprietary information should clearly identify any business confidential/proprietary portion at the time of submission, file a statement justifying nondisclosure and referencing the specific legal authority claimed, and provide a non-confidential/non-proprietary version of the submission. Any business confidential information should be in an uploaded file that has a file name beginning with the characters ·BC·. Any page containing business confidential information must be clearly marked ·BUSINESS CONFIDENTIAL/PROPRIETARY· on the top of that page. The corresponding non-confidential/non-proprietary version of those comments must be clearly marked ·PUBLIC·. The file name of the non-confidential version should begin with the character ·P·. The ·BC· and ·P· should be followed by the name of the person or entity submitting the comments or rebuttal comments. All filers should name their files using the name of the person or entity submitting the comments. Any submissions with file names that do not begin with a ·BC· will be assumed to be public and will be made publicly available through <https://www.regulations.gov>. To confirm receipt of your comment(s), please check <https://www.regulations.gov>, approximately two-to-three days after submission to verify posting. FOR FURTHER INFORMATION CONTACT: For clarification of content, contact Mr. Michael O. Jackson, Procurement Analyst, at 202-821-9776 or by email at michaelo.jackson@gsa.gov. For information pertaining to status, publication schedules, or alternate instructions for submitting comments if <https://www.regulations.gov> cannot be used, contact the Regulatory Secretariat Division at 202-501-4755 or GSARegSec@gsa.gov. Please cite FAR Case 2017-016. SUPPLEMENTARY INFORMATION: I. Background Today, Federal information and information systems are increasingly the targets of sophisticated attacks by criminals and our adversaries, as well as subject to risks involving non-adversarial threats (e.g., accidental misuse of information). Executive Order (E.O.) 13556, Controlled Unclassified Information, established the Controlled Unclassified Information (CUI) Program to manage information that requires safeguarding or dissemination controls and designated the National Archives and Records Administration (NARA) as the executive agent of the CUI Program. NARA published a final rule on September 14, 2016 (81 FR 63324) to implement the CUI requirements of E.O. 13556. As part of the implementation of the NARA final rule, NARA maintains a registry (<https://www.archives.gov/cui>

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 204, 232, and 252 [Docket DARS-2019-0047] RIN 0750-AJ52 AGENCY: Defense Acquisition Regulation System, Department of Defense (DoD). ACTION: Proposed rule. SUMMARY: DoD is proposing to amend the Defense Federal Acquisition Regulation Supplement to provide for expedited contract closeout through a waiver by the contractor and the Government of entitlement to any residual dollar amounts that are due to either party at the time of final contract closeout. The changes are necessary to establish an expedited contract closeout agreement that will save administrative costs for both the contractor and the Government. DATES: Comments on the proposed rule should be submitted in writing using one of the methods shown in ADDRESSES on or before June 8, 2020, to be considered in the formation of a final rule. ADDRESSES: Submit comments in response to DFARS CASE 2017-D042 by any of the following methods: Regulations.gov: <http://www.regulations.gov> . Submit comments via Federal Rulemaking portal by entering ·DFARS Case 2017-D042· under the heading ·Enter keyword of ID· and selecting ·Search·. Select the link ·Submit a Comment· that corresponds with ·DFARS Case 2017-D042·. Follow the instructions provided at the ·Submit a Comment· screen. Please include your name, company name (if any), and ·DFARS Case 2017-D042· on your attached document. Email: osd.dfars@mail.mil . Include DFARS Case 2017-D042 in the subject line of the message. Fax: 571-372-6094. Mail: Defense Acquisition Regulations System, Attn: Ms. Kimberly Bass, OUSD(A&S)DPC/DARS, Room 3B941, 3060 Defense Pentagon, Washington, DC 20301-3060. Comments received generally will be posted without change to <http://www.regulation.gov> , including any personal information provided. To confirm receipt of your comment(s), please check www.regulations.gov , approximately two to three days after submission to verify posting (except allow 30 days for posting of comments submitted by mail). FOR FURTHER INFORMATION CONTACT: Ms. Kimberly Bass, telephone 571-372-6174. SUPPLEMENTARY INFORMATION: I. Background

Comment: Section 159.6(a)(ii) ·PSC verification that PSCs meet all the legal, training, and qualification requirements * * *. should include ·That the FAR shall be revised to require the insertion into each covered contract of a contract clause; addressing the selection, training, equipping and conduct of personnel performing private security functions under such a contract·. Response: A FAR clause will be drafted to incorporate all of the requirements of this Rule.
Comment: Section 159.6(a)(v) ·Reporting alleged criminal activity and other incidents involving PSCs or PSC personnel by another company or any other personnel. All incidents shall be reported and documented·. These reporting requirements are already required Response: Many of the requirements in this rule are already in effect in the CENTCOM AOR. With this Rule, we are establishing the requirements for all Geographic Combatant Commanders and Chiefs of Mission in order to extend guidance and procedures globally and to the wider interagency community. Comment: Questions of the propriety of having PSCs represent the U.S. in contingency operations relative to the U.S. Constitution and the Anti Pinkerton Act Response: The DoD's use of contractors, including private security (printed page 49653) contractors, is entirely consistent with existing U.S. Government policy on inherently governmental functions. We are guided by four main documents when determining whether an activity or function is inherently governmental: DoD Instruction 1100.22 ·Policy and Procedures for Determining Workforce Mix·; the Federal Acquisition Regulations (FAR); the Performance of Commercial Activities and the Federal Activities Inventory Reform Act, or FAIR Act, of 1998; and, Office of Management and Budget (OMB) Policy Letter 92-1, issued in 1992. The DoD recognizes that there are specific security functions that are inherently governmental and cannot be contracted. The DoD does not contract those functions, but there are other security functions that are appropriate to contract. The DoD, the Government Accountability Office (GAO), the Office of Management and Budget (OMB), the Congressional Budget Office (CBO), and the Congressional Research Service (CRS) have continuously reviewed the use of PSCs, the potential for their performance of inherently governmental functions, and the appropriateness and manner in which they are employed.
Comment: Opposition to the use of mercenaries in the U.S. Department of Defense Response:

3.6.2 | Authorization Mechanisms... 3.6.2 for more details. 3.6.2 Authorization Mechanisms Some recovery and administrative actions can make significant changes to either the Platform Firmware or software.

DoD is planning for a phased roll-out of each assessment level across 7 years with the entity numbers reaching a maximum by Year 4 as shown in the tables. The target of Year 4 was selected based on the projected capacity of the CMMC Ecosystem to grow to efficiently support the entities in the pipeline. For modeling efficiency, a similar roll-out is assumed regardless of entity size or assessment level. It is assumed that by year 7 the maximum number of entities is reached. Beyond year 7, the number of entities entering and exiting are expected to net to zero. The following tables reflect the number of new entities in each year and for each level. (printed page 83178)

Public Costs Summary of Impacted Awardee Entities According to data available in the Electronic Data Access system for fiscal years (FYs) 2019, 2020, and 2021, DoD awards an average of 1,366,262 contracts and orders per year that contain DFARS clause 252.204-7012, to 31,338 unique awardees, of which 683,718 awards (50%) are made to 23,475 small entities (75%). [37]

Public Cost Analysis The following is a summary of the estimated Public costs the revised CMMC Program for other than small [38] entities, per assessment of a contractor information system, at the required periodicity for each CMMC level. The following is a summary of the estimated Public costs of the revised CMMC Program for Small Entities, per assessment of each contractor information system, estimated at one per entity, at the required periodicity for each CMMC level. (printed page 83179)

The total estimated Public (large and small entities) costs associated with this rule, calculated for a 20-year horizon in 2023 dollars at a 7 percent and 3 percent discount rate, per OMB guidance, is provided as follows:

Assumptions In estimating the Public costs, DoD considered applicable nonrecurring engineering costs, recurring engineering costs, [41] assessment costs, and affirmation costs for each CMMC Level. For CMMC Levels 1 and 2, the cost estimates are based only upon the self-assessment, certification assessment, and affirmation activities that a defense contractor, subcontractor, or ecosystem member must take to allow DoD to verify implementation of the relevant underlying security requirements, i.e.,

In the final rule, guidance on the use of an evaluation factor regarding supply chain risk is modified to require the inclusion of the evaluation factor when acquiring information technology, whether as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system. Risk levels, risk tolerance, and appropriate risk management measures must be determined at the local level. Evaluation factors are specified at the individual acquisition level and not in the DFARS. DoD is issuing DFARS Procedures, Guidance, and Information for the contracting workforce on developing and using supply chain risk evaluation factors.

c. Information Sharing Comment: Three respondents commented on the disclosure of information regarding supply chain risk to offerors and contractors. One of these respondents urged the DoD to use its discretion in sharing information concerning threats sufficient to allow suppliers to alter product designs and change components on devices to overcome known vulnerabilities. Another respondent suggested that a requirement to report identified supply chain risks and issues would assure that immediate remediation could be undertaken if problems arose. One respondent commented that DoD should consider revising the rule to promote disclosure of information regarding supply chain risks to offerors and contractors whenever possible. Whenever such notice may be accomplished consistent with the requirements of national security, DoD should provide notification to the offeror or contractor of perceived supply chain risks early in the procurement process in accordance with standard Government procurement rules (e.g., during discussions in a negotiated procurement), so that the contractor has the opportunity to mitigate or eliminate the risk. Contractors are less able to mitigate supply chain risk if the Government fails or declines to share with them risk information it has developed internally. Response: The DoD intends to share information about supply chain risk with its contractors to the extent possible, consistent with the requirements of national security. The provisions of the rule and section 806 that limit disclosure are concerned with risk information that, for national security reasons, cannot be shared despite the transparency that is normally present in procurement activities.

d. Mitigation/Less Intrusive Measures Comment:

From the NIST SP 800-172 Rev 3 Final Public Draft: architectures can also include other information, such as user roles and the access 2424 privileges assigned to each role; security requirements; types of information processed, stored, and transmitted by the system; cybersecurity supply chain risk management (CSCRM) requirements; restoration priorities of information and

system services; and other protection needs. With the use of modern computing technologies, it is becoming less common for organizations to control all information resources. There may be key dependencies on external services and service providers. Describing such dependencies as part of the security architecture is necessary for developing a comprehensive CUI protection strategy. Establishing, documenting, and maintaining a baseline configuration for organiza

(Comment 43) One comment argues that the proposed retail exemption (§ 1.327(d)) must be a complete exemption, including an exemption from recordkeeping regarding suppliers, identical to the exemption given to restaurants. The comment states that today retailers and restaurants compete in the burgeoning take home and carryout market. FDA's proposal gives an unfair and unnecessary advantage to restaurants, which are expanding out of in-restaurant dining into areas formerly served by retailers and carryout establishments. A full exemption for retailers presents no lessening of food safety safeguards. (Response) Restaurant is defined to mean a facility that prepares and sells food directly to consumers for immediate consumption. This means that an establishment that prepares and sells food that is capable of being eaten immediately, with no further preparation, is considered a restaurant. This definition and the corresponding exemption for restaurants in § 1.327(b) of the final rule includes activities such as a restaurant preparing and selling food to a consumer to be consumed at a later time, as long as the food is (printed page 71578) capable of being immediately consumed without further preparation or processing. For example, a restaurant may prepare and sell pies from a counter that consumers purchase and take home for later consumption. This activity qualifies for the restaurant exemption as long as the food is prepared and sold directly to a consumer for immediate consumption. In addition, a restaurant/retail facility is excluded from all of the requirements in subpart J of this final rule if its sales of food it prepares and sells to consumers for immediate consumption are more than 90 percent of its total food sales. FDA notes that many facilities that otherwise would be excluded as restaurants under the final rule sell a small amount of food that they do not prepare for immediate consumption. For example, some restaurant/retail facilities have small packaged goods gift shop areas that sell food. The entire facility is excluded from all of the requirements in subpart J if its sales of food it prepares and sells to consumers for immediate consumption are more than 90 percent of its total food sales. FDA exercised its discretion and excluded restaurant/retail facilities whose nonrestaurant food sales are less than 10 percent of their total food sales because many facilities that would otherwise qualify as restaurants make such sales as an incidental activity (Ref. 14). FDA believes that, were it not to provide such an exclusion, the exemption for restaurants would be undermined because many facilities that prepare and sell a high percentage of their food for immediate consumption also sell a small amount of packaged goods that they do not prepare themselves for sale to consumers (e.g., beverages, chips, candy, condiments, and sweeteners) and otherwise would be subject to the rule as to those sales.

CMMC Phase 1 (effective November 10, 2025) focuses on self-assessments. DoD is incorporating CMMC Level 1 and Level 2 self-assessment requirements into applicable solicitations and contracts. Organizations can demonstrate compliance through self-assessment during this phase. CMMC Phase 2 (scheduled November 10, 2026) expands the requirements to include C3PAO certification assessments. This means solicitations and contracts may require organizations to have undergone a third-party assessment by an authorized C3PAO and received a CMMC Level 2 certification. Phase 2 is when the independent assessment requirement becomes enforceable. The practical difference: in Phase 1, you self-attest. In Phase 2, a C3PAO verifies your implementation.

This program benefits the Department by increasing awareness and improving assessments of cyber incidents that may affect mission critical capabilities and services. It continues to be an important element of the Department's comprehensive effort to defend DoD information, protect U.S. national interests against cyber-attacks, and support military operations and contingency plans worldwide. Once a defense contractor joins the program, they are encouraged to share information, including cyber threat indicators, that they believe may be of value in alerting the Government and others, as appropriate, of adversary activity to enable the development of mitigation strategies and proactively counter threat actor activity. DC3 develops written products that include analysis of the threat, mitigations, and indicators of adversary activity. Even cyber incidents that are not compromises of covered defense information may be of interest to DoD for situational awareness purposes. This information is disseminated as anonymized threat products that are shared with authorized DoD personnel, other Federal agencies, and company-designated POCs participating in the DIB CS Program. With the revisions to the eligibility criteria, the Department will be able to

reduce the impact of cyber threat activity on DIB networks and information systems and, in turn, preserve its technological advantage and protect DoD information and warfighting capabilities. The mitigation of the cyber threat targeting defense contractors reinforces the nation's national security and economic vitality. For DIB participants, this program provides valuable cyber threat information they cannot obtain from anywhere else and technical assistance through analyst-to-analyst exchanges, mitigation and remediation strategies, and cybersecurity best practices in a collaborative environment. The shared unclassified and classified cyber threat information is used to bolster a company's cybersecurity posture and mitigate the growing cyber threat. The program's tailored support for small, mid-size, and large companies with varying cybersecurity maturity levels is an asset for participants. The program remains a key element of DoD's cybersecurity efforts by providing services to help protect DIB CS Program participants and the sensitive DoD information they handle. Alternatives Alternative #1 Maintain status quo with the ongoing voluntary cybersecurity program for cleared defense contractors. Reason for Not Selecting Alternative #1

(Aug. 24, 2009). The Department also finalized previously proposed Privacy Rule modifications as required by the Genetic Information Nondiscrimination Act of 2008, 74 FR 51698 (Oct. 7, 2009). Back to Citation 114. Among other things, the Cures Act provided ONC, in collaboration with NIST and other relevant agencies within the Department, with the authority to convene public-private and public-public partnerships to build consensus and develop or support a trusted exchange framework, including a common agreement among health information networks nationally. The purpose of this work is to ensure full network-to-network exchange of health information. Sec. 4003(b) of Public Law 114-255 , 130 Stat. 1165 (Dec. 13, 2016) (codified at 42 U.S.C. 300jj-11(c)). The Cures Act also provides penalties for any developer of certified health IT, health information exchange or network, and appropriate disincentives for any health care provider, determined by the Inspector General to have committed information blocking. Sec. 4004(b)(2) of Public Law 114-255 , 130 Stat. 1165 (Dec. 13, 2016) (codified at 42 U.S.C. 300jj-52) . Back to Citation

Revise Business Associate Agreements 1 × 1 1,822,600 Regulated Entities 169.68 309 Total Annual Cost Burden 4,655 a These represent first year estimated costs and are rounded. The Department presents the estimated cost of health plan sponsors' compliance with the proposed new requirements in table 7 below. Table 7·First Year Cost Estimates of Health Plan Sponsors' Proposed Compliance Obligations a Compliance activities Burden hours × frequency Respondents Wage rate Total annual cost (millions) Risk Analysis·Documentation 5 × 1 742,411 Plan Sponsors \$119.94 \$445 Information System Activity Review·Documentation .75 × 12 742,411 Plan Sponsors 119.94 801 Ongoing Education .17 × 12 742,411 Plan Sponsors 119.94 178 Security Incidents (other than breaches)·Documentation 2 × 12 742,411 Plan Sponsors 119.94 2,137 Contingency Plan·Testing and Revision 2 × 1 742,411 Plan Sponsors 119.94 178 Contingency Plan·Criticality Analysis .5 × 1 742,411 Plan Sponsors 119.94 45 Notification of Workforce Members' Termination of ePHI Access .25 × 1 742,411 Plan Sponsors 46.10 9 Maintenance Records .5 × 12 742,411 Plan Sponsors 111.08 495 Multi-factor Authentication 1.5 × 1 742,411 Plan Sponsors 119.94 133 Configuration

Management .5 × 1 742,411 Plan Sponsors 119.94 45 Penetration Testing 2 × 1 742,411 Plan Sponsors 119.94 178 Notification of Contingency Plan Activation .17 × 1 742,411 Plan Sponsors 119.94 15 Total Annual Cost Burden 4,659 a These represent first year estimated costs and are rounded. Together, regulated entities' and affected health plan sponsors' estimated first year costs of compliance with the proposals in the NPRM would be approximately 9,314 million (or \$9 billion). p. Costs Borne by the Department The covered entities that are operated by the Department would be affected by the changes in a similar manner to other covered entities, and such costs have been factored into the estimates above. The Department has not identified other costs to the Department related to the changes in the NPRM. A reduction in the number of large breaches (affecting 500 or more individuals per incident) would benefit the Department by enabling it to focus its resources on a smaller number of breach investigations, and potentially resolve such investigations more quickly. 4. Benefits of the Proposed Rule a. Quantitative Analysis of Benefits A key goal of strengthening the cybersecurity posture of regulated entities is to reduce the number and severity of security incidents, including breaches of ePHI. The Department believes that compliance with the proposed changes, which align with industry guidelines and best practices, would benefit regulated entities by reducing the cost of breaches. Although the costs of implementing the proposed cybersecurity measures would be significant, the costs of responding to breaches of ePHI are much higher. According to industry data, the average cost of a health care breach in 2023 rose to \$10.93 million, the highest among all industries studied, [966]

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. The Special Publication 800-series reports on ITL's research, guidelines, and outreach efforts in information system security, and its collaborative activities with industry, government, and academic organizations. 1. Broad network access : Cloud services are available over the network and accessible through standard mechanisms that promote use by heterogeneous thick and thin client platforms (e.g., mobile phones, tablets, laptops, workstations). This raises security concerns with regard to network access. For example, denial of service (DoS) attacks can be launched against a cloud system, rendering its resources unavailable to legitimate users. Thus, AC for network access should be managed. 2. Resource pooling : The computing resources of a cloud system (e.g., storage, memory, processing, network bandwidth) are pooled to serve multiple consumers using a multitenant model (i.e., a single instance of the software and its supporting infrastructure serves multiple consumers) through different physical and virtual resources, each dynamically assigned and reassigned according to consumer demands.

CMMC requirements apply to prime contractors and subcontractors throughout the supply chain at all tiers that will process, store, or transmit any FCI or CUI on contractor information systems in the performance of the DoD contract or subcontract, irrespective of the origin of the information. The executive branch's CUI Program is codified in 32 CFR part 2002 and establishes policy for designating, handling, and decontrolling information that qualifies as CUI. The definition of CUI and general requirements for its safeguarding are included in 32 CFR 2002.4 and 2002.14 , respectively. 32 CFR 2002.14(h)(2) specifically requires agencies to use NIST SP 800-171 when establishing security requirements to protect CUI's confidentiality on non-Federal information systems. At the time of award, the DoD may have no visibility into whether the awardee will choose to further disseminate DoD's CUI, but DFARS clause 252.204-7012 and DFARS clause 252.204-7021 require the prime contractor to flow down the information security requirement to any subcontractor with which the CUI will be shared. Decisions regarding which DoD information must be shared to support completion of subcontractor tasks is between the prime contractor and the subcontractors. The DoD encourages prime contractors to work with subcontractors to lessen the burden of flowing down CUI. The DoD declines to adopt alternatives such as policy-based solutions that lack a rigorous assessment component or require sharing CUI only through DoD-hosted secure platforms. Suggested alternatives to implementing NIST SP 800-171 and identifying what data is CUI are beyond the scope of the CMMC Program and this rule. b. FCI and CUI Definitions Comment: Five comments stated that what DoD considers CUI is not well defined. Another comment stated that companies should be provided a reference list of what the DoD considers CUI. Another recommended DoD use existing mechanisms like

the DD Form 254 architecture to clearly define the scope of CUI on a contract-by-contract basis. Seven comments recommended the CMMC rule mandate a Security Classification Guide (SCG) or similar document. Nine comments stated there was too much confusion and ambiguity regarding FCI and CUI and that the government needed to provide clear and standardized FCI and CUI definitions that are tailored to the specific requirements of the CMMC rule. One comment recommended rule edits to address this perceived ambiguity. One comment requested clarification and examples of differences between CUI Basic and Specialized CUI. Response: Federal Contract Information is defined in FAR clause 52.204-21, which also provides the security requirements applicable for basic safeguarding of such information. The DoD has no authority to modify definitions established in the FAR for application to all executive branch agencies. This rule makes no change to the definition or handling of CUI. c. Marking Requirements Comment:

3.1.4 Travel Information Type... 3.1.4 Travel Information Type Travel involves the activities associated with planning, preparing, and monitoring of business related travel for an organization's employees.

For purposes of this part, a signed agreement between a foreign interest and a U.S. contractor or a company in process for an FCL which, based on an assessment of FOCI information, imposes various security measures within an institutionalized set of company practices and procedures. Examples include board resolutions, security control agreements (SCAs) and special security agreements. FOCI negotiation agreement. For purposes of this part, a signed agreement between a foreign interest and U.S. contractor or a company in process for an FCL under which the foreign owner relinquishes most ownership rights to U.S. citizens who are approved by the U.S. Government and have been favorably adjudicated for access to classified information based on the results of a personnel security clearance investigation. Examples include voting trust agreements (VTAs) and proxy agreements (PAs). Foreign government information (FGI). As defined in E.O. 13526 . Foreign interest. As defined in DoD 5220.22-M. GCA. As defined in DoD 5220.22-M. Industrial security. As defined in DoD 5220.22-M. Information. As defined in E.O. 13526 . (printed page 19471) Limited Access Authorization (LAA). As defined in DoD 5220.22-M. National interest determination (NID). As defined in 32 CFR part 2004 , ·National Industrial Security Program Directive No. 1.· Non-DoD Components. Those USG executive branch departments and agencies identified in DoD 5220.22-M that have entered into agreements with the Secretary of Defense to act as the NISP Cognizant Security Agency (CSA) for, and on their behalf, in rendering security services for the protection of classified information disclosed to or generated by industry pursuant to Section 202 of E.O. 12829 . Personnel security clearance (PCL). As defined in DoD 5220.22-M. Personnel security clearance assurance (PCLSA). A written certification by USG or applicable foreign government industrial security authorities, which certifies the PCL level or eligibility for a PCL at a specified level for their citizens. The assurance is used, in the case of the United States, to give an LAA to a non-U.S. citizen, provided all other investigative requirements are met. Prime contract. As defined in DoD 5220.22-M. Proscribed information. TOP SECRET (TS) information, COMSEC information excluding controlled cryptographic items when unkeyed and utilized with unclassified keys, restricted data (RD), special access program (SAP) information, or sensitive compartmented information (SCI). Restricted Data (RD). As defined in DoD 5220.22-M. Sensitive compartmented information (SCI). As defined in Joint Publication 1-02. Security assurance.

Satellite-to-satellite communications sub-segment. Communications between operational satellites for mission functions - such as command and control, networking of compute capabilities, redundancy of operations and mission functions, tracking, and communications are known as inter-vehicle communications . Therefore, the integrity, availability, and confidentiality of these communications are critical. Satellite-to-satellite communications is a capability of a satellite in the space segment and can be for both docked systems as well as space stations, which are composed of separate operational vehicles. The cybersecurity risks of decommissioning should consider appropriate confidentiality, integrity, and availability considerations, as well as related physical threats to commercial satellite systems once decommissioned. Industry practices - such as following International Organisation for Standards (ISO) standards for decommissioning, international treaty obligations, and domestic regulations - should also be considered.

does impose reporting or recordkeeping requirements under the Paperwork Reduction Act of 1995. These requirements have been approved by OMB and assigned OMB Control Numbers 0704-0460, ·Synchronized Predeployment and Operational Tracker (SPOT) System· and 0704-0461, ·Qualification to Possess

Firearms or Ammunition. Executive Order 13132, Federalism. It has been certified that 32 CFR part 159 does not have federalism implications, as set forth in Executive Order 13132. This rule does not have substantial direct effects on: (1) The States; (2) The relationship between the National Government and the States; or (3) The distribution of power and responsibilities among the various levels of Government. List of Subjects in 32 CFR Part 159 Contracts Security measures. Accordingly, the interim rule amending 32 CFR part 159 which was published at 74 FR 34691 on July 17, 2009, is adopted as a final rule with the following change. Part 159 is revised to read as follows: PART 159-PRIVATE SECURITY CONTRACTORS OPERATING IN CONTINGENCY OPERATIONS 159.1 Purpose. 159.2 Applicability and scope. 159.3 Definitions. 159.4 Policy. 159.5 Responsibilities. 159.6 Procedures. Authority: Pub. L. 110-181; Pub. L. 110-417. § 159.1 Purpose. This part establishes policy, assigns responsibilities and provides procedures for the regulation of the selection, accountability, training, equipping, and conduct of personnel performing private security functions under a covered contract. It also assigns responsibilities and establishes procedures for incident reporting, use of and accountability for equipment, rules for the use of force, and a process for administrative action or the removal, as appropriate, of PSCs and PSC personnel. § 159.2 Applicability and scope. This part: (a) Applies to: (1) The Office of the Secretary of Defense, the Military Departments, the Office of the Chairman of the Joint Chiefs of Staff and the Joint Staff, the Combatant Commands, the Office of the Inspector General of the Department of Defense, the Defense Agencies, the DoD Field Activities, and all other organizational entities in the Department of Defense (hereafter referred to as the DoD Components). (2) The Department of State and other U.S. Federal agencies insofar as it implements the requirements of section 862 of Public Law 110-181.

If the Contractor is operating a non-Federal information system that processes, stores, or transmits CUI identified in the contract, the CUI clause requires the contractor to comply with the security requirements in NIST Special Publication 800-171, Revision 2, or as authorized by the Contracting Officer and any CUI specified requirements identified in the SF XXX. NIST SP 800-171 Revision 2 includes 110 security requirements for non-Federal information systems that can be grouped into the following 14 categories: access control, awareness and training, audit and accountability, configuration management, identification and authentication, incident response, maintenance, media protection, personnel security, physical protection, risk assessment, security assessment, system and communications protection, and system and information integrity. Specific information on the 110 individual security requirements and various templates are available on the NIST website at <https://csrc.nist.gov/publications/detail/sp/800-171/rev-2/final>. Federal contractors that handle covered Federal information (CFI), a much broader category than CUI, on their information systems are already required to have implemented 17 of the 110 security requirements, which are already included in the clause at FAR 52.204-21, Basic Safeguarding of Covered Contractor Information Systems. Such requirements are considered met by all impacted contractors, regardless of size. For the remaining 93 security requirements, a contractor may need to establish a process or procedure, configure existing information technology that the contractor already owns, or acquire additional software or hardware. Assess and report suspected CUI incidents. When the Contractor discovers a suspected CUI incident, the CUI clause requires the contractor to determine what CUI was or could have been improperly accessed, used, processed, stored, maintained, disseminated, disclosed, or disposed of; construct a timeline of user activity; and determine methods and techniques used to access CUI. The Contractor shall report any suspected or confirmed CUI incident to the agency website or point of contact identified in the SF XXX, within 8 hours of discovery. The report shall include as many of the applicable data elements located on the DIBNet website as are available and provide any remaining applicable data elements as soon as they become available. In addition, if the Contractor is a FedRAMP authorized (Joint Authorization Board or Agency) Cloud Service Provider, the Contractor shall also report to the points of contact specified in the FedRAMP incident reporting guidelines as documented in the Cloud Service Provider Incident Response Plan. The requirements of the CUI clause are flowed down to subcontracts at all tiers; subcontractors are required to notify the prime contractor or next higher-tier subcontractor within the same timeframes.

A number of the routine uses listed in the System of Records Notice below are common to systems across the government. These include routine uses allowing disclosure to Federal Agencies as necessary in order to respond to a confirmed or suspected breach of system security or confidentiality (routine use number 1); to the Department of Justice (DOJ) to obtain DOJ advice on producing user fee records in response to a FOIA request (routine use 2); to DOJ when DOJ represents

the Agency in litigation (routine use 7); in response to a subpoena issued by a duly empowered Federal Agency (routine use 3); to a court or tribunal when the records are relevant and necessary to a proceeding involving the Agency or an employee (routine use 8); to contractors and others who perform services for the Agency related to the UFS (routine use 9); to the National Archives and Records Administration (NARA) and General Services Administration as needed in the course of records management inspections (routine use 10); and to the Department of Homeland Security (DHS) in circumstances where system records are captured in an intrusion detection program and made accessible to DHS (routine use 11). Additional routine uses specific to the UFS allow disclosure to entities as permitted under the Debt Collection Improvement Act (routine use 4); to banks in order to process payment made by credit card (routine use 5); and to Dun and Bradstreet to validate submitter contact information (routine use 6). SYSTEM NUMBER: 09-10-0021. SYSTEM NAME: FDA User Fee System, HHS/FDA. SECURITY CLASSIFICATION: Unclassified. SYSTEM LOCATION: This system is located at FDA's Data Center in Ashburn, VA. CATEGORIES OF INDIVIDUALS COVERED BY THE SYSTEM: This system contains records about individuals and companies that are required to submit user fee payments to the FDA. This includes organizations registered in the UFS, those billed through the system, as well as those submitting applications for review or otherwise assessed fees under the User Fee Program. Privacy Act notification, access, and amendment rights relative to the UFS are available only to individuals who are the subject of records in this system. User fee record subjects are individuals required to pay a user fee, including individual FOIA requestors and individuals who are sole proprietors of an entity required to pay a user fee. Although records in the system may contain personally identifiable information (PII) related to other individuals, only the specified fee submitters are considered subjects of records in this system. CATEGORIES OF RECORDS IN THE SYSTEM: 1. The UFS maintains information about individuals, companies and organizations that pay user fees. This includes: (a) For an entity remitter, a FEIN, and for an individual remitter, a TIN; (b) company or organization name and address; (c) DUNS number; and (d) contact person's name, phone number, Fax number, and email address.

b. For Level 2 assessments, if all 110 requirements are satisfied, the assessment score will be 110 and the OSA will have achieved a CMMC Status of Final Level 2 (Self) or Final Level 2 (C3PAO) as applicable and is eligible for contract award as long as all other contractual requirements are met. Not all requirements must immediately be MET to be eligible for contract award. If the minimum score is achieved on the assessment (equal to 80% of the maximum score) and certain critical requirements are met, OSAs will achieve a CMMC Status of Conditional Level 2 (Self) or Conditional Level 2 (C3PAO) as applicable. All NOT MET requirements must be noted in an assessment Plan of Action and Milestones (POA&M). At this point the OSA will have satisfied the CMMC requirements needed for contract award OSAs must have met all 110 security requirements of NIST SP 800-171 R2 within 180 days of receiving their Conditional CMMC Status, which must be verified with a second assessment, called a POA&M closeout assessment. If the POA&M closeout assessment finds that all requirements have been met, then the OSA will achieve a CMMC Status of Final Level 2 (Self) or Final Level 2 (C3PAO) as applicable. However, if a POA&M closeout assessment does not find that all requirements have been met by the end of 180 days, then the CMMC Status of Conditional Level 2 (Self) or Conditional Level 2 (C3PAO) will expire. At this point, standard contractual remedies will apply. The OSA should submit an affirmation into SPRS after achieving a CMMC Status of Conditional Level 2 (Self) or CMMC Status of Conditional Level 2 (C3PAO) as applicable. OSAs should submit an affirmation once a CMMC Status of Final Level 2 (Self) or Final Level 2 (C3PAO) as applicable is achieved. Being eligible for contracts subject to CMMC Level 2 (Self) also indicates eligibility for contracts subject to Level 1 (Self), and being eligible for contracts subject to CMMC Level 2 (C3PAO) also indicates eligibility for contracts subject to Level 1 (Self) and Level 2 (Self), assuming all other contractual requirements are met. OSAs must reaffirm in SPRS their compliance with CMMC Level 2 requirements annually but need only conduct a new assessment every three years. These deadlines are based on the CMMC Status Date of the Conditional Status if a POA&M was required or the Final Status if the assessment resulted in a score of 110. CMMC Status date is not based on the date of a POA&M closeout assessment. c. For Level 3 assessments, OSAs should note that asset categories are assessed against security requirements differently than they are at Level 2. In particular, Contractor Risk Managed Assets identified in a Level 2 scope are treated as CUI Assets if they reside within a Level 3 scope. Definitions and treatment of these assets at Level 3 as they relate to scoping of the assessment, in addition to treatment of ESPs, are described in §.170.19(d).

Section VI covers the formation of a Computer Security Incident Response Team. Although not explicitly required by federal directives, forming such a team is one method agencies are using to

deal with the threat of computer security incidents - o physical access controls and their effectiveness; - o locks and entry procedures; - o air conditioning, uninterruptable power supply, and fire suppression and pumping equipment for adequacy and proper maintenance; - o reports distribution; - o protection against hardware and software theft and other human and machine-related threats; - o procedures for off-site storage of data and software; - o procedures for reacting to natural disasters and other nature-based threats to the facility, such as flood, fire, earthquake, hurricane, or twister; and - o personal computer use and software copyright license policy. recertify the adequacy of safeguards. It specifies that this be done at least every 3 years and that audits and reviews be considered part of the agency vulnerability assessment and internal control reviews conducted in accordance with OMB Circular A-123.

From the NIST SP 800-172 Rev 3 Final Public Draft: PROTECTION STRATEGY PRA, CRS NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 ADVERSARY EFFECTS 2493

There were also discussions on the role of patching. While patching is important for ongoing device cybersecurity, it is not sufficient. There are too many exploits for patching alone to work, and there is concern about running out of time and money before bad actors do, given how quickly IoT changes. Updates on Program activities and collaboration opportunities are available on the NIST Cybersecurity for IoT Program website.

- · detect and prevent unauthorized software installation - · protect ICS networks from potentially harmful applications - · determine changes made to a network using change management tools - · detect unauthorized use of systems - · continuously monitor network traffic - · leverage anti-malware tools The NCCoE, in conjunction with the NIST EL, collaborated with cybersecurity technology providers to develop and implement example solutions that demonstrate how manufacturing organizations can protect the integrity of their data from destructive malware, insider threats, and unauthorized software within manufacturing environments that rely on ICS. An organization that is interested in protecting the integrity of a manufacturing system and information from destructive malware, insider threats, and unauthorized software should first conduct a risk assessment and determine the appropriate security capabilities required to mitigate those risks. Once the security capabilities are identified, the sample architecture and solution presented in this document may be used.

Following publication of this Final Rule, these requirements will be added to the FAR and DFARS and subsequently incorporated into appropriate contracts. This will provide a basis for the management of PSC compliance. Comment: Chief of Mission Should Be Required to Opt Out of DoD PSC Processes Response: We believe that the arrangement set out in Section 159.4(c) is appropriate and meets the congressional intent of a consistent approach towards PSCs operating in combat operations or other significant military operations, across USG agencies. Comment: Any Procedures or Guidance Issued Under the Requirements of This Rule Should be Subject to an Appropriate Rule-Making with an Adequate Opportunity for Public Comment Response: The relevant provisions of this Final Rule will be implemented through military regulations and orders, in accordance with existing procedures. Comment: The Rule is Not Integrated with Standard Contracting Processes Response: The requirements associated with GCC guidance and procedures will be included in any solicitations and therefore potential bidders will be aware of GCC specific procedures prior to submitting their proposals. AOR specific procedures such as training requirements are required to be placed on GCC Web sites immediately after a declared contingency so that the requirements can get into the appropriate contracts as soon as possible. Comment: The Rule Should Fully Explain How DoD Determines a PSC Law of War Status Response: It is not the role of the Rule to make statements regarding international law. Department Of Defense Instruction 3020.41, the overarching Defense policy document for this Rule, provides in paragraph 6.1.1 that: Under applicable law, contractors may support military operations as civilians accompanying the force, so long as such personnel have been designated as such by the force they accompany and are provided with an appropriate identification card under the provisions of the 1949 Geneva Convention Relative to the Treatment of Prisoners of War (GPW) (reference (j)). If captured during armed conflict, contingency contractor personnel accompanying the force are entitled to prisoner of war status. The comments regarding direct participation in hostilities are unsupportable. There is no agreement within the international community or among recognized authorities in international humanitarian law (LOAC) on a universally applicable definition for ·Direct Participation in Hostilities· (printed page 49652)

, 529 U.S. 120, 132 (2000). The agency has determined that, in enacting section 306 of the Bioterrorism Act, Congress did not speak directly and precisely to the meaning of “food.” The FD&C Act has a definition of “food” in section 201(f). It is a reasonable assumption that, when the term “food” is used in the Bioterrorism Act, section 201(f) applies. However, although there may be “a natural presumption that identical words used in different parts of the same Act are intended to have the same meaning [citation omitted], *** the presumption is not rigid***.” Atlantic Cleaners & Dyers, Inc. v. U.S., 286 U.S. 427, 433 (1932). Accord: U.S. v. Cleveland Indians Baseball Co., 532 U.S. 200, 213 (2000). Thus, the same word may be given different meanings, even in the same statute, if different interpretations are what Congress intended. Atlantic Cleaners & Dryers, Inc., supra. Even before the Bioterrorism Act amendments, the term “food” was not given an identical meaning throughout the FD&C Act. For example, in construing the parenthetical “(other than food)” in section 201(g)(1)(C) of the FD&C Act, the Seventh Circuit noted that Congress meant to exclude only “articles used by people in the ordinary way that most people use food primarily for taste, aroma, or nutritive value” and not all substances defined as food by section 201(f) of the FD&C Act. Nutrilab, Inc. v. Schweiker, 713 F.2d 335, 338 (7th Cir. 1983). Similarly, section 409(h)(6) of the FD&C Act defines a food contact substance as “any substance intended for use as a component of materials used in manufacturing, packing, packaging, transporting, or holding food if such use is not intended to have any technical effect in such food (emphasis added).” This definition makes sense only if “food” is interpreted to exclude materials that contact food because components of food contact materials are plainly intended to have a technical effect in such materials. [1] Thus, it is in this larger statutory context, that FDA has evaluated section 306 of the Bioterrorism Act to determine whether the meaning of the word “food” is ambiguous. In conducting this Chevron step one analysis, all of the traditional tools of statutory interpretation are available to determine whether Congress’s intent is ambiguous. Pharmaceutical Research & Manufacturers of America v. Thompson

..... PART 2-DEFINITIONS OF WORDS AND TERMS 3. Amend section 2.101, in paragraph (b)(2) by: a. In the definition of “Component”, removing from the end of paragraph (3) the word “and”; removing from the end of paragraph (4) “52.225-23(a)” and adding “52.225-23(a); and” in its place; and adding a new paragraph (5); b. Removing the definitions “Federally-controlled information system” and “Information and communication technology (ICT)”; c. Adding in alphabetical order the definitions “Federal information system”, “Government data”, “Information”, “Information and communications technology (ICT)”, and “Information system”; d. In the definition of “Information technology”, revising paragraph (3)(ii); and e. Adding in alphabetical order the definitions “Internet of Things (IoT) devices”, “Operational technology”, “Telecommunications equipment”, and “Telecommunications services”. The revisions and additions read as follows: 2.101 Definitions. * * * * * (b) * * * (2) * * * Component * * * * * (5) Subpart 39.X, see the definition in 39.X01. * * * * * Federal information system (1) Means an information system (44 U.S.C. 3502(8)) used or operated by an agency, by a contractor of an agency, or by another organization, on behalf of an agency; (2) On behalf of an agency as used in this definition, means when a contractor uses or operates an information system or maintains or collects information for the purpose of processing, storing, or transmitting Government data, and those activities are not incidental to providing a service or product to the Government (32 CFR part 2002). * * * * * Government data means any information, (including metadata), document, media, or machine-readable material regardless of physical form or characteristics that is created or obtained by the Government, or a contractor on behalf of the Government, in the course of

official Government business. * * * * * Information, as used in subparts 4.19 and 39.X, means any communication or representation of knowledge such as facts, data, or opinions in any medium or form, including textual, numerical, graphic, cartographic, narrative, electronic, or audiovisual forms (see Office of Management and Budget (OMB) Circular No. A-130, Managing Information as a Strategic Resource). Information and communications technology (ICT) means information technology and other equipment, systems, technologies, or processes, for which the principal function is the creation, manipulation, storage, display, receipt, or transmission of electronic data and information, as well as any associated content. Examples of ICT include but are not limited to the following: Computers and peripheral equipment; information kiosks and transaction machines; telecommunications equipment; telecommunications services; customer premises equipment; multifunction office machines; computer software; applications; websites; electronic media; electronic documents; Internet of Things (IoT) devices; and operational technology. Information system

nonymously collect and share cybersecurity incident and supply chain data for measurement and metrics analytics and to provide users with educational and informative resources to improve their C-SCRM. - NIST launched the hardware security program to identify existing and emerging cybersecurity threats and develop mitigation techniques for semiconductors, including cybersecurity and supply chain standards, guidelines, and recommended practices in collaboration with the semiconductor community. NIST also hosted a Supply Chain workshop and published NIST IR 8540, Report on Secure Hardware Assurance Reference Dataset Program . - To support data safeguarding, NIST released NIST IR 8432, Cybersecurity of Genomic Data ; SP 1800-28, Data Confidentiality: Identifying and Protecting Assets Against Data Breaches ; SP 180029, Data Confidentiality: Detect, Respond to, and Recover from Data Breaches; and NIST IR 8496, Data Classification Concepts and Considerations for Improving Data Protection . - NIST published SP 1800-38B, Migration to Post-Quantum Cryptography (PQC) Quantum Readiness: Cryptographic Discovery , and SP 1800-38C, Migration to PQC Quantum Readiness: Testing Draft Standards . - NIST published SP 800-231, Bugs Framework (BF): Formalizing Cybersecurity Weaknesses and Vulnerabilities ; SP 800-204D, Strategies for the Integration of Software Supply Chain Security in DevSecOps CI/CD Pipelines ; SP 800-218A, Secure Software Development Practices for Generative AI and Dual-Use Foundation Models : An SSDF Community Profile ; and enhanced the Software Assurance Reference Dataset (SARD) with four test suites from the Static Analysis Tool Exposition (SATE) VI. NIST also improved the AI Bug Finder, and the National Software Reference Database added data from 10,000+ new or updated applications (totaling over 42 million files) to assist with computer security and digital forensics analysis.

multitude of errors and developer pitfalls in the cryptographic implementations of software products [1-5]. However, these studies focused on the practices of less-experienced, individual developers. Therefore, there was little understanding of the cryptographic development practices of organizations, including the benefits and challenges of using cryptographic resources such as standards specifications and libraries.

CIS Safeguard 11.1 · Establish and Maintain a Data Recovery Process Establish and maintain a data recovery process. In the process, address the scope of data recovery activities, recovery prioritization, and the security of backup data. Review and update documentation annually, or when significant enterprise changes occur that could impact this Safeguard. Implementation Groups: 1,2,3 Asset Type: data Security Function: recovery Parent Control: Data Recovery

Removing the clause date of (MAR 2014) and adding (DATE) in its place; c. Redesignating paragraphs (b)(i) through (iii) as (c)(1) through (3), respectively; d. Adding a new paragraph (b); and e. Revising paragraph (c)(1). The addition and revision reads as follows: 252.232-7012 Performance-Based Payments-Whole-Contract Basis. * * * * * (b) In accordance with 10 U.S.C. 2307(b) , the output of the Contractor's accounting system shall be in compliance with Generally Accepted Accounting Principles, as evidenced by audited financial statements, in order to receive performance-based payments. (c)(1) The Contractor shall, in addition to providing the information required by FAR 52.232-32, submit supporting information for all payment requests using the following format: * * * * * 8. Amend section 252.232-7013 by: a. In the clause introductory text, removing 232.1005-70(b) and adding 232.1005-70(a)(2) in its place; b. Removing the clause date of (APR 2014) and adding (DATE) in its place; c. Redesignating paragraphs (b)(i) through (iii) as (c)(1) through (3), respectively; d. Adding a new paragraph (b); and (printed page 18225) e. Revising newly redesignated paragraph (c)(1). The addition and revision read as

follows: 252.232-7013 Performance-Based Payments-Deliverable-Item Basis. * * * * * (b) In accordance with 10 U.S.C. 2307(b), the output of the Contractor's accounting system shall be in compliance with Generally Accepted Accounting Principles, as evidenced by audited financial statements, in order to receive performance-based payments. (c)(1) The Contractor shall, in addition to providing the information required by FAR 52.232-32, submit supporting information for all payment requests using the following format: * * * * * 9. Add section 252.232-70XX to read as follows: 252.232-70XX Performance-Based Payments-Representation As prescribed in 232.1005-70(b), use the following provision: Performance-Based Payments-Representation (DATE) (a) In accordance with 10 U.S.C. 2307(b), the output of a contractor's accounting system shall be in compliance with Generally Accepted Accounting Principles in order to receive performance-based payments. (b) The Offeror represents that the output of its accounting system is [.] is not [.] in compliance with Generally Accepted Accounting Principles, as evidenced by audited financial statements. (End of Provision) [FR Doc. 2019-08487 Filed 4-29-19; 8:45 am] BILLING CODE 5001-06-P

(1) The Contractor shall indemnify the Government and its officers, agents, and employees acting for the Government against any liability arising out of the performance of the contract, including costs and expenses, incurred as the result of the Contractor's unauthorized introduction of copyrighted material to which the Contractor has no rights or license that may infringe on the copyright interest of others, information subject to a right of privacy, and any libelous or other unlawful matter into Government data. The Contractor agrees to waive any and all defenses that may be asserted for its benefit, including (without limitation) the Government Contractors Defense. (2) The Contractor shall indemnify the Government and its officers, agents, and employees acting for the Government against any liability arising out of the performance of this contract, including costs and expenses, (printed page 68422) incurred as the result of the Contractor's potential or actual unauthorized disclosure of trade secrets, copyrighted materials, contractor bid or proposal information, source selection information, classified information, material marked as Controlled Unclassified Information, information subject to a right of privacy or publicity, personally identifiable information as defined by OMB Circular A-130 (2016) or successor thereof, or any record as defined in 5 U.S.C. 552a. (3) In the event of any claim or suit against the Government on account of any alleged unauthorized disclosure or introduction of data or information arising out of the performance of this contract or services performed under this contract, the Contractor shall furnish to the Government, when requested by the Contracting Officer, all evidence and information in the Contractor's possession pertaining to such claim or suit. (4) The provisions of this paragraph (m) do not apply unless the Government provides notice to the Contractor as soon as practicable of any claim or suit, affords the Contractor an opportunity under applicable laws, rules, or regulations to participate in the defense of the claim or suit, and these provisions do not apply to any libelous or other unlawful matter contained in such data furnished to the Contractor by the Government and incorporated in data to which this clause applies. Further, this indemnity shall not apply to: (i) A disclosure or inclusion of data or information upon specific written instructions of the Contracting Officer directing the disclosure or inclusion of such information or data; or (ii) A third-party claim that is unreasonably settled without the consent of the Contractor, unless required by final decree of a court of competent jurisdiction. (n) Subcontracts. The Contractor shall include the substance of this clause, including this paragraph (n), in all subcontracts under this contract for services to develop, implement, operate, or maintain, a FIS using other than cloud computing services. (End of clause) 23. Amend section 52.244-6 by: a.

The Department has also provided guidance that a regulated entity can use to devise its security incident plans. The policies and procedures a regulated entity establishes to prepare for and respond to security incidents can pay dividends with faster recovery times and reduced compromises of ePHI. [593] A well thought-out, well-tested security incident response plan is integral to ensuring the confidentiality, integrity, and availability of a regulated entity's ePHI. A timely response to a security incident can be one of the best ways to prevent, mitigate, and recover from future cyberattacks. For example, responding to a single intrusion or inappropriate access can prevent a pattern of repeated malicious actions. It is extremely important that a regulated entity analyzes an incident to establish what has occurred and its root cause. Doing so will enable the regulated entity to use that information to update its security incident response plans. The Department has previously issued guidance addressing such activities as forming a security incident response team, identifying and responding to security incidents, mitigating harmful effects of and

documenting a security incident, and breach reporting. [594] NIST also offers guidance for addressing security incidents. [595] It describes four key activities with detailed descriptions and sample questions: Determine the goals of an incident response. Develop and deploy an incident response team or other reasonable and appropriate response mechanism. Develop and implement policy and procedures to respond to and report security incidents. Incorporate post-incident analysis into updates and revisions. NIST has also issued comprehensive guidelines for incident handling, particularly for analyzing incident related data and determining the appropriate response to each incident. [596] For example, the NIST Cybersecurity Framework addresses these activities as part of the core function of ·[respond-a]ctions regarding a detected cybersecurity incident are taken.· [597] ·Respond· supports the ability of the regulated entity ·to contain the effects of cybersecurity incidents. Outcomes within this Function [include] incident management, analysis, mitigation, reporting, and communication.· [598] Despite this existing guidance, OCR's enforcement experience indicates that many regulated entities have not met the existing standard, so we believe that additional specificity regarding their obligations and liability for incident response is warranted. Accordingly, the Department proposes to redesignate the standard for security incident procedures as 45 CFR 164.308(a)(12)(i)

Note that agenda items may change without notice because of possible unexpected schedule conflicts of presenters. The final agenda will be posted on the Web site indicated above. Seating will be available for the public and media. No registration is required to attend this meeting. Public Participation: The ISPAB agenda will include a period of time, not to exceed thirty minutes, for oral comments from the public (Friday, February 15, 2013, between 10:00 a.m. and 10:30 a.m.). Speakers will be selected on a first-come, first-served basis. Each speaker will be limited to five minutes. Questions from the public will not be considered during this period. Members of the public who are interested in speaking are requested to contact Annie Sokol at the contact information indicated in the FOR FURTHER INFORMATION CONTACT section of this notice. Speakers who wish to expand upon their oral statements, those who had wished to speak but could not be accommodated on the agenda, and those who were unable to attend in person are invited to submit written statements. In addition, written statements are invited and may be submitted to the ISPAB at any time. All written statements should be directed to the ISPAB Secretariat, Information Technology Laboratory, 100 Bureau Drive, Stop 8930, National Institute of Standards and Technology, Gaithersburg, MD 20899-8930. Dated: December 21, 2012. Willie E. May, Associate Director for Laboratory Programs. [FR Doc. 2012-31525 Filed 12-31-12; 8:45 am] BILLING CODE 3510-13-P

(Comment 155) One comment asks that FDA not disclose personal details (name of responsible person) about secondary suppliers. The comment notes that disclosure of personal details of secondary suppliers might be contrary to international and European privacy regulations. One comment notes that disclosure to the public of the names of the firm and the responsible individual might conflict with foreign confidentiality rules of law. Other comments express concern about protecting personal privacy information. Another comment states that farmers are concerned about the effect of possible information disclosure on the personal and physical security of their farms where they reside with their families. (Response) Foreign persons, except for those who transport food in the United States, are exempt from all of the requirements in subpart J of this final rule. Farms are also exempt. FDA follows Federal statutes (e.g., FOIA, the Privacy Act) and its regulations (e.g., parts 20 and 21) in determining the proper treatment of information it receives, including personal information. FOIA, for example, contains exemptions that allow FDA to withhold personal information from the public in certain circumstances (5 U.S.C. 552(b)(6) and (b)(7)). (Comment 156) A few comments ask what assurances FDA can give to a person subject to the Bioterrorism Act that the information will not be subject to unauthorized disclosure. Other comments ask that CBP and FDA guarantee nondisclosure of the information. A comment asks how FDA can guarantee the confidentiality of confidential and secret information such as formulas. (Response) FDA complies with Federal law (e.g., the FD&C Act, FOIA, Trade Secrets Act) and regulations (e.g., parts 20 and 21) regarding the dissemination of the information it receives. FDA employees are subject to criminal penalties for disclosing information in violation of section 301(j) of the FD&C Act or the Trade Secrets Act. FDA plans to reemphasize to its field personnel the importance of current protections and legal requirements against unauthorized disclosure of any protected information FDA obtains. (Comment 157) A comment concerned about adverse publicity asks with whom might FDA share information. (Response) FDA is authorized to share certain nonpublic information with others. For example, FDA may share confidential commercial information with a sister agency within the (printed page 71609) Department of Health and Human Services, a State government agency official whom FDA has

. In addition, patch management, [924] access control, [925] authentication, [926] and appropriate business associate agreements [927] are examples of some of the required safeguards that would apply to VR and AR systems. We believe the proposals in this NPRM to clarify these safeguards would substantially improve the ability of regulated entities to address these cybersecurity risks. For example, the Department proposes to require that a regulated entity obtains from a business associate written verification that the business associate has deployed the technical safeguards required by the Security Rule, including a written analysis of the business associate's information systems from a person with (printed page 992) appropriate knowledge of and experience with generally accepted cybersecurity principles and methods for ensuring the confidentiality, integrity, and availability of ePHI verifying compliance with the requirements of 45 CFR 164.312 and a written certification that the analysis has been performed and is accurate. Under this proposal, a regulated entity would be required to obtain such verification from a business associate-developer of VR/AR software, ensuring that ePHI that is created, received, maintained, or transmitted using the VR/AR software is protected to the same extent as ePHI that is created, received, maintained, or transmitted using other technology assets that are components of the regulated entity's relevant electronic information systems. Many regulated entities are piloting innovative technologies. Such entities generally have separate departments that research, develop, test, and deploy such technologies. [928] Regulated entities might consider integrating workforce members with expertise in security and privacy into their technology development groups to ensure that privacy and security, including the Security Rule-required safeguards, are embedded into the design of new and emerging technologies. [929] Doing so can help improve security while boosting quality, efficiency, and productivity. [930]

4. Request for Comment The Department requests comment on the foregoing discussion of how the Security Rule protects ePHI used in new and developing technologies, including any benefits, drawbacks, or unintended consequences. We also request comment on the following considerations in particular:

- a. Whether the Department's understanding of how the Security Rule applies to new technologies involving ePHI is not comprehensive and if so, what issues should also be considered.
- b. Whether there are technologies that currently or in the future may harm the security and privacy of ePHI in ways that the Security Rule could not mitigate without modification, and if so, what modifications would be required.
- c. Whether there are additional policy or technical tools that the Department may use to address the security of ePHI in new technologies.

V. Regulatory Impact Analysis A. Executive Order 12866 and Related Executive Orders on Regulatory Review

(2) Nothing in the amendment process is intended or designed to permit a collateral attack upon what has already been the subject of a judicial or quasi-judicial determination. However, while the individual may not attack the accuracy of the judicial or quasi-judicial determination under this part, he or she may challenge the accuracy of the recording of that action.

(f) Sufficiency of a request to amend. Consider the following factors when evaluating the sufficiency of a request to amend: (1) The accuracy of the information; and (2) The relevancy, timeliness, completeness, and necessity of the recorded information.

(g) Time limits. (1) Provide written acknowledgement of a request to amend within 10 working days of its receipt by the appropriate systems manager. There is no need to acknowledge a request if the action is completed within 10 working days and the individual is so informed. (2) The letter of acknowledgement shall clearly identify the request and advise the individual when he or she may expect to be notified of the completed action. (3) Only under the most exceptional circumstances shall more than 30 days be required to reach a decision on a request to amend. Document fully and explain in the Privacy Act case file (see paragraph (p) of this section) any such decision that takes more than 30 days to resolve.

(h) Agreement to amend. If the decision is made to grant all or part of the request for amendment, amend the record accordingly and notify the requester.

(i) Notification of previous recipients. (1) Notify all previous recipients of the record, as reflected in the disclosure accounting records, that an amendment has been made and the substance of the amendment. Recipients who are known to be no longer retaining the information need not be advised of the amendment. All DoD Components and Federal agencies known to be retaining the record or information, even if not reflected in a disclosure record, shall be notified of the amendment. Advise the requester of these notifications. (2) Honor all requests by the requester to notify specific Federal agencies of the amendment action.

(j) Denying amendment. If the request for amendment is denied in whole or in part, promptly advise the individual in writing of the decision to include: (1) The specific reason and authority for not amending; (2) Notification that he or she may seek further independent review of the decision by

the Head of the DoD Component or his or her designee; (3) The procedures for appealing the decision citing the position and address of the official to whom the appeal shall be addressed; and (4) Where he or she can receive assistance in filing the appeal. (k) DoD Component appeal procedures. Establish procedures to ensure the prompt, complete, and independent review of each amendment denial upon appeal by the individual. These procedures must ensure:

This publication, Volume 4 of NISTIR 8011, immediately follows Hardware Asset Management (HWAM) and Software Asset Management (SWAM) capabilities published as Volumes 2 and 3 respectively. Although it was planned to be released as Volume 5, following Configuration Settings Management (CSM), the VUL capability is being addressed as Volume 4 in the NISTIR 8011 series due to its close relationship with software. Its objective is to address the management of risk created by defects present in software on the network. A software vulnerability is caused by one or more known defects that have been discovered in software, and that can be exploited to affect an adverse security or privacy outcome. 1 Vulnerable software is software in use on a system that has a software vulnerability but has not yet been patched or otherwise mitigated. The Common Weakness Enumeration (CWE) provides identifiers for weaknesses that result from poor design or coding practices and have the potential to result in software vulnerabilities. The Common Vulnerabilities and Exposures (CVEs) program works with software providers, vulnerability coordinators, bug bounty programs, and vulnerability researchers to provide a list of publicly disclosed vulnerabilities. Together, CVE and CWE are used to identify software defects and the weaknesses that caused a given defect respectively. Vulnerable software is a key target that attackers use to initiate an attack and to expand control within a system. Patching vulnerabilities discovered in existing software and improving coding practices for future releases of software are two ways to limit the success of attacks. 2 Derived from the Control Allocation Tables (CAT) in this volume. With respect to security controls selected in the NIST SP 800-53 [SP800-53] Low-Medium-High baselines that support the VUL capability, 42 of 48 determination statements (87.5 %) can be fully or partially automated. Medium-High baselines can be fully or partially automated.

Identifying the CMMC Assessment Scope CMMC Assessment Scope · Level 3 · Version 2.13 4 Asset Category Asset Description OSC Requirements CMMC Assessment Requirements Out-of-Scope Assets o Assets that cannot process, store, or transmit CUI; and do not provide security protections for CUI Assets o Assets that are physically or logically separated from CUI assets o Assets that fall into any in-scope asset category cannot be considered an Out-of-Scope Asset o An endpoint hosting a VDI client configured to not allow any processing, storage, or transmission of CUI beyond the Keyboard/Video/Mouse sent to the VDI client is considered an Out-of-Scope Asset o Prepare to justify the inability of an Out-of-Scope Asset to store, process, or transmit CUI o None

Notably, government and private industry CSRM and ERM programs have different oversight and reporting requirements (e.g., accountability to the public versus accountability to shareholders), but the general needs and processes are quite similar. The risk register provides an easily consumed summary for understanding the risk landscape, but effective risk communication requires many additional details that would not fit into this compact table. The additional information should be recorded in a Risk Detail Record (RDR) and be readily available should the additional detail be required about a risk register entry. The RDR provides an opportunity to record historical risk-related information, detailed risk analysis data, and information about individual and organizational accountability. Appendix B of this document provides a notional example of such a record. Risk appetite and risk tolerance are related but distinct in a similar manner to the relationship between governance and management activities. Where risk appetite statements define the overarching risk guidance, risk tolerance statements define the specific application of that direction. This means risk tolerance statements are always more specific than the corresponding risk appetite statements. Together, these risk appetite and risk tolerance statements represent risk limits, help communicate risk expectations, and improve the focus of risk management efforts. They also help to address other factors such as findings from internal audits or external reports (e.g., an examination of corporate financial records by an independent audit firm, a review of a federal agency's improved IT management through the Federal Information Technology Acquisition Reform Act [FITARA]). The definition of these risk parameters places the enterprise in a better position to identify, prioritize, treat, and monitor risks that may lead to unacceptable loss.

In addition, in the course of carrying out analysis for insider threats, exempt records from other

systems of records may in turn become part of the case records maintained in this system. To the extent that copies of exempt records from those other systems of records are maintained into this system, the DoD claims the same exemptions for the records from those other systems that are entered into this system, as claimed for the original primary system of which they are a part. (2) System identifier and name. DUSDI 02-DoD ·Personnel Vetting Records System.· (i) Exemption. This system of records is exempted from subsections 5 U.S.C. 552a(c)(3) , (d)(1), (d)(2), (d)(3), (d)(4), and (e)(1) of the Privacy Act. (ii) Authority. 5 U.S.C. 552a(k)(1) , (k)(2), (k)(3), (k)(5), (k)(6), and (k)(7). (iii) Exemption from the particular subsections. Exemption from the particular subsections is justified for the following reasons: (A) Subsections (c)(3), (d)(1), and (d)(2) . (1) Exemption (k)(1). Personnel investigations and vetting records may contain information properly classified pursuant to Executive Order. Application of exemption (k)(1) for such records may be necessary because access to, amendment of, or release of the accounting of disclosures of such records could disclose classified information that could be detrimental to national security. (2) Exemption (k)(2). Personnel investigations and vetting records may contain investigatory material compiled for law enforcement purposes other than material within the scope of 5 U.S.C. 552a(j)(2) . Application of exemption (k)(2) for such records may be necessary because access to, amendment of, or release of the accounting of disclosures of such records could: Inform the record subject of an investigation of the existence, nature, or scope of an actual or potential law enforcement or counterintelligence investigation, and thereby seriously impede law enforcement or counterintelligence efforts by permitting the record subject and other persons to whom he might disclose the records to avoid criminal penalties, civil remedies, or counterintelligence measures; interfere with a civil or administrative action or investigation which may impede those actions or investigations; and result in an unwarranted invasion of the privacy of others. Amendment of such records could also impose a highly impracticable administrative burden by requiring investigations to be continuously reinvestigated. (3) Exemption (k)(3). Personnel investigations and vetting records may contain information pertaining to providing protective services to the President of the United States or other individuals pursuant to 18 U.S.C. 3056 . Application of exemption (k)(3) for such records may be necessary because access to, amendment of, or release of the accounting of disclosures of such records could compromise the safety of the individuals protected pursuant to 18 U.S.C. 3056

If you are a nontransporter, you must retain for 1 year after the dates you receive and release the food all required records for any food for which a significant risk of spoilage, loss of value, or loss of palatability occurs only after a minimum of 60 days, but within 6 months, after the date you receive or release the food. If you are a nontransporter, you must retain for 2 years after the dates you receive and release the food all required records for any food for which a significant risk of spoilage, loss of value, or loss of palatability does not occur sooner than 6 months after the date you receive or release the food, including foods preserved by freezing, dehydrating, or being placed in a hermetically sealed container. If you are a nontransporter, you must retain for 1 year after the dates you receive and release the food all required records for animal food, including pet food. Transporters of food (or specified persons who agree to establish and maintain required records under agreements with transporters) in the United States must retain records for 6 months for any food having a significant risk of spoilage, loss of value, or loss of palatability within 60 days after the date the transporter receives or releases the food. Transporters of food (or specified persons who agree to establish and maintain required records under agreements with transporters) in the United States must retain records for 1 year for any food having a significant risk of spoilage, loss of value, or loss of palatability only after a minimum of 60 days after the date the transporter receives or releases the food. Records must be made available as soon as possible, not to exceed 24 hours from the time of receipt of the official request. Failure to establish or maintain records or refusal to permit access to or verification or copying of any record is a prohibited act under section 301 of the FD&C Act. The compliance date for the records establishment and maintenance requirements is December 9, 2005, except that the compliance date for small businesses employing fewer than 500, but more than 10 full-time equivalent employees is June 9, 2005, and the compliance date for very small businesses that employ 10 or fewer full-time equivalent employees is December 11, 2006. B. Significant Changes FDA Made to the Proposed Rule FDA made the following significant changes to the proposed rule: All foreign persons, except foreign persons who transport food in the United States, are excluded from all of the requirements in subpart J of this final rule. A foreign person transporting food in the United States is subject to the requirements for transporters in the subpart.

The DoD reserves the right to decide when reliance on self-assessment will suffice, and when compliance should be assessed through CMMC certification. Based on DoD decision criteria that includes a risk assessment of the type and sensitivity of program information to be shared, Program Managers will identify the appropriate CMMC requirement (e.g., CMMC Level 2 self-assessment or Level 2 certification) in the solicitation. The government does not have the capacity in house to adequately assess (printed page 83159) the 220,00+ companies in the DIB. The DoD cannot assume the workload of directly assessing every DIB contractor. With this final rule, DoD established a scalable way to verify, through assessment, that contractors have implemented required security measures necessary to safeguard DoD information. The DIBCAC's mission is derived from DoD priorities and the Department is actively working to ensure that the DIBCAC is adequately resourced to effectively execute its mission areas. Planned changes to DCMA staffing levels have been considered and are necessary to implement the elements of the CMMC program described in this rule (i.e., Level 3 and C3PAO assessments). By design, the CMMC Program depends on the supply and demand dynamics of the free market, enabling it to naturally scale and adapt to capacity requirements. The DoD established requirements for each part of the CMMC ecosystem to support a robust compliance assessment mechanism for DoD's contractual requirements to safeguard CUI that is processed, stored, or transmitted in contractor owned information systems. The DoD cannot assume the workload of directly assessing every DIB contractor. One commenter provided numerous comments expressing concern that OSAs that use ESPs will be unlikely to know which ESP services require CMMC assessment within the OSAs boundary or scope. This commenter recommended an alternate type of CMMC assessment specifically for ESPs. In lieu of adopting that recommendation, the DoD has updated the rule in §§ 170.19(c)(2) and (d)(2) to reduce the assessment burden on ESPs. DoD declined to allow partial CMMC Assessments. ESPs may request voluntary CMMC assessments of their environment and use that as a business discriminator. The marketplace for ESP services will adjust to find the efficient manner for ESPs to support OSA assessments. e. Alternate Governance Comment:

3.2.6 ||| Develop and disseminate a security policy that provides an overview of the security requirements for the manufacturing system. 3.2.6.

The Administrative Simplification provisions of HIPAA instructed the Secretary to adopt several standards concerning electronic transmission of health information, including those for the security of health information. [69] In accordance with these provisions, the Department published the Security and Electronic Signature Standards; Proposed Rule (·1998 Proposed Rule·) on August 12, 1998. [70] In support of developing the national standards mandated under HIPAA's Administrative Simplification provisions, the Secretary, with significant input from the health care industry, defined a set of principles for guiding choices for the standards to be adopted by the Secretary. [71] The principles were based on direct specifications in HIPAA and also took the purpose of the law and generally desirable principles into account. Based on this work, the Department proposed that each HIPAA standard should be clear and unambiguous but technology neutral, improve the efficiency and effectiveness of the health care system, meet the needs of covered entities related to ease of use and affordability of adoption, and maintain consistency or alignment with other HIPAA standards adopted by an organization accredited by the American National Standards Institute (ANSI) and using the ANSI process for adopting such standards. [72] In describing its general approach to the 1998 Proposed Rule, the Department defined the security standard as a set of requirements with implementation features that covered entities must include in their operations to assure the security of individuals' ePHI. [73] The security standard was based on three basic concepts that were derived from the Administrative Simplification provisions of HIPAA and consistent with the characteristics the Department identified as appropriate for all HIPAA Rules. [74] First, the standard should be comprehensive and coordinated to address all aspects of security. Second, it should be scalable, so that it could be effectively implemented by covered entities of all types and sizes. Third, it should not be linked to specific technologies, allowing covered entities the flexibility to make use of future technology advancements. [75] The 1998 Proposed Rule included four categories of requirements that a covered entity would have to address to safeguard the confidentiality, integrity, and availability of ePHI. They were as follows: Administrative procedures. Physical safeguards. Technical security services. Technical mechanisms. The implementation specifications described some of the requirements in greater detail, based on our determination regarding the level of instruction necessary to implement such requirements. [76] The Department viewed all categories as equally important. [77] The proposed standard did not address the extent to which a covered entity should implement the specifications. [78]

(C) From subsection (e)(1) because it is not always possible to determine what information is relevant and necessary at an early stage in a given investigation. Also, because Pentagon Force Protection Agency and other agencies may not always know what information about a known or suspected offender may be relevant to for the purpose of conducting an operational response. (D) From subsections (e)(4)(G) through (I) (Agency Requirements) because portions of this system are exempt from the access and amendment provisions of subsection (d). (E) From subsection (f) because requiring the Agency to grant access to records and establishing agency rules for amendment of records would compromise the existence of any criminal, civil, or administrative enforcement activity. To require the confirmation or denial of the existence of a record pertaining to a requesting individual may in itself provide an answer to that individual relating to the existence of an on-going investigation. Counterintelligence investigations would be jeopardized by agency rules requiring verification of the record, disclosure of the record to the subject, and record amendment procedures. (26) System identifier and name. DMDC 16 DoD, Identity Management Engine for Security and Analysis (IMESA). (i) Exemption. To the extent that copies of exempt records from JUSTICE/FBI-001, National Crime Information Center (NCIC) are entered into the Interoperability Layer Service records, the OSD hereby claims the same exemptions, (j)(2) and (k)(3), for the records as claimed in JUSTICE/FBI- 001, National Crime Information Center (NCIC). Pursuant to 5 U.S.C. 552a portions of this system that fall within (j)(2) and (k)(3) are exempt from the following provisions of 5 U.S.C. 552a , section (c)(3) and (4); (d); (e)(1) through (3); (e)(4)(G) through (I); (e)(5) and (8); (f); and (g) (as applicable) of the Act. (ii) Authority. 5 U.S.C. 552a(j)(2) and (k)(3) . (iii) Reasons. (A) From subsection (c)(3) because making available to a record subject the accounting of disclosure from records concerning him or her would specifically reveal any investigative interest in the individual. Revealing this information could reasonably be expected to compromise ongoing efforts to investigate a known or suspected terrorist by notifying the record subject that he or she is under investigation. This information could also permit the record subject to take measures to impede the investigation, e.g. destroy evidence, intimidate potential witnesses, or flee the area to avoid or impede the investigation. (B) From subsection (c)(4) because portions of this system are exempt from the access and amendment provisions of subsection (d).

It is also possible that the commenter interpreted that a Level 2 self-assessment is adequate for subcontractors working with a prime that has a contractual requirement for a Level 3 certification assessment. In this case, a CMMC Status of Final Level 2 (Self) is not adequate. A CMMC Status of Final Level 3 (DIBCAC) signifies that the prime first achieved a CMMC Status of Final Level 2 (C3PAO) as the risk to their CUI was deemed high enough to require Level 2 certification assessment. Since this same information may be shared with subcontractors who process, store, or transmit CUI, the subcontractor must also achieve CMMC Status of Final Level 2 (C3PAO). The decision to rely upon a CMMC Level 2 self-assessment in lieu of a certification assessment is a Government risk-based decision based upon the nature of the effort to be performed and CUI to be shared. The size of the company with access to the CUI is not a basis for this determination. The value of information and impact of its loss does not diminish when the information moves to contractors of smaller size. 4. Assessment. Commenters questioned whether CMMC will accept reciprocity with other compliance methodologies. Another questioned what would drive a company to seek a reassessment of their environment. Other commenters suggested that we allow small businesses 365 days to close their POA&M requirements, as well as suggesting that pre-assessment materials do not need to be uploaded into eMASS, and that the hashing requirements should be simplified. Other suggestions made were to allow Program Managers to relax requirements based on a risk decision and allow assessors to make judgement calls on what evidence constitutes compliance with the requirement. One commenter requested the DoD publish an overview of the assessment methodology that includes the defined frequency guidelines. Additionally, one commenter requested that access to Procurement Integrated Enterprise Environment (PIEE) and Supplier Performance Risk System (SPRS) be made easier for small contractors. DoD Response: CMMC requirements apply to DoD contracts, and not to contracts issued by other agencies. Flow down of CMMC requirements from a prime contractor to its subcontractors shall apply, as addressed in § 170.23(a) of this rule. DoD intends to allow qualified standards acceptance of a DIBCAC High Assessment using NIST SP 800-171 R2 for CMMC Status of Final Level 2 (C3PAO) as addressed in § 170.20.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this

publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. The Special Publication 800-series reports on ITL's research, guidelines, and outreach efforts in information system security, and its collaborative activities with industry, government, and academic organizations. This publication describes an approach for the development of Information Security Continuous Monitoring (ISCM) program assessments that can be used to evaluate ISCM programs within federal, state, and local governmental organizations and commercial enterprises.

(Comment 76) Many comments suggest that caterers supplying interstate conveyances are preparing meals for direct consumption by the consumer and should be excluded as restaurants. Some comments state that the manufacturer/processor of a sandwich should be treated the same, whether the sandwich is served in a restaurant, offered for sale in a vending machine, delivered as carryout, served on a hospital patient's tray, or served on a train or airplane. The comments note that, in the past, FDA has referred to "level playing fields." In this case, exempting of conveyance caterers is the only way to regulate even-handedly. If restaurants and retailers are to be exempt, these comments believe that caterers should also be exempt. The comments further state that just because FDA has historically inspected the facilities providing food to interstate conveyances under the Public Health Service Act does not mean that these facilities should be considered processors under this security regulation. The comments view the proposed distinction between a snack bar on the train selling sandwiches to consumers for immediate consumption (considered an exempted restaurant) and a facility that provides the sandwiches to an airplane or train for later consumption (considered a covered processing establishment) as an arbitrary and illogical distinction, because they view the risk associated with that sandwich as the same between the two facilities. The comments view their industry as similar to a large restaurant or hotel kitchen, which produces a wide variety of meals within a matter of hours. The comments state that inflight catering is not regulated under the same rules as a food processing plant because the same rules would not fit the inflight catering industry. Food in a processing plant may be prepared weeks to a year before consumption. The comments state that the only difference between the catering and the restaurant service is that the catering meals are generally consumed 1 to 4 hours after departing from the kitchen rather than immediately consumed, as in the restaurant industry.

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft)
Enhanced Security Requirements for Protecting CUI September 2025 1. Introduction 173 Executive Order (EO) 13556 [1] established a government-wide program to standardize how the executive branch handles Controlled Unclassified Information (CUI).¹ CUI is any information that a law, regulation, or government-wide policy requires to have safeguarding or dissemination controls, excluding information that is classified under EO 13526 [2], or any predecessor or successor order, or the Atomic Energy Act [3] as amended. EO 13556 required that the CUI program emphasize government-wide openness, transparency, and uniformity and that the program implementation take place in a manner consistent with Office of Management and Budget (OMB) policies a

systems backup and recovery 164.312(j) Dated: December 20, 2024. Xavier Becerra, Secretary, Department of Health and Human Services. Footnotes 1. Subtitle F of title II of HIPAA (Pub. L. 104-191 , 110 Stat. 1936 (Aug. 21, 1996)) added a new part C to title XI of the Social Security Act of 1935 (SSA), Public Law 74-271, 49 Stat. 620 (Aug. 14, 1935), (see sections 1171-1179 of the SSA (codified at 42 U.S.C. 1320d-1320d-8)), as well as promulgating section 264 of HIPAA (codified at 42 U.S.C. 1320d-2 note), which authorizes the Secretary to promulgate regulations with respect to the privacy of individually identifiable health information. The Privacy Rule has subsequently been amended pursuant to the Genetic Information Nondiscrimination Act of 2008, title I, section 105, Public Law 110-233 , 122 Stat. 881 (May 21, 2008) (codified at 42 U.S.C. 2000ff), and the Health Information Technology for Economic and Clinical Health (HITECH) Act of 2009, Public Law 111-5 , 123 Stat. 226 (Feb. 17, 2009) (codified at 42 U.S.C. 139w-4(0)(2)). by adding paragraph (b)(2), which provides that performance-based payments shall not be conditioned upon costs incurred in contract performance but only on the achievement of negotiated performance outcomes. Therefore, this rule proposes to remove the restrictions at DFARS 232.1001(a) and paragraph (b)(i) of the clauses at DFARS 252.232-7012 and 252.232-7013 that limit performance-based payments to amounts not greater than costs incurred up to the time of payment. However, the requirement for contractors to report costs incurred when requesting performance-based payments is retained, in order to have the data necessary for negotiation of performance-based payments on future contracts. Section 831 also added paragraph (b)(3) to 10 U.S.C. 2307 , which addresses the eligibility for performance-based payments of nontraditional defense contractors and other private sector companies. This has been added to the policy at DFARS 232.1001. 10 U.S.C. 2307(b)(4) , as added by section 831, requires contractors to be in compliance with Generally Accepted Accounting Principles in order to receive performance-based payments, with no requirement for a Government-unique accounting systems or practices as a prerequisite to receive performance-based payments. This requirement has been incorporated at DFARS 232.1003-70 and the clauses at DFARS 252.232-7012 and 252.232-7013. This rule also proposes a new representation by each offeror, if performance-based payments are anticipated, as to whether the output of its accounting system is in compliance with Generally Accepted (printed page 18222) Accounting Principles, as evidenced by audited financial statements. III. Applicability to Contracts at or Below the Simplified Acquisition Threshold and for Commercial Items, Including Commercially Available Off-the-Shelf Items This rule proposes to amend the clauses at DFARS 252.232-7012 and 252.232-7013. These clauses do not apply to contracts at or below the simplified acquisition threshold or for the acquisition of commercial items. In accordance with 10 U.S.C. 2307(f) and 41 U.S.C. 4505 , FAR 32.201 provides that payment for commercial items may be made under such terms and conditions as the agency head determines are appropriate or customary in the commercial marketplace and are in the best interest of the United States. Furthermore, FAR 32.202-1 states that Government financing of commercial purchases is expected to be different from that used for noncommercial purchases. While the contracting officer may adapt techniques and procedures from the noncommercial subparts for use in implementing commercial contract financing arrangements, the contracting officer must have a full understanding of effects of the differing contract environments and of what is needed to protect the interests of the Government in commercial contract financing. IV. Expected Cost Impact

means a visit during which a visitor will require, or is expected to require, access to classified information. Classifier means any person who makes a classification determination and applies a classification category to information or material. The determination may be an original classification action or it may be a derivative classification action. Contractors make derivative classification determinations based on classified source material, a security classification guide, or a contract security classification specification, or equivalent. Cleared commercial carrier means a carrier that is authorized by law, regulatory body, or regulation to transport SECRET and CONFIDENTIAL material and has been granted a SECRET facility clearance in accordance with the NISP. Cleared employees means all employees of industrial or commercial contractors, licensees, certificate holders, or grantees of an agency, as well as all employees of subcontractors and

personal services contractor personnel, and who are granted favorable eligibility determinations for access to classified information by a CSA or are being processed for eligibility determinations for access to classified information by a CSA. A contractor may give an employee access to classified information in accordance with the provisions of § 117.10(a)(1)(iii). Closed area means an area that meets the requirements of this rule for safeguarding classified material that, because of its size, nature, or operational necessity, cannot be adequately protected by the normal safeguards or stored during nonworking hours in approved containers. CNWDI means a DoD category of TOP SECRET RD or SECRET RD information that reveals the theory of operation or design of the components of a thermonuclear or fission bomb, warhead, demolition munition, or test device. Specifically excluded is information concerning arming, fusing, and firing systems; limited life components; and total contained quantities of fissionable, fusionable, and high explosive materials by type. Among these excluded items are the components that DoD personnel set, maintain, operate, test or replace. Compromise means an unauthorized disclosure of classified information. COMSEC means the protective measures taken to deny unauthorized persons information derived from USG telecommunications relating to national security and to ensure the authenticity of such communications. CONFIDENTIAL means the classification level applied to information, the unauthorized disclosure of which reasonably could be expected to cause damage to the national security that the original classification authority (OCA) is able to identify or describe. Consignee means a person, firm, or Government (i.e., USG or foreign government) activity named as the receiver of a shipment; one to whom a shipment is consigned. Consignor means a person, firm, or Government (i.e., USG or foreign government) activity by which articles are shipped. The consignor is usually the shipper. Constant surveillance service

45 CFR 164.312(c)(2)(ii) and (iv) . The Department estimates that 629,796 establishments are owned by small and medium-sized covered entities, [963] which is approximately 76.56 percent of all covered entities [= 629,796/822,600]. The Department applies that percentage to the estimated number of business associates [= $0.7656 \times 1,000,000$] to arrive at the estimated number of regulated entities with quantifiably increased burdens from these proposed requirements to disable unused ports and remove extraneous software. We estimate that for these 1,395,396 regulated entities [= 629,796 covered entities + 765,600 business associates], an average annual burden of 30 minutes would be needed at the wage rate of an information security analyst to make needed changes to configuration management, specifically disabling unused ports and removing extraneous software. This would result in estimated total cost increases of \$83,681,898 [= $1,395,396 \text{ regulated entities} \times 0.5 \text{ hours} \times \119.94], with a low estimate of \$41,840,949 [= $1,395,396 \text{ regulated entities} \times 0.25 \text{ hours} \times \119.94] based on an estimated annual burden of 15 minutes per affected entity and a high estimate of \$109,301,322 [= $1,822,600 \text{ regulated entities} \times 0.50 \text{ hours} \times \119.94] based on an estimated annual burden of 30 minutes for all regulated entities. h. Costs Related to Regulated Entities Conducting Penetration Testing The Department estimates that each regulated entity would spend an average of 3 hours conducting penetration testing (with a low estimate of 2 hours and a high estimate of 10 hours) at the hourly wage of an information security analyst. The Department expects that there might be a high degree of variability between entities depending on their size and technological sophistication. Large entities have more endpoints to test, and thus have greater exposure. The Department also believes there is room for significant variability in the effort that regulated entities may apply to this activity. At the wage rate of an information security analyst, this would result in estimated total annual costs for regulated entities of \$655,807,932 [= $1,822,600 \text{ regulated entities} \times 3 \text{ hours} \times \119.94], with a low estimated total of \$437,205,288 [= $1,822,600 \text{ regulated entities} \times 2 \text{ hours} \times \119.94] and high estimated total of \$2,186,026,440 [= $1,822,600 \text{ regulated entities} \times 10 \text{ hours} \times \119.94]. i. Costs Arising From Reporting Contingency Plan Activation The Department estimates that business associates would need to notify other regulated entities in the event that they activate their contingency plan once business associate agreements are revised according to proposed 45 CFR 164.314(a)(2)(i)(D)

for a CSA to review and make a determination whether the entity is under foreign ownership, control or influence (FOCI) to a degree that renders it ineligible for an FCL. The CSA will consider a U.S. entity to be under FOCI when a foreign interest has the power to direct or decide issues affecting the entity's management or operations in a manner that could either result in unauthorized access to classified information; or adversely affect performance of a classified contract or agreement. The U.S. entity may also be considered to be under FOCI when a foreign interest or government is currently exercising, or could exercise, that power, whether directly or indirectly, such as through ownership of the U.S. entity's securities, by contractual arrangements, or other means. Further, if

a foreign interest or government has the ability to control or influence the election or appointment of members of the entity's governing board, the entity may be considered to be under FOCl. When a CSA has determined that an entity is under FOCl, the primary consideration will be the protection of classified information. The CSA will take whatever action is necessary to protect classified information, in coordination with other affected agencies as appropriate. A U.S. entity that is in process for an FCL for access to classified information and subsequently determined to be under FOCl, is ineligible for access to classified information unless and until effective security measures have been put in place to negate or mitigate FOCl to the satisfaction of the CSA. Once an entity becomes a contractor in the NISP with an existing FCL, a GCA can select and award a classified contract to the entity as part of the acquisition process. The GCA attaches the Contract Security Classification Specification: (e.g., for DoD, it is the DD Form 254, available at <https://www.esd.whs.mil/Portals/54/Documents/DD/forms/dd/dd0254.pdf> and available at <https://www.dcsa.mil/is/nccs/>), to all such contracts requiring access to classified information.

II. SEAD 3 Requirements and the NISPOM In 2008, with the publication of E.O. 13467, Reforming Processes Related to Suitability for Government Employment, Fitness for Contractor Employees, and Eligibility for Access to Classified National Security Information (available at <https://obamawhitehouse.archives.gov/the-press-office/2016/09/29/executive-order-amending-executive-order-13467-establish-roles-and>), the DNI was assigned the role of the Security Executive Agent (SecEA), for the development, implementation, and oversight of effective, efficient, and uniform policies and procedures governing the conduct of investigations and adjudications for eligibility for access to classified information and eligibility to hold a sensitive position. In December 2016, the SecEA issued SEAD 3, Reporting Requirements for Personnel with Access to Classified Information or Who Hold a Sensitive Position (available at

Use of insecure cryptography: Use of weak or insecure cryptographic algorithms or key generation methods could allow cryptanalytic or brute-force attacks to recover private keys or obtain fraudulent certificates. Future developments, such as new cryptanalysis, implementation vulnerabilities, or the development of a cryptographically-significant quantum computer, could render a previously-deployed system insecure. Use strong cryptography: Use a well-designed, tested, and maintained cryptographic library, and choose NIST-approved algorithms for hashing and signing.

(1) The access provisions of this part are intended for use by individuals whose records are maintained in a Privacy Act system of records. If a representative acts on their behalf, a written authorization must be provided, with the exception of members of Congress acting on behalf of a constituent. (2) A Department of the Army Blanket Routine Use allows the release of Privacy Act protected information to members of Congress when they are acting on behalf of the constituent and the information is filed and retrieved by the constituent's name or personal identifier. The said Blanket Routine Use is listed below. Congressional Inquiries Disclosure Routine Use: Disclosure from a system of records maintained by a DOD Component may be made to a congressional office from the record of an individual in response to an inquiry from the congressional office made at the request of that individual. (3) Upon a written request, an individual will be granted access to information pertaining to him or her that is maintained in a Privacy Act system of records, unless-

(i) The information is subject to an exemption, the system manager has invoked the exemption, and the exemption is published in the Federal Register ; or (ii) The information was compiled in reasonable anticipation of a civil action or proceeding. (4) Legal guardians or parents acting on behalf of a minor child have the minor child's rights of access under this part, unless the records were created or maintained pursuant to circumstances where the interests of the minor child were adverse to the interests of the legal guardian or parent. (5) These provisions should allow for the maximum release of information consistent with Army and DOD's statutory responsibilities. (b) Individual requests for access. (1) Individuals will address requests for access to records in a Privacy Act system of records to the system manager or the custodian of the record designated in DA systems of records notices (See DA PAM 25-51 or the Defense Privacy Office's Web site <http://www.defenselink.mil/privacy>). (2) Individuals do not have to state a reason or justify the need to gain access to records under the Act. (3) Release of personal information to individuals under this section is not considered a public release of information. (c) Verification of identity for first party requesters. (1) Before granting access to personal data, an individual will provide reasonable verification of identity. (2) When requesting records in writing, the preferred method of verifying identity is the submission of a notarized signature. An alternative method of verifying identity for individuals who do not have access to notary services is the submission of an un-sworn declaration in accordance with 28 U.S.C. 1746 in the following

format: (i) If executed within the United States, its territories, possessions, or commonwealths:
·I declare (or certify, (printed page 46058)

A process to develop a Federal Information Processing Standard (FIPS) for an Advanced Encryption Standard (AES) specifying an Advanced Encryption Algorithm (AEA) has been initiated by the National Institute of Standards and Technology (NIST). In the Fall of 1998, NIST announced fifteen publicly submitted algorithms as candidates for the AES, and invites public review, comment, and analysis in order to narrow the field of candidates to (approximately) five or fewer finalists. During the Round 1 technical evaluation period, these fifteen candidates were subjected to extensive analysis and testing by the cryptographic community. At the conclusion of Round 1, NIST took the following information into consideration: (1) The submitted (official) versions of the AES candidate algorithms, (2) Round 1 public comments, (3) papers and discussions at the Second AES Candidate Conference, (4) results of NIST efficiency and statistical analysis, and (5) other relevant data (e.g., presentations at the Sixth Fast Software Encryption Workshop, discussions on NIST's AES Electronic Discussion Forum, etc.). Using this information, NIST has selected the AES finalist candidate algorithms ("finalists"), which will be subjected to further analysis during Round 2 of the AES development effort. A list of the finalists, along with specifications and intellectual property information, is available at the AES home page, <http://www.nist.gov/aes>. This notice announces the beginning of the Round 2 technical evaluation period for the AES finalists. Additionally, the notice solicits comments on the finalists from the general public, academic and research communities, manufacturers, voluntary standards organizations, and Federal, state, and local government organizations. NIST will use these comments to select one or more of the finalists for inclusion in a draft Federal Information Processing Standards Publication (FIPS PUB), on which public comments will be invited via a future Federal Register announcement. NIST's goal is that the AES will specify one or more unclassified, publicly disclosed encryption algorithm(s) available royalty-free worldwide that is (are) capable of protecting sensitive government information well into the next century.

A sanction policy that clearly communicates a regulated entity's expectations should ensure that workforce members understand their individual compliance obligations and consequences of noncompliance. Regulated entities have the flexibility to implement the standard in a manner consistent with numerous factors, including but not limited to their size, degree of risk, and environment. The HIPAA Rules do not require regulated entities to impose any specific penalty for any particular violation, nor do they require regulated entities to implement any particular methodology for sanctioning workforce members. Rather, in any particular case, each regulated entity must determine the type, cause, and severity of sanctions imposed based upon its policies and the relative severity of the violation. [515] A regulated entity may structure its sanction policies in the manner most suitable to its organization. As described in previously issued guidance materials from the Department and NIST, regulated entities should consider the following when drafting or revising their sanction policies: Documenting or implementing sanction policies pursuant to a formal process. [516] Requiring workforce members to affirmatively acknowledge that a violation of the organization's HIPAA policies or procedures may result in sanctions. [517] Documenting the sanction process, including the personnel involved, the procedural steps, the time-period, the reason for the sanction(s), and the final outcome of an investigation. [518] Creating sanctions that are appropriate to the nature of the violation. [519] Creating sanctions that vary depending on factors such as the severity of the violation, whether the violation was intentional or unintentional, and whether the violation indicated a pattern or practice of improper use or disclosure of [PHI]. [520] Creating sanctions that range from a warning to termination. [521] Providing examples of potential violations of policy and procedures. [522] Generally, it is important for a regulated entity to consider whether its sanction policies align with its general disciplinary policies, and how the individuals or departments involved in the sanction processes can work in concert, when appropriate. Regulated entities may also want to consider how sanction policies can be fairly and consistently applied throughout the organization, to all workforce members, including management. [523] The deterrent effect of penalizing noncompliance and misconduct paired with clear communications about the consequences of noncompliance can promote greater compliance with the HIPAA Rules through accountability, understanding, and transparency. (printed page 946) i. Section 164.308(a)(7)(i)-Standard: Information System Activity Review As described in previously issued HHS guidance, review of activity in its relevant electronic information systems and their components, including workstations, [524]

ing their own suppliers and serving as the principal manager for those relationships. Most companies reported using a standardized framework to manage cyber supply chain risks across the organization. These frameworks are either based on standards and best practices (e.g., NIST Cybersecurity Framework (CSF), driven by regulations (e.g., North American Electric Reliability Corporation critical infrastructure protection (NERC CIP), Health Insurance Portability and Accountability Act (HIPAA)) or developed internally (e.g., through internal ERM framework). Having a standardized approach helps multiple teams across the organization to cohesively handle cyber supply chain risks. The following are some of the benefits of adopting standardized frameworks:

Control AM-1: concept of least functionality) is created and maintained. | understood and can be maintained. Install and configure PNT devices and components per manufacturer instructions using established safety and best practices guidelines. Understand the limitations of the original equipment manufacturer (OEM) equipment being fielded and consider the ability of the PNT devices and components to be suitable for the site's environment and adaptable to new features and protection mechanisms for PNT data. Periodically review and simplify PNT systems to reduce unknown interactions and effects. Configuring the PNT devices and components in a manner such that only essential capabilities are provided can reduce complexity and may reduce the attack surface. Network configuration and deployment can impact recovery time in the event of a path or node failure. Verify that the baseline configuration results in a system that meets the baseline PNT performance requirements, such as uncertainty, wander, and jitter tolerances. | GPS-SPS 2.4 ICAO 9849 6.4, Appendix F 5.2, 5.3 IEEE 1588 Annex P IEEE 2030.101 4.6-4.13, 4.15 IETF 5906 5 IETF 8633 2-9 IMO 1575 C.1, E ITU G. 8272 I.1 ITU-T G.8275 7, 8 ITU-T GNSS 2, 4, 5, Appendix V, VII NIST SP 800-53 Rev.

Several commenters expressed concern with the 180-day timeline to close out POA&Ms or limits on which practices can be placed on them. Recommendations for changing the POA&M timeline ranged from completely deleting the time limit to extending it by 1 to 3 years. One variation was to permit more than 180 days for closeout only during an initial one-year 'ramp-up' period. One commenter encouraged DoD to reduce POA&M restrictions to facilitate contractors' genuine attempts to meet requirements and mitigate information security risks. Three commenters also thought the rule should allow contractors to request approval to delay POA&M close-out when meeting the original timeline is impracticable, while another commenter suggested defining the close-out timeline in the contract, allowing negotiation of extension or renewal of POA&Ms through the contracting officer. Two commenters asked when the 180-day timeline begins and one asked what actions occur if the POA&M is not closed out within that period. Four commenters noted that the number of security requirements explicitly precluded from POA&Ms makes CMMC challenging and requested greater flexibility in how many, and which practices may be included. Three commenters recommended that companies be allowed to have any number of failed practices reassessed for up to six-months after an assessment without having to complete and pay for a new full assessment. Three other commenters recommended that the DoD allow for risk informed POA&Ms, while one stated that the rule should not specify which requirements must be met. One commenter requested clarification on how many items of each point value may be included on a POA&M for CMMC Level 2 conditional certification. One commenter also asked DoD to consider abandoning controls with high failure rates, lowering score requirements based on evidence of sufficient mitigation. Several comments expressed concern that CMMC conditional certification does not allow higher weighted practices on a POA&M and recommended the rule reduce those restrictions to allow more security practices. One commenter also recommended eliminating weighting altogether, permitting any requirement to be part of the POA&M. As rationale, one commenter referenced DFARS clause 252.204-7012 verbiage that permits contractors to request DoD CIO approval to vary from NIST SP 800-171 requirements, saying that since all approved variances are considered as 'Not Applicable', all requirements should be POA&M eligible. Two commenters asked where POA&Ms are maintained, who is responsible for validating close-out, and whether affirmation is required after each assessment (including POA&M close-out). One commenter asked about applicability of the 180-day POA&M close-out requirement to Critical, High, Medium, or Low findings against Service Level Agreements. One commenter recommended that a description of appropriate POA&M entries to be added to the rule and (printed page 83133)

, a major rule is a rule that the Administrator of the Office of Information and Regulatory Affairs of the Office of Management and Budget finds has resulted in or is likely to result in (a) an annual effect on the economy of \$100,000,000 or more; (b) a major increase in costs or prices for

consumers, individual industries, Federal, State, or local government agencies, or geographic regions; or (c) significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic and export markets. This rule has been designated a major rule as it is expected to have annual effect on the economy of \$100M dollars or more. C. Public Law 96-354, ·Regulatory Flexibility Act· (5 U.S.C. 601) The Department of Defense Chief Information Officer certified that this rule is subject to the Regulatory Flexibility Act (5 U.S.C. 601) because it would, if promulgated, have a significant economic impact on a substantial number of small entities. DoD has considered previous comments from Small Business Administration (SBA) regarding the impact and cost to small businesses to implement CMMC. In July 2022, the CMMC PMO met with the Office of Advocacy for the U.S. SBA to address the revisions planned in CMMC that are responsive to prior SBA concerns, with which the SBA was satisfied. An Initial Regulatory Flexibility Analysis that includes a detailed discussion and explanation about the assumptions and methodology used to estimate the cost of this regulatory action on small entities follows and is available at <https://www.regulations.gov> (search for ·DoD-2023-OS-0063· click ·Open Docket· and view ·Supporting Documents·). This initial regulatory flexibility analysis has been prepared consistent with 5 U.S.C. 603 . (1) Reasons for the Action This proposed rule is necessary to create a secure and resilient supply chain, by addressing threats to the U.S. economy and national security from ongoing malicious cyber activities and preventing theft of hundreds of billions of dollars of U.S. intellectual property. The President's Executive Order (E.O.) 14028, ·Improving the Nation's Cybersecurity·, [52] emphasized that industrial security needs strengthening to ensure investments are not lost through intellectual property theft, among other supply chain risks. Currently, the FAR and DFARS prescribe contract clauses intended to protect FCI and CUI within the DoD supply chain. Specifically, the clause at FAR 52.204-21, Basic Safeguarding of Covered Contractor Information Systems, is prescribed at FAR 4.1903 for use in Government solicitations and contracts when the contractor or a subcontractor at any tier may have FCI residing in or transiting through its information system. The FAR clause focuses on ensuring a basic level of cybersecurity hygiene and is reflective of actions that a prudent businessperson would employ. In addition, DFARS clause 252.204-7012,

(2) Specific individuals or institutions need not be identified by name, particularly if these sources have been granted confidentiality. (see §310.29(b)). (p) Exemptions claimed for the System. (1) If no exemption has been claimed for the system, indicate ·None·. (2) If an exemption is claimed, cite the exemption as well as identifying the CFR section containing the exemption rule for the system. (q) Maintaining the Master DoD System Notice Registry. (1) The DPO maintains a master registry of all DoD record systems notices. (2) The DPO also posts all DoD system notices to a public Web site (see <http://www.defenselink.mil/privacy/notice/>). §310.33 New and altered record systems. (a) Criteria for a new record system. (1) If a Component is maintaining a system of records as contemplated by §310.10(a), and a system notice has not been published for it in the Federal Register , the Component shall establish a system notice consistent with the requirements of this subpart. (2) If a notice for a system of records has been canceled or deleted but a determination is subsequently made that the system will be reinstated or reused, the system may not be operated (i.e., information collected or used) until a new notice is published in the Federal Register . (b) Criteria for an altered record system. A system is considered altered whenever one of the following actions occurs or is proposed: (1) A significant increase or change in the number or type of individuals about whom records are maintained. (i) Only changes that alter significantly the character and purpose of the record system are considered alterations. (ii) Increases in numbers of individuals due to normal growth are not considered alterations unless they truly alter the character and purpose of the system. (iii) Increases that change significantly the scope of population covered (for example, expansion of a system of records covering a single command's enlisted personnel to include all of the Component's enlisted personnel would be considered an alteration). (iv) A reduction in the number of individuals covered is not an alteration, but only an amendment. (see §310.34(a).) (v) All changes that add new categories of individuals to system coverage require a change to the ·Categories of individuals covered by the system· caption of the notice (see §310.32(e)) and may require changes to the ·Purpose(s)· caption (see §310.32(h)). (2) An expansion in the types or categories of information maintained. (i) The addition of any new category of records not described under the (printed page 18779) ·Categories of Records in the System· caption is considered an alteration. (ii) Adding a new data element that is clearly within the scope of the categories of records described in the existing notice is an amendment. (see §310.34(a)). An amended notice may not be required if the data element is clearly

covered by the record category identified in the existing system notice.

for better deploying the technology? Often we are not seeing that information.' The introduction of IoT devices creates significant challenges for security assessment of federal information systems. Cybersecurity must be assessed both at the component level (i.e., individual IoT devices) and the system level (i.e., the integration of a set of IoT devices with traditional IT in a specific operating environment). An additional challenge is security testing of systems with IoT devices, especially when evaluating the impacts of updates to those devices. For example, if automatic security updates of IoT devices are enabled, when and by whom are tests of those updates to be performed?

CIS Safeguard 9.2 · Use DNS Filtering Services Use DNS filtering services on all enterprise assets to block access to known malicious domains. Implementation Groups: 1,2,3 Asset Type: network Security Function: protect Parent Control: Email and Web Browser Protections

- · Cybersecurity risks to DDM are very real; - · Cybersecurity threats have the potential to disrupt the manufacturing revolution; - · There is real opportunity to improve the security of the manufacturing supply chain, and - · The time to build cybersecurity in to the DDM process is now. The agenda contained an invited talk, four presentations, and a panel discussion that exemplified diverse perspectives. A concluding working session captured the viewpoints of the attendees in several key areas. In addition, attendees provided inputs on the risks, challenges, existing solutions, and potential/theoretical solutions for cybersecurity in DDM. Responses focused around culture / humans, threats to the integrity of design, technological capabilities - especially around quality control and event detection, and guidance specific to cybersecurity in DDM. In this work, the authors scope their research solely on Additive Manufacturing (AM; also referred to as '3D Printing') technologies. The AM process chain has unique vulnerabilities that warrant a detailed investigation due to their ability to fabricate parts in a layer-wise fashion. Because of the potential damage from a cyber-physical attack, there is a need to look at AM systems to determine what vulnerabilities exist and how to prevent and mitigate the threat of cyber-attacks.

necessary information system updates, patches, or (printed page 83219) reconfiguration as threats evolve) in implementation of requirements and documents how they will be mitigated, corrected, or eliminated. The OSA defines the format (e.g., document, spreadsheet, database) and specific content of its operational plan of action. An operational plan of action does not identify a timeline for remediation and is not the same as a POA&M, which is associated with an assessment for remediation of deficiencies that must be completed within 180 days. (CMMC-custom term) Operational Technology (OT) means programmable systems or devices that interact with the physical environment (or manage devices that interact with the physical environment). These systems or devices detect or cause a direct change through the monitoring or control of devices, processes, and events. Examples include industrial control systems, building management systems, fire control systems, and physical access control mechanisms, as defined in NIST SP 800-160 V2R1 (incorporated by reference, see §-170.2). Organization-defined means as determined by the OSA except as defined in the case of Organization-Defined Parameter (ODP). (CMMC-custom term) Organization-Defined Parameters (ODPs) means selected enhanced security requirements contain selection and assignment operations to give organizations flexibility in defining variable parts of those requirements, as defined in NIST SP 800-172A Mar2022 (incorporated by reference, see §-170.2). Note 1 to ODPs: The organization defining the parameters is the DoD. Organization Seeking Assessment (OSA) means the entity seeking to undergo a self-assessment or certification assessment for a given information system for the purposes of achieving and maintaining any CMMC Status. The term OSA includes all Organizations Seeking Certification (OSCs). (CMMC-custom term) Organization Seeking Certification (OSC) means the entity seeking to undergo a certification assessment for a given information system for the purposes of achieving and maintaining the CMMC Status of Level 2 (C3PAO) or Level 3 (DIBCAC). An OSC is also an OSA. (CMMC-custom term) Out-of-Scope Assets means assets that cannot process, store, or transmit CUI because they are physically or logically separated from information systems that do process, store, or transmit CUI, or are inherently unable to do so; except for assets that provide security protection for a CUI asset (see the definition for Security Protection Assets). (CMMC-custom term) Periodically means occurring at a regular interval as determined by the OSA that may not exceed one year. (CMMC-custom term) Personally Identifiable Information means information that can be used to distinguish or trace an individual's identity, either alone or when combined with other information that is linked or linkable to a specific individual, as defined in

) The sale or disposal of the entity's assets or a substantial part thereof. (2) Pledges, mortgages, or other encumbrances on the entity's assets, capital stock, or ownership interests. (3) Mergers, consolidations, or reorganizations. (4) Dissolution. (5) Filing of a bankruptcy petition. (B) The trustees or proxy holders may consult with the foreign owner, or vice versa, where otherwise consistent with U.S. laws, regulations, and the terms of the VT or PA. (C) The trustees or proxy holders assume full responsibility for the foreign owner's voting interests and for exercising all governance and management prerogatives relating thereto to ensure the foreign owner will be insulated from the entity, thereby solely retaining the status of a beneficiary. The entity must be organized, structured, and financed to be capable of operating as a viable business entity and independent from the foreign owners' interests that required FOCI mitigation or negation. (v) Combination measures. The CSA may apply combinations of the measures in paragraphs (d)(2)(i) through (d)(2)(iv) in this section or other similar measures that effectively mitigate or negate the risks involved with foreign ownership. (e) Limited entity eligibility determination due to FOCI. In accordance with the provisions of this section and CSA-provided guidance, a limited entity eligibility determination may be an option for a single, narrowly defined contract, agreement, or circumstance for entities under FOCI without mitigation or negation. Limitations on access to classified information are inherent with the granting of limited entity eligibility determinations and are imposed upon all of the entity's employees regardless of citizenship. (1) In exceptional circumstances, when an entity is under FOCI, the CSA may decide that a limited entity eligibility determination is appropriate when the entity is unable or unwilling to implement FOCI mitigation or negation measures, and the conditions in paragraphs (e)(1)(i) through (iii) of this section are met. This is not the same as a limited entity eligibility determination for purposes not related to FOCI. Information on limited entity eligibility determinations for purposes other than FOCI can be found in § 117.9(m). A CSA may decide that a limited entity eligibility is appropriate for an entity under FOCI if: (i) The limited entity eligibility determination is in accordance with national security interests and a GCA has informed the CSA that access to classified information by the contractor is essential to contract or agreement performance. (ii) There is an industrial security agreement with the foreign government of the country from which the FOCI is derived. (iii) The contractor meets all other entity eligibility requirements outlined in § 117.9(c) except that KMP, other than the FSO, may be citizens of the country from which the FOCI derives and the United States has obtained security assurances at the appropriate level from that country.

CIS Safeguard 11.5 · Test Data Recovery Test backup recovery quarterly, or more frequently, for a sampling of in-scope enterprise assets. Implementation Groups: 2,3 Asset Type: data Security Function: recover Parent Control: Data Recovery

Some public comments received reflect a misinterpretation of the cost estimates that accompany this rule, which are representative of average assessment efforts, and do not include actual prices of C3PAO services available in the marketplace. Market forces of supply and demand will determine C3PAO pricing for CMMC Level 2 certification assessments. Costs associated with meeting the requirements of existing DFARS clause 252.204-7012 are not captured in the CMMC rule documentation. Please refer to 81 FR 72990 , October 21, 2016, for DoD's final rule implementing the DoD's requirement that contractors shall implement NIST SP 800-171 as soon as practical, but not later than December 31, 2017. Public comments related to implementation costs were published with that final rule, along with DoD's responses. Within the limitations of section § 170.21 Plan of Action and Milestones Requirements, offerors may bid on contract opportunities while continuing to work towards full compliance. Verifying compliance with applicable security requirements may increase costs and is necessary for the adequate protection of DoD FCI and CUI. The cost of lost technological advantage over potential adversaries is far greater than the costs of such enforcement. The value of information and impact of its loss does not diminish when the information is shared with contractors. At the time of contract award, the DoD may not have visibility into whether the prime contractor's decision to further disseminate DoD FCI and CUI. However, FAR clause 52-204-21, DFARS clause 252.204-7012, and DFARS clause 252.204-7021 require the prime contractor to flow down these clauses and the included information security requirement to any subcontractor that will process, store, or transmit FCI or CUI, as applicable. Decisions regarding DoD's information that must be shared to support completion of the contract tasks, including those performed by subcontractors, takes place between the prime contractor and their subcontractors. The DoD cannot dictate business practices between prime contractors and their subcontractors, who should work together to determine

the necessary flow down of FCI and CUI, only as needed in performance of the contract, and ensuring compliance with the CMMC security requirements and in consideration of minimizing the burden. While DoD understands the burden on small business, it must enforce CMMC requirements uniformly across the Defense Industrial Base for all contractors who process, store, or transmit FCI and CUI. The requirements necessary to protect a single document are the same as to protect many documents.

(vi) Requestors affiliated with the DoD may not use official government supplies or equipment to include mailing addresses, work phones/faxes, or DoD-issued email accounts to make requests. If requests are received using DoD equipment, the requestor will be advised to make a new request, using non-DoD equipment, and processing of their request will begin only after such new request is received. (3) The System Manager shall mail a written acknowledgement of the request for access to the individual within 10 working days of receipt. The acknowledgement shall identify the request and may, if necessary, request any additional information needed to access the record, advising the requestor that they have 20 calendar days to reply. No acknowledgement is necessary if the request can be reviewed and processed, to include notification to the individual of a grant or denial of access, within the 10 working day period. Whenever practical, the decision to grant or deny access shall be made within 30 working days. For requests presented in person, written acknowledgement may be provided at the time the request is presented. (4) When a request for access is received, System Managers shall promptly take one of three actions on requests to access records: (i) If no portions of the record are exempt, pursuant to the published SORN, 32 CFR part 310, subpart F, and section 7 of 32 CFR part 329, the request for access shall be granted and the individual will be provided access to all records about him or her. If there is information within the record not about the record subject (e.g. third party information) that information will be removed and referred to the Chief of the OIP for processing under 5 U.S.C. 552, pursuant to 32 CFR part 286. (ii) If the System Manager finds that the record, or portions of the record, is exempt from access pursuant to the published SORN, 32 U.S.C. part 310, subpart F, and section 7 of 32 U.S.C. part 329, they will refer the recommended denial to the Chief of the OIP, through their Director, within 10 working days of receipt. The referral will include the following: (A) Written recommendation for denial explaining which portion(s) of the record should be exempt from access and a discussion for why the record, or portions of the record, should be denied. (B) The record, or portions of the record, being recommended for denial. If only portions of records are recommended for denial they must be clearly marked or highlighted. (C) The original request and any correspondence with the requestor. (D) A clean copy of the record.

a. The clause at DFARS 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting, covers cyber incident reporting requirements for incidents that affect a covered contractor information system or the covered defense information residing therein, or that affects the contractor's ability to perform the requirements of the contract that are designated as operationally critical support and identified in the contract. b. The provision at DFARS 252.204-7008, Compliance with Safeguarding Covered Defense Information Controls, requires an offeror that proposes to vary from any of the security controls of National Institute of Standards and Technology (NIST) Special Publication (SP) 800-171 in effect at the time the solicitation is issued to submit to the contracting officer a written explanation of how the specified security control is not applicable or an alternative control or protective measure is used to achieve equivalent protection. c. The provision at DFARS 252.239-7009, Representation of Use of Cloud Computing, requires offerors to report that they anticipate or do not anticipate utilizing cloud computing service in performance of a contract resulting from a solicitation containing the provision. The representation will notify contracting officers of the applicability of the cloud computing requirements of the DFARS 252.239-7010 clause of the contract. d. The clause at DFARS 252.239-7010, Cloud Computing Services, requires reporting of cyber incidents that occur when DoD is purchasing cloud computing services. These DFARS provisions and clauses facilitate mandatory cyber incident reporting requirements in accordance with statutory regulations. When reports are submitted, DoD will analyze the reported information for cyber threats and vulnerabilities in order to develop response measures as well as improve U.S. Government understanding of advanced cyber threat activity. In addition, the security requirements in NIST SP 800-171 are specifically tailored for use in protecting sensitive information residing in contractor information systems and generally reduce the burden placed on contractors by eliminating Federal-centric processes and requirements. The information provided will inform DoD in assessing the overall risk to DoD covered defense information on unclassified contractor systems and networks. DoD Clearance Officer: Mr. Reginald T. Lucas. Requests for copies of the information collection proposal should be sent to Mr. Lucas at

. (1) No fees may be charged by any DoD Component if the total assessable fees are less than or equal \$25.00. For requesters in the educational institution, noncommercial scientific institution, or news media categories, the Components shall provide all search time and the first 100 pages of duplication without charge. For requesters in the all other category, the Components shall provide the first 2 hours of search time, and the first 100 pages of duplication without charge. The Components shall provide all review time without charge except for requesters in the commercial category. Time expended shall be computed to the nearest 15 minutes. (2) Requesters receiving the first 2 hours of search and the first 100 pages of duplication without charge are entitled to such only once per request. Therefore, if the Component, after completing its portion of a request, finds it necessary to refer the request to a subordinate office, another DoD Component, or another Federal agency for action on their portion of the request, the referring Component shall inform the recipient of the referral of the expended amount of search time and duplication cost to date. (3) For the purposes of these restrictions, the word pages refers to paper copies of a standard size, which will normally be 8 1/2 x 11 or 11 x 14. Thus, requesters would not be entitled to 100 microfiche or 100 computer disks, for example. (4) In the case of computer searches, the first 2 free hours will be determined against the salary scale of the individual operating the computer for the purposes of the search. As an example, when the direct costs of the computer central processing unit, input-output devices, and memory capacity equal \$40.00 (2 hours of equivalent search at the clerical level), amounts of computer costs in excess of that amount are chargeable as computer search time. In the event the direct operating cost of the hardware configuration cannot be determined, computer search shall be based on the salary scale of the operator executing the computer search. See § 286.25(b)(1) for further details regarding fees for computer searches. (c) Fee waivers . (1) When assessable costs for a FOIA request total \$25.00 or less, fees shall be waived automatically for all requesters, regardless of category. (2) Documents shall be furnished without charge, or at a reduced charge, when the Component determines that waiver or reduction of the fees is in the public interest because furnishing the information is likely to contribute significantly to public understanding of the operations or activities of the Department of Defense and is not primarily in the commercial interest of the requester. Decisions to waive or reduce fees that exceed the automatic waiver threshold shall be made on a case-by-case basis and after a search for responsive records is completed, consistent with the following factors:

(i) Exemption. Any portion of this record system which falls within the provisions of 5 U.S.C. 552a(k)(2) , (k)(5) and (k)(6) may be exempt from the following subsections of 5 U.S.C. 552a : (c)(3), (d), (e)(1), (e)(4)(G), (e)(4)(H), and (e)(4)(I). (ii) Authority. 5 U.S.C. 552a(k)(2) , (k)(5) and (k)(6). (iii) Reasons. The reasons for asserting these exemptions are to ensure the integrity of the adjudication process used by the Agency to determine the suitability, eligibility or qualification for Federal service with the Agency and to make determinations concerning the questions of access to classified materials and activities. The proper execution of this function requires that the Agency have the ability to obtain candid and necessary information in order to fully develop or resolve pertinent information developed in the process. Potential sources, out of fear or retaliation, exposure or other action, may be unwilling to provide needed information or may not be sufficiently frank to be a value in personnel screening, thereby seriously interfering with the proper conduct and adjudication of such matters; and protects information used for medical, psychological evaluations, security questionnaires and polygraph testing. (4) [Reserved] (5) System identifier and name. LDIA 10-0001, Equal Opportunity, Diversity and Alternate Dispute Resolution Records. (i) Exemption. Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (b)(5)(i). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. The specific sections of 5 U.S.C. 552 a from which the system is to be exempted are 5 U.S.C. 552a (c)(3) and (c)(4), (d), (e)(1), (e)(2), (e)(3), (e)(4)(G), (H), and (I), (e)(5), (f), and (g). (ii) Authority. 5 U.S.C. 552a(k)(2) . (iii) Reasons. (A) From subsection (c)(3) because to grant

access to an accounting of disclosures as required by the Privacy Act, including the date, nature, and purpose of each disclosure and the identity of the recipient, could alert the subject to the existence of the investigation or prospective interest by DIA or other agencies. This could seriously compromise case preparation by prematurely revealing its existence and nature; compromise or interfere with witnesses or make witnesses reluctant to cooperate; and lead to suppression, alteration, or destruction of evidence.

) Request the contractor to provide information on all impacted contracts, both prime and subcontracts, unless the contractor is prohibited by contract from revealing their existence to DSS. In such instances, DSS will request that the contractor notify the government contracting officer and Program Security Officer of the need for a NID. (2) Provide written notification to the individual designated by the Component, in accordance with paragraph (f) of § 117.55 within 30 calendar days of identifying the requirement for a NID. (3) Provide to appropriate GCAs the contractor's proposed FOCI action plan, any associated risk assessments, and DSS' recommendation for FOCI mitigation. (4) Ask the GCA to identify all of the GCA's contracts affected by the proposed SSA that require a NID decision, unless the activity is unacknowledged. The cognizant SAPCO will inform the DoD SAPCO of any unacknowledged SAPs affected by the proposed SSA and consequently the NID requirement. (5) Provide OUSD(I) Security Directorate and the OUSD(AT&L), Deputy Assistant Secretary of Defense for Manufacturing and Industrial Base Policy, a monthly report of pending NID decisions that: (i) Exceed 30 calendar days from the date of the DSS written notice to the applicable GCA. (ii) Have been pending for NSA, ODNI, or DOE concurrence for more than 30 calendar days. (B) OUSD(I) will intervene, as warranted, with GCAs regarding NID decisions pending beyond 30 calendar days from the date of the DSS written notice, as well as with NSA, ODNI, and DOE regarding concurrence decisions that remain pending beyond 30 days from the date of the GCA request. (C) OUSD(AT&L) will confer, as warranted, with the applicable DoD Service Acquisition Executive or component equivalent about unresolved NID decisions. (D) The GCA will, upon written notification by DSS of the need for a NID: (1) Review the FOCI action plan proposed by the uncleared company, in addition to any associated risk assessments and the DSS analysis of the appropriate FOCI mitigation based on the existing FOCI factors. (2) Consider the FOCI factors noted in paragraph (b)(3) of this section in the aggregate with any associated risk assessments and DSS' analysis to determine whether to issue a NID. (3) Provide DSS, as appropriate, one of the following within 30 calendar days of the DSS written notification that a NID is required: (i) A final, documented NID with a copy provided to the contractor. If the NID is not specific to a single program, project, or contract (e.g., a blanket NID), the GCA will also forward a copy of the NID to the OUSD(I) Security Directorate. (ii) A copy of the GCA's request for NID concurrence sent to NSA, ODNI, or DOE, when access to COMSEC, SCI, or RD is involved. The GCA will request that NSA, ODNI, or DOE respond within 30 calendar days of the date of the GCA's written request directly to DSS with a copy to the GCA. (iii) A GCA decision that it will not issue a NID. (4

Based on its own investigations and compliance reviews, news reports, and published studies, the Department is aware that many regulated entities have failed to implement adequate technical controls, or, in some cases, any technical controls. For example: A large health system that operates in multiple States experienced a massive data breach resulting from a hacking incident. OCR's investigation found indications of potential failures to sufficiently monitor its activity in its information systems that was insufficient to protect against a cyberattack, implement an authentication process to safeguard its ePHI, and have security measures in place to protect ePHI from unauthorized access when it was being transmitted electronically. [687] A Rhode Island nonprofit health system experienced a data breach resulting from the theft of a laptop. OCR's investigation found indications of potential failures to encrypt ePHI, despite the entity's determination to implement encryption, and a lack of device and media controls. [688] At a large covered entity, workforce members used their log-in credentials to access medical records maintained in the entity's EHR without a job-related purpose. [689] OCR's investigation found evidence of potential violations of the requirement to implement reasonable and appropriate policies and procedures to comply with the standards, implementation specifications, or other requirements of the Security Rule. [690] At another covered entity, the potential failure to implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use ePHI, among other things, enabled a workforce member to sell the ePHI of more than 12,000 individuals. [691] Some investigations have found indications that regulated entities may implement technical controls that address some, but not all, users of and technology assets in a relevant electronic information system, such as software, hardware, and persons involved in the development, configuration, and implementation of technical controls. [692] And other investigations have suggested that the potential failure of a regulated entity to have security measures in place to protect ePHI from unauthorized access when it is transmitted electronically has resulted in increased risk and breaches of ePHI. [693] Common network segmentation practices would have substantially reduced the risk to the security ePHI and could have prevented such breaches. Beyond the health care sector, threat actors have been able to gain access to networks by compromising user accounts and taking advantage of insufficient network segregation. For example, the 2014 Home Depot breach involved the compromise of a third-party vendor's username and password to enter Home Depot's network, which allowed hackers to obtain elevated rights to navigate to self-checkout point-of-sale system. [694]

Section 170.15 addresses how an OSA will achieve and maintain compliance with the CMMC Status of Level 1 (Self). The OSA must successfully implement the security requirements listed in § 170.14(c)(2) within their Level 1 CMMC Assessment Scope as described in § 170.19(b). Successful implementation requires meeting all objectives defined in NIST SP 800-171A Jun2018 for the corresponding CMMC Level 1 security requirements as outlined in the mapping table 1 to § 170.15(c)(1)(i). After implementation, the OSA must perform a Level 1 self-assessment to verify the implementation and score themselves using the scoring methodology provided in § 170.24. All objectives must be met in order for a security requirement to be considered fully implemented; no security requirements may be placed on a POA&M for Level 1. The OSA must then input their results into SPRS as described in § 170.15(a)(1)(i) and submit an affirmation as described in § 170.22. In order to be eligible for a contract with a requirement for the CMMC Status of Level 1 (Self), the OSA must have achieved a CMMC Status of Final Level 1 (Self) and have submitted an affirmation. These activities must be completed annually.

Section 170.16-CMMC Level 2 Self-Assessment and Affirmation Requirements Section 170.16 addresses how an OSA will achieve and maintain compliance with the CMMC Status of Level 2 (Self). The OSA must successfully implement the security requirements listed in § 170.14(c)(3) within its Level 2 CMMC Assessment Scope as described in § 170.19(c). Successful implementation requires meeting all objectives defined in NIST SP 800-171A Jun2018 for the corresponding CMMC Level 2 security requirements. Requirements for ESPs and CSPs that process, store, transmit CUI are provided in § 170.16(c)(2) and (3). After implementation, the OSA must perform a Level 2 self-assessment to verify the implementation and score themselves using the scoring methodology provided in § 170.24. All objectives must be met in order for a security requirement to be considered fully implemented; in some cases, if not all objectives are met, some security requirements may be placed on a POA&M as provided for in § 170.21. If the minimum score has been achieved and some security requirements are in a POA&M, the OSA has achieved the CMMC Status of Conditional Level 2 (Self); if all requirements are MET as defined in § 170.24(b), the OSA has achieved a CMMC Status of Final Level 2 (Self). For Conditional Level 2 (Self), a POA&M closeout must be conducted within 180 days as described in § 170.21(b) or the Conditional Level 2 (Self) CMMC Status will expire. After a Level 2 self-assessment, as well as after a POA&M closeout, the OSA

must input their results into SPRS as described in § 170.16(a)(1)(i) and submit an affirmation as described in § 170.22.

3.3.4 Security Tag Type 3 | 4. 3.3.4 Security Tag Type 3 | 4. 3.3.4 Security Tag Type 3 | 4.

Purpose and Audience This guide is intended for Organizations Seeking Certification (OSCs) that will be obtaining a Level 3 certification assessment and the professionals or companies that will support them in those efforts. **Identifying the CMMC Assessment Scope** CMMC Assessment Scope - Level 3 - Version 2.13 2 Identifying the CMMC Assessment Scope An assessment, as defined in 32 CFR § 170.4 , means the testing or evaluation of security controls to determine the extent to which the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security requirements for an information system or organization. This document should help the reader understand the categorization of assets that, in turn, inform the specification of the boundary for a CMMC assessment. The scope of the CMMC Program does not include classified assets, even if they contain applicable Controlled Unclassified Information (CUI). Prior to conducting a Level 3 certification assessment, the CMMC Assessment Scope must be defined as addressed in 32 CFR § 170.19(d). The CMMC Assessment Scope informs which assets within the OSC's environment will be assessed and the details of the assessment. When seeking a Level 3 certification assessment, the OSC must have a Final Level 2 (C3PAO) CMMC Status for the same CMMC Assessment Scope as the Level 3 assessment. Any Level 2 Plan of Action and Milestones (POA&M) items, as defined in 32 CFR §170.4 , must be closed prior to the initiation of the Level 3 assessment. The Level 3 CMMC Assessment Scope may be a subset of the Level 2 CMMC Assessment Scope (e.g., a Level 3 data enclave with greater restrictions and protections within the Level 2 data enclave). Assets designated as Contractor Risk Managed Assets (CRMAs) in the Level 2 CMMC Assessment Scope are treated as CUI assets if they fall within the Level 3 CMMC Assessment Scope. OSCs may choose to designate them as CUI assets for the Level 2 certification assessment and have them assessed by a C3PAO. Since the assessment requirements for Specialized Assets differ between Level 2 and Level 3, the OSC may choose to have them assessed by a C3PAO during the Level 2 certification assessment. During a Level 3 certification assessment, DCMA DIBCAC may check any Level 2 security requirement of any in-scope asset. CRMAs and Specialized Assets not assessed to the Level 3 scoping requirements by a C3PAO during the Level 2 certification assessment, will undergo limited checks for compliance with Level 2 security requirements during the DCMA DIBCAC Level 3 certification assessment and will be assessed against all CMMC Level 3 security requirements. **CMMC Asset Categories** For a Level 3 assessment, assets are mapped into one of four categories defined in 32 CFR § 170.19(d)(1) Table 4 . This table describes each asset category and its corresponding OSC requirements and CMMC assessment requirements. Additional information about each asset category is provided in the ensuing sections.

3.2.2 | Logging Capabilities ... 3.2.2 Logging Capabilities IDPSs typically perform extensive logging of data related to detected events. 3.2.2 provides more information on ongoing maintenance of the technologies, with Section 3.

32 CFR part 2002 and the completion of the SF XXX during acquisition planning. (6) FAR 7.105, Contents of written acquisition plans. CUI is added to the security considerations to be addressed during acquisition planning. (7) At FAR 7.503, Policy, language has been revised to clarify that the list of examples of functions generally not considered to be inherently governmental functions, includes contractors working in any situation that permits or might permit them to gain access to CUI. (8) FAR subpart 9.5, Organizational and Consultant Conflicts of Interest, includes updates to FAR 9.505, 9.505-4, and 9.508 to make clear proprietary information is contractor proprietary business information. (9) FAR 11.002, Policy. New language is added to incorporate the requirements for CUI and use of the SF XXX when describing agency needs. (10) FAR 12.202, Market research and description of agency need. New language is added to incorporate the requirements for CUI and the SF XXX in requirements documents for the acquisition of commercial products and commercial services. (11) At FAR 15.407-1, a reference to CUI and classified information is added to clarify the type of information that should be protected from improper disclosure. (12) At FAR subpart 15.6, conforming changes are made to change ·proprietary information· and ·restrictive legend· or ·legend· to ·contractor proprietary business information· and ·administrative marking·, respectively. (13) FAR 27.203, Security requirements for patent applications and other patent information. A new section is added to inform contracting officers that CUI safeguarding requirements apply to patent application and other patent information. (14) FAR part 52. A new provision FAR 52.204-WW, Notice of Controlled

Unclassified Information Requirements, is added to inform offerors of requirements on restricted use of Government-provided information, on appropriately identifying sensitive offeror-provided information, and on notifying the Government regarding unmarked or mismarked CUI. A new FAR clause 52.204-XX, Controlled Unclassified Information, is added to require contractors to comply with applicable CUI requirements, if the SF XXX indicates that the contractor is expected to collect, develop, receive, transmit, use, handle, or store CUI under the contract. A new FAR clause 52.204-YY, Identifying and Reporting Information That Is Potentially Controlled Unclassified Information, is added to apply to contracts in which the requiring activity indicates on the SF XXX that no CUI is involved in the performance of the contract. CUI requirements include: Requirements for how the contractor must mark CUI submitted to the Government and notify the Government of any mismarked or unmarked CUI discovered; Restrictions on the contractor's use of Government-provided information apply whether or not the information is marked as CUI;

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 iii Note to Reviewers 45 The following provides a summary of the significant changes that have been made to SP 800- 172 in transitioning to Revision 3: · Streamlined introductory information in Sec. 1 and Sec. 2 to improve clarity and understanding · Increased specificity of the enhanced security requirements to remove ambiguity, improve the effectiveness of implementation, and clarify the scope of assessments · Grouped enhanced security requirements, where possible, to improve understanding and the efficiency of implementations and assessments · Removed outdated and redundant enhanced security requirements · Added new enhanced security requirements based on (1) the la

3.2.11 | Lack of Concern | 19 | | 3. 3.2.11 Lack of Concern Wealso found examples of various levels of lack of concern, with seven participants having neither privacy nor security concerns.

ing and risk management activities. It must incorporate an application system perspective, and give more detailed consideration to confidentiality, integrity, and availability protection requirements.

(Comment 93) A few comments state that the requirement to keep records that identify the specific source of each ingredient to a lot of finished product exceeds the intent of the Bioterrorism Act. One comment adds that the language in the Bioterrorism Act clearly authorizes a regulation to require the maintenance of records that show the person from whom a product is received and the person to whom a product is sent. The comment states that there is nothing in the language of the Bioterrorism Act or in its legislative history that would support including a requirement that products received be directly associated with products that are shipped. (Response) FDA does not agree with these comments. Section 306(b) of the Bioterrorism Act expressly states that the Secretary * * * may by regulation establish requirements regarding the establishment and maintenance, for not longer than two years, of records by persons (excluding farms and restaurants) who manufacture, process, pack, transport, distribute, receive, hold, or import food, which records are needed by the Secretary for inspection to allow the Secretary to identify the immediate previous sources and the immediate subsequent recipients of food, including its packaging , in order to address credible threats of serious adverse health consequences or death to humans or animals· (emphasis added).* * * Thus, the Bioterrorism Act clearly gives FDA the authority to determine what records are needed to achieve this objective. The final rule contains those requirements that FDA has determined are necessary to help FDA identify the immediate previous sources and immediate subsequent recipients of food to address credible threats of serious adverse health consequences or death to humans or animals. If FDA cannot immediately narrow its tracing to a specific source, tracing becomes much more difficult and time-consuming, there is an increased risk to consumers, and

some food sources may be unfairly implicated. FDA notes, however, that the final rule (§ 1.345(b)) only requires nontransporters to identify the specific source of each ingredient that was used to make every lot of finished product to the extent such information is reasonably available. (Comment 94) A few comments state that they are not able to provide information that ties the specific source of each ingredient to a lot of the finished product. Several comments agreed with FDA's decision to require identification of the specific source of an ingredient in a finished product only when the information is reasonably available. Some comments request that the agency make clear in the final rule that, in many instances, it will be impossible to identify the specific source of a material that is held in bulk and that multiple sourcing information in recordkeeping is to be anticipated for raw materials that are held in bulk form.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. A microservices-based architecture in applications and service mesh application infrastructure that provides various security services through service proxies has emerged as the widespread application environment for cloud-native applications. With the disappearance of the network perimeter due to the need for ubiquitous access to these applications from multiple remote locations using different types of devices, it is necessary to build the concept of zero trust [1] into this application environment.

- In his opinion, IoT security has not received enough attention, in both consumer and organizational contexts. He noted that the increasing interconnection of systems of all types increases attack surfaces and expands the threat profile. - He identified three core activities that the Office of Management and Budget (OMB) performs that are particularly relevant to federal information system security: - o Overseeing the implementation of Federal Information Security Management Act (FISMA) for non-National Security Systems; he noted that in doing this OMB works closely with the Department of Defense (DoD) and the Director of National Intelligence (DNI) to present consistent guidance across the federal space including the DoD and the intelligence community (IC). - o Overseeing the implementation of cybersecurity policies and standards. He noted that OMB has been taking a more active oversight role and seeking to assist federal organizations in meeting their FISMA responsibilities. - o Ensuring agencies comply with government-wide cybersecurity guidance and legislation, including Binding Operational Directives and Emergency Directives from the Department of Homeland Security's (DHS) Cybersecurity and Infrastructure Security Agency (CISA). - He stated that the scope of 'Federal Information systems includes IoT devices', adding 'I don't think we've had enough conversation on that.' He expressed concern that IoT devices are seen as less impactful or less risky, and cited an example of a networked traffic sign being used as an entry point for a cyber-attack as a 'wake-up call' to the range of concerns that IoT raises. - He emphasized that OMB's work in cybersecurity is guided by a risk management philosophy. He described a 'high-value asset' program intended to assist agencies in identifying and protecting their high-value information system and data, and share solutions across agencies.

(G) From subsection (e)(5) because the requirement that records be maintained with attention to accuracy, relevance, timeliness, and completeness would unfairly hamper the investigative process. It is the nature of law enforcement for investigations to uncover the commission of illegal acts at diverse stages. It is frequently impossible to determine initially what information is accurate, relevant, timely, and least of all complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light. (H) From subsection (e)(8) because the notice requirements of this provision could present a serious impediment to law enforcement by revealing investigative techniques, procedures, and

existence of confidential investigations. (l) From subsection (f) because the agency's rules are inapplicable to those portions of the system that are exempt and would place the burden on the agency of either confirming or denying the existence of a record pertaining to a requesting individual might in itself provide an answer to that individual relating to an ongoing investigation. The conduct of a successful investigation leading to the indictment of a criminal offender precludes the applicability of established agency rules relating to verification of record, disclosure of the record to that individual, and record amendment procedures for this record system. (J) From subsection (g) because this system of records should be exempt to the extent that the civil remedies relate to provisions of 5 U.S.C. 552 a from which this rule exempts the system. (printed page 14738) (7) System identifier and name. F051 AF JA F, Courts-Martial and Article 15 Records. (i) Exemption. (A) Parts of this system may be exempt pursuant to 5 U.S.C. 552a(j)(2) if the information is compiled and maintained by a component of the agency which performs as its principle function any activity pertaining to the enforcement of criminal laws. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(j) (2) from the following subsection of 5 U.S.C. 552a(c)(3) , (c)(4), (d), (e)(1), (e)(2), (e)(3), (e)(4)(G), (H) and (I), (e)(5), (e)(8), (f), and (g). (B) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (e)(7)(i)(B).

3.6.3 | Continuous Improvement ... 3.6.3 Continuous Improvement A risk-aware culture should be looking for opportunities for improvement-reinforcing effective practices and adjusting to correct deficiencies.

DoD's harmonization of requirements with other agencies is achieved through compliance with NIST standards. DoD's recognition of the standards of other nations occurs through negotiation of international arrangements and agreements, which is beyond the scope of this rule. The CMMC Program has aligned requirements with NIST standards, and many foreign nations are adopting NIST standards as well. In developing this rule, the DoD worked with standards bodies, removed unique requirements, and aligned new requirements directly with NIST SP 800-171 R2 and select NIST SP 800-172 Feb2021 requirements to reduce and streamline cybersecurity burden across the industry. CMMC Program requirements make no change to existing policies for limits on dissemination of CUI. Comments on information sharing between other agencies or foreign entities are beyond the scope of this rule. The requirement to comply with NIST SP 800-171 was mandated in DFARS clause 252.204-7012. Granting alternatives to that standard is beyond the scope of this rule. Several foreign or international companies submitted comments expressing interest in the rule section pertaining to C3PAO requirements (§ 170.9(b)) and correctly noted that this section does not preclude otherwise qualified foreign companies from achieving C3PAO accreditation. Note that the DoD does permit C3PAO personnel who are not eligible to obtain a Tier 3 background investigation to meet the equivalent of a favorably adjudicated Tier 3 background investigation. DoD will determine the Tier 3 background investigation equivalence for use with the CMMC Program only. c. CMMC Acceptance of Other DIBCAC Assessments Comment: Some commenters either did not understand or objected to the fact that standards acceptance requirements for DIBCAC High Assessments require a score of 110 without POA&Ms. Other comments requested clarity regarding standards acceptance of DIBCAC High Assessments at CMMC Levels 2 and 3. One comment inquired about the programmatic details of DCMA's Joint Surveillance Program. Another comment expressed concerns over disparities between how CMMC C3PAOs and DIBCAC assess, given the fact that DIBCAC assessors are empowered to make risk acceptance decisions on behalf of the Government, whereas C3PAO assessors are not. One commenter questioned the use of the NIST SP 800-171 R2 Cybersecurity FAQs as published in the DoD Procurement Toolbox. Another commenter asked whether C3PAOs assess for compliance with DFARS clause 252.204-7012, paragraphs c-g, as DCMA DIBCAC does in their assessments of OSAs. One commenter suggested that the DIBCAC is not certified to conduct Level 3 assessments and that training requirements for CMMC Level 2 C3PAO assessors should also apply to DIBCAC assessors, or else Level 3 assessments should be conducted by C3PAOs. Response:

The Department understands that regulated entities may be concerned with the anticipated administrative burden and cost of revising their business associate agreements or other written

arrangements to comply with a revised Security Rule. For example, a regulated entity would need to update its business associate agreements to add a provision specifying that the business associate will report to the covered entity [867] that it activated its contingency plan no later than 24 hours after activation of such plan. [868] A regulated entity may have existing contracts that are not set to terminate or expire until after the compliance date for a final rule modifying the Security Rule, and we understand that a six-month compliance period may not provide enough time to reopen and renegotiate all contracts, in addition to ensuring that all regulated entities are compliant with the revised Security Rule. Accordingly, the Department proposes to relieve some of the burden on regulated entities by adding a specified period of transition for certain existing contracts. The Department's authority to provide a transition period is expressed in 45 CFR 160.104(c), which allows the Secretary to establish the compliance date for any modified standard or implementation specification, considering the extent of the modification and the time needed to comply with the modification. [869] Given these considerations, to allow regulated entities enough time to update thousands of existing business associate agreements or other written arrangements, the Department proposes to provide additional time to update the contracts required by 45 CFR 164.314(a)(1) . Specifically, the Department proposes to add new transition provisions under 45 CFR 164.318 to allow regulated entities to continue to operate under certain existing business associate agreements or other written arrangements until the earlier of: (1) the date such contract or other arrangement either is renewed on or after the compliance date of the final rule; or (2) a year after the effective date of the final rule. The additional transition period would be available to regulated entities if both of the following conditions are met: (1) prior to the publication date of the final rule, the covered entity or business associate had an existing business associate agreement or other written arrangement with a business associate or subcontractor, respectively, that complied with the Security Rule prior to the effective date of a final rule revising the Security Rule; and (2) such contract or arrangement would not be renewed or modified between the effective date and the compliance date of the final rule.

All options consider relaxing one provision, or excluding one sector from the recordkeeping requirements. In that way, a comparison of the cost of a policy option with the cost of the baseline yields the marginal cost savings from either relaxing a provision in the baseline, or reducing the coverage by one sector relative to the baseline. The columns containing the absolute amount and percentage cost savings show the savings relative to the baseline. In the final rule reported in table 18 of this document, the provisions requiring lot code information, 4- and 8-hour records access, and short compliance dates are all relaxed to yield cost savings relative to the baseline. Additional cost savings result from excluding the following: (1) Foreign persons, except for foreign persons who transport food in the United States; (2) persons who manufacture, process, pack, transport, distribute, receive, hold, or import food contact substances except the finished container that directly contacts the food; and (3) persons who manufacture, process, pack, transport, distribute, receive, hold, or import the finished containers that directly contacts food except for those who place food directly in contact with its finished container. The option to relax the requirements for all records to contain lot code information when feasible saves more costs relative to the baseline than any other option. The cost savings from relaxing the lot code information requirement is approximately \$13 billion in present value terms with a 7 percent discount rate, and \$18 billion with a 3 percent discount rate. Based on detailed information in the comments, requiring lot code information to be contained in all records by retailers and distributors would result in approximately an 80 percent loss in productivity for distributors and retailers. Excluding many foreign persons and relaxing the 4- and 8-hour records access requirement also result in significant cost savings. By excluding all foreign persons except those who transport food in the United States, approximately 225,000 facilities would not have to establish and maintain records relative to the baseline. This exclusion results in a cost savings of approximately \$770 million, or 19 percent, relative to the baseline in present value terms when a 7-percent discount rate is used, and a savings of \$1 billion when a 3 percent discount rate is used. A 24-hour records access requirement results in a cost savings of approximately \$260 million relative to the baseline with a 7-percent discount rate, and \$318 million with a 3-percent discount rate.

2. The procedures at DFARS 232.1004 are modified to eliminate the requirement to first agree on price using customary progress payments and then require consideration if performance-based payments are subsequently negotiated. In addition, contracting officers are encouraged to use both the progress payments and performance based payments clauses and provisions, when considering both types of financing methods. 3. The DFARS clauses 252.232-7012, Performance-Based Payments-Whole-Contract

Basis, and 252.232-7013, Performance-Based Payments-Deliverable Items, are modified to specifically state that it is not necessary to have a Government-unique cost accounting system in order to report incurred costs under the clause. 4. A new paragraph (d) is added in DFARS 252.232-7012 and 252.232-7013 that provides some flexibility with regard to acceptable security, although title to the property described in paragraph (f) of the clause at FAR 52.232-32, Performance-Based Payments, is still the preferred security for receipt of performance-based payments. 5. A new provision is added at DFARS 252.232-7016, Notice of Progress Payments or Performance-Based Payments, to be used in lieu of FAR 52.232-13, Notice of Progress Payments, when the solicitation contains clauses for progress payments and performance-based payments, to explain that only one type of financing will be included in the resultant contract, except as may be authorized on separate orders subject to FAR 32.1003(c).

B. Analysis of Public Comments

1. General Support for the Rule

a. Generally support the rule. Comment: Various respondents expressed general support for the rule, particularly the removal of the requirement to limit PBP financing to costs incurred. One respondent stated that the proposed rule is a significant improvement over the current DFARS, creating a more inviting marketplace for private sector entities and nontraditional defense contractors. Another respondent wholeheartedly supported amending the DFARS to implement section 831 of the NDAA for FY 2017. Response: Noted.

b. Generally oppose the rule. Comment: One respondent stated that this rule is worse than the previous rule (DFARS Case 2017-D019, published 8/24/2018, withdrawn 10/4/2018), and against the original genuine intent of simplification to motivate the performance of the supplier. Another respondent recommended adopting the revisions to the DFARS proposed in DFARS Case 2017-D019 that implement section 831, while disregarding those changes that were outside the scope of section 831.

(Comment 193) Many comments assert that the cost estimates for requiring 4 and 8 hour records access were too low or inappropriate. Comments support this assertion by citing factors ranging from the additional staffing requirements necessary to respond to a records request at such short notice, to the burden of a records access request being dependent on the number of records, and to the length of time covered by the records requested. Some comments state that a 48-hour records access requirement would be reasonable, and some comments state that 24 hours would be reasonable.

(Response) FDA acknowledges the difficulties faced by firms complying with the 4 and 8-hour records access requirements. This final rule requires providing access to records as soon as possible, but no later than 24 hours after an FDA request. The costs for 4 and 8 hours and 24 hours are analyzed as policy options later in this document. In the PRIA, we estimated the records access costs as the costs for planning for a records access request. FDA assumed (printed page 71636) that the 4-and 8-hour response time required would compel business practices to change as firms developed preemptive emergency plans, while a 24-hour response requirement would not compel firms to modify their current business practices. Interviews with FDA traceback personnel suggest that firms are able to comply with a 24-hour records access request. Many comments support the notion that a 24-hour response time is not an unreasonable requirement given current business practices. Consequently, FDA maintains the assumption that a 24-hour records access requirement is reasonable under current business practices and that a 4 and 8 hour records access requirement would require additional planning for a records request. Relaxing the records access requirement from 4 and 8 hours to 24 hours leads to an estimated cost savings relative to the PRIA. The access planning cost estimate assumed that 6 hours of administrative labor per firm (lowered to 3 hours per convenience store firm) would be a one-time requirement for each firm. FDA estimated that new businesses would also have to incur records access costs. As a result of relaxing the records access request time to 24 hours, these costs will no longer be incurred.

5. Additional Records Maintenance and Redesign Costs

The cost estimates assume that the information a covered entity must keep is specified, but that the form or type of system in which those records are maintained is not specified; we expect that firms will collect the additional information not currently included in their existing records. Furthermore, FDA assumes that firms will choose to comply with any new requirements in the manner most economically feasible for them, including modifying shipping or purchase records, such as bills of lading, invoices, or purchase orders.

Steps a regulated entity should consider as part of its decommissioning process include: ensuring technology assets are securely erased and then either securely destroyed or recycled; ensuring that the regulated entity's technology asset inventory is updated to accurately reflect the status of decommissioned technology assets or technology assets slated to be decommissioned; and ensuring that privacy is protected through proper migration to another electronic information system or total destruction of the ePHI. [658] The Department proposes to remove the implementation

specifications for accountability and data backup and storage at 45 CFR 164.310(d)(2)(iii) and (iv). We believe that the accountability provisions would be subsumed and replaced by the proposed standard for technology asset inventory at proposed 45 CFR 164.308(a)(1)(i). Thus, when the proposed new standard and implementation specifications are read together, the written policies and procedures that govern the receipt and removal of technology assets that maintain ePHI into and out of a facility, and the movement of these assets within the facility, should include tracking relevant information in the technology asset inventory. Similarly, we are proposing to delete the specification for data backup and storage because it is redundant to the administrative safeguard on data backups at proposed 45 CFR 164.308(a)(13)(ii)(B). As referenced above, in place of the implementation specifications we are proposing to delete, the Department proposes a new implementation specification at proposed 45 CFR 164.310(d)(2)(iii) that would require a regulated entity to review and test the written policies and procedures related to the implementation specifications for technology assets at least once every 12 months or in response to environmental or operational changes, whichever is more frequent, and modify as reasonable and appropriate. Such environmental or operational changes may range from new and emerging threats to the confidentiality, integrity, or availability of ePHI (e.g., a new virus) to the adoption of new technology assets by the regulated entity (e.g., a new operating system, new types of workstations). Given the constant evolution of IT and methods for restoring data that has been disposed of or was on electronic media that has been sanitized, the Department believes that it is essential for a regulated entity to at least consider the reasonableness and appropriateness of its policies and procedures for disposal and electronic media sanitation, not only annually, but also in the face of any environmental or operational changes. We expect that pursuant to our proposals to strengthen the standard for risk analysis, a regulated entity would be able to identify such environmental and operational changes before they occur.

4. Request for Comment

The physical security measures for the classified sessions will provide for control of, access to, and dissemination of, the classified information to be presented and will provide for secure storage capability, if necessary.

(5) Disclosure authority at meetings. Authority to disclose classified information at meetings, whether disclosure is by officials of industry or USG, must be granted by the USG agency or activity that has classification jurisdiction over the information to be disclosed. Each contractor that desires to disclose classified information at a meeting is responsible for requesting and obtaining disclosure approvals. Associations are not responsible for ensuring that classified presentations and papers of other organizations have been approved for disclosure. A contractor desiring to disclose classified information at a meeting will:

- (i) Obtain prior written authorization for each proposed disclosure of classified information from the USG agency having jurisdiction over the information involved.
- (ii) Furnish a copy of the disclosure authorization to the USG agency sponsoring the meeting.

(6) Requests to attend classified meetings. Before a contractor employee can attend a classified meeting, the contractor will provide justification for why the employee requires access to the classified information, cite the classified contract or GCA program or project involved, and forward the information to the authorizing USG agency.

(printed page 83346) § 117.17 Subcontracting. (a) Prime contractor responsibilities.

(1) Responsibilities. Before a prime contractor may release or disclose classified information to a subcontractor, or cause classified information to be generated by a subcontractor, a determination that access to classified information will be required and such access serves a legitimate USG requirement for the performance of a classified contract in accordance with § 117.9(a) must be made. Prime contractors are responsible for communicating the appropriate security requirements to all subcontractors.

- (i) A security requirements clause and a Contract Security Classification Specification, or equivalent, will be incorporated in the solicitation and in the subcontract. (See the security requirements clause in the prime contract.)
- (ii) The subcontractor must possess an appropriate entity eligibility determination and a classified information safeguarding capability if possession of classified information will be required.

(A) If access to classified information will not be required in the pre-award phase, prospective subcontractors are not required to possess an entity eligibility determination to receive or bid on the solicitation.

The free, publicly available virtual workshop consisted of a mixture of plenary and breakout sessions 3. The agenda is provided in Table 1. The workshop included a keynote presentation from the U.S. Government Accountability Office (GAO) describing their survey of federal use of IoT technology and an overview from the NIST Cybersecurity for IoT Program's technical lead on potential responses to the comments NIST has received. These sessions were followed by breakout discussions on

various aspects of NIST's proposed approach to revising the documents. The plenary sessions resumed with an overview of NIST's Online Informative References (OLIR) Program, followed by a summation of the breakout sessions provided by their facilitators and closing remarks from the NIST program manager. | References | |-----|-----

A Taxonomic Approach to Understanding Emerging Blockchain Identity Management Systems Loïc Lesavre Priam Varin Peter Mell Michael Davidson James Shook Computer Security Division Information Technology Laboratory January 14, 2020 This publication is available free of charge from: <https://doi.org/10.6028/NIST.CSWP.01142020> <!-- image --> ## Abstract Identity management systems (IDMSs) are widely used to provision user identities while managing authentication, authorization, and data sharing within organizations and on the web. Traditional identity systems typically suffer from single points of failure, lack of interoperability, and privacy issues, such as enabling mass data collection and user tracking. Blockchain technology has the potential to alleviate these concerns: it can support the ability for users to control the custody of their own identifiers and credentials, enabling novel data ownership and governance models with built-in control and consent mechanisms. Hence, blockchain-based IDMSs, which could benefit both users and businesses, are beginning to proliferate. This work categorizes these systems into a taxonomy based on differences in blockchain architectures, governance models, and other salient features. Context is provided for the taxonomy through the description of related terms, emerging standards, and use cases while highlighting relevant security and privacy considerations.

3.2.2 | Unauthorized Data Alteration and Addition... 3.2.2 Unauthorized Data Alteration and Addition Data alteration refers to the process of modifying data before or after it is entered into the system.

The Department proposes to define the term ‘technology asset’ to mean the components of an electronic information system, including but not limited to hardware, software, electronic media, information, and data. In so doing, we would clarify which Security Rule requirements apply to all of the components of electronic information systems as opposed to those that apply only to certain components, and which requirements apply to each particular components and which apply to the entire electronic information system. For example, understanding the risks and vulnerabilities to a regulated entity’s ePHI requires a thorough understanding of the components of its electronic information systems, the electronic information systems themselves, how they are connected, and how ePHI moves through those systems. Thus, by requiring a regulated entity to conduct an inventory of its technology assets and to create a network map of its electronic information systems, we clarify that a regulated entity is obligated to consider not only its electronic information systems as a whole, but also the components within those electronic information systems and their functions. 19. Adding a Definition of ‘Threat’ a. Issues To Address Addressing threats to the confidentiality, integrity, and availability of ePHI is a key function of the Security Rule, but the rule does not define ‘threat.’ The concept of threat also underlies the Department’s proposed definition of ‘risk’ defined above and forms the basis of a key proposed implementation specification associated with the standard for risk analysis. [391] b. Proposal The Department proposes to define the term ‘threat’ to mean any circumstance or event with the potential to adversely affect the confidentiality, integrity, or availability of ePHI. This proposal is similar to NIST’s varying definitions of threat, edited to apply specifically to health care and the type of information addressed by the Security Rule. [392] Under this proposal, we would construe the term to apply broadly to include threats caused by, or existing because of, a variety of circumstances that specifically could affect the security of ePHI. Hackers, malicious insiders, and malicious software are examples of threat sources. 20. Clarifying the Definition of ‘User’ a. Current Provision and Issues To Address The Department first defined the term ‘person’ in the HIPAA Rules as part of the 2003 ‘Civil Money Penalties: Procedures for Investigations, Imposition of Penalties, and Hearings’ interim final rule to distinguish a ‘natural person’ who could testify in the context of administrative proceedings from an ‘entity’ (defined therein as a ‘legal person’) on whose behalf a

(A) The term "commercial use" request refers to a request from, or on behalf of one who seeks information for a use or purpose that furthers the commercial, trade, or profit interest of the requester or the person on whose behalf the request is made. In determining whether a requester properly belongs in this category, Components must determine the use to which a requester will put the documents requested. Moreover, where a Component has reasonable cause to doubt the use to which a requester will put the records sought, or where that use is not clear from the request itself, Components should seek additional clarification from the requester before assigning the request to a specific category. (B) When the Components receive a request for documents for commercial use, they should assess charges which recover the full direct costs of searching for, reviewing for release, and duplicating the records sought. Accordingly, commercial requesters are not entitled to 2 hours of free search time and 100 free pages of reproduction. (C) Commercial requesters are not normally entitled to a waiver or reduction of fees based upon an assertion that disclosure would be in the public interest. However, because use is the exclusive determining criterion, it is possible to envision a commercial enterprise making a request that is not for commercial use. It is also possible that a non-profit organization could make a request that is for commercial (printed page 71864) use. Such situations must be addressed on a case-by-case basis. (ii) Educational, non-commercial scientific institution, or news media . Requesters should indicate a willingness to pay duplication charges in excess of 100 pages if more than 100 pages of records are desired. (A) Educational institution . Fees shall be limited to only reasonable standard charges for document duplication (excluding charges for the first 100 pages) when the request is made by an educational institution whose purpose is scholarly research. The term "educational institution" refers to a pre-school, a public or private elementary or secondary school, an institution of undergraduate higher education, an institution of graduate higher education, an institution of professional education, and an institution of vocational education, which operates a program or programs of scholarly research. Fees shall be waived or reduced in the public interest if the fee waiver criteria are met. (B) Non-commercial scientific institution

A contractor will require each applicant for determination of eligibility for access to classified information who claims U.S. citizenship to provide evidence of citizenship to the FSO or other authorized representative of the contractor. All documentation must be the original or certified copies of the original documents. (1) Any document, or its successor, listed in this paragraph is an acceptable document to corroborate U.S. citizenship by birth, including by birth abroad to a U.S. citizen. (i) A birth certificate certified with the registrar's signature, which bears the raised, embossed, impressed, or multicolored seal of the registrar's office. (ii) A current or expired U.S. passport or passport card that is unaltered and undamaged and was originally issued to the individual. (iii) A Department of State Form FS-240, "Consular Report of Birth Abroad of a Citizen of the United States of America." (iv) A Department of State Form FS-545 or DS-1350, "Certification of Report of Birth." (2) Any document, or its successor, listed in this paragraph is an acceptable document to corroborate U.S. citizenship by certification, naturalization, or birth abroad to a U.S. citizen. (i) A U.S. Citizenship and Immigration Services Form N-560 or N-561, "Certification of U.S. Citizenship." (ii) A U.S. Citizenship and Immigration Services Form 550, 551, or 570, "Naturalization Certificate." (iii) A valid or expired U.S. passport or passport card that is unaltered and undamaged and was originally issued to the individual. (d) Procedures for completing the electronic version of the SF 86, "Questionnaire for National Security Positions." The electronic version of the SF 86 (available at: https://www.opm.gov/forms/pdf_fill/sf86.pdf) must be completed in e-QIP or its successor system by the contractor employee and reviewed by the FSO or other contractor employee(s) who has (have) been specifically designated by the contractor to review an employee's SF 86. The FSO or designee will: (1) Provide the employee with written notification that review of the SF 86 by the FSO or other contractor employee is for adequacy and completeness and information will be used for no other purpose within the entity. The use and disclosure by the U.S. Government, and by U.S. Government contractors operating systems of records on behalf of a U.S. Government agency to accomplish an agency function, of the information provided by the employee on the SF-86 is governed by the Privacy Act of 1974, as amended, and by the routine uses published by the USG in the applicable System of Records Notice. (2) Not share information from the employee's SF 86 within the entity and will not use the information for any purpose other than determining the adequacy and completeness of the SF 86. (e) Fingerprint collection. The contractor will submit fingerprints in accordance with CSA guidance. Contractors will use digital fingerprints whenever possible. (f) Pre-employment eligibility determination action.

DoD received numerous comments about the use of ESPs which do not process, store, or transmit CUI. In response to comments, the DoD has reduced the assessment burden on ESPs. ESP assessment, certification, and authorization requirements in §§ 170.19(c)(2) and (d)(2) have been updated. 20.

CMMC Assessment Scope for Devices and Asset Categorization

a. Asset Categorization

Comment: There were many comments regarding the scoping and treatment of assets when using table 3 to § 170.19(c)(1) and table 5 to § 170.19(d)(1). Several comments asked about when asset categorization occurs, who approves it and how to document it. Two comments questioned the applicability of using NIST SP 800-171 R2 for Specialized Assets. Two comments suggested modifying the definition of Out-of-Scope assets by removing the last bullet or discussing the use of encryption. One commenter suggested adding more detailed definitions of the asset categories to the rule. One comment recommended removing asset categories from the rule. Many comments requested scoping and categorization of specific scenarios, such as ERP systems, MRP systems, quantum computing systems, data diodes, asset isolation, and encrypted CUI. Numerous additional comments requested clarification on scoping and categorization of various security product classes.

Response: The OSA performs asset categorization and documents it in their SSP. The OSA may choose the format and content of its SSP. Table 3 to § 170.19(c)(1) requires that all asset categories, including Specialized Assets, be included in the asset inventory. There is no requirement to embed every asset in the SSP. In the SSP for Level 2, the OSA must show how Specialized Assets are managed using the contractor's risk-based security policies, procedures, and practices. Prior to the conduct of an assessment, the OSC engages with the C3PAO assessor. It is during this time that the classification of assets should be agreed upon, and the results of these discussions are documented in pre-planning materials. This is an example of the pre-assessment and planning material submitted by the C3PAO as required in § 170.9(b)(8) and the CMMC Assessment Scope submitted to eMASS as required in § 170.17(a)(i)(D). It is beyond the scope of this rule to address DoD review of specific Specialized Assets for individual contractors.

Additionally, consistent with the Department's proposal to require that a regulated entity provide role-based security awareness training on its Security Rule policies and procedures, [649] the Department expects that such training would address the physical safeguards it has implemented, particularly those policies and procedures for mobile devices that are used to create, receive, maintain, or transmit ePHI or that otherwise affect the confidentiality, integrity, or availability of ePHI.

d. Section 164.310(d)(1)-Standard: Technology Asset Controls

The Department proposes to modify the standard at 45 CFR 164.310(d)(1) by changing the heading to "Technology asset controls" from "Device and media controls," and replacing "hardware and electronic media" in 45 CFR 164.310(d)(1) and (2) with "technology assets." We believe that this modification would more accurately capture the various categories of components of a regulated entity's relevant electronic information systems that may be received in, removed from, or moved within a facility and that also affect the confidentiality, integrity, or availability of ePHI. Thus, we believe that this modification would provide regulated entities with a clearer understanding of their compliance obligations with respect to the physical safeguards that should be implemented to protect ePHI when technology assets are received by, removed from, or moved within a facility. While we are not proposing other significant changes to 45 CFR 164.310(d)(1) at this time, we remind regulated entities to consider the appropriateness of the policies and procedures they have implemented with respect to the movement of technology assets that maintain ePHI into and out of their facilities and the movement of these items within their facilities. The processes a regulated entity chooses to implement to govern the movement of technology assets may vary based on the type of technology asset. [650] For example, once installed, a server or desktop computer may not need to be moved for the entirety of its lifecycle within the regulated entity, while portable electronic devices and media, such as smartphones, tablets, and USB flash drives are designed to be mobile and may move frequently into, out of, and within a regulated entity's facilities. [651] Thus, the regulated entity's policies and procedures must account for these differences. [652] Further, we note that the proposed definition of workstation includes mobile devices. Mobile devices that serve as workstations are subject to the requirements in this paragraph and those in paragraphs (b) and (c). The Department also proposes to modify the standard at 45 CFR 164.310(d)(1)

There were no comments on this issue; however, FDA has deleted the word "domestic" and instead defines the word "person" consistent with its definition in section 201(e) of the FD&C Act. FDA believes that the term "domestic person" is no longer needed because it is exempting foreign persons, except for foreign persons who transport food in the United States, from the requirements

of subpart J of this final rule. 4. Farm (Comment 67) Several comments assert that FDA's proposed definition of farm is too narrow and would require recordkeeping by farms that minimally process their produce for further marketing. The comments claim that many fresh produce farms incorporate packing and holding activities, and that minor manufacturing/processing activities should be considered incidental to the packing and storage activities. Accordingly, to give effect to the legislative intent to exclude farms, the comments argue that the definition of "farm" should include typical fresh produce post-harvest farming operations such as packing/packaging, washing, grading, waxing, sizing, cooling, application of inventory control items (e.g., price lookup stickers (PLUs) or universal product codes (UPCs)), conventional storage, controlled-atmosphere storage, transportation from the fields, transportation to storage or processing facilities, and transportation from the farm. According to the comments, these activities should be included in the definition of "farm" whether they are conducted in the field or in a packinghouse. Some comments believe that the proposed definition of "farm" should be modified to include certain of the activities defined as manufacturing/processing, regardless of whether the foods that are the focus of these activities are consumed on that farm or one with common ownership or are offered for sale elsewhere, at least insofar as these activities relate to raw agricultural commodities. The comments state that the specific manufacturing/processing activities that should be included within the definition of "farm" are at least the following activities: Cutting, at least when this activity is applied to harvest of a farm crop; trimming; washing; labeling, at least when this activity is applied to containers that are not intended for direct consumer purchase; and packaging, at least when this activity is applied to containers that are not intended for direct consumer purchase. The comments also suggest that FDA should consider allowing farms to engage in milling and grinding without voiding the statutory exemption to section 306 of the Bioterrorism Act granted to farms, insofar as these activities are common farm activities.

According to hitech_omnibus_2013: <unknown> ## DEPARTMENT OF HEALTH AND HUMAN SERVICES
Office of the Secretary 45 CFR Parts 160 and 164 ## RIN 0945-AA03 Modifications to the HIPAA
Privacy, Security, Enforcement, and Breach Notification Rules Under the Health Information
Technology for Economic and Clinical Health Act and the Genetic Information Nondiscrimination Act;
Other Modifications to the HIPAA Rules AGENCY: Office for Civil Rights, Department of Health and
Human Services. ACTION: Final rule. SUMMARY: The Department of Health and Human Services (HHS or
"the Department") is issuing this final rule to: Modify the Health Insurance Portability and
Accountability Act (HIPAA) Privacy, Security, and Enforcement Rules to implement statutory
amendments under the Health Information Technology for Economic and Clinical Health Act ("the
HITECH Act" or "the Act") to strengthen the privacy and security protection for individuals'
health information; modify the rule for Breach Notification for Unsecured Protected Health
Information (Breach Notification Rule) under the HITECH Act to address public comment received on
the interim final rule; modify the HIPAA Privacy Rule to strengthen the privacy protections for
genetic information by implementing section 105 of Title I of the Genetic Information
Nondiscrimination Act of 2008 (GINA); and make certain other modifications to the HIPAA Privacy,
Security, Breach Notification, and Enforcement Rules (the HIPAA Rules) to improve their workability
and effectiveness and to increase flexibility for and decrease burden on the regulated entities.
DATES: Effective date: This final rule is effective on March 26, 2013. Compliance date: Covered
entities and business associates must comply with the applicable requirements of this final rule by
September 23, 2013. FOR FURTHER INFORMATION CONTACT: Andra Wicks 202-205-2292. SUPPLEMENTARY
INFORMATION: VerDate Mar<15>2010 18:57 Jan 24, 2013 Jkt 229001 sroberts on DSK5SPTVN1PROD
with ## I. Executive

- protecting the accountability, availability, integrity and confidentiality of information; -
Security management support documentation, including terminology and guidelines as well as
procedures for the registration of security components; - Security aspects of identity management,
biometrics and privacy; - Conformance assessment, accreditation and auditing requirements in the
area of information security management systems; and - Security evaluation criteria and methodology.
The FISMA Team also collaborated with DOD, the IC, DHS, the National Archives and Records
Administration (NARA), the Federal Emergency Management Agency (FEMA), the Government Accountability
Office (GAO), the Office of Management and Budget (OMB), the General Services Administration (GSA),
the Small Business Administration (SBA), and the Inspectors General (IGs) on multiple projects to
ensure consistency with FISMA-related guidance and to protect information in a way that is
commensurate with risk. In addition, the FISMA Team served as co-chairs on the Committee on National
Security Systems working groups. In FY 2017, the voting working group will focus its efforts on the

next revision of the VVSG. Based on feedback from the TGDC and election officials around the country, the new revision is expected to address new technologies and election use cases that have become commonplace in election systems. Additionally, the cybersecurity group plans to investigate security considerations and develop guidance in the areas of voter registration, electronic pollbooks, blank ballot delivery, ballot marking, auditing, and election-night reporting.

Consistent with FDA's assumption that the rule will require only small changes to current recordkeeping practices, the findings from the small business model indicate that virtually no small businesses will shut down as a result of this rule. In the Unfunded Mandates section of the PRIA, we also consider the impacts of the proposal on food prices and conclude that any effect would be negligible. E. Estimating the Benefits The benefits from the recordkeeping rule will be from illnesses averted due to faster traceback components of outbreak investigations, and an increased ability to complete investigations that previously would have been prematurely terminated due to poor records quality. Because of this new recordkeeping rule, a greater number of traceback investigations will be completed, and traceback investigations will take less time because of shorter records access times and better records quality. The benefits estimated in this analysis are realized only in the event of a foodborne outbreak (intentional or unintentional) because the probability of a terrorist attack is unknown. However, the estimated costs are incurred at all times regardless of whether there is an outbreak investigation underway, as well as by all facilities, regardless of whether they are implicated in the outbreak. 1. Bioterrorism Considerations Interviews with FDA traceback personnel indicate that traceback and source investigations involving fresh produce find that the contamination often occurs at the farm level (Ref. 2). The interviews suggest that bioterrorism scenarios envision possible intentional contaminations on the farm, in distribution, at processing, and at retail. Moreover, fresh products may be more likely targeted for intentional contamination when they are at intermediate levels of processing than when they are at the farm level. The benefits from the recordkeeping rule are from enhanced food safety and enhanced food security. We can estimate the food safety benefits, but we cannot estimate the food security benefits, as the probability of the occurrence of a deliberate outbreak is unknown. The tangible benefits from the recordkeeping rule occur after an outbreak of food-related illness. With the records required by this rule, the agency can investigate outbreaks more quickly and will not be forced to terminate an investigation because of poor or nonexistent records. The speeding up of investigations generates benefits in some cases because the information from the records will enable the agency to take actions to reduce the size of the outbreak. Both the increased completion rate and faster investigations may reveal more sources of outbreaks and help to prevent recurrences.

The OSC shall retain the hashed artifacts used as evidence during the assessment process. The OSC shall retain the unedited artifacts for the duration of the validity period of the certificate of assessment, and at a minimum, for six (6) years from the date of certification assessment. To ensure that the artifacts have not been altered, the OSC must hash the artifact files using a NIST-approved hashing algorithm. Assessors will collect the list of the artifact names, the return values of the hashing algorithm, and the hashing algorithm used and upload that data into the CMMC instantiation of eMASS. Additional guidance for hashing artifacts can be found in the guidance document listed in paragraph (h) of appendix A to this part. (5) Assessment of Cloud Service Provider. An OSC may use a Federal Risk and Authorization Management Program (FedRAMP) Moderate (or higher) cloud environment to process, store, or transmit CUI in execution of a contract or subcontract with a requirement for CMMC Level 3 under the following circumstances: (i) The Cloud Service Provider's (CSP) product or service offering is FedRAMP Authorized at the FedRAMP Moderate (or higher) baseline in accordance with the FedRAMP Marketplace; or (ii) The Cloud Service Provider's (CSP) product or service offering is not FedRAMP Authorized at the FedRAMP Moderate (or higher) baseline but meets security requirements equivalent to those established by the FedRAMP Moderate (or higher) baseline. Equivalency is met if the OSC has the CSP's System Security Plan (SSP) or other security documentation that describes the system environment, system responsibilities, the current status of the Moderate baseline controls required for the system, and a Customer Responsibility Matrix (CRM) that summarizes how each control is MET and which party is responsible for maintaining that control that maps to the NIST SP 800-171 Rev 2 requirements. (See https://www.fedramp.gov/assets/resources/documents/FedRAMP_Moderate_Security_Controls.xlsx .) (iii) In accordance with § 170.19, the OSC's on-premises infrastructure connecting to the CSP's product or service offering is part of the CMMC Assessment Scope. As such, the security requirements from the CRM must be documented or referred to in the OSC's SSP. § 170.19 CMMC scoping. (a) Scoping requirement. (1) The CMMC Assessment Scope must be specified prior to assessment in

accordance with the requirements of this section. The CMMC Assessment Scope is the set of all assets in the OSA's environment that will be assessed against CMMC security requirements. (2) The requirements for defining the CMMC Assessment Scope for CMMC Levels 1, 2, and 3 are set forth in this section. Additional guidance regarding scoping can be found in the guidance documents listed in paragraphs (e) through (g) of appendix A to this part. (b) CMMC Level 1 Scoping. Prior to performing a Level 1 CMMC Level 1 Self-Assessment, the OSA must specify the CMMC Assessment Scope. (1)

without unreasonable delay, but no later than 24 hours after activation. [836] This proposal, if finalized, would not alter the business associate's breach reporting obligations under the Breach Notification Rule. [837] The Department believes that it is necessary to notify the covered entity in a timely manner of the contingency plan activation because of the downstream implications for such activation. Receiving such prompt notice could enable the covered entity to take the necessary steps to protect its own relevant electronic information systems, as well as to implement its own contingency plan if necessary and appropriate (e.g., enable the covered entity to access a remote or offline backup of its ePHI if necessary to ensure that patient care is unaffected or to reduce the effect on patient care as much as possible). For example, in 2020, a software company was the target of an attack that used software containing malware to infiltrate the electronic information systems of subsequent users of the software. This allowed cybercriminals to gain access to several government systems and thousands of private systems worldwide. [838] Requiring a business associate to provide prompt notice to the covered entity when the business associate activates its contingency plan could enable regulated entities to maintain individuals' confidence in their commitment to protecting the confidentiality, integrity, and availability of ePHI in the event of an emergency or other occurrence that adversely affects relevant electronic information systems. [839] Additionally, the modified standard would align with the enhanced CPG for Third Party Incident Reporting because this proposal would require a business associate to both report to a covered entity or another business associate activation of its contingency plan within 24 hours of such activation and report known or suspected security incidents. [840] As discussed above, the Department proposes to require a regulated entity to activate its contingency plan to respond to an emergency or other occurrence that adversely affects relevant electronic information systems. [841] The Department believes that regulated entities activate their contingency plans infrequently because such plans are only activated when there is an emergency or other occurrence that rises to a level beyond a security incident that is thwarted or other event that does not adversely affect the confidentiality, integrity, or availability of ePHI. Thus, the need to make the proposed notification would also arise infrequently. For example, a business associate may not be required to notify a covered entity within a certain time after a relevant electronic information system receives a basic internet command such as a ping, [842]

sed on conversations he had with colleagues in which he learned 'each manufacturer is actually just borrowing security APIs instead of creating their own, and the APIs specifically have holes in them. So the same vulnerability is being propagated across vendors' (P13_A) . Others were concerned based on their exposure to news stories about smart home devices being compromised. For P34_A, one such story prompted him to be more suspicious of his devices:

1. Name of the project, and a description of the purpose and scope. 2. Mission requirement the system is designed to satisfy. 3. Estimated costs (capital investment and operations) for each fiscal year 1989-1993. 4. Description of input (typewritten text, invoices, receipts, forms, drawings, etc.). If practical, attach examples of documents that illustrate the various types of information that 5. will be captured. For example, if documents contain both text and image, provide a sample of that type of document. 5. Description of the origin of the input including both the type and location of organizations supplying the documents and the technology that the supplier uses to create the documents, if known 6. Description of the conversion and input process, including scanning system, authentication procedures, use of outside contractors, quality control and data loading procedures. 7. Proposed accuracy of stored image (150 dots per inch, 200 dots per inch, etc.). 8. Storage format for images (Group 4 FAX, etc.). 9. Description of proposed work station for retrieval (including screen resolution, number and size of screens, communications speed and protocol, zoom, local storage capacity, etc.). 10. Volume of stored images (in pages and bytes) to be captured initially, total volume online each year FY 1989-1993, volume removed from online access (archived or destroyed) each year FY 1989-1993. 11. Response time for online document retrieval. 12. Brief description of the operation of the indexing and storage system (index keys, searching

techniques, off-the-shelf system, etc.) 13. A description of unique functions, capabilities, or performance standards (such as large format hardcopy output, grey scale image enhancement, etc.) required by this system that will make it different from commercially available systems. 14. The name and telephone number of a point of contact who can provide more information.

The type of security requirement is noted in the discussion section of each requirement. NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025
Appropriately scoping security requirements is an important factor in determining protection-234

(G) From subsection (e)(5) because the requirement that records be maintained with attention to accuracy, relevance, timeliness, and completeness would unfairly hamper the investigative process. It is the nature of law enforcement for investigations to uncover the commission of illegal acts at diverse stages. It is frequently impossible to determine initially what information is accurate, relevant, timely, and least of all complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light. (H) From subsection (f) because the agency's rules are inapplicable to those portions of the system that are exempt and would place the burden on the agency of either confirming or denying the existence of a record pertaining to a requesting individual might in itself provide an answer to that individual relating to an on-going investigation. The conduct of a successful investigation leading to the indictment of a criminal offender precludes the applicability of established agency rules relating to verification of record, disclosure of the record to the individual and record amendment procedures for this record system. (I) From subsection (g) because this system of records should be exempt to the extent that the civil remedies relate to provisions of 5 U.S.C. 552 a from which this rule exempts the system. (6) System identifier and name. LDIA 10-0002, Foreign Intelligence and Counterintelligence Operation Records. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (b)(6)(i)(A). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. (B) The specific sections of 5 U.S.C. 552 a from which the system is to be exempted are 5 U.S.C. 552a (c)(3) and (c)(4), (d), (e)(1), (e)(2), (e)(3), (e)(4)(G), (H), and (I), (e)(5), (f), and (g). (ii) Authority. 5 U.S.C. 552a(k)(2) . (iii) Reasons.

Removing from paragraph (b)(2) ·Industrial Security Regulation (DOD 5220.22-R)· and adding ·DoD Manual 5220.22, Volume 2, ·National Industrial Security Program: Industrial Security Procedures for Government Activities...· in its place; and c. Redesignating paragraph (d) as (e), and adding a new paragraph (d) to read as follows: 4.402 General. * * * * * (d) Nondefense agencies that have industrial security services agreements with DoD, and DoD components, shall use the DD Form 254, Contract Security Classification Specification, to provide security classification guidance to U.S. contractors, and subcontractors as applicable, requiring access to information classified as ·Confidential·, ·Secret·, or ·Top Secret·. (1) Provided that the data submittal is unclassified, the DD Form 254 shall be completed electronically in the NISP Contract Classification System (NCCS), which is accessible via the Procurement Integrated Enterprise Environment (PIEE) at <https://wawf.eb.mil> unless a nondefense agency has an existing DD Form 254 information system. (2)(i) A contractor, or subcontractor (if applicable), requiring access to classified information under a contract shall be identified with a Commercial and Government Entity (CAGE) code on the DD Form 254 (see subpart 4.18 for information on obtaining and validating CAGE codes). (ii) Each location of contractor or subcontractor performance listed on the DD Form 254 is required to reflect a corresponding unique CAGE code for each listed location unless the work is being performed at a Government facility, in which case the agency location code shall be used. (iii) Contractor and subcontractor performance locations listed on the DD Form 254 are not required to be separately registered in the System for Award Management (SAM) solely for (printed page 33204) the purposes of a DD Form 254 (see subpart 4.11 for information on registering in SAM). * * * * * 5. Amend section 4.403 by removing from paragraph (c) introductory text ·contract as follows· and adding ·contract as identified in the requirement documentation as follows· in its place, and revising paragraph (c)(1) to read as follows: 4.403 Responsibilities of contracting officers. * * * *

* (c) * * * (1) Nondefense agencies that have industrial security services agreements with DoD, and DoD components, shall use the Contract Security Classification Specification, DD Form 254. The contracting officer, or authorized representative, is the approving official for the DD Form 254 associated with the prime contract and shall- (i) Ensure the DD Form 254 is properly prepared and distributed; and (ii) Coordinate with requirements and security personnel in accordance with agency procedures to complete the DD Form 254, including when completed in the NCCS accessible via the Procurement Integrated Enterprise Environment (PIEE) at <https://wawf.eb.mil> unless a nondefense agency has an existing DD Form 254 information system. * * * * 4.1801 [Amended] 6.

In 2013, the Department issued the final rule ·Modifications to the HIPAA Privacy, Security, Enforcement, and Breach Notification Rules Under the Health Information Technology for Economic and Clinical Health [HITECH] Act and the Genetic Information Nondiscrimination Act, and Other Modifications to the HIPAA Rules· (·2013 Omnibus Rule·), [99] which implemented applicable provisions of the HITECH Act to strengthen security protections for individuals' health information maintained in EHRs. For example, the Department modified the Security Rule to implement the HITECH Act's provisions that extended direct liability for compliance with the Security Rule to business associates. [100] We explained that before the enactment of the HITECH Act, the Security Rule did not directly apply to business associates of covered entities. The HITECH Act extended the application of the Security Rule's administrative, physical, and technical safeguards requirements, as well as the rule's policies and procedures and documentation requirements, to business associates in the same manner as the requirements apply to covered entities, making those business associates civilly and criminally liable for violations of the Security Rule. [101] The Department noted that the Security Rule requires a covered entity to establish business associate agreements that obligate business associates to implement administrative, physical, and technical safeguards that reasonably and appropriately protect the confidentiality, integrity, and availability of the ePHI that they create, receive, maintain, or transmit on behalf of the covered entity. [102] Accordingly, we reasoned that business associates and subcontractors should already have security practices in place that comply with the Security Rule, or require only modest improvement to come into compliance with the Security Rule requirements. [103] Like the 2003 Final Rule, [104] the 2013 Omnibus Rule highlighted that the Security Rule was designed to be technology neutral and scalable and reiterated that regulated entities have the flexibility to choose security measures appropriate for their size, resources, and the nature of the security risks they face. [105] Accordingly, regulated entities have the flexibility to choose appropriate security measures considering their size, capabilities, the costs of the specific security measures, and the operational impact, enabling them to reasonably implement the standards of the Security Rule. The Department also adopted technical revisions to 45 CFR 164.306(e) to clarify that regulated entities must review and modify security measures as needed to ensure reasonable and appropriate protection of ePHI, and update documentation of security measures accordingly. [106]

(Comment 99) Several comments request that the agency clarify the term ·ingredient· with respect to distilled spirits that have innumerable sources of ingredients dependent upon the category and particular brand. The comments state that there is a question of interpretation as to what is meant by ingredients, given that the distilling process changes substantially the character and chemical composition of the raw materials and some of them may even be absent from the final product. (Response) Alcoholic beverages are within the definition of ·food· in §1.328 of this final rule. A manufacturer of alcoholic beverages is required under §1.337 of this final rule to identify the source of each ingredient that was received to make the alcoholic beverage, regardless of whether it later changes character and chemical composition. (Comment 100) One comment suggests that the agency reconsider the requirement for immediate previous sources of bottled water. The comment asserts that the detail of records required under the regulations will not exist in many cases because the bottled water source will be directly out of the ground and that the bottler will capture any potential concerns of a serious threat of adverse health consequences. The comment suggests that water be viewed as other primary agricultural food ingredients. (Response) Bottled water is within the definition of food as defined in §1.328 of this final rule. If water is obtained from a public water system, then the public water system is the immediate previous source. If ground water is used, then the location where the water was extracted should be provided. (Comment 101) One comment recommends that, in requiring a record of the raw material of a product, the agency should limit its requirement to that of major ingredients of the product. (Response) FDA does not agree with the comment. The comment neither explains what distinguishes a major ingredient from a minor one, nor why the agency should limit its requirement to ·major· ingredients only. Even

if an ingredient is present only in small quantities, it may pose a risk and could be the focus of an intentional attack (e.g., the deliberate addition of a chemical toxin or pathogens), which would further contaminate food products to which they are added. 3. Requirement to Record Responsible Individual

The respondent's recommendation would require reprogramming of the Plant Clearance Automated Redistribution and Screening System (PCARSS). The cost of such reprogramming would largely offset the marginal increase in reutilization realized. C. Sales of Surplus Property Comment: In reference to 245.604-3, Sale of surplus property, a respondent suggested that risk-based techniques be used. For example, high value items should be treated differently, according to the respondent, from items with little potential for proceeds. DoD Response: The language at 245.604-3(1) has been clarified to ensure that plant clearance officers consider the market potential of items prior to authorizing surplus sales and determine the best value sales approach. Comment: A respondent recommended that 252.245-70XX(c), be changed to read 'net proceeds.' The respondent cited the Federal Property Administration Act of 1949, which states that a portion of the proceeds goes to the 'cost of the work.' The respondent also claimed that paragraph (c) conflicts with FAR 31.201-5 and ASTM International standard 2279-09, Establishing the Guiding Principles of Property Management (costs of sales may outweigh the return). DoD response: The respondent's recommendation implies that contractors are entitled to a share of sales proceeds to cover the contractor costs of conducting the sale. There is no basis for such policy or for otherwise directly reimbursing a contractor for costs incurred in conducting surplus property sales. Such action is a normal part of contractor responsibilities under the clause at FAR 52.245-1(b)(2). FAR 31.201-5 pertains to income, rebates, allowances, or other credits made to allowable costs. Because surplus property sales are a normal part of a contractor's property management responsibilities under the clause at FAR 52.245-1(b)(2) and are typically provided by the contractor as an overhead function, FAR 31.201-5 has no application here. ASTM International standard 2279-09 is not germane to the issue of proper deposit of sales proceeds received under surplus sales. Comment: A respondent recommended that a certification statement or a standard form providing the terms and conditions of the sale between the Government and buyer be provided at 252.245-70XX(e). The respondent also asked what the expectation is here. DoD Response: The language exists today in 245.604. As indicated in the proposed rule, 245.604 has been updated and the language moved to the final rule clause at 252.245.70XX. Its requirements are an important policy safeguard to ensure the integrity of the surplus sales process. Comment: A respondent requested that the language at 252.245-70XX(l)(2) be changed as follows, '(t)he Contractor shall solicit a sufficient number of bidders to obtain adequate competition and use informal invitations for bid unless the plant clearance officer approves use of formal bid procedures.' DoD Response:

In FY2013, CSD will assist the EAC in developing responses to public comments and provide updates to VVSG 1.1 and the associated security test suites. CSD will continue to support the efforts for the EAC and FVAP to improve the voting process for UOCAVA voters. CSD will also continue to expand on research activities, particularly in the areas of risks to voting systems and innovative voting system architectures. NIST continue its HIT security outreach efforts. NIST and the Department of Health and Human Services' (DHHS) Office for Civil Rights (OCR) cohosted the fifth annual HIPAA Security Rule conference, 'Safeguarding Health Information: Building Assurance through HIPAA Security,' in June 2012 at the Ronald Reagan Building and International Trade Center in Washington, D.C. The conference offered important sessions that focused on broad topics of interest to the healthcare and health IT security community. Over 500 attendees from federal, state, and local governments, academia, HIPAA-covered entities and business associates, industry groups, and vendors heard from, and interacted with, healthcare, security, and privacy experts on technologies and methodologies for safeguarding health information and for implementing the requirements of the HIPAA Security Rule.

- Employ administrative, physical, and technical safeguards on plant systems.
- Implement acquisitions management, change controls, and obsolescence and lifecycle management.
- Maintain product integrity through continuous quality testing, monitoring containment and shipments, and equipment inspection.
- Establish procedures for integrity measurement, including:
 - o Systems testing
 - o Preventive maintenance
 - o Remediation
 - o Ongoing situational awareness
 - o Process review
- Architect fault-tolerant systems to maintain operational integrity during adverse events.
- Define policy to outline standard operating procedure to maintain repeatable processes with anticipated outcomes.
- Determine a schedule and develop a plan for efficacy measures, which

include testing, preventative maintenance, remediation, and ongoing situational awareness. - Establish and leverage communication paths and trend data from devices to identify deviations from baseline traffic flows. - Document training and awareness procedures for potential cybersecurity risk vectors. Organizations mitigate supply chain risks in the procurement of information and communications technology and services through clear vendor agreements and established processes and procedures (including testing) prior to installation and updates.

3.2.2 | Organization Size... 3.2.2 Organization Size Organization size was determined by the number of federal employees.

(B) Records maintained solely for statistical research or program evaluation purposes and which are not used to make decisions on the rights, benefits, or entitlement of an individual except for census records which may be disclosed under 13 U.S.C. 8 , may be exempt pursuant to 5 U.S.C. 552a(k)(4) . (printed page 14798) (C) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (D) All portions of this system of records which fall within the scope of 5 U.S.C. 552a(k)(2) , (k)(4), and (k)(5) may be exempt from the provisions of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I) and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) , (k)(4), and (k)(5). (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would place the subject of an investigation on notice that they are under investigation and provide them with significant information concerning the nature of the investigation, thus resulting in a serious impediment to law enforcement investigations. (B) From subsections (d) and (f) because providing access to records of a civil or administrative investigation and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal their wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that would make them difficult or impossible to reach in order to satisfy any Government claim growing out of the investigation or proceeding. (C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsections (e)(4)(G) and (H) because this system of records is compiled for investigative purposes and is exempt from the access provisions of subsections (d) and (f).

and to revise the redesignated evaluation standard to require the technical and nontechnical evaluation(s) to be in writing and performed to determine whether change in the regulated entity's environment or operations may affect the confidentiality, integrity, or availability of ePHI.

Evaluating the effects of a potential change on a regulated entity's environment or operations, including the effects on the confidentiality, integrity, and availability of ePHI, is a critical step in the change control process. An evaluation serves a similar purpose to a risk analysis. However, while a risk analysis looks at the entirety of a regulated entity's enterprise regularly and in response to a change in the regulated entity's environment or operations, an evaluation looks at a specific change that a regulated entity intends to make before the change is made. Thus, this proposal, if adopted, would ensure that a regulated entity proactively considers whether any risks or vulnerabilities to ePHI or its relevant electronic information systems will be introduced by changes it intends to make to its environment or operations and responds by implementing appropriate safeguards in a timely fashion. [489] We also propose to delete the requirement that the evaluation be performed based initially on the standards implemented under this rule because an evaluation is performed to assess the effect(s) of a planned change on the environment, which can be observed when those effects are compared to the environment reflected in the risk analysis. Additionally, the Department proposes to add two implementation specifications at (printed page 942) proposed 45 CFR 164.308(a)(3)(ii) . The proposed implementation specification for performance at proposed 45 CFR 164.308(a)(3)(ii)(A) would require that a regulated entity conduct the evaluation within a reasonable period of time before making a change to its environment or operations, while the proposed implementation specification for response at proposed 45 CFR 164.308(a)(3)(ii)(B) would require a regulated entity to respond to the evaluation in accordance with its risk management plan. A change in the regulated entity's environment or operations would include, but would not be limited to, the adoption of new technology assets; the upgrading, updating, or patching of technology assets; newly recognized threats to the confidentiality, integrity, or availability of ePHI; a sale, transfer, merger or consolidation of all or part of the regulated entity with another person; a security incident that affects the confidentiality, integrity, or availability of ePHI; and relevant changes in Federal, State, Tribal, and territorial law. NIST guidance provides descriptions of key activities and sample questions that would help regulated entities meet this evaluation standard. [490] They include:

From the NIST SP 800-172 Rev 3 Final Public Draft: 03.13.02E Randomness 1773 E mploy [Assignment: organization-defined techniques] to introduce randomness into organizational operations and assets. DISCUSSION Randomness introduces increased levels of uncertainty for adversaries regarding the actions that organizations take to defend their systems against attacks. Such actions may impede the ability of adversaries to correctly target organizational systems that support critical missions or business functions. Uncertainty may cause adversaries to hesitate before initiating or continuing attacks. Misdirection techniques that involve randomness include performing certain routine actions at different times of day, employing different information technologies, using different suppliers, and rotating the roles and responsibilities of o

3.2.6 Review IT Security The Contractor shall examine sensitive and critical IT systems and data files.

(2) Ensure promises of confidentiality are not automatically given but are used sparingly. Establish appropriate procedures and identify fully categories of individuals who may make such promises. Promises of confidentiality shall be made only when they are essential to obtain the information sought (see 5 CFR part 736). (c) Access to records for which DOD-wide exemptions are claimed. Deny the individual access only to those portions of the records for which the claimed exemption applies. (d) Exempt records. Records are only exempt from pertinent provisions of 5 U.S.C. 552a to the extent that such provisions have been identified and an exemption claimed for the record and the purposes underlying the exemption for the record pertain to the record. (e) DoD-wide exemptions. The following exemptions are applicable to all components of the Department of Defense for the following system(s) of records: (1) System identifier and name. DUSDI 01-DoD Department of Defense (DoD) Insider Threat Management and Analysis Center (DITMAC) and DoD Component Insider Threat Records System. (i) Exemption. This system of records is exempted from subsections (c)(3) and (4); (d)(1), (2), (3) and (4); (e)(1), (2), (3), (4)(G)(H) and (I), (5) and (8); and (g) of the Privacy Act. (ii) Authority. 5 U.S.C. 552a(j)(2) and (k)(1) , (2), (4), (5), (6), and (7). (iii) Exemption from the particular subsections. Exemption from the particular subsections is justified for the following reasons: (A) Subsection (c)(3). To provide the subject with an accounting of disclosures of records in this system could inform that individual of the existence, nature, or scope of an actual or potential law enforcement or counterintelligence investigation, and thereby seriously impede law enforcement or counterintelligence efforts by permitting the record

subject and other persons to whom he might disclose the records to avoid criminal penalties, civil remedies, or counterintelligence measures. Access to the accounting of disclosures could also interfere with a civil or administrative action or investigation which may impede those actions or investigations. Access also could reveal the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations. (B) Subsection (c)(4). This subsection is inapplicable to the extent that an exemption is being claimed for subsection (d). (C) Subsection (d)(1).

Under the NIST SP 800-171 DoD Assessment Methodology, each of the 110 security requirements has an assigned point value based on criticality: - **5 points**: Critical controls (most impactful to CUI protection). Examples include multi-factor authentication, encryption, and incident response. - **3 points**: Important controls with moderate impact. Examples include security awareness training and configuration management. - **1 point**: Supporting controls with lower individual impact but still required for compliance. The maximum SPRS score is +110 (all controls implemented). If a 5-point control is not implemented, 5 points are deducted. The minimum possible score is -203. Note: As of February 1, 2026, the DFARS 252.204-7019 requirement to submit Basic self-assessment SPRS scores has been eliminated. However, the scoring methodology is still used for Medium and High assessments under DFARS 252.204-7020.

SI.L2-3.14.4 · Update Malicious Code Protection [CUI Data] CMMC Assessment Guide · Level 2 | Version 2.13 254 SI.L2-3.14.4 · UPDATE MALICIOUS CODE PROTECTION [CUI DATA] Update malicious code protection mechanisms when new releases are available. ASSESSMENT OBJECTIVES [NIST SP 800-171A]225 Determine if: [a] malicious code protection mechanisms are updated when new releases are available. POTENTIAL ASSESSMENT METHODS AND OBJECTS [NIST SP 800-171A]225 Examine [SELECT FROM: System and information integrity policy; configuration management policy and procedures; procedures addressing malicious code protection; malicious code protection mechanisms; records of malicious code protection updates; system security plan; system design documentation; system configuration settings and associated documentation; scan results from malicious code protection mechanisms; record of actions initiated by malicious code protection mechanisms in response to malicious code detection; system audit logs and records; other relevant documents or records]. Interview [SELECT FROM: System or network administrators; personnel with information security responsibilities; personnel installing, configuring, and maintaining the system; personnel with responsibility for malicious code protection; personnel with configuration management responsibility]. Test [SELECT FROM: Organizational processes for employing, updating, and configuring malicious code protection mechanisms; organizational process for addressing false positives and resulting potential impact; mechanisms supporting or implementing malicious code protection mechanisms (including updates and configurations); mechanisms supporting or implementing malicious code scanning and subsequent actions]. DISCUSSION [NIST SP 800-171 REV. 2]

32 CFR part 117 does not impose additional reporting or recordkeeping requirements under the Paperwork Reduction Act of 1995. Standard Form (SF) 328, ·Certificate Pertaining to Foreign Interests· has been assigned OMB Control Number 0704-0194. E.O. 13132 , ·Federalism· It has been certified that 32 CFR part 117 does not have federalism implications, as set forth in E.O. 13132 . This rule does not have substantial direct effects on: (1) The States; (2) The relationship between the National Government and the States; or (3) The distribution of power and responsibilities among the various levels of Government. List of Subjects in 32 CFR Part 117 Classified information Facility security clearances Foreign ownership, control or influence procedures Security measures Accordingly, 32 CFR part 117 is added to read as follows: (printed page 19470) PART 117·NATIONAL INDUSTRIAL SECURITY PROGRAM Subpart A·[Reserved] Subpart B·[Reserved] Subpart C·Procedures for Government Activities Relating to Foreign Ownership, Control or Influence (FOCI) 117.51 Purpose. 117.52 Applicability. 117.53 Definitions. 117.54 Policy. 117.55 Responsibilities. 117.56 Foreign ownership, control or influence (FOCI). Authority: Executive Order (E.O.) 12829, January 6, 1993, 58 FR 3479 . Subpart A·[Reserved] Subpart B·[Reserved] Subpart C·Procedures for Government Activities Relating to Foreign Ownership, Control or Influence (FOCI) §·117.51 Purpose. This part sets forth industrial security procedures and practices related to Foreign Ownership, Control or Influence (FOCI) for the Department of Defense (DoD) Components, as defined in this part and non-DoD Components, as defined in this part, to ensure maximum uniformity and effectiveness in DoD implementation of the National Industrial Security Program (NISP) established by Executive Order (E.O.) 12829 ·National Industrial Security Program,· (available at <http://www.archives.gov/isoo/policy-documents/eo-12829.html>). §·117.52

Applicability. (a) This part applies to: (1) The DoD Components. (2) The non-DoD Components. When the term Government Contracting Activities (GCAs) is used, it applies to both DoD Components and non-DoD Components. (b) This part does not: (1) Limit in any manner the authority of the Secretary of Defense, the Secretaries of the Army, Navy and Air Force; or the Heads of the Components, as defined in this part, to grant access to classified information under the cognizance of their respective department or agency to any individual or entity designated by them. The granting of such access is outside the scope of the NISP and is governed by Executive Order (E.O.) 13526, "Classified National Security Information," (available at <http://www.archives.gov/isoo/pdf/cnsi-eo.pdf>) and applicable disclosure policies. (2) Limit the authority of a GCA to limit, deny, or revoke access to classified information under its statutory, regulatory, or contractual jurisdiction.

and that is required by Executive Order to be kept classified in the interest of national defense or foreign policy. This exemption is applicable to parts of all systems of records including those not otherwise specifically designated for exemptions herein, which contain isolated items of properly classified information. (b) An individual is not entitled to have access to any information compiled in reasonable anticipation of a civil action or proceeding (5 U.S.C. 552a(d)(5)). (c) No system of records within Department of the Air Force shall be considered exempt under subsection (j) or (k) of the Privacy Act until the exemption rule for the system of records has been published as a final rule in the Federal Register . (d) Consistent with the legislative purpose of the Privacy Act of 1974, the Department of the Air Force will grant access to non-exempt material in the records being maintained. Disclosure will be governed by the Department of the Air Force's Privacy Instruction, but will be limited to the extent that identity of confidential sources will not be compromised; subjects of an investigation of an actual or potential violation will not be alerted to the investigation; the physical safety of witnesses, informants and law enforcement personnel will not be endangered, the privacy of third parties will not be violated; and that the disclosure would not otherwise impede effective law enforcement. Whenever possible, information of the above nature will be deleted from the requested documents and the balance made available. The controlling principle behind this limited access is to allow disclosures except those indicated above. The decisions to release information from these systems will be made on a case-by-case basis. (e) General exemptions. The following systems of records claim an exemption under 5 U.S.C. 552a(j)(2) , with the exception of F090 AF IG B, Inspector General Records and F051 AF JA F, Courts-Martial and Article 15 Records. They claim both the (j)(2) and (k)(2) exemption, and are listed under this part: (1) System identifier and name. F071 AF OSI A, Counter Intelligence Operations and Collection Records. (2) System identifier and name. F071 AF OSI C, Criminal Records. (3) System identifier and name. F071 AF OSI D, Investigative Support Records. (4) System identifier and name. F031 AF SP E, Security Forces Management Information System (SFMIS). (i) Exemption. Parts of this system may be exempt pursuant to 5 U.S.C. 552a(j)(2) if information is compiled and maintained by a component of the agency which performs as its principle function any activity pertaining to the enforcement of criminal laws. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(j) (2) from the following subsections of 5 U.S.C. 552a(c)(3) , (c)(4), (d), (e)(1), (e)(2), (e)(3), (e)(4)(G), and (I), (e)(5), (e)(8), (f), and (g). (ii) Authority. 5 U.S.C. 552a(j)(2) . (iii) Reasons.

· the U.S. Government, is a party to the proceeding or has an interest in such proceeding and, by careful review, the Agency determines that the records are (printed page 72689) both relevant and necessary to the proceeding and the use of such records is therefore deemed by the Agency to be for a purpose that is compatible with the purpose for which the Agency collected the records. Disclosure may be made to the National Archives and Records Administration (NARA) and/or the General Services Administration for the purpose of records management inspections conducted under authority of 44 U.S.C. 2904 and 2906 . Disclosure may be made to the DOJ when: · The Agency or any component thereof; or · any employee of the Agency in his or her official capacity; or · any employee of the Agency in his or her individual capacity where the Agency or the DOJ has agreed to represent the employee; or · the U.S. Government, is a party to litigation or has an interest in such litigation and, by careful review, the Agency determines that the records are both relevant and necessary to the litigation and the use of such records by the DOJ is therefore deemed by the Agency to be for a purpose that is compatible with the purpose for which the Agency collected the records. In the event HHS/FDA deems it desirable or necessary, in determining whether particular records are required to be disclosed under the Freedom of Information Act, disclosure may be made to the DOJ for the purpose of obtaining its advice. J. Policies and Practices for Storing, Retrieving, Accessing, Retaining, and Disposing of Records in the System 1. Storage Records are maintained in hard copy

files, image files, electronic hard drive, file servers, and other electronic data storage devices.

2. **Retrievability** To retrieve information, the system database is typically queried using any of the internal data fields. The data fields encompass any data criterion that is entered into the system including, but not limited to, name, FDA region, credential number (if issued pocket credentials), certificate expiration date, State, program area, or authority.

3. **Safeguards**

a. **Authorized users.** Access is restricted to FDA employees and contractors with a Level 5 or higher clearance who have a need for the records in the performance of their duties.

b. **Procedural and technical safeguards.** Technical controls include identification and authentication of the authorized user, access control, audit and accountability, system and communication protection, timely account disablement/deletion, configuration management, maintenance, system and information integrity, media protection, and incident response. These controls extend to remote users as well.

c. **Physical safeguards.** Physical safeguards include controlled-access buildings where all records (such as diskettes, computer listings, and paper documents) are maintained in secured areas, locked buildings, locked rooms, and locked cabinets.

K. **Retention and Disposal**

In addition, a retail food establishment that employs 10 or fewer full-time equivalent employees is excluded from all of the requirements of this subpart, except the records access provisions for existing records under §§ 1.361 and 1.363. Given the large number of establishments that would be excluded and the significant cost reduction, FDA has analyzed the impact on its ability to efficiently and effectively conduct a tracing investigation to address credible threats of serious adverse health consequences or death. FDA believes the information as to the source of the food of concern sold at these establishments may be obtainable from a larger retail food establishment that is covered by the regulations and sold the same food. Specifically, many of the foods sold at very small retail food establishments are nationally distributed and are also sold at covered retail establishments. If there is an outbreak and product could also be traced to a covered retailer, then FDA could use that retailer's records to identify the source of the food. Moreover, given the relatively small size of the exempted establishments, the exempted establishments are likely to have fewer products and suppliers than other retail establishments and are therefore more likely to be able to provide FDA with source information even if they are exempted from records establishment requirements. With larger retailers, the records of immediate previous sources are more critical to isolating quickly potential sources of food that poses a threat of serious adverse health consequences or death to humans or animals. The exclusion is based on the number of employees at each retail food establishment and not the entire company, which may own numerous retail stores.

(Comment 39) One comment argues that distributors for direct selling companies should be exempt from the requirement to maintain records concerning immediate subsequent recipients. The proposed regulation would have a significant impact on the direct selling industry. Independent distributors sell product not only to consumers, but also to other independent distributors in their network to support each others' businesses and enable them to fulfill customer orders.

(Comment 42) One comment states that, in the case of control state retail operations, keeping detailed information on the immediate subsequent recipients would impose an administrative burden. Although retailers are generally exempt from keeping records pertaining to their customers, the exemption is lost when, as is the case with control states, retail stores sell to other retailers, in this case restaurants, taverns, and bars who subsequently resell the alcoholic beverages being purchased to end-use customers. The retail store transactions are essentially the same type of over-the-counter transactions that take place between the stores and individual consumers. Some information is usually and customarily maintained (e.g., the information pertaining to the licensed purchaser and what is being purchased), although in some cases such information is not generally secured and retained. The comment further notes that some of the information sought (e.g., lot and other product identifiers) is neither generally secured, nor is it maintained.

(Response) Section 1.327(d) of the final rule excludes persons who distribute food directly to consumers from the requirement to establish and maintain records of the immediate subsequent recipients of food. As discussed in response to comment 37 of this document, such sales are excluded because FDA can learn from sickened consumers about the sources of food they purchased or notify consumers generally about food that presents a threat. However, this rationale is not applicable when, as described in the comment, retail stores sell to other retail stores. Under § 1.327(e) of the final rule, persons who operate retail food establishments that distribute food to persons who are not consumers are subject to all of the requirements in subpart J of this final rule. However, for retail food establishments, the requirements in § 1.345 of this final rule to establish and maintain records to identify the nontransporter and transporter immediate subsequent recipients that are not consumers applies as to

only those transactions and only to the extent the information is reasonably available. In addition, a retail food establishment that employs 10 or fewer full-time equivalent employees is excluded from all of the requirements in subpart J of this final rule, except §§ 1.361 and 1.363. (See response to comment 38 of this document for a further discussion of FDA's rationale underlying this exclusion.) In regard to lot identification numbers, retailers are not required to maintain this information. The final rule only requires that persons who manufacture, process, or pack food record lot or code numbers or other identifiers of that food (and only to the extent this information exists) (§§ 1.337(a)(4) and 1.345(a)(4) of the final rule).

MA.L2-3.7.3 · Equipment Sanitization CMMC Assessment Guide · Level 2 | Version 2.13 149 addition to clearing the data an organization could purge (e.g., degaussing, secure erasing, or disassembling) the data, or even destroy the media (e.g., incinerating, shredding, or pulverizing). Performing one of these activities ensures that the data is extremely hard to recover, thus ensuring its confidentiality. For additional guidance on which specific sanitization actions should be taken on any specific type of media, review the description of the Purge actions given in NIST SP 800-88 Revision 1 · Guidelines for Media Sanitization. Example You manage your organization's IT equipment. A recent DoD project has been using a storage array to house CUI. Recently, the array has experienced disk issues. After troubleshooting with the vendor, they recommend several drives be replaced in the array. Knowing the drives may contain CUI, you reference NIST 800-88 Rev. 1 and determine a strategy you can implement on the defective equipment · processing the drives with a degaussing unit [a]. Once all the drives have been wiped, you document the action and ship the faulty drives to the vendor. Potential Assessment Considerations · Is there a process for sanitizing (e.g., erasing, wiping, degaussing) equipment that was used to store, process, or transmit CUI before it is removed from the facility for off-site maintenance (e.g., manufacturer or contracted maintenance support) [a]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.7.3

ness processes, users or personnel, or external relationships that the adversary can subsequently employ in support of an attack. || Perform reconnaissance and surveillance of targeted organizations. | Adversary uses various means (e.g., scanning, physical observation) over time to examine and assess organizations and ascertain points of vulnerability. || Perform malware-directed internal reconnaissance. | Adversary uses malware installed inside the organizational perimeter to identify targets of opportunity. Because the scanning, probing, or observation does not cross the perimeter, it is not detected by externally placed intrusion detection systems. || Craft or create attack tools. | Craft or create attack tools. || Craft phishing attacks. | Adversary counterfeits communications from a legitimate/trustworthy source to acquire sensitive information such as usernames, passwords, or SSNs. Typical attacks occur via email, instant messaging, or comparable means; commonly directing users to websites that appear to be legitimate sites, while actually stealing the entered information. || Craft spear phishing attacks. | Adversary employs phishing attacks targeted at high value targets (e.g., senior leaders/executives). || Craft attacks specifically based on deployed information technology environment. | Adversary develops attacks (e.g., crafts targeted malware) that take advantage of adversary knowledge of the organizational information technology environment. || Create counterfeit/spoof website. | Adversary creates duplicates of legitimate websites; when users visit a counterfeit site, the site can gather information or download malware. || Craft counterfeit certificates. | Adversary counterfeits or compromises a certificate authority, so that malware or connections will appear legitimate. || Create and operate false front organizations to inject malicious components into the supply chain.

Homeland Security Presidential Directive 12 (HSPD-12) [4] mandated the development and use of a federal standard for identification and authentication of federal employees and contractors. HSPD-12's intent is to eliminate the 'wide variations in the quality and security of identification used to gain access.' The standard resulting from HSPD-12, Personal Identity Verification (PIV), is defined in Federal Information Processing Standards (FIPS) Publication 201 [5]. FIPS This work resulted in the development of the CSIP [1]. A major gap identified by the CSIP is the delay in utilizing PIV credentials for logical access control and identity management on federal information systems, with an especially high priority for strengthening authentication for The NIST Risk Management Framework (RMF) [12] specifies the security risk management activities that an agency should perform throughout the system development lifecycle. The RMF references the associated standards and guidelines necessary to categorize system risk, select and implement security controls, and assess, monitor, and enhance their efficacy over time.

This publication provides a catalog of security and privacy controls for information systems and organizations to protect organizational operations and assets, individuals, other organizations, and the Nation from a diverse set of threats and risks, including hostile attacks, human errors, natural disasters, structural failures, foreign intelligence entities, and privacy risks. The controls are flexible and customizable and implemented as part of an organization-wide process to manage risk. The controls address diverse requirements derived from mission and business needs, laws, executive orders, directives, regulations, policies, standards, and guidelines. Finally, the consolidated control catalog addresses security and privacy from a functionality perspective (i.e., the strength of functions and mechanisms provided by the controls) and from an assurance perspective (i.e., the measure of confidence in the security or privacy capability provided by the controls). Addressing functionality and assurance helps to ensure that information technology products and the systems that rely on those products are sufficiently trustworthy. Organizations must exercise due diligence in managing information security and privacy risk. This is accomplished, in part, by establishing a comprehensive risk management program that uses the flexibility inherent in NIST publications to categorize systems, select and implement security and privacy controls that meet mission and business needs, assess the effectiveness of the controls, authorize the systems for operation, and continuously monitor the systems. Exercising due diligence and implementing robust and comprehensive information security and privacy risk management programs can facilitate compliance with applicable laws, regulations, executive orders, and governmentwide policies.

This document captures the input received from the half-day workshop titled 'Public Safety Mobile Application Security Requirements' organized by the Association of Public-Safety Communications Officials (APCO) International, in cooperation with FirstNet and the Department of Commerce and held on February 25, 2014. This first-of-its-kind workshop was attended by public safety practitioners, mobile application developers, industry experts, and government officials who contributed their experience and knowledge to provide input in identifying security requirements for public safety mobile applications. This publication was developed as part of the NTIA/NIST Public Safety Communication Research program with sponsorship from the Office for Interoperability and Compatibility (OIC) at the Department of Homeland Security (DHS). The authors would like to thank Jeff Cohen, Jay English, Mark Reddish, and Roger Wespe from Association of Public-Safety Communications Officials (APCO) International, Alex Kreilein from DHS/OEC, as well as the workshop participants for providing valuable feedback on drafts of this document. The authors would like to thank the following organizations for their public comment submissions: Intrado Inc., Secure Access Technologies, and the Mobile EAS Coalition. On February 25, 2014, the Association of Public-Safety Communications Officials (APCO) International, in cooperation with FirstNet and the Department of Commerce held a half-day workshop titled 'Public Safety Mobile Application Security Requirements' attended by public safety practitioners, mobile application developers, industry experts, and government officials. In this first-of-its-kind workshop, attendees contributed their experience and knowledge to provide input in identifying security requirements for public safety mobile applications. The following document describes the workshop and captures the input that was received from the workshop attendees.

- o Limited check against Level 2 and assess against all Level 3 CMMC security requirements
- o Intermediary devices are permitted to provide the capability for the specialized asset to meet one or more CMMC security requirements

Assets that are not in the Level 3 CMMC Assessment Scope

3.2.12 | Risk Acceptance | 20 || 3. 3.2.12 Risk Acceptance Although some participants had concerns, they ultimately made a conscious choice, described as 'willful ignorance' by P1\ _A, to accept privacy and security risks in exchange for perceived benefits.

Control PS-199: fying opportunities for improvement. · Enable agencies to make informed trade-offs concerning the appropriateness of and investments in the cybersecurity of particular organizational units or systems. | Primary SP 800-37 Level: 2 - Mission/Business Processes Primary Cybersecurity Framework Component: Implementation Tiers | |-----

-----|-----

-----| Summary:

Implementation Tiers provide agencies with a basis for rationalizing different aspects of cybersecurity operations across an organization. These decisions are based on trade-off analyses of target Implementation Tiers for various agency business units or specific assets. Gap analysis between the current and Target Implementation Tier will reveal opportunities for prioritizing improvement investments.

ding proactive notification to consumers, retailers, and third parties. Companies should track devices to address critical vulnerabilities and create structured options for off-ramping zombie devices. Higginbotham emphasized that company priorities often overlook device security. Manufacturers should implement vulnerability disclosure programs, track issues, conduct comprehensive security audits, and allocate budgets for security maintenance. Buyers must keep products updated or segmented, and legislation should clarify responsibility to ensure herd immunity. Companies should have a dedicated point of contact for security researchers and consider recalls for insecure devices. Stacey also addressed secure repairs, both before and after end of life. Good hardware should not end up in landfills, but unpatched zombie devices pose risks. Consumer Reports advocates for designing products for longevity, including features like hardware upgrades, crypto agility, and increased memory.

From the NIST SP 800-172 Rev 3 Final Public Draft: generated by scanning, monitoring, or other data collection activities is integrated 894 with the analysis of audit record information. Security information and event management (SIEM) tools can facilitate audit record aggregation or consolidation from multiple system components as well as audit record correlation and analysis. The use of standardized audit record analysis scripts developed by organizations (with localized script adjustments, as necessary) provides more cost-effective approaches to analyzing audit record information. The correlation of audit record information with vulnerability scanning information is important in determining the veracity of vulnerability scans of the system and in correlating attack detection events with scanning results. Correlation with perfor

The respondent commented that certain commands within the Department have created contract-specific requirements mandating that contractors apply the protections and reporting requirements of DFARS 252.204-7012-including the reporting and record-keeping obligations-to categories of information much broader than CDI. The respondent recommends that commercial-item contractors and contractors that do not possess CDI, regardless of contract-specific cybersecurity requirements, be exempt from the reporting and recordkeeping requirements. The respondent further suggests that agencies be required to obtain approval from a centralized office within the Department and to explain the basis

for requiring protections in excess of what is required by DFARS 252.204-7012. Response: Covered defense information is a term used to identify information that requires protection under DFARS clause 252.204-7012 that means unclassified controlled technical information or other information that requires safeguarding or dissemination controls pursuant to and consistent with law, regulations, and Governmentwide policies. When the acquisition of commercial items or services involves (printed page 36907) covered defense information, DFARS clause 252.204-7012 and any additional contract-specific cybersecurity requirements incorporated by the requiring activity will apply to both the solicitation and resulting contract. DFARS 252.204-7012 requires the contractor to provide adequate security on any unclassified information system that is owned, or operated by or for, the contractor and that processes, stores, or transmits covered defense information. Covered defense information, when provided to the contractor, by or on behalf of DoD in support of the performance of the contract, must be marked or otherwise identified in the contract, task order, or delivery order. If a contractor has reason to question whether the information requires protection under this clause, the contractor should consult with the cognizant contracting officer for clarification. DoD agencies follow the Department's policies for information protection contained in DoD Manual (DoDM) 5200.01 Vol 4, DoD Information Security Program: CUI, and in DoD Instruction (DoDI) 5230.24, Distribution Statements on Technical Documents. As these policies have been in place for several years, the Department does not require a centralized office to oversee their execution.

E. Desk Officer Comments and recommendations on the proposed information collection should be sent to Ms. Jasmeet Seehra, DoD Desk Officer, at Oira_submission@omb.eop.gov . Please identify the proposed information collection by DoD Desk Officer and the Docket ID number and title of the information collection. You may also submit comments, identified by docket number and title, to: Federal eRulemaking Portal: <http://www.regulations.gov> . Follow the instructions for submitting comments.

F. DoD Clearance Officer

When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k) (2) from the following subsections of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (H) and (I), and (f). (ii) Authority. 5 U.S.C. 552a(j)(2) and (k)(2) . (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting, for disclosures pursuant to the routine uses published for this system, would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (c)(4) because an exemption is being claimed for subsection (d), this subsection will not be applicable. (C) From subsection (d) because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement. (D) From subsection (e)(1) because in the course of criminal investigations information is often obtained concerning the violation of laws or civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this information be retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought. (E) From subsection (e)(2) because in a criminal investigation the requirement that information be collected to the greatest extent possible from the subject individual would present a serious impediment to law enforcement in that the subject of the investigation would be placed on notice of the existence of the investigation and would therefore be able to avoid detection. (F) From subsection (e)(3) because the requirement that individuals supplying information be provided with a form stating the requirements of subsection (e)(3) would constitute a serious impediment to law enforcement in that it could compromise the existence of a confidential investigation, reveal the identity of confidential sources of information and endanger the life and physical safety of confidential informants. (G) From subsections (e)(4)(G) and (H) because this system of records is exempt from individual access pursuant to subsections (j) and (k) of the Privacy Act of 1974. (H) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants.

, an individual may submit a request to the FDA Privacy Act Coordinator, with a notarized signature, to confirm whether records exist about him or her. Requests should be directed to the FDA Privacy Act Coordinator, Division of Freedom of Information, 12420 Parklawn Dr., ELEM-1036, Rockville, MD 20857. An individual requesting notification via mail should certify in his or her request that he or she is the individual who he or she claims to be and that he or she understands that the knowing and willful request for or acquisition of a (printed page 67823) record pertaining to an individual under false pretenses is a criminal offense under the Act subject to a \$5,000 fine, and indicate on the envelope and in a prominent manner in the request letter that he or she is making a ·Privacy Act Request.· Additional details regarding notification request procedures appear in 21 CFR part 21, subpart D . RECORD ACCESS PROCEDURES: Procedures are the same as above, in Notification Procedures. Requesters should also reasonably specify the record contents being sought. Some records may be exempt from access under 5 U.S.C. 552a(d)(5) , if they are ·compiled in reasonable anticipation of a civil action or proceeding.· If access to requested records is denied, the requester may appeal the denial to the FDA Commissioner. Additional details regarding record access procedures and identity verification requirements appear in 21 CFR part 21, subpart D . CONTESTING RECORD PROCEDURES: In addition to the procedures described above, requesters should reasonably identify the record, specify the information they are contesting, state the corrective action sought and the reasons for the correction, and provide justifying information showing why the record is not accurate, complete, timely, or relevant. Rules and procedures regarding amendment of Privacy Act records appear in 21 CFR part 21, subpart E . RECORD SOURCE CATEGORIES: Information in this system is obtained from many sources, including: (1) Directly from the individual, company or organization that is required to submit user fees to FDA; (2) from materials supplied by the submitter or individual acting on his/her behalf; (3) from FDA Centers such as the Center for Drug

Evaluation and Research, Center for Devices and Radiological Health, Center for Biologics Evaluation and Research, Center for Veterinary Medicine, Center for Tobacco Products, Center for Food Safety and Applied Nutrition, and the Office of Financial Management; and (4) from any other relevant source. RECORDS EXEMPTED FROM CERTAIN PROVISIONS OF THE PRIVACY ACT: None. Dated: November 7, 2012. Leslie Kux, Assistant Commissioner for Policy. [FR Doc. 2012-27580 Filed 11-13-12; 8:45 am] BILLING CODE 4160-01-P

In the Health Insurance Reform: Standards for Electronic Transactions final rule in 2000, we explicitly adopted a broader definition of standard because we recognized that the statutory definition only applied to standards for financial and administrative transactions, despite the statute's requirement that the Secretary adopt standards addressing other matters, including privacy and security. [321] At that time, we explained that we adopted a broader definition of standard to accommodate the varying functions of the specific standards proposed in other HIPAA regulations. [322] For the same reason, we believe that it is appropriate to continue to rely on the regulatory definition of standard. [323] As discussed above, in both 1998 and 2003, the Department determined that no comprehensive, scalable, and technology-neutral set of standards exists, and accordingly, we proposed and adopted a new standard. [324] In 2013, we made only minor modifications to the standards when we complied with explicit directions from Congress to apply the requirements of the Security Rule to business associates, so we did not need to consider whether an ANSI-accredited standard setting organization had adopted a comprehensive set of standards on the security for ePHI that was flexible, scalable, and technology-neutral. [325] However, because we believe it is appropriate for us to consider modifying the Security Rule at this time for the reasons discussed above, we must again consider whether an ANSI-accredited standards setting organization has developed, adopted, or modified a standard relating to the security of ePHI. The Department continues to believe that any standard must be comprehensive, rather than piecemeal, as recommended by the ANSI Healthcare Informatics Standards Board. [326] We also continue to agree with the recommendation that the standards should be technology-neutral because security technology continues to evolve to keep pace with the evolution of technology more broadly. Additionally, the Security Rule must remain flexible and scalable to allow for consideration of the wide variety of regulated entities, enabling such entities to determine the reasonable and appropriate security measures for their circumstances by taking into account the factors specified by HIPAA. [327] We are not aware of any standard setting organizations that are accredited by ANSI that have issued standards for the security of ePHI, let alone standards that are sufficiently comprehensive, flexible, scalable, and technology-neutral to enable regulated entities to take into account the HIPAA factors. For example, NIST has issued numerous publications addressing health care cybersecurity that are considered by NIST to be guidance, rather than standards. In fact, NIST is ANSI-accredited for only one standard. [328]

For example, the standard for risk analysis proposed in 45 CFR 164.308(a)(2) would protect ePHI from risks and vulnerabilities to the confidentiality, integrity, and availability of ePHI, while the modified standard for workforce security proposed in 45 CFR 164.308(a)(9) would protect ePHI from inappropriate access by a regulated entity's workforce. An invalidated standard for workforce security would not render the entire rule unworkable because a regulated entity could still meet the requirement to conduct the risk analysis without regard to whether the entity meets the requirements included in the standard for workforce security. Similarly, were a court to invalidate the Department's proposal in 45 CFR 164.310(a)(1) requiring that implemented policies and procedures to limit physical access to relevant electronic information systems and the facility or facilities in which they are housed be in writing, a regulated entity could still meet a requirement to implement the policies and procedures. Similar considerations apply to the proposal for written policies and procedures in proposed 45 CFR 164.316(a) , and to proposals that are deemed inapplicable to certain persons or circumstances. Further, the Department believes it is necessary to clarify how regulated entities would continue to apply implementation specifications in the event a court invalidates or deems inapplicable a governing standard over a specific implementation specification, or if a court invalidates or deems inapplicable one or several implementation specifications without taking adverse action on the governing standard. The Department does not interpret that this severability proposal, if finalized, would apply to implementation specifications in the same manner as it would apply to standards. Because the implementation specifications are regulatory instructions on how a regulated entity is to comply with a particular standard, if any standard is stricken, all implementation specifications underneath are similarly stricken. Conversely, the Department does not intend for the overarching standard to be affected by

a court's decision to invalidate or make a determination of non-applicability to particular person or circumstance all implementation specifications under a particular standard. The Security Rule would still retain its flexible and scalable approach, and, therefore, a regulated entity could use any reasonable and appropriate security measure to implement the standard consistent with 45 CFR 164.306(b), even if all implementation specifications under the standard are stricken. If a court invalidates or deems inapplicable less than all implementation specifications under a specific standard (i.e.,

Executive Order (EO) 14028, 'Improving the Nation's Cybersecurity,' tasks the National Institute of Standards and Technology (NIST), in coordination with the Federal Trade Commission (FTC) and other agencies, to initiate pilot programs for cybersecurity labeling. These labeling programs are intended to educate the public on the security capabilities of software development practices. To inform this effort, the EO directs NIST to 'identify secure software development practices or criteria for a consumer software labeling program.' This document seeks to fulfill this directive by making recommendations in the following areas: 1) the role of a scheme owner in a labeling program, 2) baseline technical criteria that can inform a label, 3) labeling presentation criteria, and 4) conformity assessment criteria. This document also explores consumer education and usability for software labels. NIST was directed to 'identify secure software development practices or criteria for a consumer software labeling program' to 'reflect a baseline level of security practices, and if practicable... increasingly comprehensive levels of testing and assessment that a product may have undergone.' This document addresses the need to develop appropriate cybersecurity criteria for consumer software. It also informs the development and use of a label for consumer software. This in turn can improve consumers' ability to take cybersecurity into account when making decisions about software selection and use. The following key recommendations are addressed:

One comment states that FDA should harmonize the Bioterrorism regulations with the other current regulatory provisions such as the Perishable Agricultural Commodities Act, where available. The definition for 'perishable food' should include all fresh fruits and vegetables where the original kind or character has not been changed. The comment states that the effects of the following operations should not be considered as changing a commodity into a food of a different kind or character: Water, steam, or oil blanching; chopping; color adding; curing; cutting; dicing; drying for the removal of surface moisture; fumigating; gassing; heating for insect control; ripening and coloring; removal of seed, pits, stems, calyx, husk, pods, rind, skin, peel, etc.; polishing; precooling; refrigerating; shredding; slicing; trimming; washing with or without chemicals; waxing; adding sugar or other sweetening agents; adding ascorbic acid or other agents used to retard oxidation; mixing several kinds of sliced, chopped, or diced fruits or vegetables for packaging in any type of containers; or comparable methods of preparation. (For example, fresh iceberg lettuce, romaine and carrots would be included, as well as fresh-cut and packaged salads; fresh green beans would be included; frozen or canned green beans would not; fresh oranges would be included; frozen concentrated orange juice would not.) One comment states that the proposed definition of 'perishable food' excludes many products (including milk, which sometimes has a shelflife of up to 15 days) that are handled and treated as perishable in the food distribution system. The comment states that FDA should amend the definition so that perishable foods are those that are refrigerated or those that will be adversely affected if held longer than 20 days. The comment asserts that such a change would make the regulation more consistent with industry practice. One comment states that the 'perishable food' definition is confusing because the definition begins by stating that perishable foods are foods that are 'not heat-treated, not frozen and not otherwise preserved * * *

' Confusion arises because pasteurized milk is heat treated, and FDA's qualification of the three criteria is somewhat awkward and combined with an extensive use of negatives.

A staff IT specialist (IT4-SB) for 48 hours (\$86.24/hr × 48hrs = \$345) Affirmation initial affirmation post assessment: \$1,876 Reaffirmations: It is estimated that the costs to reaffirm a CMMC Level 3 Assessment annually is \$1,876 (three-year cost is \$5,628, or \$1,876 × 3) A director (MGMT5) for 8 hours (\$190.52/hr × 8hrs = \$1,524) A staff IT specialist (IT4-SB) for 4.08 hours (\$86.24/hr × 4.08hrs = \$352) The Level 3 Affirmations cost burden will be addressed as part of the 48 CFR acquisition rule. Summary: The following is the annual small entities total cost summary for CMMC Level 3 Certifications and Affirmations over a ten-year period. Example calculation, Year 2 (reference per entity amounts shown): *(\$9,050 Certification per entity × 45 entities) + (\$1,876 Annual Affirmation per entity × 3 entities) = \$412,897, and \$121,500,000 Nonrecurring Engineering

cost (\$2,700,000 per entity × 45 entities being certified), and \$23,520,000 Recurring Engineering cost (\$490,000 per entity × 45 entities being certified) + (\$490,000 per entity × 3 entities performing affirmations) \$145,432,897 Total Cost = Certification and Affirmation Cost (\$412,897) + Nonrecurring Engineering cost (\$121,500,000) + Recurring Engineering cost (\$23,520,000), or \$145,432,897. (printed page 89111) Relevant Federal rules which may duplicate, overlap, or conflict with the rule. The rule does not duplicate, overlap, or conflict with any other Federal rules. Rather, this rule allows DoD to validate and verify that defense contractors and subcontractors have implemented existing cybersecurity requirements set forth in FAR clause 52.204-21 and in the NIST SP 800-171 Rev 2, which are intended to protect FCI and CUI during contract performance. D. Sec. 202, Public Law 104-4 , ·Unfunded Mandates Reform Act· (2 U.S.C. Chapter 25) The Unfunded Mandates Reform Act requires agencies to assess anticipated costs and benefits before issuing a rule including mandates that require the spending of \$100M dollars or more in a single year (in 1995 dollars and updated for inflation) by State, local, or Tribal governments, in the aggregate, or by the private sector. This rule's impact, if any, on State, local, or Tribal governments, in the aggregate, will not exceed \$100M dollars or more in a single year, and it will not significantly or uniquely affect small governments. This rule is expected to have an impact on the private sector of \$100M dollars or more annually; however, this rule is being published as a national security function of the United States as unauthorized disclosure of FCI or CUI information to parties outside the Department or foreign entities can cause significant harm to the interests of the United States. See the regulatory impact section of the preamble for an assessment of the costs and benefits for this rule. E. Public Law 96-511, ·Paperwork Reduction Act· (44 U.S.C. Chapter 35)

(1) Individual items of unclassified information, when compiled, reveal additional associations or relationships that meet the standard for classification under an existing Executive Order and DoD 5200.1-R, and are not otherwise revealed in the individual items of information. This is known as the ·mosaic·, or ·compilation· approach. (2) The existence or nonexistence of a record would itself reveal classified information. (b) Exemption 2. Pursuant to 5 U.S.C. 552(b)(2) , records related solely to the internal personnel rules and practices of the Department of Defense or any of the DoD Components are exempt from disclosure. This exemption has two profiles, high ·(b)(2)· and low ·(b)(2)·. (1) High ·(b)(2)·. Records qualifying under high ·(b)(2)· are those containing or constituting rules, regulations, orders, manuals, directives, instructions, and unclassified portions of security classification guides, the release of which would allow circumvention of these rules, regulations, and policies, thereby substantially hindering the effective performance of the mission of the Department of Defense. Examples include: (i) Critical infrastructure information that reasonably could be expected to enable someone to succeed in causing the harms described in Homeland Security Presidential Directive 7. [2] This exempt information could include agency vulnerability assessments or evaluations of items of critical infrastructure that are internal to the Government. (ii) Those operating rules, guidelines, and manuals for DoD investigators, inspectors, auditors, or examiners that must be protected in order for the DoD Component to fulfill a legal requirement. (iii) Personnel and other administrative matters, such as examination questions and answers used in training courses or in the determination of the qualifications of candidates for employment, entrance on duty, advancement, or promotion. (iv) Computer software (Government-owned), the release of which would allow circumvention of a statute or of DoD rules, regulations, orders, manuals, directives, or instructions. In this situation, the use of the software must be closely examined to ensure a circumvention possibility exists. (2) Low ·(b)(2)·. Records qualifying under low ·(b)(2)· are those that are trivial and housekeeping in nature for which there is no legitimate public interest or benefit to be gained by release, and for which processing the request would constitute an administrative burden. Examples include rules for personnel use of parking facilities or regulation of lunch hours, statements of policy as to sick leave, and administrative data such as file numbers, mail routing stamps, initials, data processing notations, brief references to previous communications, and other like administrative markings. (c) Exemption 3. Pursuant to 5 U.S.C. 552(b)(3)

One questioned use of the CNSSI-4009 Glossary instead of the NIST Glossary of Terms. One comment requested a change to text quoted from another source. One commenter asserted that the rule includes no reference to ·existing FAR, DFARS, or DoD authoritative sources· and recommended that they be added in instead referencing NIST publications only. One comment asked if it is necessary to read and understand all FIPS, NIST SP 800, CNSSI, and ISO/IEC documents incorporated by referenced in §.170.2. One comment requested the references for CMMC Assessment Guides in Appendix A be changed to

NIST SP 800-171A Jun2018 and NIST SP 800-172A Mar2022. Two comments noted version numbers are not always provided for two specific document sources. Another comment requested references for supporting information, resources, and training for the DIB. A commenter asked if the term 'Government Information Systems' was equivalent to the term 'Federal Information Systems' while another expressed that the term, 'CMMC Level 2 Final Certification Assessment' was confusing given that 'Assessment' and 'Certification' are two separate and distinct terms. Another comment noted that the Summary Information section states there is a difference between a POA and a POA&M but recommended both terms be defined for clarity. One comment stated the 'CMMC Certified Assessor (CCA)' definition and acronym are not used consistently in the rule and the current CMMC AB's website. Another comment noted that the term, 'related practitioners' under the definition of CAICO in § 170.4 could be confused with the term 'Registered Practitioners (RP)' used by the CMMC AB as their designation for consultants. One comment stated that the DoD must be deliberate in its use of certain terms, especially the words 'must' and 'shall', which connote legal requirements, versus words like 'will', 'expected', 'can', 'may', 'should', etc., which are permissive (i.e., optional) One commenter noted the word 'practice' was replaced multiple times based on a comparison of pre-publication drafts with the formal drafts that were published for public comment. Another comment asserted that the DoD is falsely describing the CMMC program as addressing 'basic' cybersecurity requirements when this is the most demanding cybersecurity standard ever produced. One commenter objected to the CMMC Level 1, 2, and 3 Assessment definitions in § 170.4 referring to the content of corresponding rule sections and suggested that the definitions be deleted from § 170.4 unless they can be succinctly defined without doing so. Response: The rule has been updated to reference DoD Manual 8140 'Cyberspace Workforce Qualification and Management Program' which replaced DoD Manual 8570, 'Information Assurance Workforce Improvement Program'. DOD Manual 8140.03 is available at: <https://dodcio.defense.gov/Portals/0/Documents/Library/DoDM-8140-03.pdf> .

(x) 252.225-7050, Disclosure of Ownership or Control by the Government of a Country that is a State Sponsor of Terrorism. * * * * * PART 209-CONTRACTOR QUALIFICATIONS 3. Amend section 209.104-1, by revising paragraph (g)(i) to read as follows: 209.104-1 General standards. * * * * * (g)(i) Ownership or control by the government of a country that is a state sponsor of terrorism. (See 225.771.) * * * * * 4. Revise section 209.104-70 to read as follows: 209.104-70 Solicitation provision. Use the provision at 252.209-7002, Disclosure of Ownership or Control by a Foreign Government, in all solicitations, including those subject to the procedures in FAR part 13, when access to proscribed information is necessary for contract performance. If the solicitation includes the provision at FAR 52.204-7, do not separately list the provision 252.209-7002 in the solicitation. 5. Amend section 209.405, by revising paragraph (b)(i) to read as follows: 209.405 Effect of listing. * * * * * (b)(i) The Procurement Cause and Treatment Code 'H' annotation in the Exclusions section of the System for Award Management (SAM Exclusions) identifies contractor facilities where no part of a contract or subcontract may be performed because of a violation of the Clean Air Act (42 U.S.C. 7606) or the Clean Water Act (33 U.S.C. 1368). * * * * * 6. Revise section 209.405-2 to read as follows: 209.405-2 Restrictions on subcontracting. (a) The contracting officer shall not consent to any subcontract with a firm, or a subsidiary of a firm, that is identified by the Secretary of Defense in SAM Exclusions as being owned or controlled by the government of a country that is a state sponsor of terrorism unless the agency head states in writing the compelling reasons for the subcontract. (See also 225.771.) 7. Revise section 209.409 to read as follows: 209.409 Solicitation provision and contract clause. Use the clause at 252.209-7004, Subcontracting with Firms that are Owned or Controlled by the Government of a Country that is a State Sponsor of Terrorism, in solicitations and contracts with a value of \$150,000 or more. PART 212-ACQUISITION OF COMMERCIAL ITEMS 8. Amend section 212.301 by: a. Removing paragraph (f)(xi); b. Redesignating paragraphs (f)(xii) through (xlvi) as (xi) through (xlvii); and b. Adding a new paragraph (f)(xlviii) to read as follows: 212.301 Solicitation provisions and contract clauses for the acquisition of commercial items. (f) * * * * * (xlviii) Use the provision at 252.225-7050, Disclosure of Ownership or Control by the Government of a Country that is a State Sponsor of Terrorism, as prescribed in 225.771-5, to comply with 10 U.S.C. 2327(b) . * * * * * PART 225-FOREIGN ACQUISITION 225.701 [Amended] 9. In section 225.701, remove the section text. 10. Add sections 225.771, 225.771-0, 225.771-1, 225.771-2, 225.771-3, 225.771-4, and 225.771-5 to subpart 225.7 to read as follows: 225.771 Prohibition on contracting or subcontracting with a firm that is owned or controlled by the government of a country that is a state sponsor of terrorism. 225.771-0

requires federal contractors and subcontractors to implement 15 basic cyber hygiene requirements, as applicable, to protect contractor information systems that process, store, or transmit FCI. December 31, 2017, was DoD's deadline for contractors to implement, as applicable, the cybersecurity protection requirements set forth in NIST SP 800-171 Rev 2, Protecting Controlled Unclassified Information in Nonfederal Systems and Organizations, in accordance with DFARS clause 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting. The current NIST 800-171A Assessment Guide states, "For the CUI security requirements in NIST Special Publication 800-171 Rev 2, nonfederal organizations describe in a system security plan, how the specified requirements are met or how organizations plan to meet the requirements [in a Plan of Action]." [53] NIST's process provides contractors with a tool to assess their security posture and decide if or when to mitigate the risks based upon the organizational risk tolerance. As such, a contractor could be compliant with NIST SP 800-171 Rev 2 if some of NIST SP 800-171 Rev 2 requirements are implemented but others are listed in a Plan of Action. As a result, at present, defense contractors and subcontractors can process, store, or transmit CUI without having implemented all security requirements set forth in NIST SP 800-171 Rev 2 and without establishing concrete, prompt, and enforceable timelines for addressing shortfalls and gaps documented in the Plan of Action. Findings from DoD Inspector General report (DODIG-2019-105 "Audit of Protection of DoD Controlled Unclassified Information on Contractor-Owned Networks and Systems") indicated that DoD contractors did not consistently implement mandated system security requirements for safeguarding CUI and recommended that DoD take steps to assess a contractor's ability to protect this information. CMMC adds a third-party assessment requirement, as applicable, to verify defense contractors and subcontractors have implemented the required security requirements prior to award. CMMC also adds affirmation processes at every CMMC level requiring contractors and subcontractors to attest to compliance with CMMC's security requirements and then provide annual affirmations thereafter. (b) Comprehensive Implementation of Cybersecurity Requirements Although the security requirements in NIST SP 800-171 Rev 2 address a range of threats, they do not sufficiently address Advanced Persistent Threats (APTs). An APT is an adversary that possesses sophisticated levels of expertise and significant resources, which allow it to create opportunities to achieve its objectives by using multiple attack vectors (e.g.,

Under the current Security Rule, we consider the technology asset inventory to be a component of the standard for risk analysis. Back to Citation

Other comments asked what tools would be available to assist contractors in checking subcontractor compliance with CMMC requirements or suggested that SPRS should be made available for this purpose. One suggested that without this transparency, CMMC compliance would become a meaningless effort to ·check the box· without actual steps to secure their systems. Another simply asked if they would have their own SPRS and eMASS access, or access through their prime. Some asked what action meets the rule's requirement to ·require subcontractor compliance·, i.e., does simply including the CMMC clause in subcontracts meet that requirement. One comment objected to the definition of subcontractor used in the rule, which they stated was overly broad and would result in application of CMMC requirements to too many businesses. Some comments suggested the flow-down requirement apply only to one sub-tier, while another requested advance notice of solicitations that plan to include CMMC requirements. One comment suggested that CUI be treated more like classified information, meaning to limit sharing of CUI with subcontractors. Some comments asked whether prime contractors are responsible for verifying subcontractor compliance with DFARS clause 252.204-7012, as C3PAOs do during an assessment. Two comments recommended rephrasing the flow-down section, with one specifically asking to clarify it is required only when FCI or CUI will be processed, stored, or transmitted in the performance of any particular prime contract. Another suggested edits for clarity or for consistency with DFARS clause 252.204-7012. Response: It is up to each OSA to protect FCI and CUI and to determine the assessment boundary, policies, and procedures necessary to do that. Section 170.23 specifically addresses the CMMC requirements that apply to subcontractors that will process, store, or transmit FCI or CUI. Section 170.23 addresses flow down of CMMC requirements from the prime contractor to the subcontractors in the supply chain. Prime contractors are responsible for complying with contract terms and conditions, including the requirement to flow down applicable CMMC requirements to subcontractors. The DoD modified §.170.23(a)(3) to clarify that when a subcontractor will process, store, or transmit CUI in performance of the subcontract and the Prime contractor has, for the associated prime contract, a requirement of Level 2 certification assessment, then CMMC Level 2 certification assessment is the minimum requirement for the subcontractor. Requirements for External Service Providers are defined in §.170.4; not all companies that provide services to an OSA are considered ESPs. (printed page 83117)

(I) From subsection (f) because the agency's rules are inapplicable to those portions of the system that are exempt and would place the burden on the agency of either confirming or denying the existence of a record pertaining to a requesting individual might in itself provide an answer to that individual relating to an on-going investigation. The conduct of a successful investigation leading to the indictment of a criminal offender precludes the applicability of established agency rules relating to verification of record, disclosure of the record to that individual, and record amendment procedures for this record system. (J) For comparability with the exemption claimed from subsection (f), the civil remedies provisions of subsection (g) must be suspended for this record system. Because of the nature of criminal investigations, standards of accuracy, relevance, timeliness, and completeness cannot apply to this record system. Information gathered in an investigation is often fragmentary and leads relating to an individual in the context of one investigation may instead pertain to a second investigation. (2) System identifier and name.

CIG-06, Investigative Files. (i) Exemption. Any portion of this system which falls within the provisions of 5 U.S.C. 552a(j)(2) may be exempt from the following subsections of 5 U.S.C. 552a (c)(3), (c)(4), (d), (e)(1), (e)(2), (e)(3), (e)(4) (G), (H), (I), (e)(5), (e)(8), (f), and (g). (ii) Authority. 5 U.S.C. 552a(j)(2). (iii) Reasons. (A) From subsection (c)(3) because the release of accounting of disclosure would inform a subject that he or she is under investigation. This information would provide considerable advantage to the subject in providing him or her with knowledge concerning the nature of the investigation and the coordinated investigative efforts and techniques employed by the cooperating agencies. This would greatly impede OIG's criminal law enforcement. (B) From subsection (c)(4) and (d), because notification would alert a subject to the fact that an open investigation on that individual is taking place, and might weaken the on-going investigation, reveal investigatory techniques, and place confidential informants in jeopardy. (C) From subsection (e)(1) because the nature of the criminal and/or civil investigative function creates unique problems in prescribing a specific parameter in a particular case with respect to what information is relevant or necessary. Also, due to OIG's close liaison and working relationships with other Federal, state, local and foreign country law enforcement agencies, information may be received which may relate to a case under the investigative jurisdiction of another agency. The maintenance of this information may be necessary to provide leads for appropriate law enforcement purposes and to establish patterns of activity which may relate to the jurisdiction of other cooperating agencies.

Module 11 -Change Control and Management Module B. The Environment with MLS added. Impact of an MLS accreditation on configuration management Hardware, ancillary equipment, software, especially upgrading to new functionality. Maintaining accreditation -documentation for the Life cycle A checklist of warning signs for the Admin/Security staff Addressing security violations (vulnerabilities) in the MLS environment How to use the CERT to best advantage. Objectives of the course: Give managers and Technical personnel the tools to make cost-effective Operational decisions regarding MLS Information Systems. Course Curriculum consists of: The Technology with MLS added The Information Systems equivalents to Markings, Caveats, handling instructions -Mandatory Access Control labels Exploring operational impacts of MLS: MAC vs DACvulnerabilities New audit considerations - impact of MLS and MAC on the makeup and sensitivity of the Audit Trail data. Tracking an atomic action through several audit trails. Enhancing the security profile of an MLS system Impact of an MLS accreditation on Configuration Management A checklist of warning signs for the Admin/Security staff Addressing security violations How to use the CERT to best advantage Impact of having a CRYPTO in the closet. You will receive checklists and suggestions for operating sensitive systems daily.

PS.L2-3.9.1 · Screen Individuals CMMC Assessment Guide · Level 2 | Version 2.13 175 Personnel Security (PS) PS.L2-3.9.1 · SCREEN INDIVIDUALS Screen individuals prior to authorizing access to organizational systems containing CUI. ASSESSMENT OBJECTIVES [NIST SP 800-171A]157 Determine if: [a] individuals are screened prior to authorizing access to organizational systems containing CUI. POTENTIAL ASSESSMENT METHODS AND OBJECTS [NIST SP 800-171A]157 Examine [SELECT FROM: Personnel security policy; procedures addressing personnel screening; records of screened personnel; system security plan; other relevant documents or records]. Interview [SELECT FROM: Personnel with personnel security responsibilities; personnel with information security responsibilities]. Test [SELECT FROM: Organizational processes for personnel screening]. DISCUSSION [NIST SP 800-171 REV. 2]158 Personnel security screening (vetting) activities involve the evaluation/assessment of individual-s conduct, integrity, judgment, loyalty, reliability, and stability (i.e., the trustworthiness of the individual) prior to authorizing access to organizational systems containing CUI. The screening activities reflect applicable federal laws, Executive Orders, directives, policies, regulations, and specific criteria established for the level of access required for assigned positions. FURTHER DISCUSSION Ensure all employees who need access to CUI undergo organization-defined screening before being granted access. Base the types of screening on the requirements for a given position and role. 157 NIST SP 800-171A, p. 45. 158 NIST SP 800-171 Rev. 2, p. 31.

Level 3 certification assessment requires the CMMC Status of Final Level 2 (C3PAO) and compliance with the security requirements set forth in §.170.18 to protect CUI. CMMC Level 3 adds additional security requirements to those required by existing acquisition regulations as specified in this rule. A Level 3 certification assessment of the applicable contractor information system(s) provided by the DCMA Defense Industrial Base Cybersecurity Assessment Center (DIBCAC) is required to

validate implementation of the DoD-defined selected security requirements set forth in NIST SP 800-172 Feb2021. A CMMC Status of Final Level 2 (C3PAO) is a prerequisite to schedule a DCMA DIBCAC Level 3 certification assessment. DCMA DIBCAC will upload the Level 3 certification assessment results into the CMMC instantiation of eMASS, which will feed the information into SPRS. OSCs will submit in SPRS an initial affirmation of compliance, and, if necessary, a POA&M closeout affirmation, and then annually following the Final CMMC Status Date, an affirmation of continued compliance as set forth in § 170.22. The Level 3 certification assessment cost burdens are included in this part with the exception of the requirement for the OSC to upload the affirmation in SPRS that is included in the 48 CFR part 204 CMMC Acquisition rule and an update to DFARS collection approved under OMB Control Number 0750-0004, Assessing Contractor Implementation of Cybersecurity Requirements. Additionally, the information collection reporting requirements for the CMMC instantiation of eMASS are included in a separate ICR for this part and cover only those requirements pertaining to the CMMC process. As described, the CMMC Program couples an affirmation of compliance with certification assessment requirements to verify OSA implementation of cybersecurity requirements, as applicable. The CMMC Program addresses DoD's need to protect FCI and CUI during the acquisition and sustainment of products and services from the DIB. This effort is instrumental in ensuring cybersecurity is the foundation of future DoD acquisitions. Policy Problems Addressed by the Revised CMMC Program Implementation of the CMMC Program is intended to solve the following policy problems: Lack of Verification of Contractor Compliance With Cybersecurity Requirements

. Any official who willfully maintains a system of records without meeting the publication requirements, as prescribed by 5 U.S.C. 552a, OMB Circular A-130, and DoD 5400.11-R, is subject to possible criminal penalties and/or administrative sanctions. § 310.9 Privacy boards and office, composition and responsibilities. (a) The Defense Privacy Board .(1) Membership. The Board shall consist of the DA&M, OSD, who shall serve as the Chair; the Director of the DPO, DA&M, who shall serve as the Executive Secretary and as a member; the representatives designated by the Secretaries of the Military Departments; and the following officials or their designees: the Deputy Under Secretary of Defense for Program Integration (DUSD(PI)); the Assistant Secretary of Defense for Health Affairs; the Assistant Secretary of Defense for Networks and Information Integration (ASD) (NII)/Chief Information Officer (CIO); the Director, Executive Services and Communications Directorate, WHS; the GC, DoD; and the Director for Information Technology Management Directorate (ITMD), WHS. The designees also may be the principal POC for the DoD Component for privacy matters. (2) Responsibilities. (i) The Board shall have oversight responsibility for implementation of the DoD Privacy Program. It shall ensure the policies, practices, and procedures of that Program are premised on the requirements of 5 U.S.C. 552a and OMB Circular A-130, as well as other pertinent authority, and the Privacy Programs of the DoD Component are consistent with, and in furtherance of, the DoD Privacy Program. (ii) The Board shall serve as the primary DoD policy forum for matters involving the DoD Privacy Program, meeting as necessary, to address issues of common concern so as to ensure uniform and consistent policy shall be adopted and followed by the DoD Components. The Board shall issue advisory opinions as necessary on the DoD Privacy Program so as to promote uniform and consistent application of 5 U.S.C. 552a, OMB Circular A-130, and DoD 5400.11-R. (iii) Perform such other duties as determined by the Chair or the Board. (b) The Defense Data Integrity Board .(1) Membership. The Board shall consist of the DA&M, OSD, who shall serve as the Chair; the Director of the DPO, DA&M, who shall serve as the Executive Secretary; and the following officials or their designees: the representatives designated by the Secretaries of the Military Departments; the DUSD(PI); the (ASD) (NII)/CIO; the GC, DoD; the Inspector General, DoD; the ITMD, WHS; and the Director, Defense Manpower Data Center. The designees also may be the principal points of contact for the DoD Component for privacy matters. (2) Responsibilities. (i) The Board shall oversee and coordinate, consistent with the requirements of 5 U.S.C. 552a, OMB Circular A-130, and DoD 5400.11-R, all computer matching programs involving personal records contained in system of records maintained by the DoD Components.

(iii) Reporting any change to the information provided on its SF 328 by resubmitting the SF 328 to DCSA within 15 business days of the change being effective. A disqualifying eligibility determination, based on the results of the change, will result in the C3PAO losing its authorization or accreditation. (6) Obtain a CMMC Level 2 Certification Assessment in accordance with the procedures specified in § 170.17(a)(1) and (c). This assessment, conducted by DCMA DIBCAC, shall meet all requirements for a Level 2 Final Certification Assessment and will not result in a CMMC Level 2 certificate. The CMMC Level 2 assessment process must be performed on a triennial basis.

(7) Provide all documentation and records in English. (8) Submit pre-assessment and planning material, final assessment reports, and CMMC certificates of assessment into the CMMC instantiation of eMASS. (9) Submit all assessment appeal investigations and decisions to include assessment results into the CMMC instantiation of eMASS. (10) Unless disposition is otherwise authorized by the CMMC PMO, maintain all assessment related records for a period of six (6) years. Such records include any materials provided by OSC, generated by the C3PAO in the course of an assessment, any working papers generated from Level 2 Certification Assessments; and materials relating to monitoring, education, training, technical knowledge, skills, experience, and authorization of all personnel involved in inspection activities; contractual agreements with OSCs; and organizations for whom consulting services were provided. (11) Provide any requested audit information, including any out-of-cycle from ISO/IEC 17020:2012 requirements, or subsequent revisions, to the Accreditation Body. (12) Ensure that all personal information is encrypted and protected in all C3PAO information systems and databases. (13) Meet the requirements for Assessment Team composition, comprised of a Lead CCA, CCAs, and any participating CCPs. (printed page 89126) (14) Implement a quality assurance function that ensures the accuracy and completeness of assessment data prior to upload into the CMMC instantiation of eMASS. Any individual fulfilling the quality assurance function must be a CCA and cannot be a member of an Assessment Team for which they are performing a quality assurance role. A quality assurance individual shall manage the C3PAO's quality assurance reviews as defined in paragraph (b)(15) of this section and the appeals process as required by paragraph (b)(21) of this section and in accordance with ISO/IEC 17020:2012 and ISO/IEC 17011:2017, or subsequent revisions. (15) Conduct quality assurance reviews for each assessment, including observations of the Assessment Team's conduct and management of CMMC assessment processes. (16) Ensure that all CMMC assessment activities are performed on the information system within the CMMC Assessment Scope.

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft)

zed disclosure of information, unauthorized modification of information, unauthorized destruction of
information, or loss of information or information system availability. | | Impact Value [CNSSI No.
1253] | The assessed potential impact resulting from a compromise of the confidentiality, integrity,
or availability of an information type, expressed as a value of low, moderate, or high. | |
Industrial Control System [NIST SP 800-39] | An information system used to control industrial
processes such as manufacturing, product handling, production, and distribution. Industrial control
systems include supervisory control and data acquisition systems used to control geographically
dispersed assets, as well as distributed control systems and smaller control systems using
programmable logic controllers to control localized processes. | | Information [CNSSI No. 4009] |
Any communication or representation of knowledge such as facts, data, or opinions in any medium or
form, including textual, numerical, graphic, cartographic, narrative, or audiovisual. | | [FIPS 199]
| An instance of an information type. | | Information Owner [CNSSI No. 4009] | Official with
statutory or operational authority for specified information and responsibility for establishing the
controls for its generation, classification, collection, processing, dissemination, and disposal.
See Information Steward . | | Information Resources [44 U.S.C., Sec. 3502] | Information and related
resources, such as personnel, equipment, funds, and information technology. |

This includes approved CUI categories and category descriptions, the basis for safeguarding and
dissemination controls, and procedures for the use of CUI. 2 Procedures for the use of CUI include
marking, safeguarding, transporting, disseminating, reusing, and disposing of the information. The
CUI federal regulation provides guidance to federal agencies on the designation, safeguarding,
marking, dissemination, decontrolling, and disposition of CUI; establishes self-inspection and
oversight requirements; and delineates other facets of the program. [5] The CUI regulation
requires federal agencies that use federal information systems 3 A federal information system is a
system that is used or operated by an executive agency, by a contractor of an executive agency, or

by another organization on behalf of an executive agency. Any system that does not meet the definition of a federal information system is designated as a nonfederal system. to process, store, or transmit CUI to comply with NIST standards and guidelines. The responsibility of federal agencies to protect CUI does not change when such information is shared with nonfederal organizations.

By implementing this standard, the risk of inappropriate disclosure, alteration, or destruction of ePHI is minimized. A regulated entity must determine those persons and technology assets that need access to ePHI within its environment. The implementation specifications associated with the standard on information access management are closely related to those associated with the standard for workforce security. [567] Compliance with the proposed and existing standards for information access management should support a regulated entity's compliance with the Privacy Rule's minimum necessary requirements, which requires a regulated entity to evaluate its practices and enhance safeguards as needed to limit unnecessary or inappropriate access to and disclosure of PHI. [568] OCR's enforcement experience demonstrates that many regulated entities have not adequately implemented this standard. Thus, we believe it is necessary to consider strengthening the requirement. For example, on one occasion, a large covered entity's failure to implement its written policies and procedures to ensure that employees only had access to ePHI that they had proper authorization or authority to access enabled an employee to access the ePHI of more than 24,000 individuals. [569] This failure also enabled other employees to inappropriately access the ePHI of a celebrity. [570] To ensure that regulated entities implement recommendations and best practices for securing ePHI, we propose to require in the standard for information access management and associated implementation specifications that a regulated entity must establish and implement written policies and procedures for authorizing access to ePHI and relevant electronic information systems that are consistent with the Privacy Rule. The Department also proposes to redesignate the standard at 45 CFR 164.308(a)(4)(i) as proposed 45 CFR 164.308(a)(10)(i) and to add a paragraph heading to clarify the organization of the regulatory text. Additionally, the Department proposes to modify three of the associated existing implementation specifications and to add three new implementation specifications as follows. Specifically, the Department proposes to redesignate the implementation specification for isolating health care clearinghouse functions as proposed 45 CFR 164.308(a)(10)(ii)(A) and to modify it to require a health care clearinghouse that is part of a larger organization to establish and implement written policies and procedures that protect the ePHI and relevant electronic information systems of the clearinghouse from unauthorized access by the larger organization.

3.3.3 KMS Requirements Table 4-1 KMS Requirements Attribute Low Moder High Requirements Reference Key material and cryptographic operations protection ate X X X Software protection of cryptographic materials used in individual devices (e.

lementation, but there are challenges both with the complexity of creating complete, accurate SBOMs and with trust that either the SBOM or the device has not been altered so that they no longer match. Participants largely seemed to agree that many manufacturers currently have poor visibility into and management control over the supply chains for their products.

The CMMC Program is designed to enforce protection of unclassified information, to include FCI and CUI, not intended for public release that is shared by the Department with its contractors and subcontractors. The program provides the Department increased assurance that contractors and subcontractors are meeting the cybersecurity requirements that apply to acquisition programs and systems that process federal contract information and controlled unclassified information. (printed page 89075) Any discussion regarding the use of classified networks is outside of the scope of the CMMC Program. 20. CMMC Requirements Comment: There were multiple comments suggesting additions, deletions, or changes to model requirements. One commenter noted multiple instances of CMMC requirements with the term `information system' rather than `system' used in NIST SP 800-171 Rev 2, asking if CMMC meant to change the intent by inserting `information' in these requirements. Multiple commenters questioned the intent, clarity, or interpretation of several CMMC requirements/NIST SP 800-171 Rev 2 requirements, recommending clarification regarding vulnerability management, protection of mobile devices, review of audit logs, disabling of identifiers, FIPS validated encryption, and malicious code scans. One comment suggested that CMMC 1.0 requirements RM.2.141 and RM.3.144 are redundant and recommended incorporating RM 3.146 into CA.2.159, justifying that a plan of action is essentially a risk management plan. Two commenters noted that two CMMC 1.0

requirements (RE.2.137 and RE.3.139) are unclear as they do not specify what data requires backup, or the meaning of resilient backup. One commenter said that CMMC 1.0 requirement MA.2.114 removed the qualifier of 'maintenance' when describing personnel requiring supervision of maintenance activities, asking if this is an insignificant change to the NIST SP 800-171 Rev 2 security requirement, or whether there is some rationale or message that the CMMC specification is trying to adjust by deviating from the NIST SP 800-171 Rev 2. Two commenters stated that CMMC 1.0 requirement MP.1.1.18 requires only FCI be sanitized, but, for CMMC 1.0 Level 3 (CMMC Level 2 under CMMC 2.0) assessments, there is no requirement to sanitize CUI. One commenter wanted to know which CMMC requirement requires a medium assurance certificate for reporting cyber incidents. Response:

Establish and implement written policies and procedures to limit physical access to all of its relevant electronic information systems and the facility or facilities in which they are housed, while ensuring that properly authorized access is allowed. (2) Implementation specifications (i) Contingency operations. Establish (and implement as needed) written procedures that allow facility access in support of the covered entity's or business associate's contingency plan required by § 164.308(a)(13). (ii) Facility security plan. Establish and implement written policies and procedures to safeguard all facilities and the equipment therein from unauthorized physical access, tampering, and theft. (iii) Access management and validation procedures. Establish and implement written procedures to authorize and manage a person's access to facilities based on their role or function, including visitor management. (iv) Physical maintenance records. Establish and implement written policies and procedures to document repairs and modifications to the physical components of a facility that are related to security, including but not limited to hardware, walls, doors, locks, and security cameras. (v) Maintenance. For each facility, review and test the written policies and procedures required by this paragraph (a)(2) at least once every 12 months, and modify such policies and procedures as reasonable and appropriate. (b) Standard: Workstation use (1) General. Establish and implement written policies and procedures that govern the use of workstations that access electronic protected health information or the covered entity's or business associate's relevant electronic information systems. (2) Implementation specifications (i) Policies and procedures. The written policies and procedures must specify all of the following with respect to a workstation that accesses electronic protected health information or the covered entity's or business associate's relevant electronic information systems: (A) The functions for which a workstation may be used. (B) The manner in which a workstation may be used to perform those functions. (C) The physical attributes of the surroundings of a specific workstation or class of workstation that can access electronic protected health information, including the removal of such workstations from a facility and the movement of such workstations within and outside of a facility. (ii) Maintenance. Review and test written policies and procedures at least once every 12 months, and modify as reasonable and appropriate. (c) Standard: Workstation security. Implement and modify physical safeguards for all workstations that access electronic protected health information or relevant electronic information systems, to address the written policies and procedures for workstation use required by paragraph (b) of this section and restrict access to authorized users. (d) Standard: Technology asset controls (1) General.

computer cybersecurity; control; digital twin technology; instrumentation; real-time command; real-time monitoring; simulation; standards; testing; trust; use case scenarios. 7. Instrumentation and monitoring: Instrumentation of a digital twin is a beneficial and unique advantage that digital twin technology offers. While one might not be able to instrument the physical object, one may be able to instrument the digital twin. However, instrumentation and probes are not as simple or easy to correctly inject into a digital twin as might be expected. Much can be learned here from the safety-critical software community. First, a determination of where to inject the probes is necessary [28], though this is not easy and can be more art than science. Second, the number of probes to inject is also a consideration. As shown in real-time systems, probes can slow down performance and timing, which may cause a problem for synchronization between the digital twin and physical object. That said, there are ways to reduce this impact by having the probes only collect raw data rather than compute internal test results, such as built-in self-tests. Collecting the 'right' information from the internal state of an executing digital twin is an expensive and error-prone effort. 8. Heterogeneity of standards: Heterogeneity of different formats for digital twins may cause composability problems [29]. Composing digital twin definitions from different component vendors may not be achievable if vendors misuse standardized formats [4]. This is a consideration for trusting composed digital twins. 9. Non-functional requirements: Functional requirements state what a system shall do, negative requirements state what a system shall not do, and non-functional requirements

(i.e., the 'ilities' 7) typically state what level of quality the system shall exhibit for both the functional and negative requirements. The 'ilities' apply to both 'things' and the systems into which they are built.

Recent security-related incidents indicate the need for a secure software supply chain to protect software products (also referred to as code) during the development, build, distribution, and maintenance phases. Of particular concern is provisioning and updating software that plays a critical role in platform security. A wide range of software products, including firmware, operating systems, mobile applications, and application container images must be distributed and updated in a secure and automatic way to prevent forgery and tampering. This white paper targets software developers and product vendors who are implementing a code signing system or reviewing the security of an existing system, with the goal of achieving improved security and customer confidence in code authenticity and integrity. System integrators and administrators who are concerned about the trustworthiness of the applications that are installed and run on their systems will learn the properties they should expect from a code signing solution to protect their software supply chain. This white paper describes features and architectural relationships of typical code signing solutions that are widely deployed today. It defines code signing use cases and identifies some security problems that can arise when applying code signing solutions to those use cases. Finally, it provides recommendations for avoiding those problems, and resources for more information. Properly applied, these recommendations will help to ensure that the software supply chain is resistant to attack.

for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 204 and 252 [Docket DARS-2019-0049] RIN 0750-AK14 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Final rule. SUMMARY: DoD is issuing a final rule amending the Defense Federal Acquisition Regulation Supplement (DFARS) to modify the text of an existing DFARS clause to clarify its intent and conform its language to current DFARS terminology, pursuant to action taken by the Regulatory Reform Task Force. DATES: Effective April 8, 2020. FOR FURTHER INFORMATION CONTACT: Ms. Carrie Moore, telephone 571-372-6093. SUPPLEMENTARY INFORMATION: I. Background DoD published a proposed rule in the Federal Register at 84 FR 58362 on October 31, 2019, to modify DFARS clause 252.207-7002, Payment for Subline Items Not Separately Priced, to conform the text of the clause to the current contract line item structure terminology by replacing ·contract line item· with ·contract line or subline item· and add a prescription for the DFARS clause in the applicable section of DFARS 204.71. No public comments were received in response to the proposed rule. No changes are made in the final rule from the proposed rule. II. Applicability to Contracts at or Below the Simplified Acquisition Threshold and for Commercial Items, Including Commercially Available Off-the-Shelf Items This rule does not create any new provisions or clauses. The rule updates language used in the clause text to conform with current contract line item structure terminology. This rule does not change the applicability of the affected clause. III. Executive Orders 12866 and 13563 E.O.s 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under section 6(b) of E.O. 12866 , Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804 . IV. Executive Order 13771 This rule is not subject to E.O. 13771 , because this rule is not a significant regulatory action under E.O. 12866 . V. Regulatory Flexibility Act

ABE provides confidentiality and data integrity when used in a public environment with a large scope (e.g., cloud) of users. However, relying only on user-specified attributes may create various security issues from the perspectives of key management processes and intentional threats or attacks. Integrity: If an ABE system is outsourced, it requires trust so that the decrypted ciphertext is a legitimate message based on legitimate user attributes. Additionally, the message uploaded to the resource provider can be falsified, and it is unknown whether the value calculated by the Researchers are currently working on blockchain fundamentals and customizing blockchainbased ABE models for IoT applications to provide privacy and minimize computational overhead. For example, [QYLPYH] describes the use of a lightweight blockchain ABE to outsource decryption based on the blockchain, which can be extended to effectively reduce the burden of encryption computation on the user side. Blockchain technology can also provide integrity (i.e., the secret key does not contain specific information about users who may share their secret keys with other users) and the non-repudiation of data, as well as prevent the leaking of sensitive information from the ABE access structure [WZZGZZ].

(Comment 32) One comment requests clarification on how imported food samples that do not enter commerce will be handled based on the regulations. These food samples have the intended end use of analysis, experimentation, and/or subsequent destruction within approved company premises. The samples may be carried into the United States as personal baggage of company representatives or sent unaccompanied. The comment points out that food carried in personal baggage is exempt from the registration interim final rule only if the food is for personal enjoyment/use. Another foreign comment states that the recordkeeping requirement should not apply to commercial samples. The comment states that new exporters cannot be expected to engage in recordkeeping requirements concerning exports before testing marketing opportunities. (Response) Persons who manufacture, process, pack, transport, distribute, receive, hold, or import food in the United States that is intended for consumption by humans or animals are subject to these regulations. The recordkeeping requirements would not apply to food samples that are used for quality assurance, research or analysis purposes, as long as the food samples are not consumed by humans or animals. Samples of food are considered to be for quality assurance, research or analysis purposes, rather than human consumption, when they are in small quantities (i.e., quantities consistent with the quality assurance, research, or analysis purposes) and the entire sample is used up by the analysis, destroyed after analysis, or destroyed following a reasonable retention period after analysis. The

analysis may include sensory examination, such as organoleptic examination for determining tea quality or detecting the presence of histamines. Evidence that an article of food is for quality assurance, research, or analysis purposes only might include, among other evidence, markings on the food and shipping documents. Food samples intended for consumption via test marketing, such as tasting at trade shows or product promotional tasting events, are subject to this subpart.

CHAPTER THREE PAGE 54 This publication is available free of charge from:

<https://doi.org/10.6028/NIST.SP.800-37r2> DOCUMENTATION OF PLANNED CONTROL IMPLEMENTATIONS TASK

S-4 Document the controls for the system and environment of operation in security and privacy plans. Potential Inputs: Security categorization; organization- and system-level risk assessment results (security, privacy, and/or supply chain); system element information; system component inventory; business impact or criticality analysis; list of security and privacy requirements allocated to the system, system elements, and environment of operation; risk management strategy; list of selected controls for the system and environment of operation; organizational security, privacy, and SCRM policies. Expected Outputs: Security and privacy plans for the system. Primary Responsibility: System Owner; Common Control Provider. Supporting Roles: Authorizing Official or Authorizing Official Designated Representative; Information Owner or Steward; Systems Security Engineer; Privacy Engineer; System Security Officer; System Privacy Officer. System Development Life Cycle Phase: New · Development/Acquisition. Existing · Operations/Maintenance. Discussion: Security and privacy plans contain an overview of the security and privacy requirements for the system and the controls selected to satisfy the requirements. The plans describe the intended application of each selected control in the context of the system with a sufficient level of detail to correctly implement the control and to subsequently assess the effectiveness of the control. The control documentation describes how system-specific and hybrid controls are implemented and the plans and expectations regarding the functionality of the system. The description includes planned inputs, expected behavior, and expected outputs where appropriate, typically for those controls implemented in the hardware, software, or firmware components of the system. Common controls are also identified in the plans. There is no requirement to provide implementation details for inherited common controls. Rather, those details are provided in the plans for common control providers and are made available to system owners. For hybrid controls, the organization specifies in the system-level plans the parts of the control that are provided by the common control provider and the parts of the control that are implemented at the system level. Organizations may develop a consolidated plan that incorporates security and privacy plans or maintain separate plans. If developing a consolidated plan, privacy programs collaborate with security programs to ensure that the plan reflects the selection of controls that provide protections with respect to managing the confidentiality, integrity, and availability of PII; and delineates roles and responsibilities for control implementation, assessment, and monitoring. For separate system security plans and privacy plans, organizations cross-reference the controls in all plans to help maintain accountability and awareness. The senior agency official for privacy reviews and approves the privacy plan (or integrated plan) before the plan is provided to the authorizing official or designated representative for review (see Task S-6). Organizations may document the control selection and tailoring information in documents equivalent to security and privacy plans, for example, in systems engineering or system life cycle artifacts or documents. Documentation of planned control implementations allows for traceability of decisions prior to and after the deployment of the system. To the extent possible, organizations reference existing documentation (either by vendors or other organizations that have employed the same or similar systems or system elements), use automated support tools, and coordinate across the organization to reduce redundancy and increase the efficiency and cost-effectiveness of control documentation. The documentation also addresses platform dependencies and includes any additional information necessary to describe how the capability required is to be achieved at the level of detail sufficient to support control implementation and assessment. Documentation for control implementations follows best practices for hardware and software development and for systems security and privacy engineering disciplines and is also consistent with established policies and procedures for documenting activities in the SDLC. In certain situations,

General Security of Information Agreements and General Security of Military Information Agreements) are negotiated with various foreign governments. Confidentiality requested by some foreign governments prevents a listing of the countries that have executed these agreements. The bilateral security agreement, negotiated through diplomatic channels: (A) Requires that each government provide substantially the same degree of protection to classified information released by the other government. (B) Contains provisions concerning limits on the use of each government's information, including restrictions on third-party transfers and proprietary rights. (C) Does not commit governments to share classified information, nor does it constitute authority to release classified material to that government. (D) Satisfies, in part, the eligibility requirements of the Arms Export Control Act concerning the agreement of the recipient foreign government to protect U.S. classified defense articles and classified information. (ii) The applicable CSA will provide a mechanism for contractors to access, for official purposes, classified general security agreements. (iii) Industrial security agreements have been negotiated with certain foreign governments that identify the procedures to be used when foreign government classified information is provided to U.S. industry and UUSG classified information is provided to foreign defense industry. (3) Authorization for disclosure. The GCA will provide disclosure guidance. (i) Contractors will only disclose non-public USG information to foreign persons in accordance with specified requirements of the contract. In the absence of any specified requirements the contractor will not disclose non-public USG information to foreign persons. (ii) Disclosure authorization may be in the form of an export license or other export authorization by a cognizant export authority. (iii) The contractor may not use disclosure guidance provided by the GCA for a previous contract or program unless so instructed in writing by the GCA or the licensing authority. (iv) Disclosure and export of classified information, authorized by an appropriate USG disclosure official, by a contractor will ensure the following: (printed page 83349) (A) International agreements. Contractors may not disclose classified information until agreements are signed by the participating government and disclosure guidance and security arrangements are established. The export of technical data pursuant to such agreements may be exempt by approval of the Department of State or the Department of Commerce. (B) Symposia, seminars, exhibitions, and conferences. Contractors must assure that any foreign nationals who will be attending a classified gathering have the appropriate export license, disclosure authority, and security assurance on file. (C) Visits by foreign nationals to the contractor.

(c) Include Privacy Act training in other courses of training when appropriate. Stress individual responsibilities and advise individuals of their rights and responsibilities under this part to ensure that it is understood that, where personally identifiable information is involved, individuals should handle and treat the information as if it was their information. §-310.38 Training methodology and procedures. (a) Each DoD Component is responsible for the development of training procedures and methodology. (b) The DPO shall assist the Components in developing these training programs and may develop privacy training programs for use by all DoD Components. (c) Components shall conduct training as frequently as believed necessary so that personnel who are responsible for or are in receipt of information protected by 5 U.S.C. 552a are sensitive to the requirements of this part, especially the access, use, and dissemination restrictions. Components shall give consideration to whether annual training and/or annual certification should be mandated for all or specified personnel whose duties and responsibilities require daily interaction with personally identifiable information. (d) Components shall conduct training that reaches the widest possible audience. Web-based training and video conferencing have been effective means to provide such training. §-310.39 Funding for training. Each DoD Component shall fund its own privacy training program. Subpart I-Reports §-310.40 Requirement for reports. The DPO shall establish requirements for DoD Privacy Reports and the DoD Components may be required to provide data. §-310.41 Suspense for submission of reports. The suspenses for submission of all reports shall be established by the DPO. §-310.42 Reports control symbol. Any report established by this subpart in support of the Privacy Program shall be assigned Report Control Symbol DD-COMP(A)1379. Subpart J-Inspections §-310.43 Privacy Act inspections. During internal inspections, Component inspectors shall be alert for compliance with this part and for managerial, administrative, and operational problems associated with the implementation of the Defense Privacy Program. Programs shall be reviewed as frequently as considered necessary by Components or the Component Inspector General. §-310.44 Inspection reporting. (a) Document the findings of the inspectors in official reports that are furnished the responsible Component officials. These reports, when appropriate, shall reflect overall assets of the Component Privacy Program inspected, or portion thereof, identify

deficiencies, irregularities, and significant problems. Also document remedial actions taken to correct problems identified. (b) Retain inspections reports and later follow-up reports in accordance with established records disposition standards. These reports shall be made available to the Privacy Program officials concerned upon request. Subpart K-Privacy Act Violations §-310.45 Administrative remedies.

It is estimated that the costs to perform an initial and annual affirmation of compliance with CMMC Level 1 for an other than small entity is \$584 A director (MGMT5) for 2 hours ($\$190.52/\text{hr} \times 2\text{hrs} = \381) A staff IT specialist (IT4) for 2.08 hours ($\$97.49/\text{hrs} \times 2.08\text{hrs} = \203) The Level 1 Self-Assessment and Affirmations cost burden will be addressed as part of the 48 CFR acquisition rule. Summary: The following is the annual other than small entities total cost summary for CMMC Level 1 self- (printed page 89090) assessments and affirmations over a ten-year period: (Example calculation, Year 1: $\$4,042$ per entity $\times 246$ entities (cumulative) = $\$994,233$). Small Entities Nonrecurring and recurring engineering costs: There are no nonrecurring or recurring engineering costs associated with CMMC Level 1 since it is assumed the contractor or subcontractor has implemented the applicable security requirements. [39] Assessment Costs and Initial Affirmation Costs: It is estimated that the cost to support a CMMC Level 1 assessment and affirmation is $\$5,977$ (as summarized in 4.1.2, Table 2). A Level I Self-Assessment is conducted annually, and is based on the assumptions detailed: Phase 1: Planning and preparing for the assessment: $\$1,803$ A director (MGMT5) for 4 hours ($\$190.52/\text{hr} \times 4\text{hrs} = \762) An external service provider (ESP) for 4 hours ($\$260.28 \times 4\text{hrs} = \$1,041$) Phase 2: Conducting the self-assessment: $\$2,705$ A director (MGMT5) for 6 hours ($\$190.52/\text{hr} \times 6\text{hrs} = \$1,143$) An external service provider (ESP) for 6 hours ($\$260.28 \times 6\text{hrs} = \$1,562$) Phase 3: Reporting of assessment results into SPRS: $\$909$ A director (MGMT5) for 2 hours ($\$190.52/\text{hr} \times 2\text{hrs} = \381) An external service provider (ESP) for 2 hours ($\$260.28/\text{hr} \times 2\text{hrs} = \521) A staff IT specialist (IT4-SB) for 0.08 hours [40] ($\$86.24/\text{hr} \times 0.08\text{hrs} = \7) Affirmation: initial affirmation post assessment: $\$560$ Reaffirmations: It is estimated that the costs to reaffirm a CMMC Level I annually for a small entity is $\$560$ A director (MGMT5) for 2 hours ($\$190.52/\text{hr} \times 2\text{hrs} = \381) A staff IT specialist (IT4-SB) for 2.08 hours ($\$86.24/\text{hr} \times 2.08\text{hrs} = \179) The Level 1 Self-Assessment and Affirmations cost burden will be addressed as part of the 48 CFR acquisition rule. Summary: The following is the annual small entities total cost summary for CMMC Level 1 self-assessments and affirmations over a ten-year period: (Example calculation, Year 1: $\$5,977$ per entity $\times 699$ entities (cumulative) = $\$4,177,845$). (printed page 89091) All Entities Summary The following is a summary of the combined costs for both small and other than small entities for CMMC Level 1 Self-Assessments and Affirmations over a ten-year period: CMMC Level 2 Self-Assessment and Affirmation Costs Other Than Small Entities Nonrecurring and Recurring Engineering Costs: There are no nonrecurring or recurring engineering costs associated with CMMC Level 2 Self-Assessment since it is assumed the contractor or subcontractor has implemented the NIST SP 800-171 Rev 2 security requirements.

evice connects to a Wi-Fi network, it will save the randomized MAC address into a network profile. Subsequent associations to the same Wi-Fi network will utilize the saved network profile information. It is important to recognize if the feature is enabled and which MAC address is the device's permanent and randomized address. Alternative enrollment methods may be required if MAC address based network access controls and/or MDM inventory tracking are used.

(G) From subsection (g) for compatibility with the exemption claimed from subsection (f), the civil remedies provisions of subsection (g) must be suspended for this record system. Because of the nature of criminal, administrative and civil investigations, standards of accuracy, relevance, timeliness and completeness cannot apply to open or closed investigations in this record system. Information gathered in criminal investigations is often fragmentary and leads relating to an individual in the context of one investigation may instead pertain to a second investigation. (25) System identifier and name. DPFPA 07, Counterintelligence Management Information System (CIMIS). (i) Exemption. Portions of this system that fall within 5 U.S.C. 552a (k)(2) are exempt from the following provisions of 5 U.S.C. 552a , section (c)(3); (d); (e)(1); (e)(4)(G) through (I); and (f) of the Act, as applicable. (printed page 14810) (ii) Authority. 5 U.S.C. 552a(k)(2) . (iii) Reasons. (A) From subsections (c)(3) because making available to a record subject the accounting of disclosure from records concerning him or her would specifically reveal any investigative interest in the individual. Revealing this information could reasonably be expected to compromise ongoing efforts to investigate a known or suspected offender by notifying the record subject that he or she is under investigation. This information could also permit the record subject

to take measures to impede the investigation, e.g. destroy evidence, intimidate potential witnesses, or flee the area to avoid or impede the investigation. (B) From subsection (d) because these provisions concern individual access to and amendment of certain records contained in this system, including counterintelligence, law enforcement, and investigatory records. Compliance with these provisions could alert the subject of an investigation of the fact and nature of the investigation, and/or the investigative interest of agencies; compromise sensitive information related to national security; interfere with the overall counterintelligence and investigative process by leading to the destruction of evidence, improper influencing of witnesses, fabrication of testimony, and/or flight of the subject; could identify a confidential source or disclose information which would constitute an unwarranted invasion of another's personal privacy; reveal a sensitive investigation or constitute a potential danger to the health or safety of law enforcement personnel, confidential informants, and witnesses. Amendment of these records would interfere with ongoing counterintelligence investigations and analysis activities and impose an excessive administrative burden by requiring investigations, analyses, and reports to be continuously reinvestigated and revised.

One commentor correctly interpreted § 170.23(a)(3) as meaning that CMMC level 2 Certification requirements (not self-assessments) flow down for subcontractors that will handle CUI when the Prime contract specifies a CMMC Level 2 Certification requirement. At the time of award, the DoD may have no visibility into whether the awardee will choose to further disseminate DoD's CUI, but DFARS clause 252.204-7012 and DFARS clause 252.204-7021 require that the prime contractor flow down the information security requirement to any subcontractor with which the CUI will be shared. Decisions regarding the DoD information that must be shared to support completion of subcontractor tasks, will take place between the prime contractor and the subcontractors chosen to complete the specific tasks. The DoD encourages prime contractors to work with its subcontractors to flow down CUI with the required security and the least burden. The DoD declines to revise the rule to address responsibilities for derivative marking of CUI because this rule makes no change to DFARS clause 252.204-7012 or DoD's CUI policies regarding marking of CUI, including creation of information. The specific contractual language is part of the 48 CFR part 204 CMMC Acquisition rule and beyond the scope of this 32 CFR part 170 CMMC Program rule. This rule describes DoD's intent for CMMC Program requirements, which include that all prime and subcontractors at all tiers that process, store, or transmit CUI in the performance of a DoD contract (or sub-contract) are required to demonstrate compliance with the contract requirements (i.e., FAR clause 52.204-21 or DFARS clause 252.204-7012) for adequately safeguarding FCI or CUI. CMMC flow-down requirements are designed to apply consistent assessment requirements to all subcontractors, regardless of company size, who are required to adequately safeguard CUI. The DoD cannot dictate DIB business practices and encourages prime contractors to carefully consider the necessity of sharing CUI information and work with subcontractors to flow down CUI only when deemed appropriate. Likewise, the criteria by which contractors select CSPs for support or the availability of GFE for any particular contract are beyond the scope of this rule. The DoD declines to limit CMMC program requirements to the first-tier subcontractor, as suggested by the commenter. When a contractor or subcontractor responds to multiple solicitations, that contractor should complete the highest assessment level among them for the assessment scope defined for use in performance of the contracts. The contractor may also elect to structure its environment to meet differing CMMC requirements based on the contract(s) in question. Contractual remedies for non-compliance are a 48 CFR part 204 CMMC Acquisition rule matter and beyond the scope of this rule. c. Requirements Comment:

The Internet of Things (IoT) market is rapidly expanding, with the number of IoT devices expected to increase from 26 billion in 2019 to 75 billion in 2025 [1]. With this increase, IoT smart home technology is becoming more pervasive, with an annual growth of 31% [2] and 34% of broadband households forecasted to have smart home systems by 2025 [3]. While early adopters of smart home technology have typically been more technically savvy, smart home devices are increasingly being purchased by users who may not understand the technology's privacy and security implications [2]. Within the current dynamic threat and technology environment, the uptick of smart home technology adoption may expose users to increased risks to their network security, privacy of their information, and quite possibly their physical safety [4, 5]. As such, it is imperative that smart home consumers be able to protect the security and privacy of their devices while still being able to enjoy the benefits of the technology. Within the security context, participants mentioned that they were concerned about their devices being hacked by unauthorized or malicious actors, as expressed by one participant who worried that hackers would be able to 'shut o GLYPH<11> ; or

dismantle, or mess with the system that I have in place' (P37\A) . In fact, the threat of device exploitation underpinned many of the privacy and security concerns discovered in our study. For example, exploitation could lead to unauthorized individuals gaining access to audio and video feeds. Governments could hack into devices or their companion apps for surveillance purposes. One participant was concerned about smart home vulnerabilities in certain types of devices based on conversations he had with colleagues in which he learned 'each manufacturer is actually just borrowing security APIs instead of creating their own, and the APIs specifically have holes in them.

(3) If Army organizations are unable to comply with policy, they will immediately notify their superiors, who will submit a memorandum through the chain of command to the Administrative Assistant of the Secretary of the Army to explain why the affected individuals or population's personal information has been lost, stolen, or compromised. (4) This policy is also applicable to Army contractors who collect, maintain, use, or disseminate protected personal information on behalf of the organization. (f) Federal government contractors' compliance. (1) When a DA activity contracts for the design, development, or operation of a Privacy Act system of records in order to accomplish a DA mission, the agency must apply the requirements of the Privacy Act to the contractor and its employees working on the contract (See 48 CFR part 24 and other applicable supplements to the FAR; 32 CFR part 310). (2) System Managers will review annually, contracts contained within the system(s) of records under their responsibility, to determine which ones contain provisions relating to the design, development, or operation of a Privacy Act system of records. (3) Contractors are considered employees of the Army for the purpose of the sanction provisions of the Privacy Act during the performance of the contract requirements. (4) Disclosing records to a contractor for use in performing the requirements of an authorized DA contract is considered a disclosure within the agency under exception (b)(1), 'Official Need to Know', of the Act. § 505.3 Privacy Act systems of records. (a) Systems of records. (1) A system of records is a group of records under the control of a DA activity that are retrieved by an individual's name or by some identifying number, symbol, or other identifying particular assigned to an individual. (2) Privacy Act systems of records must be: (i) Authorized by Federal statute or an Executive Order; (ii) Needed to carry out DA's mission; and (iii) Published in the Federal Register in a system of records notice, which will provide the public an opportunity to (printed page 46056) comment before DA implements or changes the system. (3) The mere fact that records are retrievable by a name or personal identifier is not enough. Records must actually be retrieved by a name or personal identifier. Records in a group of records that may be retrieved by a name or personal identifier but are not normally retrieved by this method are not covered by this part. However, they are covered by AR 25-55, the Department of the Army Freedom of Information Act Program. (4) The existence of a statute or Executive Order mandating the maintenance of a system of records to perform an authorized activity does not abolish the responsibility to ensure the information in the system of records is relevant and necessary to perform the authorized activity. (b) Privacy Act system of records notices. (1) DA must publish notices in the Federal Register

1 OT includes hardware and software that use direct monitoring and control of industrial equipment to detect or cause a change. Additional Guidance on Level 2 Scoping CMMC Assessment Scope · Level 2 | Version 2.13 8 Specialized Assets are part of the CMMC Assessment Scope. In accordance with 32 CFR § 170.19(c)(1) Table 3, the OSA shall document these assets in the SSP and detail how they are managed using the OSA's risk-based information security policy, procedures, and practices. In addition, the OSA is required to: · document each asset in asset inventory; there is no requirement to embed every asset in the SSP; · document these assets in the SSP to show they are managed using the OSA's risk-based security policies, procedures, and practices; and · provide a network diagram of the CMMC Assessment Scope (to include these assets) to facilitate scoping discussions during the pre-assessment. An assessor will review the SSP to verify that specialized assets are managed using the OSA's risk-based information security policy, procedures, and practices , and accounted for within the OSA's CMMC Assessment Scope. The assessor will not retain a copy of the SSP. Out-of-Scope Assets Out-of-Scope Assets cannot process, store, or transmit CUI, and do not provide security protections for CUI Assets. Assets that are physically or logically separated from CUI Assets and do not provide security protections for CUI Assets are also Out-of-Scope Assets. An asset that falls into any in-scope asset category cannot be considered an Out-of-Scope Asset. In accordance with 32 CFR § 170.19(c)(1), Out-of-Scope Assets are not part of a Level 2 self-assessment or certification assessment. There are no documentation requirements for Out - of-Scope Assets. Defining the CMMC Assessment Scope After categorizing its assets, the OSA then specifies the CMMC Assessment Scope. The CMMC Assessment Scope includes all assets in the OSA's environment

that will be assessed in accordance with Table 1. OSAs will be required to provide documentation that specifies the CMMC Assessment Scope to the assessor. Details about required documentation for each asset category can be found in the CMMC Asset Categories section above. The following asset categories are part of the Level 2 CMMC Assessment Scope: · CUI Assets · Security Protection Assets · Contractor Risk Managed Assets · Specialized Assets

Once CMMC is fully implemented, certain DoD contractors that handle sensitive unclassified DoD information will be required to achieve a particular CMMC level as a condition of contract award. In September 2020, the DoD published an interim DFARS rule in the Federal Register (DFARS Case 2019-D041) that implemented the DoD's initial vision for the CMMC Program (·CMMC 1.0·) and outlined the basic features of the program (tiered model, required assessments, and implementation through contracts). The interim rule became effective on November 30, 2020. In March 2021, the Department initiated an internal review of CMMC's implementation, informed by more than 750 public comments in response to the interim DFARS rule. This comprehensive, programmatic assessment engaged cybersecurity and acquisition leaders within DoD to refine policy and program implementation. In November 2021, the Department announced ·CMMC 2.0,· which is an updated program structure and revised requirements designed to achieve the primary goals of an internal DoD review of the CMMC Program. With the implementation of CMMC 2.0, the Department introduced several key changes that build on and refine the original program requirements. These include: Streamlining the model from five levels to three levels. Exclusively implementing National Institute of Standards and Technology (NIST) cybersecurity guidelines. Allowing all companies at Level 1 and a subset of companies at Level 2 to demonstrate compliance through self-assessments. Increased oversight of professional and ethical standards of third-party assessors. Allowing companies, under limited circumstances, to make Plan of Action & Milestones (POA&M) to achieve certification. In July 2022, the CMMC PMO met with the Office of Advocacy for the U.S. SBA to address the revisions planned in CMMC 2.0 that are responsive to prior SBA concerns. As a result of the alignment of CMMC 2.0 to NIST guidelines, the Department's requirements will continue to evolve as changes are made to the underlying NIST SP 800-171 Rev 2 and NIST SP 800-172 requirements. (2) Objectives of, and Legal Basis for, the Rule Legal Basis: 5 U.S.C. 301 ; Sec. 1648, Public Law 116-92 , 133 Stat. 1198. The objective of this proposed rule (CMMC Program rule) is to provide the Department with increased assurance that a defense contractor can adequately protect sensitive unclassified information commensurate with the risk, accounting for information flow down to its subcontractors in a multi-tier supply chain. This rule meets the objective by providing a mechanism to assess contractor and subcontractor implementation of DoD's cyber security protection requirements for FCI and CUI. Implementation of the CMMC Program is intended to address the following policy issues: (a) Verification of a Contractor's Cybersecurity Posture Effective June 2016, FAR clause 52.204-21 Basic Safeguarding of Contractor Information Systems,

This applies when the disclosure of law enforcement records would disclose techniques and procedures for law enforcement investigations or prosecutions, or would disclose guidelines for law enforcement investigations or prosecutions, if such disclosure could reasonably be expected to risk circumvention of the law (5 U.S.C. 552(b)(7)(E)). (vi) Exemption 7F. This applies when the disclosure of law enforcement records could reasonably be expected to endanger the life or physical safety of any individual (5 U.S.C. 552(b)(7)(F)). (2) Examples of Exemption 7 applications. (i) Statements of witnesses and other material developed during the course of the investigation and all materials prepared in connection with related Government litigation or adjudicative proceedings may be exempt from disclosure pursuant to Exemptions 7A, 7C, and/or 7D. (ii) The identity of firms or individuals being investigated for alleged irregularities involving contracting with the Department of Defense when no indictment has been obtained nor any civil action filed against them by the United States may be exempt from disclosure pursuant to Exemptions 7A and/or 7C. (iii) Information obtained in confidence, expressed or implied, in the course of a criminal investigation by a criminal law enforcement agency or a lawful national security intelligence (printed page 71857) investigation, may be exempt from disclosure pursuant to Exemptions 7A, 7C and/or 7D. National security intelligence investigations include background security investigations and those investigations conducted for the purpose of obtaining affirmative or counterintelligence information. (iv) Emergency action plans, guidelines for response to terrorist attacks, analyses of security procedures, and other sensitive information that could prove deadly if obtained by those seeking to do harm to the public on a large scale may be exempt from disclosure pursuant to Exemptions 7E and/or 7F. The Components should also assert Exemption 2 in conjunction with Exemption 7E to withhold this type of law enforcement information. (3) Exclusions. The FOIA contains 3

special protection provisions referred to as record exclusions. Of these exclusions, only 2 are used by the Department of Defense. These exclusions expressly authorize Department of Defense law enforcement agencies to treat especially sensitive records under certain specified circumstances as not subject to the requirements of the FOIA. The DoD Component considering invoking one of these exclusions shall first consult with legal counsel and with DFOIPO. In turn, DFOIPO will consult with the Office of Information and Privacy, Department of Justice. If the records are determined to be excluded, the response to the requester will state that no records were found. (i) Exclusion 1. The DoD Components may treat records requested as not subject to the FOIA when the following circumstance applies: (A) The request involves access to records or information compiled for law enforcement purposes.

(ii) Home addresses and phone numbers; or (iii) Date of birth. (i) Disclosures for established routine uses. (1) Records may be disclosed outside the DOD without the consent of the individual to whom they pertain for an established routine use. (2) A routine use shall (i) Be compatible with and related to the purpose for which the record was compiled; (ii) Identify the persons or organizations to which the records may be released; and (iii) Have been published previously in the Federal Register. (3) Establish a routine use for each user of the information outside the Department of Defense who needs official access to the records. (4) Routine uses may be established, discontinued, or amended without the consent of the individuals involved. However, new or changed routine uses must be published in the Federal (printed page 24506) Register at least 30 days before actually disclosing any records. (5) In addition to the routine uses listed in the applicable systems of records notices, Blanket Routine Uses for all DOD maintained systems of records have been established. These Blanket Routine Uses are applicable to every record system maintained within the DOD unless specifically stated otherwise within a particular record system. The Blanket Routine Uses are listed at appendix C of this part. (j) Disclosure accounting. (1) System managers must keep an accurate record of all disclosures made from DA Privacy Act system of records, including those made with the consent of the individual, except when records are (i) Disclosed to DOD officials who have a need to know the information to perform official government duties; or (ii) Required to be disclosed under the Freedom of Information Act. (2) The purpose for the accounting of disclosure is to (i) Enable an individual to ascertain those persons or agencies that have received information about them; (ii) Enable the DA to notify past recipients of subsequent amendments or Statements of Dispute concerning the record; and (iii) Provide a record of DA compliance with the Privacy Act of 1974, if necessary. (3) Since the characteristics of records maintained within DA vary widely, no uniform method for keeping the disclosure accounting is prescribed. (4) Essential elements to include in each disclosure accounting report are (i) The name, position title, and address of the person making the disclosure; (ii) Description of the record disclosed; (iii) The date, method, and purpose of the disclosure; and (iv) The name, position title, and address of the person or agency to which the disclosure was made. (5) The record subject has the right of access to the disclosure accounting except when (i) The disclosure was made for law enforcement purposes under 5 U.S.C. 552a(b)(7); or (ii) The disclosure was made from a system of records for which an exemption from 5 U.S.C. 552a(c)(3) has been claimed.

3.5.2 | Sandboxing... 3.5.2 Sandboxing Sandboxing refers to a security model where applications are run within a sandbox-a controlled environment that restricts what operations the applications can perform and that isolates them from other applications running on the same host.

The following is the annual small entities total cost summary for CMMC Level 1 self-assessments and affirmations over a ten-year period: (Example calculation, Year 1: $\$5,977$ per entity (detailed above) $\times$ 699 entities (cumulative) = $\$4,177,845$) (printed page 83206) CMMC Level 2 Self-Assessment and Affirmation Costs for Small Business Entities The costs below account for a CMMC Level 2 self-assessment of the applicable contractor information system(s) with NIST SP 800-171 R2 requirements based on assumptions defined above. Nonrecurring and recurring engineering costs: There are no nonrecurring or recurring engineering costs associated with CMMC Level 2 self-assessment since it is assumed the contractor has implemented NIST SP 800-171 R2 requirements. Assessment Costs and Initial Affirmation Costs: It is estimated that the cost to support a CMMC Level 2 self-assessment and affirmation for a small entity is $\$34,277$. The three-year cost is $\$37,196$ (as summarized in 4.1.2 above, table 2), which includes the triennial assessment + affirmation, plus two additional annual affirmations ($\$34,277 + \$1,459 + \$1,459$). · Phase 1: Planning and preparing for the self-assessment: $\$14,426$ A director (MGMT5) for 32 hours ($\$190.52/\text{hr} \times 32\text{hrs} = \$6,097$) An external service provider (ESP) for 32 hours ($\$260.28/\text{hr} \times 32\text{hrs} = \$8,329$) · Phase 2: Conducting the self-assessment: $\$15,542$ A director (MGMT5) for 16 hours ($\$190.52/\text{hr} \times 16\text{hrs} = \$3,048$) An external service provider (ESP) for 48 hours ($\$260.28/\text{hr} \times 48\text{hrs} = \$12,493$) · Phase 3: Reporting of assessment results: $\$2,851$ A director (MGMT5) for 4 hours ($\$190.52/\text{hr} \times 4\text{hrs} = \762) An external service provider (ESP) for 8 hours ($\$260.28/\text{hr} \times 8\text{hrs} = \$2,082$) A staff IT specialist (IT4) for 0.08 hours ($\$86.24/\text{hr} \times 0.08\text{hrs} = \7) · Affirmation ·initial affirmation post assessment: $\$1,459$ Reaffirmations: It is estimated that the costs to reaffirm a CMMC Level 2 self-assessment annually is $\$1,459$ (three-year costs to reaffirm a CMMC Level 2 self-assessment annually is $\$4,377$, or $\$1,459 \times 3$): ·A director (MGMT5) for 4 hours ($\$190.52/\text{hr} \times 4\text{hrs} = \762) ·A staff IT specialist (IT4) for 8.08 hours ($\$86.24/\text{hr} \times 8.08\text{hrs} = \697) Summary: The following is the annual small entities total cost summary for CMMC Level 2 self-assessments and Affirmations over a ten-year period: (Example calculation, Year 2: ($\$34,277$ self-assessment per entity $\times$ 101 entities) + ($\$1,459$ annual affirmation per entity $\times$ 20 entities) = $\$3,491,193$) (printed page 83207) CMMC Level 2 Certification and Affirmation Costs for Small Business Entities The costs below account for a CMMC Level 2 Certification assessment and affirmation costs of the applicable contractor information system(s) with NIST SP 800-171 R2 requirements based on assumptions defined above. CMMC Level 2 certification assessments require hiring a C3PAO to perform the assessment. Nonrecurring or recurring engineering costs:

The analysis of the benefits of the final rule uses characteristics of conventional outbreaks and investigations to more clearly identify and quantify shortfalls in existing recordkeeping practices and how each is addressed by the recordkeeping regulation. We measure the effects in terms of the number of illnesses averted due to reductions in the duration of outbreak investigations and reductions in the number of investigations that are prematurely terminated because of poor records quality. When an investigation is prematurely terminated, there is both a loss of data that might prevent recurrences of the outbreak and a decrease in the effectiveness of any preventive action. The need for this regulation is underscored when the potentially large sizes of outbreaks from intentional attacks on the food supply are considered. Although the probability of such an intentional attack is unknown, the size of the benefits from this regulation are larger, the larger the size of such an outbreak. We estimate benefits using data from FDA outbreak investigations. We then compared estimated benefits for a number of regulatory options. In this way, the benefits of each regulatory option can be compared to its costs. While the costs and benefits of the policy alternative ·not to regulate· are not considered in the final rule, they were analyzed in the proposed rule. We did not estimate the effects of potential future regulatory actions because we do not anticipate any such actions that would affect the estimated costs or benefits of this final rule. In response to the comment that we have not shown that benefits exceed costs, the Executive Order requires that costs must be justified by benefits. We believe we have done so in this analysis. Finally, in the PRIA, FDA addressed the state of the national economy by examining the impact of the final rule on the most vulnerable firms in the industry, through simulations using our small business model (Ref 1.), and also in the Unfunded Mandates section by examining the impact of the rule on all consumers as well as producers in the food economy in general. In this analysis we use the small business model to calculate the effects of the costs of this final rule on the survival of small businesses. We incorporated both the annualized one-time costs and the recurring costs for computing the effects on cash flows. We computed the effects for firms manufacturing dietary supplements, candy, and ready-to-eat foods, including breakfast cereals, beverages, canned foods, baked items and breads, and dressings and sauces. While these firms do not represent every

category of food establishment covered by this final rule, they do reflect a large number of firms in the food industry, including manufacturers, input suppliers, and distributors. FDA assumes that the cost and revenue structures of firms not explicitly included in the computation of the model do not differ substantially from those that are included.

means assets that cannot process, store, or transmit CUI because they are physically or logically separated from information systems that do process, store or transmit CUI, or are inherently unable to do so; except for assets that provide security protection for a CUI asset (see the definition for Security Protection Assets). (CMMC-custom term) Periodically means occurring at regular intervals. As used in many requirements within CMMC, the interval length is organization-defined to provided OSA flexibility, with an interval length of no more than one year. (CMMC-custom term) Plan of action and milestones (POA&M) means a document that identifies tasks needing to be accomplished. It details resources required to accomplish the elements of the plan, any milestones in meeting the tasks, and scheduled completion dates for the milestones, as defined in NIST SP 800-115 (incorporated by reference, see § 170.2). Prime Contractor is defined in 48 CFR 3.502-1 . Process, store, or transmit means data can be used by an asset (e.g., accessed, entered, edited, generated, manipulated, or printed); data is inactive or at rest on an asset (e.g., located on electronic media, in system component memory, or in physical format such as paper documents); or data is being transferred from one asset to another asset (e.g., data in transit using physical or digital transport methods). (CMMC-custom term) Restricted Information Systems means systems (and associated IT components comprising the system) that are configured based on government requirements (e.g., connected to something that was required to support a functional requirement) and are used to support a contract (e.g., fielded systems, obsolete systems, and product deliverable replicas). (CMMC-custom term) Risk means a measure of the extent to which an entity is threatened by a potential circumstance or event, and typically a function of the adverse impacts that would arise if the circumstance or event occurs and the likelihood of occurrence, as defined in CNSSI 4009 (incorporated by reference, see § 170.2). Risk Assessment means the process of identifying risks to organizational operations (including mission, functions, image, reputation), organizational assets, individuals, other organizations, and the Nation, resulting from the operation of a system. Risk Assessment is part of risk management, incorporates threat and vulnerability analyses, and considers mitigations provided by security controls planned or in place. Synonymous with risk analysis, as defined in NIST SP 800-39 (incorporated by reference, see § 170.2). Security Protection Assets means assets providing security functions or capabilities to the OSA's CMMC Assessment Scope, irrespective of whether or not these assets process, store, or transmit CUI. (CMMC-custom term) Specialized Assets

facilities covered by the regulation by not identifying transporters of food contact materials, and that the 20 NAICS codes do not cover all food packaging manufacturers and distributors. Several comments state that all packaging firms handle both outer packaging and food contact substances, and for all practical purposes, will have to track all products they produce, because they may not know if a shipment is destined for food or nonfood use. One comment states that FDA's count of foreign facilities from OASIS did not include all imported food contact substances. (Response) The final rule does not require persons who manufacture, process, pack, transport, distribute, import, receive, or hold packaging (the outer packaging of food that bears the label and does not contact the food) to establish or maintain records. However, these persons are subject to the records access requirements with respect to any existing records if they also engage in another regulated activity with respect to the food in, or to be placed in, such packaging. Persons who place food directly in contact with its finished container are subject to all of the requirements of subpart J as to the finished container that directly contacts that food. Moreover, all other persons who manufacture, process, pack, transport, distribute, receive, hold, or import the finished container that directly contacts the food are excluded from the establishment and maintenance requirements with regard to the finished container, and are only subject to the records access provisions for existing records under §§ 1.361 and 1.363. In the final rule, records access costs are estimated to be zero and we assume that the only costs incurred by persons who manufacture, process, pack, transport, distribute, receive, hold, or import the finished container that directly contacts the food are learning costs. Because the economic burden on these facilities in the final rule has been substantially reduced from that estimated in the PRIA, we assume that the impact on costs of any possible underestimation of their numbers will be very small. e. Foreign facilities and related impacts . (Comment 212) There were many comments that state that the expansion of requirements to foreign facilities would have a large impact on international trade by making imports more

expensive. Some comments state that costs for compliance by developing countries were underestimated in the PRIA because their labor and technology are so different from those that prevail in developed countries.

(i) For the purpose of monitoring alarms, an equivalent level of monitoring service is available from multiple types of providers. The central monitoring station may be located at a one of the following: (A) Government contractor monitoring station (GCMS), formerly called a proprietary central station. (B) Cleared commercial central station. (C) Cleared protective signal service station (e.g., fire alarm monitor). (D) Cleared residential monitoring station. (E) National industrial monitoring station. (ii) SECRET-cleared central station employees at the alarm monitoring station will be in attendance in sufficient number to monitor each alarmed area within the cleared contractor facility. (iii) The central monitoring station will be supervised continuously by a U.S. citizen who has eligibility for access to SECRET information. (iv) The IDS must be activated at the close of business whenever the area is not occupied by cleared personnel. Any IDS exit delay function must expire prior to the cleared personnel leaving the immediate area. A record will be maintained to identify the person or persons who are responsible for setting and deactivating the IDS. (v) Records will be maintained for 12 months indicating time of receipt of alarm, name(s) of security force personnel responding, time dispatched to facility or area, time security force personnel arrived, nature of alarm, and what follow-up actions were accomplished. (3) Investigative response to alarms. (i) Alarm response teams will ascertain if intrusion has occurred and, if possible, assist in the apprehension of the individuals involved. (A) If an alarm activation resets in a reasonable amount of time and no damage to the area is visible, then entrance into the area is not required and an initial response team may consist of uncleared personnel. (B) If the alarm activation does not reset and damage is observed, then a cleared response team must be dispatched. The initial uncleared response team must stay on station until relieved by the cleared response team. If a cleared response team does not arrive within 1 hour, then a report to the CSA must be made by the close of the next business day. (ii) The following resources may be used to investigate alarms: Proprietary security force personnel, central station guards, local law enforcement personnel, or a subcontracted guard service. The CSA may approve procedures for the use of entity cleared employees who can meet the minimum response requirements outlined in this section. (A) For a GCMS, trained proprietary or subcontractor security force personnel, cleared to the SECRET level and sufficient in number to be dispatched immediately to investigate each alarm, will be available at all times when the IDS is in operation.

- Sequencers are typically connected to a network and the internet. This provides access to the manufacturer for updates and transfer of files to secure storage. There is no guidance on the network addresses and the corresponding network protocols that are required for sequencers to effectively operate. The development of DLP guidance specifically developed for the sector would prevent the unwarranted flow of information and provide data confinement. For example, it would be possible to microsegment sequencers on the network, providing them with only the required resources for their proper functioning in keeping with ZTA cybersecurity principles. This would mitigate the possibilities of adversaries exploiting vulnerabilities in the sequencer's hardware or software for exfiltration of data as well as using the sequencers as entry points that allow lateral movement throughout the enterprise network. Another control is to use current technical solutions regarding data confinement offering protective controls that prevent exfiltration to non-permitted internet protocol (IP) addresses, such as cloud features that can create a secure perimeter. - The potential loss of patient and sample information, credentials, and other private information can be partially addressed by the requirement of 'device reset' functionality to delete critical data and stored credentials from the equipment without affecting the operational state, which is particularly important when decommissioning an instrument. Also, users should be able to reinstall or update software for safely resetting instruments and eliminating stored data. - Most genetic data sharing and processing occurs in cloud environments, frequently leveraging containers (e.g., Docker or Pods). Many cybersecurity vulnerability scanners are not optimized for scanning containers, resulting in an inability to identify certain vulnerabilities and a high number of false positives.

Several respondents commented on the need for DoD to focus on mitigation plans and less intrusive measures. One of these respondents commented that DoD should create a mechanism for vendors to file supply chain risk mitigation plans with DoD. DoD could take these plans into consideration when assessing supply chain risk for any particular procurement activity. By viewing filed mitigation plans from multiple vendors, DoD could gain greater insight into commercially viable supply chain

mitigation practices. This respondent further stated that DoD should approach supply chain risk with an eye toward encouraging mitigation rather than simply disqualifying vendors, suggesting that DoD can and should implement robust supply chain security practices. One respondent suggested that DoD should clarify what it believes are less intrusive measures under section 239.7304(b)(1)(2), recommending that in order to prevent the interim rule from impeding the use of commercial technology (including commercially available off-the-shelf items) in NSS, which ultimately benefits DoD, the Department should provide wide discretion to the judgment of manufacturers in their use of industry standards and internal processes to meet its supply chain risk goals. This respondent further commented that while DFARS section 239.7304 of the rule provides that an exclusion under DFARS 239.7305 may occur when it is determined that, among other factors, 'less intrusive measures are not reasonably available to reduce such supply chain risk,' at no point in the rule is clarity provided on what this language is defined as or what an authorized individual should refer to in order to gauge what 'less intrusive measures' are and whether they are 'not reasonably available.' Another of these respondents suggested that the opportunity to mitigate or eliminate the noticed risk from the supply chain would avoid significant costs that would be passed along to DoD. One respondent suggested that DoD modify the interim rule to clarify that the exercise of the authorities under DFARS 239.7305 should be a 'last resort,' invoked only after other methods of mitigating supply chain risk have been considered or attempted. Response: Section 806(b)(2) requires that 'less intrusive measures are not reasonably available to reduce supply chain risk' to use its authority. Whenever it is appropriate, DoD will work with its offerors to mitigate supply chain risk using less intrusive measures than exclusion based on section 806 authorities. In the notification to congressional committees when exercising section 806 authority, a summary of the mitigation analysis evaluating reasonably available mitigations will be documented. In most cases, DoD expects these mitigations will sufficiently mitigate the risks so that exclusion will not be necessary. e. Standards and Controls Comment:

From the NIST SP 800-172 Rev 3 Final Public Draft: b. Employ the threat-hunting capability [Assignment: organization-defined frequency]. DISCUSSION Threat hunting is an active means of cyber defense in contrast to traditional protection measures, such as firewalls, intrusion detection and prevention systems, quarantining malicious code in sandboxes, and Security Information and Event Management (SIEM) technologies and systems. Cyber threat hunting involves proactively searching organizational systems, networks, and infrastructure for advanced threats. The objective is to track and disrupt adversaries as early as possible in the attack sequence and to measurably improve the speed and accuracy of responses. Indications of compromise include unusual network traffic, unusual file changes, and the presence of malicious code. Threat-

The DoD declined to produce another cost estimate for CMMC assessment and certification. As required by the Rulemaking Guidance, the DoD provided cost estimates and impact analyses in the proposed rule. The analysis included estimated costs for each level and type of assessment or certification for different sized contractor businesses. The cost estimates did not include an analysis of profit margins, which is not required. This rule also does not provide the cost analysis for all actions, personnel, and security measures required to protect CUI information, data, systems, and technical products through the life cycle of the work and data generated. The cost estimates represent derived estimates based on internal expertise and public feedback in accordance with OMB Circular A-4. Market forces of supply and demand will determine C3PAO pricing for CMMC Level 2 certification assessments. The size and complexity of the network within scope of the assessment impacts the costs as well. CMMC Level 3 assessments against the NIST SP 800-172 Feb2021 baseline are performed free of cost by DoD assessors, which reduces the cost of CMMC Level 3. The costs associated with a government-owned SECRET-level network are not relevant to the CMMC Program which ensures protection of FCI and CUI. e. Assistance Programs or Other Relief Comment: Several commenters proposed that financial assistance, contract incentives, direct reimbursement of assessment costs (in whole or in part), and market rate price caps be considered to lessen financial burden and decrease the entry barrier for SMBs. Several comments also inquired about DoD SMB grant programs to help SMBs cover the cost of CMMC Level 2 certification assessments. Multiple comments suggested DOD provide actionable guidance through outreach support and assistance along with free or reduced cost cybersecurity services to SMBs, with two referencing the DoD Office of Small Business Programs and one the DoD Procurement Toolbox. One comment, from a large business with SMB suppliers, requested clearer guidance and support for flow down to sub-tier suppliers and SMB supply chains. One comment stated firms who receive a low number of CUI documents (30 docs in 3-years on 10 computers) do not justify the cost of becoming CMMC compliant, and added the cost is nearly as much as protection for

classified documents. One commenter suggested NIST SP 800-171 R2 security requirements would not apply to their specific characteristics, i.e., a very small (printed page 83152) business with minimal internet connectivity, no remote access, no public access, no mobile devices, no remote work, and no known cybersecurity issues. The comment asserted that the company posed minimal risk to CUI and should be excused from adhering to CMMC program requirements based on cost burden.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. Figure 1 depicts a notional enterprise with subordinate organizations, illustrating that one of those subordinate organizations is itself an enterprise. Both government and industry are represented in this depiction. Consider the example of the Department of Commerce as a higherlevel enterprise with bureaus (e.g., Census Bureau, National Oceanic and Atmospheric Administration [NOAA], NIST) as lower-level enterprises and subordinates (e.g., NOAA's National Weather Service, NIST laboratories) representing organizations.

3.1.6 | Human Error and Deliberate Misconfiguration... 3.1.6 Human Error and Deliberate Misconfiguration Even with the existence of security controls, users may end up performing technically supported storage configuration changes that still present an unacceptable exposure (e.

As of 2026, the DFARS cybersecurity clause landscape is as follows: - DFARS 252.204-7012 (Safeguarding Covered Defense Information): Active. Requires contractors to implement NIST SP 800-171 and report cyber incidents within 72 hours. - DFARS 252.204-7019 (Notice of NIST SP 800-171 DoD Assessment Requirements): Eliminated as of February 1, 2026. Basic self-assessment SPRS uploads no longer required. - DFARS 252.204-7020 (NIST SP 800-171 DoD Assessment Requirements): Active. Governs Medium and High assessments conducted by DIBCAC. - DFARS 252.204-7021 (CMMC Requirements): Active as of November 10, 2025 (Phase 1). Requires CMMC certification at the level specified in the contract. The elimination of 7019 consolidates assessment requirements under the CMMC framework.

would require a regulated entity to establish written policies and procedures for retaining and reviewing records of activity in the regulated entity's relevant electronic information systems by persons and technology assets. Such written policies and procedures should require review of activity in the regulated entity's relevant electronic information systems as a whole, as well as the system's components, including but not limited to any workstations. They should also include information on the frequency for reviewing such records. The frequency of review may vary based on the specific type of record being reviewed and the information it contains. According to the proposed implementation specification for scope at proposed 45 CFR 164.308(a)(7)(ii)(B) , records of activity in the regulated entity's relevant electronic information systems by persons and technology assets would include, but would not be limited to, audit trails, event logs, firewall logs, system logs, data backup logs, access reports, anti-malware logs, and security incident tracking reports. The proposed implementation specification for records review at proposed 45 CFR 164.308(a)(7)(ii)(C) would require a regulated entity to review records of activity in its relevant electronic information systems by persons and technology assets as often as reasonable and appropriate for the type of report or log. They would also be required to document such review. A proposed implementation specification for record retention at proposed 45 CFR 164.308(a)(7)(ii)(D) would require a regulated entity to retain records of activity in its relevant electronic information systems by persons and technology assets. Under the proposal, the regulated entity would be required to retain such records for an amount of time that is reasonable and appropriate for the specific type of report or log. For example, it may be reasonable and appropriate to retain audit trails for a different amount of time than security incident tracking reports because of the type of

information they contain and their purpose. The proposed implementation specification for response at proposed 45 CFR 164.308(a)(7)(ii)(E) would require a regulated entity to respond to a suspected or known security incident identified during the review of activity in its relevant electronic information systems, including any components thereof, such as workstations, in accordance with the regulated entity's security incident plan. [541] Finally, the proposed implementation specification for maintenance at proposed 45 CFR 164.308(a)(7)(ii)(F) would require a regulated entity to review and test its written policies and procedures for reviewing activity in its relevant electronic information systems at least once every 12 months. The regulated entity would be expected to modify such policies and procedures as reasonable and appropriate, based on the results of that review.

(b) The requirements of this part do not apply to Federal information systems operated by contractors or subcontractors on behalf of the Government. (c) CMMC Program requirements apply to all DoD solicitations and contracts pursuant to which a defense contractor or subcontractor will process, store, or transmit FCI or CUI on unclassified contractor information systems, including those for the acquisition of commercial items (except those exclusively for COTS items) valued at greater than the micro-purchase threshold except under the following circumstances: (1) The procurement occurs during Implementation Phase 1, 2, or 3 as described in paragraph (e) of this section, in which case CMMC Program requirements apply in accordance with the requirements for the relevant phase-in period; or (2) Application of CMMC Program requirements to a procurement or class of procurements may be waived in advance of the solicitation at the discretion of DoD in accordance with all applicable policies, procedures, and approval requirements. (d) DoD Program Managers or requiring activities are responsible for selecting the CMMC Status that will apply for a particular procurement or contract based upon the type of information, FCI or CUI, that will be processed on, stored on, or transmitted through a contractor information system. Application of the CMMC Status for subcontractors will be determined in accordance with § 170.23. (e) DoD is utilizing a phased approach for the inclusion of CMMC Program requirements in solicitations and contracts. Implementation of CMMC Program requirements will occur over four (4) phases: (1) Phase 1. Begins on the effective date of the complementary 48 CFR part 204 CMMC Acquisition final rule. DoD intends to include the requirement for CMMC Statuses of Level 1 (Self) or Level 2 (Self) for all applicable DoD solicitations and contracts as a condition of contract award. DoD may, at its discretion, include the requirement for CMMC Status of Level 1 (Self) or Level 2 (Self) for applicable DoD solicitations and contracts as a condition to exercise an option period on a contract awarded prior to the effective date. DoD may also, at its discretion, include the requirement for CMMC Status of Level 2 (C3PAO) in place of the Level 2 (Self) CMMC Status for applicable DoD solicitations and contracts. (2) Phase 2. Begins one calendar year following the start date of Phase 1. In addition to Phase 1 requirements, DoD intends to include the requirement for CMMC Status of Level 2 (C3PAO) for applicable DoD solicitations and contracts as a condition of contract award. DoD may, at its discretion, delay the inclusion of requirement for CMMC Status of Level 2 (C3PAO) to an option period instead of as a condition of contract award. DoD may also, at its discretion, include the requirement for CMMC Status of Level 3 (DIBCAC) for applicable DoD solicitations and contracts. (3) Phase 3.

(F) From subsections (e)(4)(G), (e)(4)(H), and (e)(4)(I) (Agency Requirements) and (f) (Agency Rules), because portions of this system are exempt from the individual access provisions of subsection (d) for the reasons noted above, and therefore NGA is not required to establish requirements, rules, or procedures with respect to such access. Providing notice to individuals with respect to existence of records pertaining to them in the system of records or otherwise setting up procedures pursuant to which individuals may access and view records pertaining to themselves in the system would undermine investigative efforts and reveal the identities of witnesses, and potential witnesses, and confidential informants. (G) From subsection (e)(5) (Collection of Information) because with the collection of information for law enforcement purposes, it is impossible to determine in advance what information is accurate, relevant, timely, and complete. Compliance with subsection (e)(5) would preclude NGA personnel from using their investigative training and exercise of good judgment to both conduct and report on investigations. (H) From subsection (e)(8) (Notice on Individuals) because compliance would interfere with NGA's ability to cooperate with law enforcement who would obtain, serve, and issue subpoenas, warrants, and other law enforcement mechanisms that may be filed under seal and could result in disclosure of investigative techniques, procedures, and evidence. (I) From subsection (g)(1) (Civil Remedies) to the extent that the system is exempt from other specific subsections of the Privacy Act. (5) System identifier and name.

NGA-010, National Geospatial-Intelligence Agency Security Financial Disclosure Reporting Records System. (i) Exemption. Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2), may be exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a (printed page 14785) confidential source. When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. Investigative material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5), but only to the extent that such material would reveal the identity of a confidential source. (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5). (iii) Reasons. Pursuant to 5 U.S.C. 552a(k)(2), and (k)(5)

From the NIST SP 800-172 Rev 3 Final Public Draft: · Damage-limiting operations: Procedural and operational measures that use system capabilities to maximize the ability of an organization to detect successful system compromises by an adversary and to limit the effects of such compromises (both detected and undetected). NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 · Cyber resiliency: The ability to anticipate, withstand, recover from, and adapt to adverse 297

NIST SP 800-171 Rev 3 (published May 2024) is the current version. Key changes from Rev 2: - Reorganized from 14 to 17 control families - Updated control numbering (3.X.X format to 03.XX.XX format) - Added new controls for supply chain risk management - Introduced Organization-Defined Parameters (ODPs) - Better alignment with NIST SP 800-53 Rev 5 - 97 security requirements (vs 110 in Rev 2 when counting sub-requirements) The DoD is transitioning to Rev 3 for CMMC assessments. Check with your contracting officer for the current requirement in your specific contract.

to control information flows between security domains on connected systems. (iii) AT.L3-3.2.1e Provide awareness training upon initial hire, following a significant cyber event, and at least annually, focused on recognizing and responding to threats from social engineering, advanced persistent threat actors, breaches, and suspicious behaviors; update the training at least annually or when there are significant changes to the threat. (iv) AT.L3-3.2.2e Include practical exercises in awareness training for all users, tailored by roles, to include general users, users with specialized roles, and privileged users, that are aligned with current threat scenarios and provide feedback to individuals involved in the training and their supervisors. (v) CM.L3-3.4.1e Establish and maintain an authoritative source and repository to provide a trusted source and accountability for approved and implemented system components. (vi) CM.L3-3.4.2e Employ automated mechanisms to detect misconfigured or unauthorized system components; after detection, remove the components or place the components in a quarantine or remediation network to facilitate patching, re-configuration, or other mitigations. (vii) CM.L3-3.4.3e Employ automated discovery and management tools to maintain an up-to-date, complete, accurate, and readily available inventory of system components. (viii) IA.L3-3.5.1e Identify and authenticate systems and system components, where possible, before establishing a network connection using bidirectional authentication that is cryptographically based and replay resistant. (ix) IA.L3-3.5.3e Employ automated or manual/procedural mechanisms to prohibit system components from connecting to organizational systems unless the components are known, authenticated, in a properly configured state, or in a trust profile. (x) IR.L3-3.6.1e Establish and maintain a security operations center capability that operates 24/7, with allowance for remote/on-call staff. (xi) IR.L3-3.6.2e Establish and maintain a cyber-incident response team that can be deployed by the organization within 24 hours. (xii) PS.L3-3.9.2e Ensure that organizational systems are protected if adverse information develops or is obtained about individuals with access to CUI. (xiii) RA.L3-3.11.1e Employ threat intelligence, at a minimum from open or commercial sources, and any DoD-provided sources, as part of a risk assessment to guide and inform the development of organizational systems, security architectures, selection of security solutions, monitoring, threat hunting, and response and recovery activities. (xiv) RA.L3-3.11.2e Conduct cyber threat hunting activities on an on-going aperiodic basis or when indications warrant, to search for indicators of compromise in organizational systems and detect, track, and disrupt threats that evade existing controls. (xv) RA.L3-3.11.3e Employ advanced automation and analytics capabilities in support of analysts to predict and identify risks to

organizations, systems, and system components. (xvi) RA.L3-3.11.4e

(v) Only persons with appropriate training may review matter to determine if it contains TFNI. Training must be completed prior to making determinations and every two years after. The training must include the content for persons with access to TFNI and the following: (A) The markings applied to matter containing TFNI. (B) Limitations on their authority to remove TFNI portions from matter. (C) Only DOE authorized persons may determine that classified matter no longer contains TFNI. (D) Only DOE-authorized persons may declassify matter marked as containing TFNI. (E) The DOE must review matter that potentially contains TFNI for public release. (vi) RD derivative classifiers must use approved classification guides, classification bulletins, or portion-marked source documents as the basis for classifying matter containing RD and FRD. (vii) Persons trained to make TFNI determinations must use approved TFNI guidelines, classification guides, classification bulletins, or portion-marked source documents as the basis for classifying or upgrade matter containing TFNI. (6) Marking matter containing RD, FRD, and TFNI. The front page of matter containing RD or FRD must have the highest classification level of the information on the top and bottom of the first page, the RD or FRD admonishment, the subject or title marking, and the classification authority block. Matter containing TFNI must include the TFNI identifier on each page unless the matter also contains RD or FRD, in which case the RD or FRD takes precedence. (i) Documents classified as RD or FRD must also include a Classification Authority Block with the RD derivative classifier's name and position, title, or unique identifier and the classification guide or source document (by title and (printed page 83362) date) used to classify the document. No declassification date or event may be placed on a document containing RD, FRD, or TFNI. If a document containing RD, FRD, or TFNI also contains NSI, ·N/A to RD/FRD/TFNI· (as appropriate) must be placed on the ·Declassify On:· line. (ii) Each interior page of matter containing RD or FRD must be clearly marked at the top and bottom with the overall classification level and category of the matter or the overall classification level and category of the page, whichever is preferred. The abbreviations ·RD· or ·FRD· may be used in conjunction with the matter classification (e.g., SECRET//RD, CONFIDENTIAL//FRD). Table 1 to Paragraph (e)(ii) RD and FRD Admonishment Markings Document containing Admonishment that must be included on the front page of the document RD ·RESTRICTED DATA This document contains RESTRICTED DATA as defined in the Atomic Energy Act of 1954. Unauthorized disclosure is subject to administrative and criminal sanctions.· FRD ·FORMERLY RESTRICTED DATA Unauthorized disclosure subject to administrative and criminal sanctions. Handle as Restricted Data in foreign dissemination. Section 144b, AEA 1954.·

One comment proposed eliminating third party assessment costs and relying only on self-certification to address the cost burdens. One comment noted that free market pricing and a short supply of C3PAOs combined with excessive waiting times may result in SMB attrition. Response: It is not within in scope of this rule to address how companies recover assessment costs. The CMMC rule makes no change to the cost allowability parameters described in FAR 31.201-2 Determining Allowability. Contractors are required to comply with all terms and conditions of DoD contracts, to include terms and conditions relating to cybersecurity protections and assessment requirements, as implemented by this rule. This holds true when a contract clause is flowed down to subcontractors. Several of the commenters' recommendations have potential benefit for the contractor and sub-contractor communities; however, they are beyond the scope of the rule. These recommendations included creation or expansion of: grants and assistance programs, financial support for small business, the DoD [Procurement] Toolbox, the DoD Office of Small Business Programs, contract incentives and free or reduced cost DoD cybersecurity services. DoD understands the burden on small business. Nonetheless, DoD must enforce CMMC requirements uniformly across the Defense Industrial Base for all contractors who process, store, or transmit CUI. The requirements necessary to protect a single document are the same as to protect many documents, therefore scaling by amount of CUI expected is not a viable approach. Solicitations for DoD contracts that will involve the processing, storing, or transmitting of FCI or CUI on any nonfederal system, regardless of the size or configuration of the nonfederal system, will specify the required CMMC Level (1, 2 or 3) and assessment type (self-assessment or independent third-party assessment). That requirement applies, regardless of the number of computers or components in a nonfederal information system. DoD's original implementation of security requirements for adequate safeguarding of CUI relied upon self-attestation by contractors. Since that time, the DoD Inspector General and DCMA found that contractors did not consistently implement mandated system security requirements for safeguarding CUI and recommended that DoD take steps to assess a contractor's ability to protect this information. All contractors or sub-contractors with access to CUI need to be capable of protecting that information to the standard

specified in 32 CFR part 2002. If a small business cannot comply with DFARS clause 252.204-7012 and NIST SP 800-171 R2, then that business should not be processing, storing, or transmitting CUI. DoD's programs, technological superiority, and best interests are not served if CUI is not consistently safeguarded by all who process, store, or transmit it. 28. Perceived Cost of CMMC Program Comment:

One comment requested the rule state that records in SPRS must be updated within six months of the rule's effective date or when the functionality is in place, whichever is longer. Two comments asked for mitigations for assessment delays that could impact the timeliness of certification. One comment asked for more information about assessment frequency guidelines, and one asked which date would be used to determine timing of CMMC Level 2 triennial assessments, where this date is maintained, and who is responsible for ensuring contractors meet all applicable security requirements. Response: To be eligible for a contract with a CMMC Level 1 self-assessment requirement, the OSA must perform a Level 1 self-assessment, input the result into SPRS, and submit an affirmation. The timeline for initiating and reporting a self-assessment is a business decision to be made by each contractor considering contract opportunities it wishes to pursue. Because the OSA can fully control timelines for completion of self-assessments and plan for changes within the assessment scope, and because CMMC certification assessments occur on a standard 3-year cycle, the DoD expects that companies will plan assessments well in advance of need. The required assessment frequency is every year for CMMC Level 1, and every 3 years for CMMC Levels 2 and 3, or when changes within the CMMC Assessment Scope invalidate the assessment. Certification dates for CMMC levels 2 and 3 are set to the date the certification assessment results are entered into SPRS for self-assessments or the date the Certificate of CMMC Status is (printed page 83134) entered into eMASS for third-party assessments. The triennial requirement renews on that date; there is no grace period. Each OSA's annual affirmation attests that they have implemented, and are maintaining their implementation of, the security requirements. 2. Supplier Risk Performance System and eMASS Comment:

A director (MGMT5) for 8 hours (\$190.52/hr × 8hrs = \$1,524) A staff IT specialist (IT4-SB) for 4.08 hours (\$86.24/hr × 4.08hrs = \$352) Phase 4: Closing out POA&Ms [51] (for CMMC Level 3 if necessary and allowed): \$1,869 A director (MGMT5) for 8 hours (\$190.52/hr × 8hrs = \$1,524) A staff IT specialist (IT4-SB) for 48 hours (\$86.24/hr × 48hrs = \$345) Reaffirmations: It is estimated that the costs to reaffirm a Level 3 certification assessment annually is \$1,876 (three-year cost is \$5,628, or \$1,876 × 3) A director (MGMT5) for 8 hours (\$190.52/hr × 8hrs = \$1,524) A staff IT specialist (IT4-SB) for 4.08 hours (\$86.24/hr × 4.08hrs = \$352) The Level 3 affirmations cost burden will be addressed as part of the 48 CFR part 204 CMMC Acquisition rule. Summary: The following is the annual small entities total cost summary for Level 3 certification assessments and affirmations over a ten-year period. Example calculation, Year 2 (reference per entity amounts shown): *(\$9,050 Certification per entity × 45 entities) + (\$1,876 Annual Affirmation per entity × 3 entities) = \$412,897, and \$121,500,000 Nonrecurring Engineering cost (\$2,700,000 per entity × 45 entities being certified), and (printed page 83189) \$23,520,000 Recurring Engineering cost (\$490,000 per entity × 45 entities being certified) + (\$490,000 per entity × 3 entities performing affirmations) \$145,432,897 Total Cost = Certification and Affirmation Cost (\$412,897) + Nonrecurring Engineering cost (\$121,500,000) + Recurring Engineering cost (\$23,520,000), or \$145,432,897. All Entities Summary The following is a summary of the cost to all entities regardless of size for Level 3 certification assessments and affirmations over a ten-year period: (printed page 83190) Government Costs Summary of Impact The following is a summary of the estimated Government costs calculated for a 20-year horizon in 2023 dollars at a 7 percent and 3 percent discount rate. The Government costs include conducting Level 3 certification assessments, uploading results into the CMMC instantiation of eMASS, and the CMMC PMO costs. Government Costs (All Levels)

The recordkeeping rule, however, exempts all foreign persons, except foreign persons who transport food in the United States. Therefore, the foreign exporter of the samples mentioned by the comment's is not required to establish and maintain records under this final rule. With respect to the comments assertion that the registration interim final rule exempts food carried in personal baggage for personal use, FDA notes that it is the prior notice interim final rule (part 1, subpart I) that exempts these products, not the registration interim final rule (part 1, subpart H). The registration interim final rule applies to all domestic and foreign facilities that manufacture, process, pack, or hold food that will be consumed in the United States, unless otherwise exempted. This includes facilities performing covered activities with respect to commercial samples if those

samples will be consumed in the United States. See response to comment 67 at 68 FR 58911 through 58912 (October 10, 2003). As detailed in the response to comment 22, this final rule does not distinguish between food consumed in the United States and food that is exported. (Comment 33) One comment indicates that the proposal is silent as to whether firms producing finished food products or food additives and ingredients intended solely for export must comply with the recordkeeping requirements. The comment argues that because this regulation applies to foods for consumption in the United States, producers of such products should be exempt from the recordkeeping requirements. (Response) Persons who manufacture, process, pack, transport, distribute, receive, hold, or import food in the United States are subject to these regulations. If the food is intended solely for export, the person producing that food in the United States would still be subject to these regulations with respect to that food. 2. Farms (Comment 34) Several comments ask if foreign farms, including fish farms (aquaculture) fall under the regulation's farm exemption. (Response) Section 306 of the Bioterrorism Act specifically exempts farms from these regulations. The definition of a farm includes aquaculture facilities. In addition, foreign persons (except for foreign persons who transport food in the United States), including foreign farms, are excluded from all of these regulations. (Comment 35) One comment states that FDA has not clarified whether producers who ship live food animals to the United States will be required to keep records on their farm operations, as their products will be 'finished' in another country, may have been raised on more than one farm, and may not be considered as going directly to the consumer for consumption. The comment strongly urges the FDA not to require farmers shipping live animals to the United States to incur the additional cost, time, and work involved in maintaining records, beyond those which are currently being maintained for their operations, solely for the purpose of this regulation.

The health care sector has undergone a dramatic transformation over the last 24 years, and particularly in the past 10 years, spurred at least in part by the Department's implementation of HIPAA, the HITECH Act, and the Cures Act. The industry has shifted from one that generally relied upon a system of paper-based recordkeeping and siloed devices to one that depends on interconnected information systems to maintain and exchange patient records, conduct research, run health care provider facility management systems, and provide patient care. [166] This shift is largely the result of HIPAA's emphasis on the development and use of standards and the EHR incentive funds made available under the HITECH Act for health care providers. [167] Data from ASTP/ONC offer clear and convincing evidence of this shift. In 2008, before the enactment of the HITECH Act, less than 10 percent of non-Federal acute hospitals had implemented what was referred to at the time as a 'Basic EHR' (i.e., an electronic health record). [168] By 2015, six years after the enactment of the HITECH Act, almost 84 percent had adopted a Basic EHR while 96 percent had adopted a certified EHR. [169] The transformation was further enabled by the Cures Act, which encouraged the development of a trusted exchange framework for the nationwide exchange of health information and provided penalties for health care providers, health information exchanges and networks, and developers of certified health IT that engage in information blocking. [170] In 2014, 41 percent of such hospitals routinely had electronic access to clinical information from outside providers or sources when treating a patient. [171] By 2023, 70 percent of non-Federal acute care hospitals engaged in all domains of interoperable exchange routinely or sometimes, a significant leap forward. [172] In 2017, only 38 percent of hospitals enabled patients to access their health information using an application and in 2018, 57 percent enabled patient access to their clinical notes in their patient portal; by 2021, 70 percent of hospitals enabled patients to access their health information using an application and 82 percent enabled patients to view their clinical notes in their patient portal. [173] And just a year later, the percentage of hospitals that supported patient access through applications increased to 86 percent. [174] Based on this data, it is clear that HIPAA, coupled with the HITECH Act and the Cures Act, has successfully encouraged the development of a nationwide electronic health information system. Not only is PHI increasingly maintained and transmitted electronically, but treatment is also increasingly provided electronically. The coronavirus disease 2019 (COVID-19) pandemic led to a dramatic increase in the use of telemedicine. [175] According (printed page 911) to ONC data, only 15 percent of office-based physicians used any form of telemedicine in 2018-19. In 2021, telemedicine usage increased to 87 percent. [176]

From the NIST SP 800-172 Rev 3 Final Public Draft: nonfederal system A system that does not meet the criteria for a federal system. NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 o n behalf of (an agency) 3026

(E) Agency materials underlying the President's budget decisions as described in OMB Circular No. A-11. This includes planning, programming, and budgetary information that is involved in the defense planning and resource allocation process and outyear discretionary data. (ii) Attorney client privilege. This privilege protects confidential communications between an attorney and a client relating to legal matters for which the client has sought professional advice. The information the client supplies to the attorney and the advice the attorney gives to the client in return are protected under this privilege. Courts extend the confidential element of this privilege to lower echelon Government employees because it is recognized when the Government is seeking legal advice it usually involves more than one client and one attorney. This privilege cannot be used if confidentiality is compromised. (iii) Attorney work product privilege. This privilege protects documents prepared by an attorney or at an attorney's direction in reasonable anticipation of litigation. Unlike the deliberative process privilege, under the attorney work product privilege all of the information can be withheld, including the facts. Similarly, this privilege has no time limit. This privilege can be used after the litigation is complete. (iv) Government trade secret privilege. This privilege protects trade secrets or other confidential research, development, or commercial information owned by the Government, where premature release is likely to affect the Government's negotiating position or other commercial interest. (v) Aircraft accident witness statements privilege. This privilege protects witness statements generated during military aircraft accident investigations. (vi) Presidential communications privilege. This privilege protects communications among the President and his advisors created within an agency to assist the President in the exercise of his nondelegable constitutional duties. (f) Exemption 6. Pursuant to 5 U.S.C. 552(b)(6), information in personnel and medical files, as well as similar in other files, that if disclosed to a requester other than the person whom the information is about, would result in a clearly unwarranted invasion of personal privacy is exempt from disclosure. If the information qualifies as Exemption 6 information, there is no discretion in its release. (1) When applying this exemption, an agency must balance the public interest in disclosure and the individual's privacy interest. When there is no public interest in the requested (printed page 71856) information, the information can be withheld even if there is only a negligible privacy interest. The public interest to be considered when applying this exemption is whether the information sheds light on the operations or activities of the Federal government. The requester has the burden to show there is a public interest in disclosure.

Note that ISCM Process Step is listed as a view. While ISCM Process Step is a view in many respects, the ISCM Process Step view has a special role in ISCMA as the foundation of the ISCM process, and modifying individual ISCM process steps or deleting the ISCM Process Step view undermines the integrity of the ISCMaX application.

(iii) The contractor will not disclose information protected by this statutory provision to anyone except personnel who require access to the information in connection with the contract. (3) It is the responsibility of the foreign entity that awards the contract to incorporate requirements for the protection and marking of RESTRICTED or In Confidence information in the contract. The contractor will advise the CSA if requirements were not provided by the foreign entity. (n) Marking U.S. documents containing FGI. (1) U.S. documents containing FGI must be marked on the front, THIS DOCUMENT CONTAINS (indicate country of origin) INFORMATION. In addition, the portions must be marked to identify both the country and classification level, (e.g., (UK-C), (GE-C)). The Derived From line will identify U.S. as well as foreign classification sources. (2) If the identity of the foreign government must be concealed, the front of the document will be marked THIS DOCUMENT CONTAINS FOREIGN GOVERNMENT INFORMATION; paragraphs will be marked FGI, together with the classification level (e.g., (FGI-C)); and the Derived From line will indicate FGI in addition to any U.S. source. The identity of the foreign government will be maintained with the record copy of the document. (3) A U.S. document that contains FGI will not be downgraded below the highest level of FGI contained in the document or be declassified without the written approval of the foreign government that originated the information. Recommendations concerning downgrading or declassification will be submitted to the GCA or foreign government contracting authority, as applicable. (o) Marking documents prepared for foreign governments. Documents prepared for foreign governments that contain U.S. classified information and FGI will be marked as prescribed by the foreign government. In addition, they will be marked on the front, THIS DOCUMENT CONTAINS UNITED STATES CLASSIFIED INFORMATION. Portions will be marked to identify the U.S. classified information. (p) Marking requirements for transfers of defense articles to Australia (AUS) or the United Kingdom (UK). Marking requirements for transfers of defense articles to AUS or the UK

without a license or other written authorization are pursuant to § 117.19(i). (q) Commingling of RD and FRD. Commingling of RD, FRD, and TFNI with national security information (NSI) in the same document should be avoided to the greatest degree possible. When mixing this information cannot be avoided, the marking requirements in 10 CFR part 1045, section 140(f) and declassification requirements of 10 CFR part 1045, section 155 apply. § 117.15 Safeguarding Classified Information. (a) General safeguarding.

, which are the definitive sources for these definitions. DoDI 8582.01, published on December 9, 2019, points to FAR clause 52.204-21 and DFARS clause 252.204-7012, both of which preceded it, to address the safeguarding requirements for FCI and CUI. CMMC builds from those requirements by requiring that defense contractors and subcontractors provide assurance, either with Self-Assessments, Third-Party Assessments, or Level 3 Assessments, as required, that they have implemented the required information protection requirements. 8. Small Business/Entities a. Assistance/Support for Small Business Comment: Several commenters suggested that in order to successfully implement cybersecurity requirements, contractors require support from the Department. One commenter suggested DoD should perform an analysis of each requirement and ensure that necessary support structures are in place and fully functioning prior to implementing this rule, and that access to tech support/solutions should be provided. Multiple commenters suggested that more support and guidance is needed for small businesses trying to comply with CMMC. One commenter suggested that DoD should relax affiliation rules (in conjunction with the Small Business Association (SBA)) to allow small companies to work together to meet CMMC requirements while spreading the cost over a larger base and expand mentor-protégé agreements for larger businesses to help smaller companies with CMMC appraisals. One commenter expressed concern for non-traditional, innovative companies that are coming in through the Small Business Innovation Research (SBIR) and Small Business Technology Transfer (STTR) process and asked what DoD is doing to help them become compliant. Another noted that if CMMC Level 1 will be the minimum requirement for SBIRs and STTRs, regardless of whether they include FCI, it may significantly limit the number of universities that can partner with small businesses under these awards. Response: DoD's Office of Small Business and Technology Partnerships (OSBTP) is working to provide SBIR/STTR programs with support for CMMC implementation through the use of Technical and Business Assistance. The SBA's affiliation rules are codified at 13 CFR 121.103, available at <https://www.ecfr.gov/current/title-13/chapter-I/part-121>. Any change to the SBA's affiliation rules is outside the scope of this rulemaking. The CMMC Program is designed to increase assurance that defense contractors do in fact, comply with information protection requirements to adequately protect FCI and CUI. Additional information to assist contractors regarding DoD's current information security protection requirements may be found in Frequently Asked Questions (FAQs) Regarding the Implementation of DFARS subpart 204.73, published at <https://DoDprocurementtoolbox.com/>. b. Impact of Cost Comment:

The phased implementation plan for CMMC described in § 170.3(e) is intended to address ramp-up issues, provide time to train the necessary number of assessors, and allow companies the time needed to understand and implement CMMC requirements. The rule has been updated to add an additional six months to the Phase 1 timeline. Phase 2 will start one calendar year after the start of Phase 1. 5. Scoping. Commenters expressed concerns about how External Service Providers (ESP) and SPA and SPD are handled with regard to certification. Another commenter expressed concern about the lack of FedRAMP Moderate certified capabilities in the market as well as requesting clarification on the definition of 'Specialized Assets', specifically regarding equipment in manufacturing that may not fall under the conventional categories of IoT, IIoT, and OT. Another commenter expressed concerns about how Contractor Risk Managed Assets (CRMA) are handled, along with concerns about available FedRAMP certified capabilities. Other comments identified concerns with the responsibility of a company that adopts an ESP and their adherence to security requirements, and the lack of time given in Phase 2 of the CMMC roll-out to garner certification. A question was also asked regarding the Department's assumptions on the rigor a Certifying Officer [Affirming Official in the rule] would require before signing an attestation and the methodology used to determine the resultant actions that must be taken. Another raised a concern regarding how sub-environments are handled as well as end-to-end encryption in handling CUI. Another expressed concern regarding the marking of data as CUI and the potential for overmarking. Some commenters made suggestions that all CUI be held in a special appendix for contracts and only be allowed to be accessed at the prime's facility or through a government hosted secure portal. A commenter also suggested that small businesses should not be made to meet the CMMC Level 3 requirements. Another commenter raised questions about the alternatives that the Department considered in developing the CMMC Program. Another suggestion was

to provide uniform web-based training on cybersecurity and that the definition of CUI was unclear, and CUI should stay under the control of the Federal Government and be maintained in a government owned secure portal. A suggestion was also made that DoD establish a Cyber Protection Program that monitors DIB companies and provides real time health reports on the DIB and dynamic intelligence security alerts and recommended actions. A suggestion that NIST establish a special standard for micro-organizations was also provided. Commenters also suggested that the rule was too stringent, and CUI was not marked well or flowed down to subcontractors appropriately. DoD Response:

- Protected execution: Lets applications run in isolated environments so that no unauthorized software on the platform can observe or tamper with the operational information. Each of these isolated environments executes with the use of dedicated resources managed by the platform.
- Sealed storage: Provides the ability to encrypt and store keys, data, and other sensitive information within the hardware. This can only be decrypted by the same environment that encrypted it.
- Attestation: Enables a system to provide assurance that the protected environment has been correctly invoked and to take a measurement of the software running in the protected space. This is achieved by the attestation process defined in Section 3.1. The information exchanged during this process is known as the attestation identity key credential and is used to establish mutual trust between parties.
- Protected launch: Provides the controlled launch and registration of critical system software components in a protected execution environment.

Port	Purpose	Direction

19445	Authentication and Authorization Service	Inbound/outbound

Allowing Plans of Action & Milestones (POA&M) under limited circumstances to achieve conditional certification. As a result of the alignment of the revised CMMC Program to NIST guidelines, the Department's requirements will continue to evolve as changes are made to the underlying NIST SP 800-171 R2, NIST SP 800-171A Jun2018, NIST SP 800-172 Feb2021, and NIST SP 800-172A Mar2022 requirements. CMMC Assessment Criteria CMMC requires that defense contractors and subcontractors entrusted with FCI and CUI implement cybersecurity standards at progressively more secure levels, depending on the type and sensitivity of the information. Level 1 Self-Assessment An annual Level 1 self-assessment and annual affirmation asserts that an OSA has implemented all the basic safeguarding requirements to protect FCI as set forth in § 170.14(c)(2). An OSA can choose to perform the annual self-assessment internally or engage a third-party to assist with evaluating its Level 1 compliance. Use of a third party to assist with the assessment process is still considered a self-assessment and results in a CMMC Status of Final Level 1 (Self). An OSA achieve the CMMC Status of Level 1 (Self) for an entire enterprise network or for a particular enclave(s), depending upon where the FCI is or will be processed, stored, or transmitted. Level 2 Self-Assessment A Level 2 self-assessment and annual affirmation attests that an OSA has implemented all the security requirements to protect CUI as specified in § 170.14(c)(3). Level 2 Certification Assessment A Level 2 certification assessment, conducted by a C3PAO, verifies that an OSC is conforming to the security requirements to protect CUI as specified in § 170.14(c)(3). Each OSC information system that will process, store, or transmit CUI in the execution of the contract is subject to the corresponding CMMC Status requirements set forth in the contract. Level 3 Certification Assessment Achievement of the CMMC Status of Final Level 2 (C3PAO) for information systems within the Level 3 CMMC Assessment Scope is a prerequisite for initiating a Level 3 certification assessment. A Level 3 certification assessment, conducted by DCMA Defense Industrial Base Cybersecurity Assessment Center (DIBCAC), verifies that an OSC has implemented the CMMC Level 3 security requirements to protect CUI as specified in § 170.14(c)(4). A Level 3 certification assessment must be conducted for each OSC information system that will be used in the execution of the contract that will process, store, or transmit CUI. Impact and Cost Analysis of the Revised CMMC Program Summary of Impact Public comment feedback on the initial CMMC Program indicated that cost estimates were too low. The revised (printed page 83176) CMMC Program cost estimates account for that feedback with the following improvements: Allowance for outsourced IT services

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of

Department of Defense Office of the Secretary 32 CFR Part 117 [Docket ID: DOD-2011-OS-0063] RIN 0790-AI71 AGENCY: Department of Defense (DoD). ACTION: Interim final rule. SUMMARY: This DoD interim final rule (rule) assigns responsibilities and establishes requirements related to the National Industrial Security Program (NISP) to ensure maximum uniformity and effectiveness for both DoD and non-DoD Components, as defined in this rule, for which the Department serves as the Cognizant Security Agency (CSA) and provides industrial security services in accordance with Executive Order (EO) 12829, National Industrial Security Program. The rule provides guidance on the procedures used to ensure classified information will be properly safeguarded if a contractor has reported foreign ownership, control or (printed page 19468) influence (FOCI) information which DoD must evaluate, mitigate, or negate as appropriate. The rule also provides guidance for the evaluation, mitigation, and/or negation of FOCI information reported by a company, as defined in the rule, which is in process for a facility security clearance (FCL). DATES: Effective Date: This rule is effective April 9, 2014. Comments must be received by June 9, 2014. ADDRESSES: You may submit comments, identified by 32 CFR part 117 , Docket No. DoD-2011-OS-0063 or Regulatory Information Number (RIN) 0790-AI71 by any of the following methods: Federal Rulemaking Portal: <http://www.regulations.gov> . Follow the instructions for submitting comments. Mail: Federal Docket Management System Office, 4800 Mark Center Drive, 2nd floor, East Tower, Suite 02G09, Alexandria, VA 22350-3100. Instructions: All submissions received must include the agency name and docket number or RIN for this Federal Register document. The general policy for comments and other submissions from members of the public is to make these submissions available for public viewing on the Internet at <http://www.regulations.gov> as they are received without change, including any personal identifiers or contact information. FOR FURTHER INFORMATION CONTACT: Valerie Heil, (703) 604-1112. SUPPLEMENTARY INFORMATION: Executive Summary The purpose of this part 117, subpart C is to set forth industrial security procedures and practices related to FOCI for the Components to ensure maximum uniformity and effectiveness in the DoD implementation of E.O. 12829 .

FDA outbreak investigation personnel estimate that a full outbreak investigation lasts at least 3 to 5 weeks, with a most likely duration of 2 to 6 months, and a maximum duration of 10 months (Ref. 2). The numbers of outbreak investigations and investigative visits come from internal interviews with investigation personnel and from other data maintained by FDA (Ref. 2). The annual numbers of outbreaks investigated, investigative visits, and investigations that are prematurely terminated for reasons of poor records quality are reported in table 8 of this document. A traceback is defined to be prematurely terminated for records quality reasons if investigators noted in summarizing information that data quality impeded the investigation which ended before investigators were able to determine the specific cause of the outbreak. We used the simple averages over the 4 years reported in the table to estimate the annual numbers of outbreaks investigated, the annual numbers of investigative visits per outbreak investigated, and the annual rates of investigations prematurely terminated for reasons of poor records quality. We characterized the uncertainty of these estimates as normal distributions with means and standard deviations taken from the data on annual numbers of outbreaks and investigative visits per outbreak. For the annual rate of prematurely terminated investigations, we characterized the uncertainty with a beta pert distribution using the average, low and high values reported in the table 8 of this document. Table 8. Outbreak Investigation Data

Year	Number of Outbreaks Investigated	Number of Investigative Visits per outbreak	Rate of records quality related premature terminations
2000	9	12	0.11
2001	9	11	0.33
2002	18	7	0.06
2003	17	6	0.00

The recordkeeping requirements of this final rule will improve the quality of records established and maintained by persons that manufacture, process, pack, transport, distribute, receive, hold, or import food. For options that provide comprehensive coverage of all food facilities, we estimate that the number of investigations prematurely terminated because of poor records would fall to zero. For options that provide less than comprehensive coverage, the reduction in premature terminations is reduced in proportion to the coverage.

Section 170.5 addresses that the CMMC Program does not alter the requirements imposed on contractors and subcontractors in FAR clause 52.204-21, DFARS clause 252.204-7012, or any other applicable safeguarding of information requirement. The CMMC Program verifies implementation of security requirements in FAR clause 52.204-21, NIST SP 800-171 R2, and selected security requirements in NIST SP 800-172 Feb2021, as applicable. Section 170.6·CMMC PMO Section 170.6 addresses the CMMC Program Management Office (PMO) functions that are performed within the Department of Defense Chief Information Officer (DoD CIO). Section 170.7·DCMA DIBCAC Section 170.7 addresses how DCMA DIBCAC will support the CMMC Program by conducting CMMC Level 2 certification assessments of the Accreditation Body and C3PAOs; conducting CMMC Level 3 certification assessments for OSCs; and recording results, issuing certificates, tracking appeals, and retaining records as required.

Section 170.8·Accreditation Body Section 170.8 addresses the roles and responsibilities of the Accreditation Body, as well as requirements that the Accreditation Body must meet. The Accreditation Body must be US-based and be and remain a member in good standing with the Inter-American Accreditation Cooperation (IAAC) and become an International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA) signatory, with a signatory status scope of ISO/IEC 17020:2012(E) and be compliant with ISO/IEC 17011:2017(E) [20] . There is only one Accreditation Body for the DoD CMMC Program at any given time, and its primary mission is to authorize and accredit the C3PAOs. The Accreditation Body authorizes and accredits C3PAOs in accordance with the requirements in section 170.8(b). The Accreditation Body also oversees the CAICO to ensure compliance with ISO/IEC 17024:2012(E) [21] and to ensure all training products, instruction, and testing materials are of high quality. Section 170.8 addresses specific requirements for the Accreditation Body with regards to national security background checks, foreign ownership, reporting, information protection, and appeals. The Accreditation Body will also develop policies for Conflict of Interest (Col), Code of Professional Conduct (CoPC), and Ethics that comply with all ISO/IEC 17011:2017(E) and DoD requirements. These policies will apply to the Accreditation Body as well as to all other individuals, entities, and groups within the CMMC Ecosystem. The information systems used by the Accreditation Body to process CMMC information have to meet all of the security requirements for CMMC Level 2 and will be assessed by DCMA's Defense Industrial Base Cybersecurity Assessment Center (DIBCAC). Section 170.9·CMMC Third-Party Assessment Organizations

(C3PAOs)

Long distance companies entering the market initially relied on a five or six digit Personal Identification Number (PIN) to provide each customer access to their networks. Codes were easy to break and companies using them were very vulnerable. Long distance companies lengthened their codes to seven, nine and finally, to the 14-digit authentication codes currently used. Even 14 digit codes are vulnerable since the first ten digits are usually the home phone number and the last four digits are the PIN.

(Comment 8) One comment requests that source labeling, including country-of-origin labeling, be required as a component of an effective traceback program in the event of a food emergency. The comment states that some industries have already developed technologies such as barcodes, stamps, stickers, or tags to identify the source of produce as well as software to assist in more accurate traceback to the grower/packer level. (Response) FDA does not agree. At this time, FDA does not believe this information is necessary to enable a traceback. FDA believes the requirements of the final regulations for the establishment and maintenance of records to identify the immediate previous sources and immediate subsequent recipients of food in order to address credible threats of serious (printed page 71568) adverse health consequences or death to humans or animals are sufficient. (Comment 9) Some comments ask that the agency generate more publicity on the regulations and provide the industry with educational materials and training. One comment states that because food wholesale distributors have no significant contact with FDA personnel and procedures, they have a limited understanding of the requirements. One comment asks that the agency help promote and educate the industry abroad on the recordkeeping regulations. Another comment asks that FDA provide materials in other languages. One comment asks that the agency develop a strong communications program to disseminate the new regulations once they become final because the fresh produce industry and its transportation partners are highly diverse and fragmented. The comment states that independent truckers in particular need to be made aware of the regulations because the fresh produce industry in the United States relies heavily on independent truckers to move fresh fruits and vegetables to market quickly. (Response) FDA conducted extensive outreach on the proposed recordkeeping rule, including having relevant FDA staff attend 6 international meetings and more than 100 domestic meetings to ensure that affected parties were aware of the Bioterrorism Act requirements. On May 7, 2003, FDA held a public meeting (via satellite downlink) to discuss the recordkeeping and administrative detention proposed rules. See 68 FR 16998 (April 8, 2003) or <http://www.cfsan.fda.gov/~dms/~fsbttraz.html>. Nearly 1,000 participants in North and South America and the Caribbean viewed that live broadcast. The meeting was later rebroadcast to Europe, Asia, Africa, and the Pacific (areas in different time zones). FDA has also provided transcripts of the broadcast in English, French, and Spanish (the three official World Trade Organization languages) on the agency's Web site. In addition to this outreach to the affected industry, FDA has conducted outreach on the proposed rule to States.

(1) Obtain and maintain certification from the CAICO in accordance with the requirements set forth in § 170.10. Certification is valid for 3 years from the date of issuance. (2) Comply with the Accreditation Body policies for Conflict of Interest, Code of Professional Conduct, and Ethics as set forth in § 170.8(b)(17). (3) Complete a Tier 3 background investigation resulting in a determination of national security eligibility. This Tier 3 background investigation will not result in a security clearance and is not being executed for the purpose of government employment. The Tier 3 background investigation is initiated using the Standard Form (SF) 86 (www.gsa.gov/reference/forms/questionnaire-for-national-security-positions). These positions are designated as non-critical sensitive with a risk designation of 'Moderate Risk' in accordance with 5 CFR 1400.201(b) and (d) and the investigative requirements of 5 CFR 731.106(c)(2). (4) Meet the equivalent of a favorably adjudicated Tier 3 background investigation when not eligible to obtain a Tier 3 background investigation. DoD will determine the Tier 3 background investigation equivalence for use with the CMMC Program only. (5) Provide all documentation and records in English. (6) Not share any information about an OSC obtained during CMMC pre-assessment and assessment activities with any person not involved with that specific assessment, except as otherwise required by law. Subpart D-Key Elements of the CMMC Program § 170.14 CMMC Model. (a) Overview. The CMMC Model incorporates the security requirements from: (1) 48 CFR 52.204-21, Basic Safeguarding of Covered Contractor Information Systems; (2) NIST SP 800-171 R2, Protecting Controlled Unclassified Information in Nonfederal Systems and Organizations (incorporated by reference, see § 170.2); and (3) Selected security requirements from NIST SP 800-172 Feb2021,

Enhanced Security Requirements for Protecting Controlled Unclassified Information: A Supplement to NIST Special Publication 800-171 (incorporated by reference, see § 170.2). (b) CMMC domains. The CMMC Model consists of domains that map to the Security Requirement Families defined in NIST SP 800-171 R2 (incorporated by reference, see § 170.2). (c) CMMC level requirements. CMMC Levels 1-3 utilize the safeguarding requirements and security requirements specified in 48 CFR 52.204-21 (for Level 1), NIST SP 800-171 R2 (incorporated by reference, see § 170.2) (for Level 2), and selected security requirements from NIST SP 800-172 Feb2021 (incorporated by reference, see § 170.2) (for Level 3). This paragraph discusses the numbering scheme and the security requirements for each level. (1) Numbering. Each security requirement has an identification number in the format DD.L#-REQ where: (i) DD is the two-letter domain abbreviation; (ii) L# is the CMMC level number; and (iii) REQ is the 48 CFR 52.204-21 paragraph number, NIST SP 800-171 R2 requirement number, or NIST SP 800-172 Feb2021 requirement number. (2)

According to Report_ Authentication Diary Study, EXECUTIVE SUMMARY: EXECUTIVE SUMMARY The purpose of authentication is to ensure that only authorized individuals have access to a particular resource or physical area. To authenticate and prove their 'right to access,' a person must essentially prove that they are who they claim to be (i.e., an authorized individual) by presenting elements such as ID badges, fingerprints, personal identification numbers (PINs) or - very often - a username and password. For users of information technology, authentication is an inescapable fact of daily life - and it affects them in ways that are still poorly understood. In order to better understand users' authentication-related perceptions and behaviors, we conducted a two-part study with 25 NIST employees. In the first part of the study, we instructed our participants to record all the authentication events they encountered over a 24-hour period (in the workplace and, if they so chose, at home) using forms we provided. The second part of the study consisted of individual follow-up interviews regarding participants' experiences with authentication. Our study was designed to answer the following questions: - Where does authentication fit into the daily activities people carry out? - What characteristics of authentication may interfere with the primary activity that authentication is supposed to enable? What are the friction points? - How do people add up the cumulative costs of authenticating multiple times each day, and how do they balance them against their own perceived security needs? - How do people perceive the costs of performing security tasks (particularly authentication tasks) in comparison with the benefits of performing those tasks? We found that our participants were confused about what 'authentication' actually meant. For example, one participant erroneously recorded unlocking his car with his remote key fob as an authentication event.

3.4.2 Intel QuickAssist Technology (QAT) with Intel Key Protection Technology (KPT) Intel QuickAssist Technology (QAT) is a high-performance hardware accelerator for performing cryptographic, security, and compression operations.

(B) From subsections (d) and (f) because providing access to records of a civil or administrative investigation and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal their wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that would make them difficult or impossible to reach in order to satisfy any Government claim growing out of the investigation or proceeding. (C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsections (e)(4)(G) and (H) because there is no necessity for such publication since the system of records will be exempt from the underlying duties to provide notification about and access to information in the system and to make amendments and corrections to the information in the system. (E) From subsection (e)(4)(I) because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. NSA will, nevertheless, continue to publish such a notice in broad generic terms, as is its current practice. (16) System identifier and name.

GNSA 20, NSA Police Operational Files. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2), may be exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (c)(16)(i)(A). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions.

(Comment 137) One comment expressed concern that, under the proposed regulation, persons who do not know if perishable food is intended for processing into nonperishable food would have to assume it is and maintain records for 2 years. A few comments state that persons, such as distributors, carriers, farms or orchards, roadside stands, and small collection centers generally have no way of knowing whether a perishable food will be processed into a nonperishable food by other parties. A few comments ask FDA to clarify that companies selling perishables can rely on the applicability of the 1-year records retention period unless they have actual knowledge at the time of sale that the perishables will be used for processing into nonperishable foods. (Response) Section 1.360 of the final rule specifies retention periods based on the type of food being received or released, not on the end use of the food being delivered. (Comment 138) One comment states that the proposed requirements are more burdensome than is necessary to enable food producers to respond quickly and appropriately to a food safety emergency. The comment further states that the proposal does not take into account the sheer volume that retail grocery stores deal with on a daily basis. According to the comment, the average retail grocery store currently is capable of retaining such records for only approximately 1 week. The comment concludes that the requirement to maintain records for 2 years is completely unworkable and will not serve in the interest of public health in times of crisis. (Response) FDA has revised the record retention periods for nontransporters to 6, 12, and 24 months as discussed in response to comment number 129. FDA believes that these timeframes are within the period Congress believed appropriate because the Bioterrorism Act gives FDA authority to require records to be retained for up to 2 years. Moreover, Congress did not exempt retailers (e.g., retail grocery stores) from the recordkeeping requirements, as they did in section 305 of the Bioterrorism Act (registration of food facilities). FDA believes that the benefit to FDA and consumers in conducting an efficient and rapid traceback in a public health emergency justifies the burden to industry.

CMMC Program rule. Any discussion of exemptions for foreign businesses are outside the scope of the 32 CFR part 170 CMMC Program rule and may be addressed through government-to-government international arrangements or agreements. The Discussion of Public Comments and Resulting Changes section in the preamble of the final rule addresses all public comments received during the mandatory 60-day public comment period for the proposed rule and supporting documents. Response to Comments From Chief Counsel for Advocacy of the SBA On December 26, 2023, the Department of Defense (DoD) published a proposed rule entitled Cybersecurity Maturity Model Certification (CMMC) Program, 88 CFR 89058. This proposed rule intends to create a mechanism by which the DoD can certify that contractors and subcontractors are in compliance with the stated cybersecurity guidelines. The SBA Office of Advocacy (SBA or Advocacy) submitted the following comments and concerns on the proposed rule in a letter addressed to the DoD CIO within the public comment period for the proposed 32 CFR part 170 CMMC Program rule. ·Advocacy is principally concerned with the ability for small businesses to meet and comply with the standards and timelines set out in the CMMC Program without further clarification and guidance documents from the DoD. The current rule does not provide clear guidance on the process to create enclaves, which would allow more small business subcontractors to participate in DoD contracts without meeting the full requirements necessary for the prime contractor. Advocacy seeks clarification on the role of Third-Party Assessment Organizations (C3PAO) and the indemnification a C3PAO has if a contractor or subcontractor is out of compliance. ·Advocacy concerns also include the process of how and if more C3PAOs can be certified by the DoD to review the numerous contracts that will be subject to certifications. Advocacy urges the DoD to provide clarification about the enforcement mechanisms for breaches of cybersecurity. ·Lastly, Advocacy reminds the DoD that this rule will impose a high cost of compliance on small businesses and any means to reduce the burden on small businesses will increase the participation of these impacted businesses. ·The proposed rule would give contractual effect to NIST SP 800-171 and 172, requiring companies to meet the three levels of compliance if the contracts involve FCI or CUI. CMMC

attempts to redesign previous iterations of cybersecurity models with a more streamlined process. This proposal would simplify previous systems to create a more streamlined certification system. This rule differs from previous iterations by allowing for businesses to create enclaves within their business models, allowing the business to implement the CMMC standards while not drastically changing every aspect of their business process. · SBA Comment 1:

Middle and high estimates of the value of a health day are derived from estimates reported in the literature of the value of a statistical life. A value of a statistical life of \$6.5 million is consistent with the findings of a literature survey of the premium for risk observed in labor markets, reported by Aldy and Viscusi (Ref. 15). We derive middle and high estimates of the value of a health day by annualizing the value of a statistical life of \$6.5 million over 35 years at discount rates of 3 percent and 7 percent. These computations yield middle and high estimates for the value of an additional year of life of about \$300,000 and \$500,000. We estimated the range in values of a health day by dividing each of the estimates of the value of an additional year of health by 365, which yields estimates of \$274, \$822, and \$1,370. To calculate the indirect costs of mild, moderate, and severe cases of the illnesses, we multiplied the low, middle, and high estimates of the value of a health day by the QALD estimated for each illness and severity. Consistent with OMB's guidance on the use of multiple values for a statistical life, we used values of \$5.0 million and \$6.5 million to compute the value of a death from an illness. The estimated range of the average cost of an illness resulting from outbreaks monitored by FDA from 2000 to 2003 is reported in the following table. The averages reported in table 7 of this document are weighted by the total number of reported and unreported illnesses from each agent, as well as the assumed distributions of mild, moderate, and severe cases, including deaths, from those illnesses. As explained earlier, we valued statistical deaths at \$5 million and \$6.5 million, and the low, medium, and high estimates assume values of a healthy year of \$100,000, \$300,000, and \$500,000. Table 7. Average Cost of an Illness Across Outbreaks

	Low	Medium	High	VSL = \$5 million	\$6,136	\$13,209	\$20,282	VSL = \$6.5 million
million	\$6,810	\$13,883	\$20,955	6.	The Stages of an Outbreak Investigation			

binary OCSP - ## Key Usage : critical Key Encipherment ## Certificate Policies : id_fpci_common_hardware ## Subject Alternative Name ## : email:test.cardholder4@mail.example.com ## D.4.4.7 Test PIV Card 4: Retired Key Management Certificate C Serial Number : 407 (0x197) Signature Algorithm : sha1WithRSAEncryption Issuer : CN=Expired Test RSA 2048-bit CA for Test PIV Cards, ou=Test CA, o=Test Certificates 2010, c=US Validity : Not Before: Mar 2 11:17:23 2007 GMT, Not After: Mar 2 11:17:23 2010 GMT Subject : CN=Test E.

The rule will apply to all small entities that will be awarded cost-reimbursement, time-and-material, or labor-hour contracts. However, the rule requires negligible additional effort by contractors, including small entities, because it simply clarifies the identification and use of payment information elements in payment requests. According to data from the Federal Procurement Data System for fiscal years 2020 through 2022, approximately 6,800 cost-reimbursement, time-and-material, and labor-hour contracts (0.01% percent of all awards) are awarded to approximately 1,100 small businesses (3 percent of all awardees) each year. This rule also applies to contracts that use multiple accounting classifications or that involve progress payments for multiple production lots. DoD cannot accurately quantify the number of contracts subject to the multiple-lot progress payments clause, but such contracts are likely few in number. The rule does not contain any new reporting, recordkeeping, or other compliance requirements for small entities. There are no known, significant, alternative approaches to the rule that would meet the objectives of the rule. VIII. Paperwork Reduction Act The Paperwork Reduction Act (44 U.S.C. chapter 35) applies to this rule regarding new DFARS clause 252.232-7018, Progress Payments Multiple Lots. However, these changes to the DFARS do not impose additional information collection requirements to the paperwork burden previously approved under Office of Management and Budget (OMB) Control Number 9000-0010, titled Progress Payments, SF 1443. The rule affects information collection requirements in DFARS 252.232-7002, Progress Payments for Foreign Military Sales Acquisitions, currently approved under OMB Control Number 0704-0321, titled DFARS Part 232, Contract Financing, and the Clause at 252.232-7002, Progress Payments for Foreign Military Sales Acquisition. The impact, however, is negligible because the changed reporting requirement is not anticipated to increase the estimate of total burden hours; rather the requirement to submit separate payment requests by rate is merely replaced by a requirement to submit separate payment requests for FMS and U.S. line items in the contract. List of Subjects in 48 CFR Parts 204 , 232 , and 252 Government procurement Jennifer D. Johnson, Editor/Publisher, Defense Acquisition Regulations System. Therefore, 48 CFR

parts 204 , 232 , and 252 are amended as follows: 1. The authority citation for 48 CFR parts 204 , 232 , and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1 . PART 204-ADMINISTRATIVE AND INFORMATION MATTERS 2. Amend section 204.7109 by revising paragraph (b) to read as follows: 204.7109 Contract clauses. * * * * (b) Use the clause at 252.204-7006, Billing Instructions-Cost Vouchers, in solicitations and contracts when a cost-reimbursement contract, a time-and-materials contract, or a labor-hour contract is contemplated. PART 232-CONTRACT FINANCING 3.

As prescribed in 209.409, use the following clause: SUBCONTRACTING WITH FIRMS THAT ARE OWNED OR CONTROLLED BY THE GOVERNMENT OF A COUNTRY THAT IS A STATE SPONSOR OF TERRORISM (DEC 2014) (a) Unless the Government determines that there is a compelling reason to do so, the Contractor shall not enter into any subcontract in excess of \$30,000 with a firm, or a subsidiary of a firm, that is identified in the Exclusions section of the System for Award Management System (SAM Exclusions) as being ineligible for the award of Defense contracts or subcontracts because it is owned or controlled by the government of a country that is a state sponsor of terrorism. (b) A corporate officer or a designee of the Contractor shall notify the Contracting Officer, in writing, before entering into a subcontract with a party that is identified, in SAM Exclusions, as being ineligible for the award of Defense contracts or subcontracts because it is owned or controlled by the government of a country that is a state sponsor of terrorism. The notice must include the name of the proposed subcontractor and the compelling reason(s) for doing business with the subcontractor notwithstanding its inclusion in SAM Exclusions. (End of clause) 15. Add section 252.225-7050 to read as follows: 252.225-7050 Disclosure of Ownership or Control by the Government of a Country that is a State Sponsor of Terrorism. As prescribed in 225.771-5, use the following provision: DISCLOSURE OF OWNERSHIP OR CONTROL BY THE GOVERNMENT OF A COUNTRY THAT IS A STATE SPONSOR OF TERRORISM (DEC 2014) (a) Definitions. As used in this provision: Government of a country that is a state sponsor of terrorism includes the state and the government of a country that is a state sponsor of terrorism, as well as any political subdivision, agency, or instrumentality thereof. Significant interest means: (i) Ownership of or beneficial interest in 5 percent or more of the firm's or subsidiary's securities. Beneficial interest includes holding 5 percent or more of any class of the firm's securities in :nominee shares, :street names, or some other method of holding securities that does not disclose the beneficial owner; (ii) Holding a management position in the firm, such as a director or officer; (iii) Ability to control or influence the election, appointment, or tenure of directors or officers in the firm; (iv) Ownership of 10 percent or more of the assets of a firm such as equipment, buildings, real estate, or other tangible assets of the firm; or (v) Holding 50 percent or more of the indebtedness of a firm. State sponsor of terrorism means a country determined by the Secretary of State, under section 6(j)(1)(A) of the Export Administration Act of 1979 (50 U.S.C. App. 2405(j)(1)(A)), to be a country the government of which has repeatedly provided support for acts of international terrorism. As of the date of this provision, state sponsors of terrorism include: Cuba, Iran, Sudan, and Syria. (b) Prohibition on award. In accordance with 10 U.S.C. 2327

From the NIST SP 800-172 Rev 3 Final Public Draft: 03.11.11E Discoverable Information 1612 Determine information about the system that is discoverable and take [Assignment: organization-defined corrective actions]. DISCUSSION Discoverable information includes information that adversaries could obtain without compromising or breaching the system, such as by collecting information that the system is exposing or by conducting extensive web searches. Corrective actions include notifying organizational personnel, removing designated information, or changing the system to make the designated information less relevant or attractive to adversaries. This requirement excludes intentionally discoverable information that may be part of a decoy capability (e.g., honeypots, honeynets, or deception nets) implemented by the organization. This

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. In today's cloud data centers and edge computing, attack surfaces have significantly increased, cyber attacks are industrialized, and most security control implementations are not coherent or

consistent. The foundation of any data center or edge computing security strategy should be securing the platform on which data and workloads will be executed and accessed. The physical platform represents the foundation for any layered security approach and provides the initial protections to help ensure that higher-layer security controls can be trusted. This report explains an approach based on hardware-enabled security techniques and technologies for safeguarding container deployments in multi-tenant cloud environments. It also describes a prototype implementation of the approach intended to be a blueprint or template for the general security community. There are security and privacy concerns with allowing unrestricted container deployment orchestration. A common desire is to only use cloud servers physically located within the same country as the organization, or physically located in the same country as the origin of the information.

(B) From subsections (d) and (f) because providing access to investigative records and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal their wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that would make them difficult or impossible to reach in order to satisfy any Government claim growing out of the investigation or proceeding. (C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsections (e)(4)(G) and (H) because this system of records is compiled for investigative purposes and is exempt from the access provisions of subsections (d) and (f). (E) From subsection (e)(4)(I) because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. (19) [Reserved] (20) System identifier and name. F033 AF A, Information Requests-Freedom of Information Act. (i) Exemption. During the processing of a Freedom of Information Act request, exempt materials from `other' systems of records may in turn become part of the case record in this system. To the extent that copies of exempt records from those other systems of records are entered into this system, the Department of the Air Force hereby claims the same exemptions for the records from those `other' systems that are entered into this system, as claimed for the original primary system of which they are a part. (ii) Authority. 5 U.S.C. 552a(j)(2) , (k)(1), (k)(2), (k)(3), (k)(4), (k)(5), (k)(6), and (k)(7). (iii) Reasons. Records are only exempt from pertinent provisions of 5 U.S.C. 552a

recognizes that widespread health IT adoption ·has the potential to ameliorate many of the quality and efficiency problems endemic to our health care system.· Congress also understood that ·[e]nsuring the privacy and security of electronic health information is critical to the success· of this immense effort to promote health IT adoption. [54] As a result, the HITECH Act also introduced substantial changes to the HIPAA regulations by mandating stronger safeguards for the privacy and security of ePHI. [55] The HITECH Act's security requirements focused on safeguarding an individual's health information while allowing covered entities to rapidly adopt new technologies to improve the quality and efficiency of patient care. [56] Specifically, the HITECH Act extends the application of the Security Rule's provisions on administrative, physical, and technical safeguards and documentation requirements to business associates of covered entities, making those business associates subject to civil and criminal liability for violations of the Security Rule. [57] The HITECH Act also requires existing business associate agreements to incorporate new security requirements. [58] Additionally, the HITECH Act requires the Secretary to regularly issue guidance on the most effective and appropriate technical safeguards. [59] In enacting the HITECH Act, Congress affirmed that the existing HIPAA Rules were to remain in effect to the extent that they are consistent with the HITECH Act and directed the Secretary to revise the HIPAA Rules as necessary for consistency with the HITECH Act. [60] Congress confirmed that the new law was not intended to have any effect on authorities already granted under HIPAA to the Department, including part C of title XI of the SSA. [61] Thus, Congress affirmed the Secretary's ongoing rulemaking authority to modify the Security Rule's standards and implementation specifications as often as every 12 months when appropriate, including to strengthen

security protections for IIHI. In 2021, the HITECH Act was amended to require the HHS Secretary to further encourage regulated entities to bolster their cybersecurity practices. [62] The amendment requires the Department to consider certain recognized security practices of regulated entities when making determinations relating to certain Security Rule compliance and enforcement activities. [63] B. Regulatory History The Security Rule requires regulated entities to implement administrative, physical, and technical safeguards to (printed page 904) protect ePHI. [64] Specifically, regulated entities must ensure the confidentiality, integrity, and availability of all ePHI they create, receive, maintain, or transmit; [65] protect against reasonably anticipated threats or hazards to the security or integrity of the information [66] and reasonably anticipated impermissible uses or disclosures; [67] and ensure compliance by their workforce. [68] 1. 1998 Security Rule Notice of Proposed Rulemaking

A preamble overview paragraph about Affirming Officials is revised to clarify that CMMC affirmations shall be submitted by the OSA and apply only to the information systems of that organization. DoD's use of the term OSA within the affirmations section is deliberate and conveys that each organization is responsible for affirmations pertaining to their own assessments. A preamble overview paragraph about Cloud Service Providers has been aligned to DFARS clause 252.204-7012 language and specifies that defense contractors must confirm that any CSPs they use to handle CUI must meet FedRAMP Moderate Baseline standards. Wording in the preamble overview of the rule has been edited from ·may include· to ·require·, to clarify a statement about when DFARS clause 252.204-7012 applies. One sentence in the preamble about the regulatory impact of CMMC Requirements has been edited into two sentences to make clear that solicitations identify CMMC contract requirements, rather than ·for contractors·, and that only contractors handling FCI or CUI must meet the specified CMMC requirements. The DoD has incorporated a suggested re-wording to simplify the description of CMMC Level 2 assessments in the preamble paragraph describing Key Changes Incorporated in the Revised CMMC Program. b. Changes to the Regulatory Text Comment: Of the 52 comments that requested changes to the regulatory text (§§ 170.1 through 170.24), the nine which DoD incorporated are summarized below. Word choices: In § 170.1(b), two comments posited that the word ·enhance· is inaccurate in the phrase (printed page 83165) ·The CMMC Program is designed to enhance protection of FCI and CUI In § 170.9(a) one comment noted that C3PAOs do not ·grant· assessments, they ·conduct· them. Another asked why, in table 3 to § 170.19(c)(1), the CUI Asset category needs to be assessed against ·CMMC security requirements· but in table 5 to § 170.19(d)(1), the same category is assessed against ·all CMMC security requirements·. For § 170.4(b) One comment requested appending ·and to the DoD· to the definition of Assessment Findings Report. Paragraph Organization: For Applicability, a comment recommended changing the order of paragraphs in § 170.3 and other text changes to improve clarity. Reference: One comment noted that the § 170.6(b) phrase ·as provided for under DFARS clauses 252.204-7012 and 7020 . . . is in error because the section describes CMMC PMO responsibilities and only DFARS clause 252.204-7020 references DIBCAC assessments of OSAs. Redundancy: One comment asserted that § 170.9(b)(9) and § 170.9(b)(20) are redundant as both describe that assessment appeals and results are entered into eMASS. Consistency: One comment pointed out an inconsistency between the text in § 170.18(c)(1)(i) and the Scoping Guide related to whether a CMMC Level 3 Assessment Scope must be the same as, or may be a subset of, the Assessment Scope of the prerequisite CMMC Level 2 certification. Clarifications:

Defense Federal Acquisition Regulation Supplement (DFARS), Part 204, Administrative Matters and Related Clauses at 252.204; OMB Control Number 0704-0225. Needs and Uses: DFARS 204.404-70(a) prescribes the use of the clause at DFARS 252.204-7000, Disclosure of Information, when the contractor will have access to or generate unclassified information that may be sensitive and inappropriate for release to the public. Upon receipt of a contractor's request, the Government reviews the information provided by the contractor to determine if it is sensitive or otherwise inappropriate for release for the stated purpose. Affected Public: Businesses or other for-profit and not-for profit institutions. Number of Respondents: 1,196. Responses per Respondent: Approximately 2.35. Annual Responses: 2,806. Average Burden per Response: Approximately 3 hours. Annual Burden Hours: 8,418. Reporting Frequency: On occasion. Summary of Information Collection DFARS 204.404-70(a) prescribes use of DFARS Clause 252.204-7000, Disclosure of Information, in contracts that require the contractor to access or generate unclassified information that may be sensitive and inappropriate for release to the public. The clause requires the contractor to obtain approval of the contracting officer before release of any unclassified contract-related information outside the contractor's organization, unless the information is already in the public domain. In requesting this approval, the contractor must identify the specific information to be released, the

An attack graph is often perceived to have a deterministic semantics: as long as all the preconditions of an attack can be achieved, the attack can always succeed resulting in the attacker obtaining the postcondition privilege. In reality, it is often not that clear. The 'possibly execute arbitrary code' in the vulnerability's overview highlights the uncertainty in the true consequence of exploiting a vulnerability. Depending on the difficulty level of the exploit, the attacker's skills and resources, and how hard it is to get to it, a vulnerability may or may not pose a high risk to the system. Since all security hardening measures (e.g. , patching) inevitably incur cost in terms of human labor, increased inconvenience, or degraded performance, security administration is an art of balancing risk and cost. A quantitative model for risk assessment is indispensable to make this effort a more scientific process. Table 1 shows the metric calculation results based on the method of Homer et al. [34]. Column 2 shows the risk metrics for Example 3. Columns 3-6 show the new risk assessment values based on various mitigation options: patching different vulnerabilities or changing the firewall rules so that the user workstations cannot access the database server. We try to give intuitive reasons to justify the security risk scores for each of the options. Patching the vulnerability on the web server would eliminate the known risk of compromise for the web server, but would have little effect on the other two hosts. The web server does not contain sensitive information, so protecting this host may not be the best choice. Even if the web server vulnerability gets patched, there are other attack paths. For example, an attacker can first gain control of a user workstation and then launch attacks against the database server from the workstation.

LTE infrastructure components (e.g., eNodeB, MME, S-GW) rely on purpose built systems to perform their network functions. The core software these systems run on is often a general purpose operating system. It is important that computer security recommended practices, including network, physical, and personnel security, be applied to these components in the same way they are applied to general information technology systems throughout industry today. Protection mechanisms such as patch management, configuration management (e.g., disabling serial ports on field network equipment), identity and access management, malware detection, and intrusion detection and prevention systems can be carefully planned and implemented throughout the MNO's LTE infrastructure. These processes and protection mechanisms can be tailored to best support and protect the specialized LTE system.

, as it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From 5 U.S.C. 552a(e)(4)(G) , (H), and (I), as it will provide protection against notification of investigatory material which might alert a subject to the fact that an investigation of that individual is taking place, and the disclosure of which would weaken the ongoing investigation, reveal investigatory techniques, and place in jeopardy confidential informants who furnished information under an express promise that the sources' identity would be held in confidence (or prior to the effective date of the Act, under an implied promise). (4) System identifier and name. S500.30 (Specific exemption), Incident Investigation/Police Inquiry Files. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . If an individual, however, is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information, except to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (c)(4)(i)(A). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. (B) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (C) The specific sections of 5 U.S.C. 552 a from which the system is exempt are 5 U.S.C. 552a(c)(3) , (d)(1) through (d)(4), (e)(1), (e)(4)(G), (H), and (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5) . (iii) Reasons. (A) From 5 U.S.C. 552a(c)(3) , because to grant access to the accounting for each disclosure as required by the Privacy Act, including the date, nature, and purpose of each disclosure and the identity of the recipient, could alert the

subject to the existence of the investigation or prosecutive interest by DLA or other agencies. This could seriously compromise case preparation by: Prematurely revealing its existence and nature; compromising or interfering with witnesses or making witnesses reluctant to cooperate; and leading to suppression, alteration, or destruction of evidence. (B) From 5 U.S.C. 552a(d)(1) through (d)(4) , and (f)

, FAR 32.201 provides that payment for commercial items may be made under such terms and conditions as the agency head determines are appropriate or customary in the commercial marketplace and are in the best interest of the United States. Furthermore, FAR 32.202-1 states that Government financing of commercial purchases is expected to be different from that used for noncommercial purchases. While the contracting officer may adapt techniques and procedures from the noncommercial subparts for use in implementing commercial contract financing arrangements, the contracting officer must have a full understanding of effects of the differing contract environments and of what is needed to protect the interests of the Government in commercial contract financing.

IV. Expected Cost Impact

This rule amends the DFARS to implement changes to performance-based payment policies for DoD contracts by amending the policy on performance-based payments at DFARS 232.1001 and amending the clauses at DFARS 252.232-7012, Performance-Based Payments-Whole Contract Basis, and 252.232-7013, Performance-Based Payments-Deliverable Item Basis. This rule may benefit contractors who receive contract financing from the Government in the form of performance-based payments. Performance-based payments do not apply to: Payments under cost-reimbursement line-items; Contracts awarded under the authority of FAR part 12 or part 13; Contracts for architect-engineer services or construction, or for shipbuilding or ship repair, when the contract provides for progress payments based upon a percentage or stage of completion. Performance-based payments are tied to the achievement of specific, measurable events or accomplishments that are defined and valued in advance by the parties to the contract. Total performance-based payments cannot exceed 90 percent of the contract price. This rule removes the DFARS restrictions that limit performance-based payments to amounts not greater than costs incurred up to the time of payment. If performance-based payments to the contractor based on the negotiated value of completed milestone events are allowed to exceed the total costs incurred up to the time of payment, the cost to the contractor of short-term borrowing will decrease and the cost to the Government of borrowing will increase. In addition, there is a minimal cost to offerors and the Government related to a new provision at DFARS 252.232-7015, Performance-Based Payments-Representation, which requires each offeror responding to a solicitation that may result in a contract providing performance-based financing to represent whether the offeror's financial statements are in compliance with Generally Accepted Accounting Principles.

The CMMC Program verifies defense contractor compliance with DoD's cybersecurity information protection requirements. It is designed to protect FCI and CUI that is shared by the Department with, or generated by, its contractors and subcontractors. The cybersecurity standards required by the program are the same as those set forth in FAR clause 52.204-21 (CMMC Level 1), the NIST SP 800-171 R2 guidelines, which is presently required by DFARS clause 252.204-7012 (CMMC Level 2), and additional selected requirements from the NIST SP 800-172 Feb2021 guidelines (CMMC Level 3). The program adds a robust assessment element and provides the Department increased assurance that contractors and subcontractors are meeting these requirements. In September 2020, the DoD published the 48 CFR CMMC interim final rule to the DFARS in the Federal Register (DFARS Case 2019-D041, 85 FR 48513 , September 9, 2020), which implemented the DoD's vision for the initial CMMC Program and outlined the basic features of the program (tiered model, required assessments, and implementation through contracts). The 48 CFR CMMC interim final rule became effective on November 30, 2020, establishing a five-year phase-in period. In March 2021, the Department initiated an internal review of CMMC's implementation, informed by more than 750 CMMC-related public comments in response to the 48 CFR CMMC interim final rule. This comprehensive, programmatic assessment engaged cybersecurity and acquisition leaders within DoD to refine policy and program implementation. In November 2021, the Department announced plans for a revised CMMC Program, which incorporates an updated program structure and requirements designed to achieve the primary goals of an internal DoD review of the CMMC Program. With the implementation of the CMMC Program, the Department introduced several key changes that build on and refine the original program requirements. These include: Streamlining the model from five to three certification levels; Allowing all companies at Level 1 and a subset of companies at Level 2 to demonstrate compliance through self-assessments; Increased oversight of professional and ethical standards of third-party assessors; and Allowing companies, under certain limited circumstances, to make POA&Ms to achieve certification. In December 2023, the Department published a proposed rule to amend 32 CFR part 170 in the Federal Register (Docket ID

2023-OS-0063, 88 FR 89058 , December 26, 2023), which implemented the DoD's vision for the revised CMMC Program outlined in November 2021. The comment period for the proposed rule concluded on February 26, 2024.

Where multiple persons have control over a technology asset, all persons that have control should include the asset in both their technology asset inventories and on their network maps. For example, where a covered entity contracts with a cloud-based EHR vendor, both the covered entity and the EHR vendor have control over the ePHI in the EHR. Thus, the ePHI in the EHR and the EHR should be included in the technology asset inventories and network maps of both the covered entity and the cloud-based EHR vendor. Where the technology assets are controlled entirely by another person, such as the servers controlled by a cloud-based provider of data backup services, the technology assets would not be considered part of a health care provider's electronic information systems, and therefore would not have to be included in its technology asset inventory. However, the data backup provider would have to be included in the health care provider's network map. When creating or maintaining a technology asset inventory that can aid in identifying risks to ePHI, regulated entities should consider their technology assets that may not create, receive, maintain or transmit ePHI, but that may affect technology assets that do so. [458] Assets within an organization that do not create, receive, maintain, or transmit ePHI may still present opportunities for intruders to enter the regulated entity's electronic information systems, which could lead to risks to the confidentiality, integrity, or availability of an organization's ePHI. For example, consider a smart device that is connected to the internet (e.g., connected to the Internet of Things [459] (IoT)) and provides access to facilities for maintenance personnel to control and monitor an organization's heating, ventilation, and air conditioning (HVAC). Although it may not maintain or process ePHI, such a device potentially can present serious risks to the security of ePHI in an organization's information systems. Unpatched IoT devices with known vulnerabilities, such as weak or unchanged default passwords installed on a network without firewalls, network segmentation, or other techniques that deny or impede an intruder's lateral movement, can provide an intruder with access to an organization's relevant electronic information systems. The intruder may then leverage this access to conduct reconnaissance and further penetrate an organization's network and potentially compromise ePHI. The risks and deficiencies OCR has observed in its enforcement experience persuades us that we must consider adding an express requirement for a regulated entity to conduct an accurate and thorough written inventory of its technology assets and create a network map. d. Section 164.308(a)(2)(i)·Standard: Risk Analysis

Back to the future. As we look back on our past fiscal year's work in cybersecurity and privacy, we
can see the fruition of many long-standing efforts that will position us well in the changing times
ahead. NIST has set foundations to ensure our security and privacy now and into the future with new
quantumresistant encryption algorithms, updates to the NIST Cybersecurity Framework, and the
establishment of Artificial Intelligence programs, testbeds, and research agendas. Our research has
also demonstrated practical applications of our work that spans several key priority areas that are
outlined in this report with hyperlinked pointers to help you dig deeper and learn more.

particularly want to thank Rebecca Bace of KSR for her careful review of the publication and for her
work on the predecessor publication, NIST Special Publication 800-31, Intrusion Detection Systems .
The authors would also like to express their thanks to security experts Andrew Balinsky (Cisco
Systems), Anton Chuvakin (LogLogic), Jay Ennis (Network Chemistry), John Jerrim (Lancop), and Kerry
Long (Center for Intrusion Monitoring and Protection, Army Research Laboratory), as well as
representatives from the Department of State and Gartner, for their particularly valuable comments
and suggestions. Additional acknowledgements will be added to the final version of the publication.

Control PS-15413: ons into acquisition activities within every step of the procurement and contract management life cycle process is essential to improving management of cybersecurity risks throughout the supply chain. This life cycle begins with a purchaser identifying a need and includes the processes to plan for and articulate requirements, conduct research to identify and assess viable sources of supply, solicit bids, evaluate offers to ensure conformance with C-SCRM requirements, and assess C-SCRM risks associated with the bidder and the proposed product and/or service. After contract award, ensure that the supplier satisfies the terms and conditions articulated in the contractual agreement and that the products and services conform as expected and required. Monitoring for changes that may affect cybersecurity risks in the supply chain should occur throughout the life cycle and may trigger reevaluation of the original assessment or require a mitigation response. Enterprises rely heavily on commercial products and outsourced services to perform operations and fulfill their mission and business objectives. However, it is important to highlight that products and services can also be obtained outside of the procurement process, as is the case with open source software, relying on an in-house provider for shared services, or by repurposing an existing product to satisfy a new need. C-SCRM must also be addressed for these other 'acquiring' processes. In addition to addressing cybersecurity risks throughout the supply chain and performing C-SCRM activities during each phase of the acquisition process, enterprises should develop and execute an acquisition strategy that drives reductions in their overall risk exposure. By applying 25 Departments and agencies should refer to Appendix F to implement this guidance in accordance with Executive Order 14028, Nation's Cybersecurity .

to the extent such provisions have been identified and an exemption claimed for the original record and the purposes underlying the exemption for the original record still pertain to the record which is now contained in this system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided to the President and others are not compromised, to protect records used solely as statistical records, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, and to preserve the confidentiality and integrity of Federal evaluation materials. The exemption rule for the original records will identify the specific reasons why the records may be exempt from specific provisions of 5 U.S.C. 552a . (22) System identifier and name. A0351-12 DAPE, Applicants/Students, U.S. Military Academy Prep School. (i) Exemption. (A) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (B) Evaluation material used to determine potential for promotion in the Military Services may be exempt pursuant to 5 U.S.C. 552a(k)(7) , but only to the extent that the disclosure of such material would reveal the identity of a confidential source. (C) It is imperative that the confidential nature of evaluation material on individuals, furnished to the U.S. Military Academy Preparatory School under an express promise of confidentiality, be maintained to ensure the candid presentation of information necessary in determinations involving admission to or retention at the United States Military Academy and suitability for commissioned military service. (D) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(5) and (k)(7) subsections 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(5) and (k)(7) . (iii) Reasons. (A) From subsections (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement.

From the NIST SP 800-172 Rev 3 Final Public Draft: This requirement is sourced to a control tailored out of the SP 800-53B [13] moderate baseline in SP 800-171. NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 PROTECTION STRATEGY 2555

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology promotes the United States economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof-of-concept implementations, and technical analyses to advance the development and productive

use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of non-national-security-related information in federal information systems. This Special Publication 800 series reports on ITL's research, guidelines, and outreach efforts in information system security and its collaborative activities with industry, government, and academic organizations. applications 3 are not required because the security controls for those applications are typically provided by the general support system or major application in which they operate. In those cases where the minor application is not connected to a major application or general support system, the minor application should be briefly described in a general support system plan that has either a common physical location or is supported by the same organization. Additional information is provided in Chapter 2. system to the high watermark or highest impact level must be applied when grouping minor applications/subsystems with varying FIPS 199 impact levels into a single general support system or major application unless there is adequate boundary protection, e.g., firewalls and encryption, around those subsystems or applications with the highest impact level. Additionally, there must be assurance that the shared resources, i.e., networks, communications, and physical access within the whole general support system or major application, are protected adequately for the highest impact level.

or any other applicable information protection requirements. The CMMC Program provides a means of verifying implementation of the security requirements set forth in 48 CFR 52.204-21, NIST SP 800-171 R2, and NIST SP 800-172 Feb2021, as applicable. Subpart B-Government Roles and Responsibilities. §-170.6 CMMC PMO. (a) The Office of the Department of Defense Chief Information Officer (DoD CIO) Office of the Deputy CIO for Cybersecurity (DoD CIO(CS)) provides oversight of the CMMC Program and is responsible for establishing CMMC assessment, accreditation, and training requirements as well as developing and updating CMMC Program policies and implementing guidance. (b) The CMMC PMO is responsible for monitoring the CMMC AB's performance of roles assigned in this rule and acting as necessary to address problems pertaining to effective performance. (c) The CMMC PMO retains, on behalf of the DoD CIO(CS), the prerogative to review decisions of the CMMC Accreditation Body as part of its oversight of the CMMC program and evaluate any alleged conflicts of interest purported to influence the CMMC Accreditation Body's objectivity. (d) The CMMC PMO is responsible for sponsoring necessary DCSA activities including FOCl risk assessment and Tier 3 security background investigations for the CMMC Ecosystem members as specified in §§-170.8(b)(4) and (5), 170.9(b)(3) through (5), 170.11(b)(3) and (4), and 170.13(b)(3) and (4). (e) The CMMC PMO is responsible for investigating and acting upon indications that an active CMMC Status has been called into question. Indications that may trigger investigative evaluations include, but are not limited to, reports from the CMMC Accreditation Body, a C3PAO, or anyone knowledgeable of the security processes and activities of the OSA. Investigative evaluations include, but are not limited to, reviewing pertinent assessment information, and exercising the right to conduct a DCMA DIBCAC assessment of the OSA, as provided for under the 48 CFR 252.204-7020. (f) If a subsequent DCMA DIBCAC assessment shows that adherence to the provisions of this rule and the required CMMC Status have not been achieved or maintained, the DIBCAC results will take precedence over any pre-existing CMMC Status recorded in SPRS, or its successor capability. The DoD will update SPRS to reflect that the OSA is out of compliance and does not meet DoD CMMC requirements. If the OSA is working on an active contract requiring CMMC compliance, then standard contractual remedies will apply. §-170.7 DCMA DIBCAC. (a) DCMA DIBCAC assessors in support of the CMMC Program will: (1) Complete CMMC Level 2 and Level 3 training. (2) Conduct Level 3 certification assessments and upload assessment results into the CMMC instantiation of eMASS, or its successor capability. (3) Issue Certificates of CMMC Status resulting from Level 3 certification assessments. (4) Conduct Level 2 certification assessments of the Accreditation Body and prospective C3PAOs' information (printed page 83221)

(2) If the GCA does not provide a remedy, and the contractor still believes that corrective action is required, the contractor will make a formal written challenge to the GCA. The challenge will include: (i) A description sufficient to identify the issue. (ii) The reasons why the contractor thinks that corrective action is required. (iii) Recommendations for appropriate corrective action. (3) The contractor will safeguard the information as required for its assigned or proposed level of classification, whichever is higher, until action is completed. (4) If the contractor does not receive a written answer from the GCA within 60 days, the contractor will request assistance from the CSA. If the contractor does not receive a response from the GCA within 120 days, the contractor may appeal the challenge to the Interagency Security Classification Appeals Panel through ISOO. (5) The fact that a contractor has initiated such a challenge will not, in any way, serve as a basis for

adverse action against the contractor by the USG. If a contractor believes that adverse action did result from a classification challenge, the contractor will promptly furnish full details to ISOO for resolution. (f) Contractor developed information. Whenever a contractor develops an unsolicited proposal or originates information not in the performance of a classified contract, the provisions of this paragraph apply. (1) If the information was previously identified as classified, it will be classified according to an appropriate classification guide, or source document, and appropriately marked. (2) If the information was not previously classified, but the contractor believes the information may or should be classified, the contractor will: (i) Protect the information as though classified at the appropriate level. (ii) Submit the information to the agency that has an interest for a classification determination. In such cases, clearly mark the material ·CLASSIFICATION DETERMINATION PENDING; Protect as either TOP SECRET, SECRET, or CONFIDENTIAL.· This marking will appear conspicuously at least once on the material but no further markings are necessary until a classification determination is received. (iii) Not be precluded from marking such material as entity-private or entity-proprietary information, unless the material was based upon information obtained from prior deliverables to the USG or was developed from USG material. (iv) Protect the information pending a final classification determination. The information may be CUI, if it is not classified. Only information that is owned by, produced by, produced for, or is under the control of the USG can be classified in accordance with E.O. 13526 . (3) To be eligible for classification: (i) The information must incorporate classified information to which the contractor was given prior access. (ii) The information must be partially or wholly owned by, produced by or for, or under the control of the USG. (4) 10 CFR 1045.21

CIS Safeguard 17.7 · Conduct Routine Incident Response Exercises Plan and conduct routine incident response exercises and scenarios for key personnel involved in the incident response process to prepare for responding to real-world incidents. Exercises need to test communication channels, decision making, and workflows. Conduct testing on an annual basis, at a minimum. Implementation Groups: 2,3 Asset Type: N/A Security Function: recover Parent Control: Incident Response Management

Four comments questioned the eligibility and scope of the program, to include recommending that the program remain voluntary, and questioning whether the program was ·under inclusive or overly restrictive because the program is only available to companies that have a Facility Security Clearance and a Communications Security account.· Response: The DIB CS/IA program will remain a voluntary program to enhance and supplement DIB participants' capabilities to safeguard DoD information that resides on, or transits, DIB unclassified information systems. The eligibility requirements for the program (§ 236.7) are based on security requirements to ensure the protection of Government furnished information (GFI) at DIB companies in possession of DoD information, as described in the definition for ·covered defense information,· (§ 236.2(c)). No change is made to the rule. Comment: One comment asserted that the rule should not have been published as an interim rule. Response: In light of the growing cyber threat activity against DoD information and DIB information systems and the associated risk to U.S. national security, the Government determined it appropriate to issue an interim rule. This allowed eligible DIB companies to receive cyber threat information, without delay in order to enhance their capability to defend against ongoing and continuous cyber threats and to safeguard DoD information. No change is made to the rule. Comment: One comment asserted that the Framework Agreement (FA) should be available for public review to evaluate the estimates of projected paperwork for participants. Response: The Framework Agreement is a representation of the federal rule converted into an agreement format for implementation of the program. In addition, all information required to evaluate the projected cost and time for the information collection requirements is available in the rule. No change is made to the rule. Comment: One comment asserted that transparency into public-private cyber security programs is crucial to ensure that federal agencies respect privacy rights and comply with their obligations. Response: Extensive coordination across the Government has ensured that the privacy rights of U.S. citizens are protected under the DIB CS/IA voluntary program, including developing a comprehensive Privacy Impact Assessment (PIA) for the DIB CS/IA program. The PIA is publically available at: http://dodcio.defense.gov/·Portals/·0/·Documents/·DIB%20CS-IA%20PIA_·FINAL_·signed_·30jun2011_·VMSS_·GGMR_·RC.pdf . No change is made to the rule. Comment: One comment asserted that the Defense Department opted to issue a rule even though no law has been passed by Congress regarding Government-industry cyber security activities and that rulemaking should come after Congress concludes its legislative efforts. Response:

Document Headings Document headings vary by document type but may contain the following: the

agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System [Docket Number DARS-2019-0021; OMB Control Number 0704-0478] AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Notice. SUMMARY: The Defense Acquisition Regulations System has submitted to OMB for clearance, the following proposal for collection of information under the provisions of the Paperwork Reduction Act. DATES: Consideration will be given to all comments received by August 29, 2019. SUPPLEMENTARY INFORMATION: A. Title and OMB Number Safeguarding Covered Defense Information, Cyber Incident Reporting, and Cloud Computing; OMB Control Number 0704-0478. B. Needs and Uses Offerors and contractors must report cyber incidents on unclassified networks or information systems, within cloud computing services, and when they affect contractors designated as providing operationally critical support, as required by statute. C. Annual Burden Number of Respondents: 2,017. Responses per Respondent: 17.35. Annual Responses: 34,974. Average Burden per Response: .29 hours. Annual Burden Hours: 10,071. Reporting Frequency: On Occasion. Affected Public. Businesses or other for-profit and not-for-profit institutions. Respondent's Obligation: Required to obtain or retain benefits. Frequency: On occasion. Type of Request: Renewal of a currently approved collection. (printed page 36906) D. Public Comments A 60-day notice was published in the Federal Register at 84 FR 23532 on May 22, 2019. One respondent provided four comments, which are summarized below along with responses; however, the comments did not change the estimate of the burden. Comment: To ensure proper safeguarding of contractors' attributional/proprietary information, the respondent recommends that the contractor submitting the information be: (1) Afforded an opportunity to review and propose redactions prior to release; (2) permitted to apply protective markings to information after its submission to the Government; and (3) allotted additional time to pursue any administrative or legal remedies in the event that the Government plans to disclose information that the contractor has otherwise proposed to be withheld. Response:

to the extent such provisions have been identified and an exemption claimed for the original record and the purposes underlying the exemption for the original record still pertain to the record which is now contained in this system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided to the President and others are not compromised, to protect records used solely as statistical records, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, to preserve the confidentiality and integrity of Federal testing materials, and to safeguard evaluation materials used for military promotions when furnished by a confidential source. The exemption rule for the original records will identify the specific reasons why the records may be exempt from specific provisions of 5 U.S.C. 552a . (30) System identifier and name. A0601-141 DASG, Applications for Appointment to Army Medical Department. (i) Exemption. Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. Therefore, portions of the system of records may be exempt pursuant to 5 U.S.C. 552(a)(k) (5) from subsections 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (d), because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement. (C) From subsection (e)(1) because in the course of criminal investigations, information is often obtained concerning the violation of laws or civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this valuable information be retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought.

Establish and implement written policies and procedures for granting and revising access to electronic protected health information and relevant electronic information systems as necessary and appropriate for each prospective user and technology asset to carry out their assigned function(s).

(C) Authentication management. Establish and implement written policies and procedures for verifying the identities of users and technology assets prior to accessing the covered entity's or business associate's relevant electronic information systems, including written policies and procedures for implementing multi-factor authentication technical controls required by § 164.312(f)(2)(ii) through (v).

(D) Access determination and modification. Establish and implement written policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, determine, document, review, and modify the access of each user and technology asset to specific components (printed page 1015) of the covered entity's or business associate's relevant electronic information systems.

(E) Network segmentation. Establish and implement written policies and procedures that ensure that a covered entity's or business associate's relevant electronic information systems are segmented to limit access to electronic protected health information to authorized workstations.

(F) Maintenance. Review and test the written policies and procedures required by this paragraph (a)(10)(ii) at least once every 12 months, and modify as reasonable and appropriate.

(11) Standard: Security awareness training

(i) General. Implement security awareness training for all workforce members on protection of electronic protected health information and information systems as necessary and appropriate for the members of the workforce to carry out their assigned function(s).

(ii) Implementation specifications

(A) Training. A covered entity or business associate must develop and implement security awareness training for all workforce members that addresses all of the following:

- (1) The written policies and procedures with respect to electronic protected health information required by this subpart as necessary and appropriate for the workforce members to carry out their assigned functions.
- (2) Guarding against, detecting, and reporting suspected or known security incidents, including but not limited to, malicious software and social engineering.
- (3) The written policies and procedures for accessing the covered entity's or business associate's relevant electronic information systems, including but not limited to: safeguarding passwords; setting unique passwords of sufficient strength to ensure the confidentiality, integrity, and availability of electronic protected health information; and limitations on sharing passwords.

(B) Timing. A covered entity or business associate must provide security awareness training as follows:

(1

To address the potential for a bad actor to exploit publicly known vulnerabilities, and consistent with NCVHS' recommendation, the Department proposes to add a new standard for vulnerability management at 45 CFR 164.312(h)(1) . [800] The proposed standard would require a regulated entity to deploy technical controls to identify and address technical vulnerabilities in the regulated entity's relevant electronic information systems. The deployment of technical controls should be consistent with the regulated entity's patch management policies and procedures at proposed 45 CFR 164.308(a)(4) . This proposed standard aligns with the Department's enhanced CPGs for Cybersecurity Testing and Third Party Vulnerability Disclosure by calling for regulated entities to employ multiple processes to discover technical vulnerabilities, including vulnerabilities in workstations and in technology assets provided by vendors and service providers. [801] For example, a regulated entity should include a device owned by a person other than the regulated entity (e.g., the medical device manufacturer) in its vulnerability management activities where the device is deployed on the regulated entity's network. The regulated entity should also include all workstations (e.g., desktop computers, mobile devices) that are part of its relevant electronic information systems in its vulnerability management activities. To implement this proposed standard, we propose four implementation specifications. Proposed 45 CFR 164.312(h)(2)(i)(A) would require a regulated entity to conduct automated scans of the regulated entity's relevant electronic information systems, including all of the components of such relevant electronic information systems (e.g., workstations, private networks) to identify technical vulnerabilities. Vulnerability scans detect vulnerabilities such as obsolete software (printed page 978) and missing patches. [802] Once identified, assessed, and prioritized, appropriate measures need to be implemented to mitigate these vulnerabilities (e.g., apply patches, harden systems, retire equipment). [803] Under the proposal, the scans would be required to be conducted in accordance with the regulated entity's risk analysis under proposed 45 CFR 164.308(a)(2) and no less frequently than once every six months. Relatedly, proposed 45 CFR 164.312(h)(2)(i)(B) would add an implementation specification for maintenance of the technology

assets that conduct the required automated vulnerability scans. Under this proposal, a regulated entity would be expressly required to review and test the effectiveness of the technology asset(s) that conducts the automated vulnerability scans that would be required by the proposed implementation specification at proposed 45 CFR 164.312(h)(2)(i)(A) at least once every 12 months or in response to environmental or operational changes, whichever is more frequent, and modify as reasonable and appropriate.

From the NIST SP 800-172 Rev 3 Final Public Draft: As a result, when an adversary's attack on one supplier causes it to shut down, the defender can increase its use of the other suppliers, thus shortening the time when it is without the critical components. NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System [Docket DARS-2020-0007; OMB Control Number 0704-0519] AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Notice. SUMMARY: The Defense Acquisition Regulations System has submitted to OMB for clearance the following proposal for a new collection of information under the provisions of the Paperwork Reduction Act. DATES: Consideration will be given to all comments received by January 28, 2021. SUPPLEMENTARY INFORMATION: Title and OMB Number: Defense Federal Acquisition Regulation Supplement (DFARS); DFARS Subpart 204.17, Service Contracts Inventory and Associated Clause; OMB Control Number 0704-0519. Affected Public: Businesses and other for-profit entities. Respondent's Obligation: Required to obtain or retain benefits. Type of Request: Approval of a new information collection. Reporting Frequency: Annually. Number of Respondents: 1,934. Responses per Respondent: 2.267, approximately. Annual Responses: 4,386. Average Burden per Response: 2 hours. Total Annual Burden Hours: 8,772. Needs and Uses: 10 U.S.C. 2330a , as amended by section 812 of National Defense Authorization Act for Fiscal Year 2017, requires DoD to establish a data collection system to provide certain management information with regard to each purchase of services by a Military Department or Agency that is in excess of \$3 million for services in the following service acquisition portfolio groups: Logistics management services, equipment-related services, knowledge-based services, and electronics and communications services. New DFARS clause 252.204-70XX, Reporting Requirements for Contracted Services, requires a contractor to report annually, in the System for Award Management, on the services performed under the contract or order, during the preceding Government fiscal year. Specifically, the contractor is required to report the total dollar amount invoiced for services performed during the preceding fiscal year and the number of direct labor hours, including subcontractor hours (when applicable), expended on services performed during the previous Government fiscal year. The information collection will provide DoD with the ability to identify and report annually to Congress, in accordance with 10 U.S.C. 2330a , on the inventory of contractor service contract actions. As an adjunct, the information will support DoD's total force management and in making strategic workforce planning and budget decisions pursuant to 10 U.S.C. 129a .

Similarly, the RMF also demonstrates this bilateral relationship. For example, every task within the Prepare step of the RMF aligns with the Cybersecurity Framework Core. Specifically, the P-2 Risk Management Strategy aligns with the Cybersecurity Framework Core [Identify Function at ID.RM; ID.SC]. Other RMF examples include: Task P-4, Organizationally-Tailored Control Baselines and Cybersecurity Framework Profiles, aligns with the Cybersecurity Framework Profile construct; and Task R-5, Authorization Reporting, and Task M-5, Security and Privacy Reporting, support OMB reporting and risk management requirements organizationwide by using the Cybersecurity Framework constructs of Functions, Categories, and Subcategories. ² Still, it remains challenging to ensure a specific set of system configuration baseline settings is applied while maintaining compliance with multiple requirements (e.g., FISMA, HIPAA, PCI DSS, Special Publication 800-70 Revision 4, etc.). The NIST National Checklist Program provides a catalog of automated and implementable security settings to assist with the attestation trail from the applied setting to the framework. ⁶ In the RMF, after the system is categorized as a high, moderate, or low impact (based on FIPS 199/SP 800-60), organizations leverage FIPS 200 to identify minimum security requirements associated with the system impact level [12][16][17]. They then use the SP 800-53 tailoring process to apply any

other needed security to address specific mission objectives, operational constraints, cybersecurity requirements, and other organizational considerations. This process is used to customize the controls baseline for each system.

The HHS Office for Civil Rights estimated first-year compliance costs of approximately \$9 billion across all covered entities and business associates. This estimate accounts for the proposed requirements including mandatory encryption, MFA implementation, annual asset inventory and network mapping, and the elimination of the 'addressable' specification category. Individual organization costs will vary significantly based on size, current security posture, and technology infrastructure. Note: These are estimated costs for proposed changes. The final rule may differ from the NPRM.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Office of the Secretary 32 CFR Part 117 [Docket ID: DoD-2023-OS-0061] RIN 0790-AL52 AGENCY: Office of the Under Secretary of Defense for Intelligence & Security, Department of Defense (DoD). ACTION: Proposed rule. SUMMARY: DoD is proposing amendments to the National Industrial Security Program Operating Manual (NISPOM) based on public comments received on a final rule published on December 21, 2020. The proposed amendments address implementation guidance and costs for the Security Executive Agent Directive (SEAD) 3, clarifications on procedures for the protection and reproduction of classified information, controlled unclassified information (CUI), National Interest Determination (NID) requirements for cleared contractors operating under a Special Security Agreement for Foreign Ownership, Control or Influence, and eligibility determinations for personnel security clearance processes and requirements. DATES: Comments must be received on or before February 12, 2024. ADDRESSES: You may submit comments, identified by docket number and/or Regulatory Identifier Number (RIN) and title, by any of the following methods: Federal eRulemaking Portal: <http://www.regulations.gov> . Follow the instructions for submitting comments. Mail: Department of Defense, Office of the Assistant to the Secretary of Defense for Privacy, Civil Liberties, and Transparency, Regulatory Directorate, 4800 Mark Center Drive, Attn: Mailbox 24, Suite 08D09, Alexandria, VA 22350-1700. Instructions: All submissions received must include the agency name and (printed page 86289) docket number or RIN for this Federal Register document. The general policy for comments and other submissions from members of the public is to make these submissions available for public viewing at <http://www.regulations.gov> as they are received without change, including any personal identifiers or contact information. FOR FURTHER INFORMATION CONTACT: Allyson Renzella, 703-697-9209. SUPPLEMENTARY INFORMATION: Background The NISPOM establishes requirements for the protection of classified information disclosed to or developed by contractors, licensees, grantees, or certificate holders to prevent unauthorized disclosure. The National Industrial Security Program (NISP) is established by Executive Order (E.O.) 12829 -National Industrial Security Program (NISP) (available at <https://www.archives.gov/files/isoo/policy-documents/eo-12829-with-eo-13691-amendments.pdf>

Department of Defense General Services Administration National Aeronautics and Space Administration 48 CFR Parts 1, 2, 4, 52, and 53 [FAR Case 2015-002; Docket No. 2015-0002, Sequence No. 1] RIN 9000-AN40 AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA). ACTION: Proposed rule. SUMMARY: DoD, GSA, and NASA are proposing to amend the Federal Acquisition Regulation (FAR) to require electronic submission of the DD Form 254, Contract Security Classification Specification. DATES: Interested parties should submit written comments to the Regulatory Secretariat Division at one of the addresses shown below on or before September 10, 2019 to be considered in the formulation of a final rule. ADDRESSES: Submit comments in response to FAR Case 2015-002 by any of the following methods: Regulations.gov: <http://www.regulations.gov> . Submit comments via the Federal eRulemaking portal by searching for 'FAR Case 2015-002'. Select the link 'Comment Now' that

corresponds with ·FAR Case 2015-002·. Follow the instructions provided on the screen. Please include your name, company name (if any), and ·FAR Case 2015-002· on your attached document. Mail: General Services Administration, Regulatory Secretariat Division (MVCB), ATTN: Lois Mandell, 1800 F Street NW, Second Floor, Washington, DC 20405. Instructions: Please submit comments only and cite ·FAR case 2015-002· in all correspondence related to this case. All comments received will be posted, without change, to <http://www.regulations.gov> , including any personal and/or business confidential information provided. To confirm receipt of your comment(s), please check www.regulations.gov , approximately two to three days after submission to verify posting (except allow 30 days for posting of comments submitted by mail). FOR FURTHER INFORMATION CONTACT: Mr. Curtis E. Glover, Sr., Procurement Analyst, at (202) 501-1448 for clarification of content. For information pertaining to status or publication schedules, contact the Regulatory Secretariat Division at (202) 501-4755. Please cite ·FAR case 2015-002·. SUPPLEMENTARY INFORMATION: I. Background

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is a significant regulatory action and, therefore, was subject to review under section 6(b) of E.O. 12866 , Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804 . IV. Regulatory Flexibility Act DoD does not expect this interim rule to have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601 , et seq., because companies have an existing interest in having a supply chain that it can rely on to provide it with material and supplies that allow the contractor to ultimately supply its customers with products that are safe and that do not impose threats or risks to government information systems. However, an Initial Regulatory Flexibility Analysis (IRFA) has been prepared because there is a growing interest by both the Government and industry in establishing cost efficient ways to protect the supply chain related to information technology purchases. Congress has recognized a growing concern for risks to the supply chain for technology contracts supporting the Department of Defense (DoD). Congress has defined supply chain risk as ·the risk that an adversary may sabotage, maliciously introduce unwanted function, or otherwise subvert the design, integrity, manufacturing, production, distribution, installation, operation, or maintenance of a covered system so as to surveil, deny, disrupt, or otherwise degrade the function, use, or operation of such system.· (See section 806(e)(4) of Pub. L. 111-383 .) The objective of this rule is to protect DoD against risks arising out of the supply chain. The legal basis for this rule is section 806 of the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2011 (Pub. L. 111-383), as amended by section 806 of the NDAA for FY 2013 (Pub. L. 112-239). Additionally, the Department of Defense Instruction (DoDI) 5200.44, Protection of Mission Critical Functions to Achieve Trusted Systems and Networks (TSN), recognizes the need to improve supply chain risk management (SCRM). In doing so, the DoDI requires, among other things, implementation of section 806 in the DFARS and in appropriate solicitation and contract language. This rule applies to contractors involved in the development or delivery of any information technology, whether acquired by DoD as a service or as a supply. This includes commercial purchases as well as purchases of commercial off-the-shelf (COTS) services or supplies.

A written confirmation, requested by and exchanged between governments, that contains the following elements: Verification of the personnel security clearance (PCL) level of the sponsoring foreign government's citizens or nationals; a statement by a responsible official of the sponsoring foreign government that the recipient of the information is approved by the sponsoring foreign government for access to information of the security classification involved on behalf of the sponsoring government; and an obligation that the sponsoring foreign government will ensure compliance with any security agreement or other use, transfer and security requirements specified by the components. The security assurance usually will be in a request for visit authorization or with courier orders or a transportation plan; but is not related to the PCL security assurance. Special Access Program (SAP). As defined in E.O. 13526 . Subcontract. As defined in DoD 5220.22-M. §117.54 Policy. It is DoD policy that DoD FOCI procedures will be used to protect against foreign interests: (a) Gaining unauthorized access to classified, export-controlled, or all communications security (COMSEC) (classified or unclassified) information in accordance with E.O. 12829 and DoD Instruction 8523.01, ·Communications Security· (available at

<http://www.dtic.mil/whs/directives/corres/pdf/852301p.pdf>). DoD FOCI procedures for access to unclassified COMSEC are set forth in National Security Agency Central Security Service (NSA/CSS) Policy Manual 3-16, Control of Communications Security Material (available to authorized users of SIPRNET at www.iad.nsa.smil.mil/resources/library/nsa_office_of_policy_section/pdf/NSA_CS_S_MAN-3-16_080505.pdf). (b) Adversely affecting the performance of classified contracts, in accordance with E.O. 12829 . (c) Undermining U.S. security and export controls, in accordance with E.O. 12829 . § 117.55 Responsibilities. (a) The Under Secretary of Defense for Intelligence (USD(I)) will, in accordance with DoD Directive 5143.01, Under Secretary of Defense for Intelligence (USD(I)) (available at <http://www.dtic.mil/whs/directives/corres/pdf/514301p.pdf>) and DoD Instruction 5220.22, National Industrial Security Program (see <http://www.dtic.mil/whs/directives/corres/pdf/522022p.pdf>): (1) Oversee policy and management of the NISP, to include FOCI matters. (2) Direct, administer, and oversee the FOCI provisions of the NISP to ensure that the program is efficient and consistently implemented. (3) Provide additional guidance regarding FOCI matters by memorandum as needed. (4) Coordinate with the Under Secretary of Defense for Policy (USD(P)) and the Under Secretary of Defense for Acquisition, Technology and Logistics (USD(AT&L)) on matters under their cognizance that affect the NISP consistent with paragraphs (c) and (d) of this section.

DFARS 252.204-7012 (Safeguarding Covered Defense Information and Cyber Incident Reporting) Core CUI protection clause requiring NIST SP 800-171 implementation, cyber incident reporting within 72 hours, and preservation of evidence. DFARS 252.204-7012 works in conjunction with the CMMC program. While 252.204-7012 establishes the contractual requirement, CMMC (under 32 CFR Part 170) provides the assessment framework. Phase 1 began November 10, 2025, with Phase 2 (C3PAO certification requirements) scheduled for November 10, 2026.

and to modify the heading to Access determination and modification. We also propose to modify this implementation specification to require a regulated entity to establish and implement written policies and procedures that, based on its access authorization policies, establish, document, review, and modify the access of each user and technology asset to specific components of the regulated entity's relevant electronic information systems. Such written policies and procedures would be required to be based upon the regulated entity's policies for authorizing access. Under this proposal, and consistent with the existing implementation specification, [575] the regulated entity would be required to establish standards for granting access to ePHI and relevant electronic information systems and provide formal authorization from the appropriate authority before granting access to ePHI or relevant electronic information systems. Regulated entities should regularly review personnel access to ePHI and relevant electronic information systems to ensure that access is still authorized and needed, and modify personnel access to ePHI and electronic information systems, as needed, based on review activities. The existing implementation specification for access authorization calls for the regulated entity to implement policies and procedures for granting access to ePHI, for example, through components of its information system. [576] The Department's proposal to revise this implementation specification would provide greater specificity than our existing requirements, and echo NIST guidance on this topic. Specifically, NIST guidance [577] describes the key steps for developing policies and procedures for granting access to ePHI as follows: Decide and document procedures for how access to ePHI would be granted to workforce members within the organization. Select the basis for restricting access to ePHI. Select an access control method (e.g., identity-based, role based, or other reasonable and appropriate means of access). Decide and document how access to ePHI would be granted for privileged functions. Ensure that there is a list of personnel with authority to approve user requests to access ePHI and systems with ePHI. Identify authorized users with access to ePHI, including data owners and data custodians. Consider whether multiple access control methods are needed to protect ePHI according to the results of the risk assessment. Determine whether direct access to ePHI would ever be appropriate for individuals external to the organization (e.g., business partners or patients seeking access to their own ePHI). Other questions that a regulated entity should consider when establishing such policies and procedures include: Have appropriate authorization and clearance procedures, as specified in the standard for workforce security, [578]

information security terms. - — Performed research and conducted outreach on standards, practices, and technologies to enable prompt and effective computer security incident handling and

(5) SP 800-53, Security and Privacy Controls for Information Systems and Organizations, Revision 5, September 2020 (includes updates as of December 10, 2020) (NIST SP 800-53 R5); IBR approved for § 170.4(b).

se enterprises and their subordinate organizations as well as systems owners to better identify, assess, and manage cybersecurity risks in the context of their broader mission and business objectives. 6 This document will help cybersecurity professionals understand what executives and corporate officers need to carry out enterprise risk management (ERM). This includes, but is not limited to, what data to collect, what analyses to perform, and how to consolidate and condition this discipline-specific risk information so that it provides useful inputs for ERM programs. This document will also help high-level executives and corporate officers understand the challenges that cybersecurity professionals face in providing them with relevant information. Because enterprise stakeholders are accustomed to receiving reports regarding many types of risk, guidance on cybersecurity that is consistent with these other risk categories will support well-crafted and actionable risk appetite and risk tolerance decisions and statements.

To ensure the integrity of the privacy and civil liberties process. The execution requires that information be provided in a free and open manner without fear of retribution or harassment in order to facilitate a just, thorough, and timely resolution of the complaint or inquiry. Disclosures from this system can enable individuals to conceal their wrongdoing or mislead the course of the investigation by concealing, destroying, or fabricating evidence or documents. In addition, disclosures can subject sources and witnesses to harassment or intimidation which may cause individuals not to seek redress for wrongs through privacy and civil liberties channels for fear of retribution or harassment. There is a clear need to protect national security information from inadvertent disclosure. § 310.29 Office of the Secretary of Defense (OSD) exemptions. (a) General information. The Secretary of Defense designates those Office of the Secretary of Defense

(OSD) systems of records which will be exempt from certain provisions of the Privacy Act. There are two types of exemptions, general and specific. The general exemption authorizes the exemption of a system of records from all but a few requirements of the Act. The specific exemption authorizes exemption of a system of records or portion thereof, from only a few specific requirements. If an OSD Component originates a new system of records for which it proposes an exemption, or if it proposes an additional or new exemption for an existing system of records, it shall submit the recommended exemption with the records system notice as outlined in § 311.6. No exemption of a system of records shall be considered automatic for all records in the system. The systems manager shall review each requested record and apply the exemptions only when this will serve significant and legitimate Government purpose. (b) General exemptions. The general exemption provided by 5 U.S.C. 552a(j)(2) may be invoked for protection of systems of records maintained by law enforcement activities. Certain functional records of such activities are not subject to access provisions of the Privacy Act of 1974. Records identifying criminal offenders and alleged offenders consisting of identifying data and notations of arrests, the type and disposition of criminal charges, sentencing, confinement, release, parole, and probation status of individuals are protected from disclosure. Other records and reports compiled during criminal investigations, as well as any other records developed at any stage of the criminal law enforcement process from arrest to indictment through the final release from parole supervision are excluded from release. (1) System identifier and name. DWHS P42.0, DPS Incident Reporting and Investigations Case Files. (i) Exemption. Portions of this system that fall within 5 U.S.C. 552a(j)(2) are exempt from the following provisions of 5 U.S.C. 552a

This rule proposes to amend the DFARS to implement changes to performance-based payment policies for DoD contracts by amending the policy on performance-based payments at DFARS 232.1001 and amending the clauses at DFARS 252.232-7012, Performance-Based Payments-Whole Contract Basis, and 252.232-7013, Performance-Based Payments-Deliverable Item Basis. This rule may benefit contractors who receive contract financing from the Government in the form of performance-based payments. Performance-based payments do not apply to: Payments under cost-reimbursement line-items; Contracts awarded under the authority of FAR part 12 or part 13; Contracts for architect-engineer services or construction, or for shipbuilding or ship repair, when the contract provides for progress payments based upon a percentage or stage of completion. Performance-based payments are tied to the achievement of specific, measurable events or accomplishments that are defined and valued in advance by the parties to the contract. Total performance-based payments cannot exceed 90 percent of the contract price. This rulemaking proposes to remove the DFARS restrictions that limit performance-based payments to amounts not greater than costs incurred up to the time of payment. If performance-based payments to the contractor based on the negotiated value of completed milestone events are allowed to exceed the total costs incurred up to the time of payment, the cost to the contractor of short-term borrowing will decrease and the cost to the Government of borrowing will increase. In addition, there is a minimal cost to offerors and the Government related to a new provision at DFARS 252.232-70XX, Performance-Based Payments-Representation, that requires each offeror responding to a solicitation that may result in a contract providing performance-based financing to represent whether the output of the offeror's accounting system is in compliance with Generally Accepted Accounting Principles, as evidenced by audited financial statements. DoD has performed a regulatory cost analysis on this rule. The following is a summary of the estimated public cost savings and Government costs in millions calculated in perpetuity in 2016 dollars at a 7-percent discount rate: Summary Public Government Total Present Value -\$53.971 \$27.338 -\$26.633 Annualized Costs -3.778 1.914 -1.864 Annualized Value Costs (as of 2016 if Year 1 is 2019) -3.084 1.562 -1.522 To access the complete Regulatory Cost Analysis, go to the Federal eRulemaking Portal at www.regulations.gov, search for "DFARS Case 2019-D002," click "Open Docket," and view "Supporting Documents." V. Executive Orders 12866 and 13563 Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563

). If a rule has a significant economic impact on a substantial number of small entities, the Regulatory Flexibility Act requires agencies to analyze regulatory options that would lessen the economic effect of the final rule on small entities. FDA finds that this final rule may have a significant economic impact on a substantial number of small entities. We estimate that more than 75 percent of all businesses covered by this final rule are small or very small. The undiscounted

per-facility costs for small and very small businesses are reported in the following table. Costs for learning and records redesign are one-time costs incurred in the first 2 years following publication of the final rule. Additional records maintenance costs are incurred each year following publication of the final rule beginning in the second year for large and small firms, and in the third year for very small firms. Table 23. Estimated Per Facility Recordkeeping Costs 21 CFR Section Costs 1.337, 1.345, and 1.352 (learning) \$120.00 1.337, 1.345, and 1.352 (records redesign) \$411.00 1.337, 1.345, and 1.352 (additional records maintenance) \$219.00 Comments Summary Comments cover topics such as reasons why staggering compliance dates will not achieve regulatory flexibility objectives, suggestions of regulatory alternatives that would achieve regulatory flexibility objectives, appeals to consider the cumulative costs of all four bioterrorism regulations together when considering the impact on small businesses, appeals for exclusion of certain categories of small businesses, as well as other general topics. The different categories of comments are summarized in the following paragraphs. (Comment 214) One comment finds the definition of "small business" uncertain and asks whether it is based on either the number of employees at a (printed page 71647) firm or the number of employees at a facility. (Response) The U.S. Small Business Administration (SBA) establishes small business definitions (or size standards) by industry (Ref. 28). The most common SBA size standard applicable to manufacturers covered by this final rule is 500 employees. Other pertinent SBA size standards include 100 employees for wholesale distributors, \$21.5 million in receipts for transporters, and \$6 million or \$23 million in receipts for retailers, depending on the type of store. After discussions with the SBA, we define a small business in the food industry as having more than 10 and fewer than 500 full-time equivalent employees, and we define very small firms as having 10 or fewer full-time equivalent employees. Firm size, rather than facility size, is used in the cost estimates for regulatory flexibility purposes whenever the data permit. For purpose of the compliance dates, the firm size governs. For purpose of the retail exclusion, the number of employees at the facility applies.

Form 1: DPA Security Profile, begins on page 13. Consult with the system manager, users, programmers, maintenance and procurement personnel, and any other associated persons to become familiar with the DPA and its operations before filling out this form. 1. Unsound installation or maintenance procedures; 3. Inadequate maintenance and inventory controls;

(W) 52.239-YY Federal Information Systems Using Non-Cloud Computing Services (DATE) (E.O. 14028 and 15 U.S.C. 278g-3e). (X) 52.239-XX Federal Information Systems Using Cloud Computing Services (DATE) (E.O. 14028). * * * * * 21. Amend section 52.213-4 by: a. Revising the date of the clause; b. Adding paragraphs (a)(1)(xii) and (xiii); and c. Revising the date of paragraph (a)(2)(vii). The additions and revisions read as follows: 52.213-4 Terms and Conditions-Simplified Acquisitions (Other Than Commercial Products and Commercial Services). * * * * * Terms and Conditions-Simplified Acquisitions (Other Than Commercial Products and Commercial Services) (DATE) * * * * * (a) * * * (1) * * * (xii) 52.239-YY Federal Information Systems Using Non-Cloud Computing Services (DATE) (E.O. 14028 and 15 U.S.C. 278g-3e). (xiii) 52.239-XX Federal Information Systems Using Cloud Computing Services (DATE) (E.O. 14028). (2) * * * (vii) 52.244-6, Subcontracts for Commercial Products and Commercial Services (DATE). * * * * * 22. Adding new sections 52.239-XX and 52.239-YY to read as follows: 52.239-XX Federal Information Systems Using Cloud Computing Services. As prescribed in 39.X04(b) insert the following clause: Federal Information Systems Using Cloud Computing Services (DATE) (a) Definitions. As used in this clause: Cloud computing means a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction. Cloud computing is characterized by on-demand self-service, broad network access, resource pooling, rapid elasticity, and measured service; and includes service models such as software-as-a-service, infrastructure-as-a-service, and platform-as-a-service (NIST SP 800-145). Federal information system: (1) Means an information system (44 U.S.C. 3502(8)) used or operated by an agency, by a contractor of an agency, or by another organization, on behalf of an agency; (2) On behalf of an agency as used in this definition, means when a contractor uses or operates an information system or maintains or collects information for the purpose of processing, storing, or transmitting Government data, and those activities are not incidental to providing a service or product to the Government (32 CFR part 2002). Full access means, for all contractor information systems used in performance, or which support performance, of the contract: (1) Physical and electronic access to: (i) Contractor networks; (ii) Systems; (iii) Accounts with access to Government systems; (iv) Other infrastructure housed

on the same computer network; (printed page 68418) (v) Other infrastructure with a shared identity boundary or interconnection to the Government system; and (2) Provision of all requested Government data or Government-related data, including: (i) Images; (ii) Log files; (iii) Event information; and

From the NIST SP 800-172 Rev 3 Final Public Draft: PROTECTION STRATEGY PRA ADVERSARY EFFECTS Preclude (Preempt), Impede (Contain, Exert) NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 REFERENCES 487

Keywords: Security Metrics; Computer Security, Security Evaluation While some movement toward quantitative metrics for IT system security exists, in practice, qualitative measures that reflect reasoned estimates of security by an evaluator are the norm. That is, measures of information system security properties are often based on an evaluator's expertise, intuition, and insight to induce an ordering, which is then quantified (e.g., 1=low, 2=medium, 3=high). Because of the subjectivity involved, some of the attributes sought in a good metric are not readily obtainable. For example, results in penetration testing or other methods of assessment that involve specialized skills are sometimes not repeatable, since they rely on the knowledge, talent, and experience of an individual evaluator, which can differ from other evaluators with respect to a property being measured. Many major efforts to measure or assess security have been attempted. They include the Trusted Computer System Evaluation Criteria (TCSEC) [DOD85], Information Technology Security Evaluation Criteria (ITSEC) [CEC91], Systems Security Engineering Capability Maturity Model (SSE-CMM) [ISS08], and Common Criteria [CCP06]. Each attempt has obtained only limited success.

From the NIST SP 800-172 Rev 3 Final Public Draft: The result is that malware targeted at specific software can only compromise a subset of the targeted systems, and a sufficient number continue to operate to complete the mission or business function. Following analysis of a cyber incident, DC3/DCISE may provide information relevant to the potential or known compromise of DoD acquisition program information to the Office of the Secretary of Defense's Damage Assessment Management Office (OSD DAMO) for a cyber intrusion damage assessment. The Government may provide DIB participants with information regarding the damage assessment. (e) DIB participant attribution information. The Government acknowledges that information shared by the DIB participants under this program may include extremely sensitive proprietary, commercial, or operational information that is not customarily shared outside of the company, and that the unauthorized use or disclosure of such information could cause substantial competitive harm to the DIB participant that reported that information. The Government shall take reasonable steps to protect against the unauthorized use or release of such information (e.g., attribution information and other nonpublic information) received from a DIB participant or derived from such information provided by a DIB participant, including applicable procedures (see § 236.5(h)). The Government will restrict its internal use and disclosure of attribution information to only Government personnel and Government support contractors that are bound by appropriate confidentiality obligations and restrictions relating to the handling of this sensitive information and are engaged in lawfully authorized activities. (f) Non-attribution information. The Government may share non-attribution information that was provided by a DIB participant (or derived from information provided by a DIB participant) with other DIB participants in the DIB CS/IA program, and may share such information throughout the Government (including with Government support contractors that are bound by appropriate confidentiality obligations) for cyber security and information assurance purposes for the protection of Government information or information systems. (g) Electronic media. Electronic

media/files provided by DIB participants to DC3 under paragraphs (b), (c) and (d) of this section are maintained by the digital and multimedia forensics laboratory at DC3, which implements specialized handling procedures to maintain its accreditation as a digital and multimedia forensics laboratory. DC3 will maintain, control, and dispose of all electronic media/files provided by DIB participants to DC3 in accordance with established DoD policies and procedures. (h) Freedom of Information Act (FOIA). Agency records, which may include qualifying information received from non-federal entities, are subject to request under the Freedom of Information Act (5 U.S.C. 552) (FOIA), which is implemented in the Department of Defense by DoD Directive 5400.07 and DoD Regulation 5400.7-R (see 32 CFR Parts 285 and 286

IdAM is an important component of cloud computing security, and NIST publishes access control characteristics and general access control guidelines for various cloud service models. NIST also performs research and development regarding access control rules and methods. ## Access Control Policy Verification and Development Tools Traditional access control policy verification methods have capability and performance issues related to inaccuracy and complexity that is limited by applied technologies. For instance, model proof, test oracle, and data structure methods initially assume that the policy under verification is faultless unless the policy model cannot handle test cases. Thus, the challenge of the method is to compose test cases that can comprehensively discover all faults. Alternatively, a system simulation method requires translating the policy to a simulated system. The translation between systems may be difficult or impractical to implement if the policy logic is complicated or the number of policy rules is large. To answer these challenges, Machine Learning Method for Access Control Policy Verification (NISTIR 8360) proposes an efficient and straightforward method for access control policy verification by applying a classification algorithm of machine learning that does not require comprehensive test cases, oracle, or system translation but rather checks the logic of policy rules directly, making it more efficient and feasible compared to traditional methods.

(1) A record must exist and be in DoD possession and control at the time of the search to be subject to this part and the FOIA. The DoD Components are not obligated to create, compile, or obtain a record to satisfy a FOIA request. The DoD Components, however, may compile a new record when so doing would result in a more useful response to the requester or would be less burdensome to the agency than providing existing records. Any such compilation should be coordinated with and approved by the requester. The cost of creating or compiling such a record may not be charged to the requester unless the fee for creating the record is equal to or less than the fee that would be charged for providing the existing record. Fee assessments shall be in accordance with § 286.25.

(2) With regards to electronic data, the issue of whether records are actually created or merely extracted from an existing database is not always readily apparent. Consequently, when processing FOIA requests for electronic data where creation of a record, programming, or organizing in a particular format is questionable, if the Component has the capability to respond to the request, and the effort would be a business-as-usual approach then the request should be processed. (i) A business as usual approach exists when the Component has the capability to process the request without a significant expenditure of resources. If processing a request would cause a significant interference with the operation of the Component's automated information system, then it has a significant expenditure of resources. (ii) Creating computer programs and/or purchasing additional hardware to extract electronic mail that has been archived for the purpose of emergency retrieval normally are not viewed as business as usual. This is especially true if extensive resources are needed to complete the project. (iii) Creating a computer program that produces specific requested fields or records contained within a database normally is viewed as business as usual. The time to create this program shall be considered as computer operator [clarify] search time for fee assessment purposes and the requester may be assessed fees in accordance with § 286.25. (3) The DoD Components are not required to expend DoD funds to establish data links that provide real-time or near-real-time data to a FOIA requester. The Components are responsible to provide existing data downloaded to electronic media or printed in hard copy at the time the FOIA request is received or processed. If the information would serve the public interest or need, and is economically feasible, the Component may consider posting the information on the Internet. (g) Description of a requested record.

(a) For each requirement, except those exclusively for the acquisition of commercially available off-the-shelf items, the contracting officer shall obtain from the requiring activity an SF XXX that (1) Identifies what CUI is involved in the contract; (2) Specifies if and how the contractor

is to mark CUI involved in the contract (e.g., when the contractor is generating or developing the CUI, or when the purpose of the contract is to mark CUI); and (3) Conforms to 11.002(i).

(b)(1) If the contracting officer has a reason to question the information on the SF XXX, the contracting officer shall request that the requiring activity verify that the SF XXX is accurate.

(2) If the requiring activity has marked the 'Yes' box in Part A of SF XXX, the contracting officer shall incorporate the SF in the solicitation and contract and the clause at 52.204-XX, as prescribed at 4.403-7, to communicate requirements for safeguarding CUI during contract performance. (3) If the requiring activity has marked the 'No' box in Part A of SF XXX, the contracting officer shall include in the contract file a copy of the SF XXX and include in the solicitation and contract the clause at 52.204-YY, as prescribed at 4.403-7, to communicate requirements related to CUI should the contractor encounter suspected CUI during performance or the contract. (c) If the requiring activity states that there should be controlled access to the contents of the SF XXX or the SF XXX is marked as CUI itself, contracting officers shall follow agency procedures (printed page 4293) for safeguarding and disseminating the SF XXX. (d) If the contracting officer is notified or otherwise discovers that there is, or potentially could be CUI involved in the contract and it was not properly identified on an SF XXX, the contracting officer shall coordinate with the requiring activity to determine if the information is CUI. If the agency determines that the information is CUI, then the agency shall take the following steps: (1) If the agency wants the contractor to handle this kind of CUI during performance of the contract, the contracting officer shall: (i) Coordinate with the requiring activity to have the SF XXX updated; (ii) Modify the contract to incorporate the new SF XXX and, if CUI was not previously anticipated under the contract, to remove the clause at 52.204-YY and incorporate the clause at 52.204-XX; (iii) Consider any request for equitable adjustment submitted by the contractor, as appropriate; and (iv) Provide to the contractor marking instructions for the CUI. (2) If the agency does not want the contractor to handle this kind of CUI, the contracting officer shall coordinate with the requiring activity to address the CUI (e.g., retrieve the CUI) and shall convey such instructions to the contractor.

Specialized Assets) between the Level 2 and Level 3 assessments. As addressed in § 170.18, a condition to request a Level 3 certification assessment from DCMA DIBCAC is the receipt of a Final Level 2 (C3PAO) CMMC Status. The DoD considered, but declined, the recommendation to allow OSAs to simultaneously pursue Level 2 and Level 3 in one assessment. DoD must enforce CMMC requirements uniformly across the Defense Industrial Base for all contractors and subcontractors who process, store, or transmit CUI, regardless of an OSA's intended CMMC level. Permitting OSCs to seek combined CMMC Level 2 and 3 assessments would unfairly benefit only a subset of OSCs that were identified to meet CMMC Level 3 requirements. The rule has been updated to clarify that the OSC will be ineligible for additional contract awards that require a CMMC Level 3 certification assessment until such time as a valid (Conditional or Final) CMMC Level 3 (DIBCAC) CMMC Status is achieved for the information systems within the CMMC Assessment Scope. (printed page 83130) d. Scoring Methodology 1. CMMC Point Value System Comment: Multiple comments were received concerning the point values assigned to CMMC security requirements, their association to other frameworks, consistency between CMMC levels, and their use in POA&M eligibility determination. Numerous comments recommended that the CMMC Level 2 weighted point system where security requirements are valued as 1, 3, or 5 be modeled after the one point per requirement used in CMMC Level 3 scoring. Some also questioned why the CMMC Level 2 scoring structure was the same as the NIST SP 800-171 DoD Assessment Methodology (DODAM). Four comments recommended changes to the criteria for adding unimplemented security requirements to an Assessment POA&M. One comment noted that temporary deficiencies which are appropriately addressed in plans of action should be assessed as implemented. Some of the comments recommended not assigning point values to determine POA&M eligibility. Two other comments recommended dropping the NIST Basic and Derived security requirement designations and disassociating them from CMMC point values. Response:

(1) The appeal with all supporting materials both that furnished the individual and that contained in Component records is provided to the reviewing official; and (2) If the appeal is denied completely or in part, the individual is notified in writing by the reviewing official that: (i) The appeal has been denied and the specific reason and authority for the denial; (ii) The individual may file a statement of disagreement with the appropriate authority and the procedures for filing this statement; (iii) If filed properly, the statement of disagreement shall be included in the records, furnished to all future recipients of the records, and provided to all prior recipients of the disputed records who are known to hold the record; and (iv) The individual may seek a judicial review of the decision not to amend. (3) If the record is amended, ensure: (i) The requester is notified promptly of the decision; (ii) All prior known recipients of the records who are known to be retaining the record are notified of the decision and the specific nature of the amendment (see (l) of this Section); and (iii) The requester is notified which DoD Components and Federal agencies have been told of the amendment. (4) Process all appeals within 30 days unless the appeal authority determines that a fair review cannot be made within this time limit. If additional time is required for the appeal, notify the requester, in writing, of the delay, the reason for the delay, and when he or she may expect a final decision on the (printed page 18770) appeal. Document fully all requirements for additional time in the Privacy Case File. (See paragraph (p) of this section.) (l) Denying amendment of OPM records held by the DoD Components. (1) The records in all systems of records controlled by the OPM Government-wide system notices are technically only temporarily in the custody of the Department of Defense. (2) All requests for amendment of these records must be processed in accordance with 5 CFR part 297 . The Component denial authority may deny a request. However, when an amendment request is denied, the DoD Component shall advise the individual that his or her appeal must be directed to the Assistant Director for Workforce Information, Personnel Systems and Oversight Group, U.S. Office of Personnel Management, 1900 E Street, Washington, DC 20415 in accordance with the procedures of 5 CFR 297 . (m) Statements of disagreement submitted by individuals. (1) If the appellate authority refuses to amend the record as requested, the individual may submit a concise statement of disagreement setting forth his or her reasons for disagreeing with the decision not to amend. (2) If an individual chooses to file a statement of disagreement, annotate the record to indicate that the statement has been filed (see paragraph (n) of this section).

Training that provides information as to the application of specific provisions of this part to specialized areas of job performance. Personnel of particular concern include, but are not limited to, personnel specialists, finance officers, DOD personnel who may be expected to deal with the news media or the public, special investigators, paperwork managers, individuals working with medical and security records, records managers, computer systems development personnel, computer systems

operations personnel, statisticians dealing with personal data and program evaluations, contractors and anyone responsible for implementing or carrying out functions under this part. Specialized training should be provided on a periodic basis; and (iii) Managerial training. Training designed to identify for responsible managers (such as senior system managers, Denial Authorities, and functional managers described in this section) issues that they should consider when making management decisions affected by the Privacy Act Program. (b) Training tools. Helpful resources include-

- (1) Privacy Act training slides for Major Commands and Privacy Act Officers: Contact the DA FOIA/P Office, or slides can be accessed at the Web site <https://www.rmda.belvoir.army.mil/rmdaxml/rmda/FPHomePage.asp>.
- (2) The DOJ Freedom of Information Act Guide and Privacy Act Overview: The U.S. Department of Justice, Executive Office for United States Attorneys, Office of Legal Education, 600 E. Street, NW., Room 7600, Washington, DC 20530, or training programs can be accessed at the Web site www.usdoj.gov/usa/ea/ole.html.

§ 505.9 Reporting requirements. The Department of the Army will submit reports, consistent with the requirements of DOD 5400.11-R, OMB Circular A-130, and as otherwise directed by the Defense Privacy Office. Contact the DA FOIA/P Office for further guidance regarding reporting requirements.

§ 505.10 Use and establishment of exemptions. (a) Three types of exemptions. (1) There are three types of exemptions applicable to an individual's right to access permitted by the Privacy Act. They are the Special, General, and Specific exemptions. (2) Special exemption (d)(5)-Relieves systems of records from the access provision of the Privacy Act only. This exemption applies to information compiled in reasonable anticipation of a civil action or proceeding. (3) General exemption (j)(2)-Relieves systems of records from most requirements of the Act. Only Army activities actually engaged in the enforcement of criminal laws as their primary function may claim this exemption. (4) Specific exemptions (k)(1)-(k)(7)-Relieves systems of records from only a few provisions of the Act.

[WHAnnouncement] White House (2023) BidenHarris Administration Announces Cybersecurity Labeling Program for Smart Devices to Protect American Consumers. One comment asks what action FDA can take against foreign companies that do not establish and maintain the records required under section 306 of the Bioterrorism Act. A few comments state that the fact that section 306 of the Bioterrorism Act does not provide any mechanisms for enforcement of the recordkeeping and records access requirements against foreign persons supports the position that Congress did not intend that section to apply to foreign entities. (Response) Because FDA has decided, for policy reasons, to exempt foreign facilities that do not manufacture, process, pack, distribute, hold, or import food in the United States from the requirements of the rule, FDA does not need to decide this jurisdictional issue. FDA is exempting all foreign persons (except for foreign persons who transport food in the United States) from the final regulation because FDA does not believe such records would be needed. Much of this information is available to the Secretary from facilities required to provide prior notice under part 1, subpart I. FDA intends to work with the competent authorities in foreign countries to access records during public health emergencies to obtain additional information, if necessary. However, the final rule explicitly provides that

persons who transport food in the United States are subject to subpart J of this final rule. (Comment 26) One comment questions FDA's determination that it can perform its Bioterrorism Act (printed page 71573) mission of tracking shipments by exempting Mexican and Canadian motor carriers from the recordkeeping requirements while requiring U.S. motor carriers to comply with the recordkeeping requirements. The comment notes that, based on CBP figures for Mexico-domiciled carriers, referenced in the 'Economic Impact Estimates' section of the proposed rule, 63,000 out of 80,000 carriers operating across the southern border are Mexico-domiciled. The comment points out that, therefore, the majority of cross-border FDA-regulated shipments at the southern border may be exempt from the requirements of the regulation. (Response) FDA agrees. The final rule provides that foreign persons who transport food in the United States are subject to this final rule. A 'transporter' is now defined as: * * * a person who has possession, custody, or control of an article of food in the United States for the sole purpose of transporting the food, whether by road, trail, water, or air. Transporter also includes a foreign person that transports food in the United States, regardless of whether the foreign person has possession, custody, or control of that food for the sole purpose of transporting that food.* * * Thus, even if a foreign manufacturing facility transports its own manufactured food into the United States, it is considered a 'transporter' under subpart J of this final rule and must comply with the requirements applicable to transporters.

As discussed above in greater detail, physical safeguards encompass the physical measures, and related policies and procedures, to protect relevant electronic information systems and related buildings and equipment from natural and environmental hazards, and unauthorized intrusion. [633] The standard for facility access controls applies to protect the physical premises, while the standards for workstation use, workstation security, and device and media controls are aimed at protecting the electronic information systems and electronic media that create, receive, maintain, or transmit ePHI or that otherwise affect its confidentiality, integrity, and availability. The standard for facility access controls at 45 CFR 164.310(a)(1) requires a regulated entity to implement policies and procedures that limit physical access to electronic information systems and facilities that contain those systems. Section 164.310(a)(1) also requires a regulated entity to ensure its policies and procedures allow persons who are properly authorized to access its facilities. Under 45 CFR 164.310(a)(2) , a regulated entity must implement the standard for facility access controls in accordance with four implementation specifications. The implementation specification for contingency operations addresses the establishment (and implementation as needed) of procedures that allow for facility access in support of the restoration of lost data under a disaster recovery plan and emergency mode operations. [634] Section 164.310(a)(2)(ii) contains the specification for a facility security plan and addresses the implementation of policies and procedures to safeguard facilities and equipment in such facilities from unauthorized physical access, tampering, and theft. The implementation of procedures for role-based access control, including for visitors and for access to software programs for testing and revision is addressed in 45 CFR 164.310(a)(2)(iii) , while 45 CFR 164.310(a)(2)(iv) addresses the implementation of policies and procedures for the documentation of repairs and modifications to physical security components of a facility, such as hardware, walls, doors, and locks. Section 164.310(b) requires a regulated entity to implement policies and procedures specifying proper workstation functions, the manner in which those functions are to be performed, and the physical attributes of the environment for where specific workstations or classes of workstation used for accessing ePHI. [635] This standard is not accompanied by standalone implementation specifications, compared to the standards for facility access controls at 45 CFR 164.310(a) and device and media controls at 45 CFR 164.310(d)

AC.L2-3.1.6 · Non-Privileged Account Use CMMC Assessment Guide · Level 2 | Version 2.13 28
 system. System administrators and users with privileged accounts must be trained not to use their privileged accounts for everyday tasks, such as browsing the internet or connecting unnecessarily to other systems or services. Example You are logged in using your privileged account and you need to look up how to reset a non- functioning application which processes CUI . You should log on to another computer with your non-privileged account before you connect to the web and start searching for the reset information [b]. That way, if your account is compromised during the search, it will be your regular user account rather than an account with elevated privileges. Potential Assessment Considerations · Are nonsecurity functions and non-privileged roles defined [a,b]? · Is it required that nonsecurity functions only be accessed with the use of non- privileged accounts? How is this verified [b]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.1.6

means an entity's senior management official (SMO), facility security officer (FSO), insider threat program senior official (ITPSO), and all other entity officials who either hold majority interest or stock in, or have (printed page 83317) direct or indirect authority to influence or decide issues affecting the management or operations of, the entity or classified contract performance. L access authorization means an access determination that is granted by DOE or NRC based on a Tier 3 or successor background investigation as set forth in applicable national-level requirements and DOE directives. Within DOE and NRC, an L access authorization permits an individual who has an official need to know to access Confidential Restricted Data, Secret and Confidential Formerly Restricted Data, Secret and Confidential Transclassified Foreign Nuclear Information, or Secret and Confidential National Security Information, required in the performance of official duties. An L access authorization determination is required for individuals with a need to know outside of DOE, NRC, DoD, and in limited cases NASA, to access Confidential Restricted Data. LAA means security access authorization to CONFIDENTIAL or SECRET information granted to non-U.S. citizens requiring only limited access in the course of their regular duties. Material means any product or substance on or in which information is embodied. Matter means anything in physical form that contains or reveals classified information. Media means physical devices or writing surfaces including but not limited to, magnetic tapes, optical disks, magnetic disks, large-scale integration memory chips, and printouts (but not including display media) onto which information is recorded, stored, or printed within an information system. MFO means a legal entity (single proprietorship, partnership, association, trust, or corporation) composed of two or more entities (facilities). National of the United States means a person who owes permanent allegiance to the United States. All U.S. citizens are U.S. nationals; however, not all U.S. nationals are U.S. citizens (for example, persons born in American Samoa or Swains Island). NATO information means information bearing NATO markings, indicating the information is the property of NATO, access to which is limited to representatives of NATO and its member nations unless NATO authority has been obtained to release outside of NATO. NATO visits means visits by personnel representing a NATO entity and relating to NATO contracts and programs. Need-to-know means a determination made by an authorized holder of classified information that a prospective recipient has a requirement for access to, knowledge of, or possession of the classified information to perform tasks or services essential to the fulfillment of a classified contract or program. Network means a system of two or more information systems that can exchange data or information. NNPI

From the NIST SP 800-172 Rev 3 Final Public Draft: The type of security requirement is noted in the discussion section of each requirement. NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 Appropriately scoping security requirements is an important factor in determining protection-234

, records concerning matters that another statute specifically exempts from disclosure are exempt under this exemption. This exemption allows for the withholding of information because its release is prohibited by another statute only if one of two disjunctive requirements is met: The statute requires that the information be withheld from the public in such a manner as to leave no discretion on the issue, or the statute establishes particular criteria for withholding or refers to particular types of matters to be withheld. The DFOIPO maintains on its Web site a list of Exemption 3 statutes used within the Department of Defense. (d) Exemption 4. Pursuant to 5 U.S.C. 552(b)(4) , records containing trade secrets or commercial or financial information received by the DoD Component from a person or organization outside the Government are exempt from release. Information protected by this exemption must be trade secrets or commercial or financial records, the disclosure of which is likely to cause substantial harm to the competitive position of the submitter providing the information; impair the Government's ability to obtain necessary information in the future; or impair some other legitimate Government interest. If the information qualifies as Exemption 4 information, there is no discretion in its release. (1) Examples of information protected by Exemption 4 include: (i) Commercial or financial information received in confidence in connection with loans, bids, contracts, or proposals. (ii) Statistical data and commercial or financial information concerning contract performance, income, profits, losses, and expenditures. (iii) Personal statements given in the course of inspections, investigations, or audits. (iv) Financial data provided by private employers in connection with locality wage surveys that are used to fix and adjust pay schedules applicable to the prevailing wage rate of employees within the Department of Defense. (v) Scientific and manufacturing processes or developments concerning technical or scientific data or other information submitted with an application for a research grant, or with a report while research is in progress. (vi) Technical or scientific data developed by a contractor

or subcontractor exclusively at private expense, or developed in part with Federal funds and in part at private expense. The contractor or subcontractor must retain legitimate proprietary interests in such data in accordance with 10 U.S.C. 2320-2321 and DoD Federal Acquisition Regulation Supplement, Chapter 2 of title 48 Code of Federal Regulations, Subpart 227.71-227.72. Technical data developed exclusively with Federal funds may be withheld under Exemption 3, if it meets the criteria of 10 U.S.C. 130 and 48 CFR. See § 286.14. (vii) Copyrighted information under 17 U.S.C. 106.

(ii) Efforts by any individual, regardless of nationality, to elicit information from an employee determined eligible for access to classified information, and any contact which suggests the employee may be the target of an attempted exploitation by an intelligence service of another country. See SEAD 3 for specific information to be reported. (3) Change in status of employees determined eligible for access to classified information. Contractors will report by means of the CSA-designated reporting mechanism information pertaining to changes in status of employees determined eligible for access to classified information such as: (i) Death. (ii) Change in name. (iii) Termination of employment. (iv) Change in citizenship. (4) Citizenship by naturalization. Contractors will report if a non-U.S. citizen employee granted an LAA becomes a citizen through naturalization. The report will include: (i) City, county, and state where naturalized. (ii) Date naturalized. (iii) Court. (iv) Certificate number. (5) Employees desiring not to be processed for a national security eligibility determination or not to perform classified work. Contractors will report instances when an employee no longer wishes to be processed for a determination of eligibility for access to classified information or to continue having access to classified information, and the reason for that request. (6) Classified information nondisclosure agreement (NDA). Contractors will report the refusal by an employee to sign the SF 312, Classified Information Nondisclosure Agreement, (available at: <https://www.gsa.gov/cdnstatic/SF312-13.pdf?forceDownload=1>) or other approved NDA. (7) Changed conditions affecting the contractor's eligibility for access to classified information. Contractors are required to report certain events that affect the status of the entity eligibility determination (e.g., FCL), affect the status of an employee's PCL, may indicate an employee poses an insider threat, affect the proper safeguarding of classified information, or indicate classified information has been lost or compromised, including: (i) Change of ownership or control of the contractor, including stock transfers that affect control of the entity. (ii) Change of operating name or address of the entity or any of its locations determined eligible for access to classified information. (iii) Any change to the information previously submitted for KMP including, as appropriate, the names of the individuals the contractor is replacing. A new complete KMP listing need be submitted only at the discretion of the contractor or when requested by the CSA. The contractor will provide a statement indicating: (A) Whether the new KMP are cleared for access to classified information, and if cleared, to what level they are cleared and when they were cleared, their dates and places of birth, social security numbers, and citizenship. (B) Whether they have been excluded from access to classified information in accordance with § 117.7(b)(5)(ii).

Internal system clocks are used to generate time stamps, which include date and time. Time is expressed in Coordinated Universal Time (UTC), a modern continuation of Greenwich Mean Time (GMT), or local time with an offset from UTC. The granularity of time measurements refers to the degree of synchronization between system clocks and reference clocks, for example, clocks synchronizing within hundreds of milliseconds or within tens of milliseconds. Organizations may define different time granularities for different system components. Time service can also be critical to other security capabilities such as access control and identification and authentication, depending on the nature of the mechanisms 74 NIST SP 800-171A, pp. 23-24. 75 NIST SP 800-171 Rev. 2, p. 19.

(Response) FDA does not agree that much of the information required under this recordkeeping rule is already required under the registration interim final rule. Information required under the registration interim final rule pertains to the facility itself, including information about the general food product categories that the facility manufactures/processes, packs, or holds. Information that this final rule mandates be established and maintained in records is information pertaining to food that will assist FDA in identifying the immediate previous sources and the immediate subsequent recipients of all food that is received and released by a person. In addition, to complete the tracing investigation, the identity of the transporters who transported the food to and from the sources and recipients is required, which is not covered by the facility registration. Moreover, the scope of section 305 of the Bioterrorism Act (registration) is not as broad as section

306 of the Bioterrorism Act (establishment and maintenance of records). Specifically, registration applies only to facilities that manufacture, process, pack, or hold food for consumption for humans or animals in the United States. Recordkeeping applies to these facilities, as well as those who transport, distribute, receive, or import food. Recordkeeping also applies to all food regardless of whether it will be consumed in the United States or exported. However, FDA has deleted the requirement that persons subject to subpart J of this final rule identify a responsible individual in the records. Instead, for those facilities required to register under part 1, subpart H, FDA will use the emergency contact telephone number provided by those facilities. For other facilities, FDA does not believe requiring such facilities to provide an emergency contact telephone number is needed to assist the Secretary to identify the immediate previous sources and immediate subsequent recipients of food, since that telephone number would be contained in the very records FDA would be seeking assistance in locating. (Comment 89) One comment states that it is unreasonable to require nontransporters to have a record of the intermediate transporters, i.e., transporters who do not have direct contact with the nontransporters. (Response) Neither the proposed rule nor the final rule requires nontransporters to establish and maintain records identifying intermediate transporters. With respect to transportation records, § 1.337(a)(6) of this final rule only requires nontransporters to establish and maintain records of the transporter that brought the food to them. Similarly, § 1.345(a)(6) of this final rule only requires nontransporters to establish and maintain records of the transporter that took the food from them. The transporters are required to keep records that identify intermediate transporters.

Disclosure from a system of records maintained by a Component may be made to a congressional office from the record of an individual in response to an inquiry from the congressional office made at the request of that individual. E. Routine Use-Private Relief Legislation Relevant information contained in all systems of records of the Department of Defense published on or before August 22, 1975, may be disclosed to the Office of Management and Budget in connection with the review of private relief legislation as set forth in OMB Circular A-19 at any stage of the legislative coordination and clearance process as set forth in that circular. F. Routine Use-Disclosures Required By International Agreements A record from a system of records maintained by a Component may be disclosed to foreign law enforcement, security, investigatory, or administrative authorities to comply with requirements imposed by, or to claim rights conferred in, international agreements and arrangements, including those regulating the stationing and status in foreign countries of Department of Defense military and civilian personnel. G. Routine Use-Disclosure to State and Local Taxing Authorities Any information normally contained in Internal Revenue Service (IRS) Form W-2 which is maintained in a record from a system of records maintained by a Component may be disclosed to State and local taxing authorities with which the Secretary of the Treasury has entered into agreements under 5 U.S.C., sections 5516, 5517, 5520, and only to those State and local taxing authorities for which an employee or military member is or was subject to tax regardless of whether tax is or was withheld. This routine use is in accordance with Treasury Fiscal Requirements Manual Bulletin No. 76-07. H. Routine Use-Disclosure to the Office of Personnel Management A record from a system of records subject to the Privacy Act and maintained by a Component may be disclosed to the Office of Personnel Management (OPM) concerning information on pay and leave, benefits, retirement reductions, and any other information necessary for the OPM to carry out its legally authorized government-wide personnel management functions and studies. I. Routine Use-Disclosure to the Department of Justice for Litigation A record from a system of records maintained by a Component may be disclosed as a routine use to any component of the Department of Justice for the purpose of representing the Department of Defense, or any officer, employee or member of the Department in pending or potential litigation to which the record is pertinent. J. Routine Use-Disclosure to Military Banking Facilities

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Department of the Army [Docket No. USA-2006-0011] 32 CFR Part 505 RIN 0702-AA53 AGENCY: Department of the Army, DoD. ACTION: Final rule. SUMMARY: The Department of the Army is updating policies and responsibilities for the Army Privacy Program, which implements the Privacy Act of 1974, by showing organizational realignments and by revising referenced statutory and regulatory authority, such as the Health Insurance Portability and

Accountability Act and E-Government Act of 2002. This rule finalizes the proposed rule that was published in the Federal Register on April 25, 2006. DATES: Effective Date: September 11, 2006. ADDRESSES: U.S. Army Records Management and Declassification Agency, Freedom of Information and Privacy Office, 7701 Telegraph Road, Casey Bldg., Suite 144, Alexandria, VA 22315-3905. FOR FURTHER INFORMATION CONTACT: Ms. Janice Thornton at (703) 428-6503. SUPPLEMENTARY INFORMATION: A. Background In the April 25, 2006, issue of the Federal Register (71 FR 24494), the Department of the Army issued a proposed rule to revise 32 CFR part 505 . It incorporates Privacy Act policy objectives to include (1) restricting disclosure of personally identifiable records maintained; (2) to grant individuals rights of access to agency records maintained on themselves; (3) to grant individuals the right to seek amendment of agency records maintained on themselves upon a showing that the records are not accurate, relevant, timely, or complete; and (4) to establish practices ensuring the Army is complying with statutory norms for collection, maintenance, and dissemination of records. The Department of the Army received two comments from one commenter. No substantive changes were requested or made; however, the proposed changes were accepted and made to the final rule. The commenter expressed concern on §-505-2(e) titled ·Nomination of individuals when personal information * * *. It was changed to read ·Notification of individuals when personal information * * *. The other concern was in §-505.2(a)(2), suggestion was made to clarify the section by incorporating the DoD 6025.18-R, Privacy of Individually Identifiable Health Information in DoD Health Care Programs, language. The proposed §-505.2 (a)(3) through §-505.2(a)(13) was redesignated as §-505.2(a) (4) through §-505.2(a)(14) and a new §-505.2(a)(3) was added. B. Executive Order 12866 (Regulatory Planning and Review)

(ii) During working hours when an open storage area is unattended, admittance to the area must be controlled by locked entrances and exits secured by GSA-approved pedestrian door locking hardware (FF-L-2890C), ·Federal Specification Lock Extension,· or CSA approved deadbolts or emergency exit hardware on any secondary doors. * * * * * (c) Storage. Contractors will store classified information and material in General Services Administration (GSA)-approved security containers, vaults built to Federal Standard 832, or an open storage area constructed in accordance with 32 CFR 2001.53 . The CSA may grant self-approval to the FSO for open storage area approvals, provided the FSO meets specified qualification criteria as determined by the CSA. In the instance that an open storage area has a false ceiling or raised floor, contractors shall develop and implement procedures to ensure their structural integrity in accordance with CSA provided guidance. Nothing in 32 CFR part 2001 , should be construed to contradict or inhibit compliance with local laws or building codes, but the contractor will notify the applicable CSA if there are any conflicting issues that would inhibit compliance. Contractors will store classified material in accordance with the specific sections of 32 CFR 2001.43 : * * * * * (d) * * * (3) * * * (i) * * * (A) If after a thorough inspection of the facility perimeter with no damage to the facility visible, the alarm system resets and remains in the secure condition, then entrance into the area is not required and an initial response team may consist of uncleared personnel. * * * * * (e) * * * (1) * * *

(ii) An information management system to protect and control the classified information in their possession regardless of media, to include information processed and stored on information systems with an authorization to operate by an applicable CSA, otherwise referred to as an authorized information system. (2) Top secret information. Unless otherwise directed by the applicable CSA, the contractor will establish the following additional controls: * * * * * (viii) When TOP SECRET information and material is generated or stored on authorized information systems, contractors will establish controls for TOP SECRET information and material to validate procedures are in place to address accountability, need to know, and retention, e.g., demonstrating that TOP SECRET material stored in an electronic format on an authorized information system does not need to be individually numbered in series. These controls are in addition to the information management system and must be applied, unless otherwise directed by the applicable CSA, regardless of the media of the TOP SECRET information, to include information processed and stored on authorized information systems. * * * * * (6) Reproduction of classified information.

, which permits DoD to disclose information to a litigation support contractor if the disclosure is for the sole purpose of providing administrative, technical, or professional services to DoD in anticipation of or during litigation. The statute also requires that, under a contract, the contractor agree to and acknowledge specific terms and conditions on the use and disclosure of the information, and that any violation of these terms and conditions is a basis for termination of the litigation support contract. DFARS clause 252.204-7014 is included in all solicitations and

contracts that involve litigation support services. The clause contains all of the information in DFARS provision 252.204-7013, as well as a statement that violation of the terms and conditions of the clause is a basis for termination of the contract. As such, the DFARS provision is redundant and can be removed from the DFARS. The repeal of the DFARS provision implements a recommendation from the DoD Regulatory Reform Task Force. On February 24, 2017, the President signed Executive Order (E.O.) 13777, 'Enforcing the Regulatory Reform Agenda,' which established a Federal policy 'to alleviate unnecessary regulatory burdens' on the American people. In accordance with E.O. 13777, DoD established a Regulatory Reform Task Force to review and validate DoD regulations, including the DFARS. A public notice of the establishment of the DFARS Subgroup to the DoD Regulatory Reform Task Force, for the purpose of reviewing DFARS provisions and clauses, was published in the Federal Register at 82 FR 35741 on August 1, 2017, and requested public input. No public comments were received on the provision. Subsequently, the DoD Task Force reviewed the requirements of DFARS provision 252.204-7013 and determined that it could be repealed.

III. Applicability to Contracts at or Below the Simplified Acquisition Threshold and for Commercial Items, Including Commercially Available Off-the-Shelf Items This rule only removes obsolete DFARS provision 252.204-7013, Limitations on the Use or Disclosure of Information by Litigation Support Contractors. This rule does not create any new provisions or clauses or impose any new requirements on contracts at or below the simplified acquisition threshold and for commercial items, including commercially available off-the-shelf items.

IV. Publication of This Final Rule for Public Comment Is Not Required by Statute The statute that applies to the publication of the Federal Acquisition Regulation (FAR) is Office of Federal Procurement Policy statute (codified at title 41 of the United States Code). Specifically, 41 U.S.C. 1707(a)(1)

a physical item such as hardware, firmware, computing platform, network device, or other technology component) or intangible (e.g., humans, data, information, software, capability, function, service, trademark, copyright, patent, intellectual property, image, or reputation). The value of an asset is determined by stakeholders in consideration of loss concerns across the entire system life cycle. Such concerns include but are not limited to business or mission concerns, as defined in NIST SP 800-160 V2R1 (incorporated by reference, see §.170.2). Asset Categories means a grouping of assets that process, store or transmit information of similar designation, or provide security protection to those assets. (CMMC-custom term) Authentication is defined in FIPS PUB 200 Mar2006 (incorporated by reference, see §.170.2). Authorized means an interim status during which a CMMC Ecosystem member (person or organization), having met all criteria for the specific role they perform other than the required ISO/IEC accreditations, may act in that role for a specified time as set forth in §.170.8 for the Accreditation Body and §.170.9 for C3PAOs. (CMMC-custom term) Capability means a combination of mutually reinforcing controls implemented by technical means, physical means, and procedural means. Such controls are typically selected to achieve a common information security or privacy purpose, as defined in NIST SP 800-37 R2 (incorporated by reference, see §.170.2). Cloud Service Provider (CSP) means an external company that provides cloud services based on cloud computing. Cloud computing is a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction. This definition is based on the definition for cloud (printed page 83218) computing in NIST SP 800-145 Sept2011. (CMMC-custom term) CMMC Assessment and Certification Ecosystem means the people and organizations described in subpart C of this part. This term is sometimes shortened to CMMC Ecosystem. (CMMC-custom term) CMMC Assessment Scope means the set of all assets in the OSA's environment that will be assessed against CMMC security requirements. (CMMC-custom term) CMMC Assessor and Instructor Certification Organization (CAICO) is defined in §.170.10 and means the organization responsible for training, testing, authorizing, certifying, and recertifying CMMC certified assessors, certified instructors, and certified professionals. (CMMC-custom term) CMMC Instantiation of eMASS means a CMMC instance of the Enterprise Mission Assurance Support Service (eMASS), a government owned and operated system. (CMMC-custom term) CMMC Security Requirements means the 15 Level 1 requirements listed in the 48 CFR 52.204-21(b)(1)

3.4.3 | Risk ... 3.4.3 Risk The risk to an organization is the intersection of: - · the vulnerabilities and threats to the organization - · the likelihood that the vulnerability and threat event will be realized - · the impact to the organization should the event be realized A meaningful risk assessment must be performed in the context of the cyber-ecosystem and the impact to an organization should a loss or degradation occur.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by Federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, Federal agencies may wish to closely follow the development of these new publications by NIST. The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in Federal information systems. - · Current research in Cyber Physical Systems is focused on Supervisory Control and Data Acquisition (SCADA) systems, but Additive Manufacturing is different. - · Researchers were able to intercept a job initialization file and decode it, allowing attackers to potentially alter printer parameters mid-print. The STL (or newer AMF) standard files are especially vulnerable to attacks which alter a design. - · The presenters described an experiment run on students at Virginia Tech. Seven groups of students were given an 'extra credit' assignment to design a standard dog bone, print it, and test it.

Some comments addressed the DoD's internal policies and training efforts to prepare the Government workforce for CMMC program implementation. For example, some commenters opined that the rule's focus on contactor responsibilities misses the true risk that lies further up obscure supply chains. Another commenter recommended DoD work with contractors in each sector to provide clear guidance on the types of data that the Department would consider CTI. One commenter requested DoD acknowledge that human factors influence DIB cybersecurity while another stated DoD should provide uniform web-based training at no cost to ensure applicable training requirements are satisfactorily met. Another asked whether DoD PMs would receive CMMC related training prior to implementation. Another comment asked whether specific risk mitigating approaches, such as product monitoring or software testing might suffice to manage supply chain risk considering lack of visibility into the origins of 3rd and 4th tier components. One commenter perceived the CMMC requirement for Program Managers to identify the level of assessment requirement appropriate for a solicitation as removing the contract award decision from the USD(A&S). One commenter stated more information about procedures for implementing CMMC into government-wide contracts is needed. Another commenter expressed a need to use a basic contract that is unclassified, and any CUI would be contained in a separate appendix to allow sub-contractors to plan with their Prime to access the information on the Prime's network and avoid requirements for their own CMMC certification. Another comment recommended revisions to describe that medium assurance certificates for incident reporting are a DFARS clause 252.204-7012 requirement, independent of CMMC program requirements. Two commenters criticized the DFARS clause 252.204-7020 requirement to allow 'full access' to contractor facilities, systems, and personnel for the purposes of DIBCAC assessment, or for damage assessment following incident, and recommended that the CMMC program not include or rely on this authority. Another commenter recommended that, prior to issuing a final rule on CMMC, DoD work with other relevant agencies to integrate and harmonize the numerous regulatory changes that impact contractors' capacity to safeguard data and systems. One commenter suggested rule publication be delayed until DoD articulates the benefit expected from contractor compliance with the rule. Response: All recommendations to revise other Government-wide or DoD policies and programs are beyond the scope of the CMMC rule.

, at least one court has stated that compliance obligations are limited to the plain words of regulatory text and that a requirement to 'implement' does not mean that a requirement must be in place throughout the regulated entity's enterprise. [639] Additionally, the standards for facility access controls, workstation use, and device and media controls all require a regulated entity to implement policies and procedures, while the standard for workstation security requires regulated entities to implement physical safeguards. The differences in regulatory text among these provisions could be interpreted to mean that a regulated entity's obligations differ depending on whether a provision requires it to implement only policies and procedures or whether the provision requires the implementation of something more. This may confuse regulated entities and lead some to believe that less comprehensive protection is needed for ePHI subject only to policies and

procedures. The Department believes that the current Security Rule provides a clear path for regulated entities to protect the confidentiality, integrity, and availability of ePHI. However, as discussed above, we also believe recent caselaw has created confusion about the steps regulated entities must take to adequately protect the confidentiality, integrity, and availability of ePHI, as required by the statute. Further, the conditions highlighted by caselaw may also cause regulated entities to misinterpret the regulatory text that connects the current maintenance requirement at 45 CFR 164.306(e), the documentation requirement at 45 CFR 164.316, and the requirement to implement physical safeguards. For example, regulated entities may be confused about how 45 CFR 164.316 requires a regulated entity to document the policies and procedures for specific physical safeguard in 45 CFR 164.310 (or across any other safeguard). In this case, the regulated entity also might not apply the implementation specifications to retain, make available, and review documentation of how it has operationalized the physical safeguard. Failing to connect these provisions would lead to inadequate protection of ePHI and/or an inability to demonstrate compliance with the Security Rule. Our experience enforcing the Security Rule provides examples of the types of breaches that can occur because of absent or insufficient physical safeguards: An investigation of a large health system indicated potential failures to implement policies and procedures and facility access controls to limit physical access to the electronic information systems housed within a large data support center. While the health system did have video surveillance, the investigation found indications that laptops were stored in an interior room that was unlocked and the facility did not have an alarm system. [640]

(B) From subsections (c)(4), (d), and (f) because providing access to this information could result in the concealment, destruction or fabrication of evidence and jeopardize the safety and well being of informants, witnesses and their families, and law enforcement personnel and their families. Disclosure of this information could also reveal and render ineffectual investigative techniques, sources, and methods used by this component and could result in the invasion of privacy of individuals only incidentally related to an investigation. Investigatory material is exempt to the extent that the disclosure of such material would reveal the identity of a source who furnished the information to the Government under an express promise that the identity of the source would be held in confidence, or prior to September 27, 1975 under an implied promise that the identity of the source would be held in confidence. This exemption will protect the identities of certain sources that would be otherwise unwilling to provide information to the Government. The exemption of the individual's right of access to his/her records and the reasons therefore necessitate the exemptions of this system of records from the requirements of the other cited provisions. (C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsection (e)(2) because collecting information to the fullest extent possible directly from the subject individual may or may not be practical in a criminal investigation. (printed page 14773) (E) From subsection (e)(3) because supplying an individual with a form containing a Privacy Act Statement would tend to inhibit cooperation by many individuals involved in a criminal investigation. The effect would be somewhat adverse to established investigative methods and techniques. (F) From subsections (e)(4)(G), (H), and (I) because it will provide protection against notification of investigatory material which might alert a subject to the fact that an investigation of that individual is taking place, and the disclosure of which would weaken the on-going investigation, reveal investigatory techniques, and place confidential informants in jeopardy who furnished information under an express promise that the sources' identity would be held in confidence (or prior to the effective date of the Act, under an implied promise). In addition, this system of records is exempt from the access provisions of subsection (d).

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft)
Enhanced Security Requirements for Protecting CUI September 2025 2. The Fundamentals 267 This section describes the assumptions and methodology used to develop the enhanced security requirements for nonfederal systems and organizations to protect the confidentiality, integrity, and availability of CUI associated with critical systems or high value assets. 2.1. Enhanced Security Requirement Assumptions The enhanced security requirements in this publication are based on the following assumptions:

- Federal information that is designated as CUI has the same value whether such information resides in a federal or nonfederal system or organization.
- Statutory and regulatory requirements for the protection of CUI are consistent in federal a

assurance requirement Beta-testing is a primary assurance method for commercial vendors. - All of the assurance requirements apply to the TCB and not to the entire product This restriction is too strong. Some requirements, for example configuration management should include the entire product - Operational assurance needs to be decoupled from the functionality requirements and treated separately from functionality and development assurance (much like the ITSEC's effectiveness requirements). - We expected the PC would be able to handle conceptually complex systems. - The PC suggests that the existence of a defined TCB is a mandatory requirement for any product to be evaluated. The ITSEC view is that while a defined TCB is a valid method, it is not the only method for achieving assurance. - The chief concern is that the basis in science on which the TCSEC is based (i.e., the reference monitor concept) is clearly not the basis upon which the PC is founded. Certain aspects of some security policies (e.g., confidentiality and integrity) can be implemented with high-assurance using the reference monitor concept Others cannot (e.g., availability). The PC should embrace the reference monitor concept for high-assurance while recognizing the utility and limitations of low-assurance mechanisms. - The PC lacks a single, consistent assurance paradigm, and in some respects destroys the TCSEC's operational assurance requirements.

) before an interim or final rule takes effect, DoD will submit a copy of the interim or final rule with the form, Submission of Federal Rules under the Congressional Review Act, to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States. A major rule under the Congressional Review Act cannot take effect until 60 days after it is published in the Federal Register . The Office of Information and Regulatory Affairs has determined that this rule is not a major rule as defined by 5 U.S.C. 804 . VI. Regulatory Flexibility Act A final regulatory flexibility analysis (FRFA) has been prepared consistent with the Regulatory Flexibility Act, 5 U.S.C. 601 , et seq. The FRFA is summarized as follows: This final rule is necessary to revise the Defense Federal Acquisition Regulation Supplement (DFARS) to incorporate the expanded capabilities of the Supplier Performance Risk System (SPRS), made possible by recent technical enhancements. SPRS is a DoD enterprise application that retrieves price, item, quality, delivery, and contractor performance data from Government reporting systems. SPRS collects quality and delivery data from Government systems to develop risk assessments. The system provides three risk assessments for contracting officer use in evaluations of quotations and offers: an item risk assessment, a price risk assessment, and a supplier risk assessment. The objective of the final rule is to notify offerors, via the new solicitation provision at DFARS 252.204-7024, that SPRS collects performance data from a variety of Government sources on awarded contracts to develop item risk, price risk, and supplier risk assessments for contracting officers to consider during evaluation of quotations or offers. The final rule also requires contracting officers to consider the supplier risk assessment in the determination of contractor responsibility. No comments were received in response to the initial regulatory flexibility analysis. The Federal Procurement Data System indicates that in fiscal years 2020 through 2022, DoD awarded an average of 483,364 contracts per year for both products and services, of which an average of 338,039 (approximately 70 percent) were awarded to an average of 22,760 unique small businesses. This rule does not require any specific reporting, recordkeeping, or compliance requirements. No significant economic impact on small businesses is anticipated as a result of the final rule. DoD does not expect small entities will be materially affected by this rule. There are no (printed page 17338) known significant alternatives to the rule. VII. Paperwork Reduction Act The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). List of Subjects in 48 CFR Parts 204 , 208 , 209 , 212 , 213 , 215 , 216 , and 252 Government procurement Jennifer D. Johnson, Editor/Publisher, Defense Acquisition Regulations System.

<https://www.dni.gov/files/NCSC/documents/Regulations/SEAD-3-Reporting-U.pdf>), to executive branch agencies or covered individuals with an effective date of June 12, 2017. SEAD 3 defines covered individuals as: A person who performs work for or on behalf of the executive branch who has been granted access to classified information or holds a sensitive position, but does not include the President or the Vice President. a person who performs work for or on behalf of a state, local, tribal, or private sector entity, as defined in E.O. 13549 , who has been granted access to classified information or holds a sensitive position, but does not include duly elected or appointed governors of a state or territory, or an official who has succeeded to that office under applicable law; and a person working in or for the legislative or judicial branches who has been granted access to classified information or holds a sensitive position and the investigation or determination was conducted by the executive branch, but does not include members of Congress,

Justices of the Supreme Court, or Federal judges appointed by the President. covered individuals are not limited to government employees and include all persons, not excluded under paragraphs D.5(a), (b), or (c) of SEAD 3, who have access to classified information or who hold sensitive positions, including, but not limited to, contractors, subcontractors, licensees, certificate holders, grantees, experts, (printed page 83303) consultants, and government employees. SEAD 3 identifies required reporting of data elements that are contained in the Standard Form-86, ·Questionnaire for National Security Positions· (available at https://www.opm.gov/forms/pdf_fill/sf86.pdf), which applicants and clearance holders complete during the initial and periodic reinvestigation processes, respectively. SEAD 3 requires these elements to be reported prior to participation in such activities or otherwise as soon as possible following the start of their involvement. Most notably, SEAD 3 requires covered individuals to obtain prior agency approval before conducting unofficial foreign travel. For this rule, SEAD 3 applies only for those contractor personnel who have been granted eligibility for access to classified information through the NISP. In accordance with paragraph E.4 of SEAD 3, NISP CSAs, acting on behalf of Heads of agencies or designees, for the NISP contractors under their security cognizance may determine that operational and mission needs preclude strict adherence to these reporting requirements. In those instances, a NISP CSA may provide CSA guidance to supplement unique CSA mission requirements to the contractors under its security cognizance of equivalent notification, briefing and reporting to be accomplished. III. Requirements From Section 842 of Public Law 115-232 Currently, the NISPOM and 32 CFR part 2004

3.1.6 | Review Preparation or Execution ... 3.1.6 Review Preparation or Execution Similar to Section 3.

- Training on specific tools required for employees to perform security-related job duties - Training for employees who have privileged access to applications or systems - Training for oversight roles such as information systems security officer (ISSO), information systems security manager (ISSM), or auditors - Training for employees who manage access and authorizations to applications and systems - Training on organizational policies and procedures related to security and privacy configurations, settings, controls, etc. - Cybersecurity for employees in leadership positions, such as 'Cybersecurity for Executives,' Cybersecurity for System Owners,' or 'Becoming A Chief Information System Officer'

- (1) The definition is quoted (i.e., not adapted) from a federal law or regulation. - (2) The definition is quoted from an international, federal, or widely adopted technical standard [e.g., International Organization for Standardization (ISO), FIPS, American National Standards Institute (ANSI)], a common English or mathematical dictionary, or is an authoritative original technical source (e.g., the Defense Discovery Metadata Specification for the definition of the Defense Discovery Metadata Standard). - (3) The definition is quoted from an Office of Management and Budget (OMB) Policy or Circular, CNSS Policies and Directives, or similar documents. - (4) The definition is from NIST SPs, CNSS Instructions, OMB Memorandum, similar documents, or a specialized dictionary. - (5) The definition is from Government Accountability Office (GAO) Reports, CNSS Advisory Memoranda, Agency-specific standards, regulations, and policies. - (6) The definition is from NIST IRs, white papers, academic or technical papers, or other publications. - (7) The definition is from draft, archived, or superseded publications.

Through interactions with the group and analysis of existing systems, the contracted security consultant is drafting a security profile specification document that defines the security environment, threats, vulnerabilities, and assumptions about a typical systems in the terminology used within the industrial control community. Along with this specification development, the intermediate task of performing vulnerability and threat analysis within the specific sector industries of the PC'SRF is being conducted through working groups. Once the security profile specification is drafted, work will begin to translate it into a common set of formal information security requirements (Common Criteria, ISO/IEC 15408, Protection Profiles) and documented best practices for the systems described. Organization based members of the PCSRF are also discussing the future requirements of training and certification to insure the implementation of IT security in process control systems.

memory may pass information from one user to another user. In other words, when objects are reused no residual information should exist on that object. This protects the confidentiality of the information. This is typically a feature provided by operating system and software vendors. Example You are a system administrator responsible for creating and deploying the system hardening procedures for your company's computers. You ensure that the computer baselines include software patches to prevent attackers from exploiting flaws in the processor architecture to read data (e.g., the Meltdown and Spectre exploits). You also verify that the computer operating system is configured to prevent users from accessing other users' folders [a]. Potential Assessment Considerations · Are shared system resources identified and documented [a]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.13.4

Additionally, the Department is concerned about the extent to which regulated entities have updated their security measures to adjust to the changes in the health care environment and their operations, including new and emerging threats to the confidentiality, integrity, and availability of ePHI. And the Department is not alone in its concerns. NCVHS serves as the Department's advisory body for HIPAA. [122] Given the increase in cybersecurity incidents affecting the health care sector, NCVHS held a series of public hearings on cybersecurity to better understand how to protect ePHI and individuals. In response to those hearings, NCVHS submitted several recommendations to the Department regarding the importance of strengthening the Security Rule. [123] As discussed above, HIPAA requires the Secretary to rely on NCVHS' recommendations [124] with respect to standards promulgated under the statute. Given the importance of strong security measures, the changed environment and operations for health care, uncertainty expressed by regulated entities regarding their compliance obligations, deficiencies identified by OCR in its investigations of regulated entities, and the recommendations of NCVHS, we believe that it is necessary and appropriate for the Department to propose modifications to clarify and strengthen the Security Rule.

A. Strong Security Standards Are Essential to Protecting the Confidentiality, Integrity, and Availability of ePHI and Ensuring Quality and Efficiency in the Health Care System A primary purpose of HIPAA's Administrative Simplification provisions [125] is to, among other things, ·improve [. . .] the efficiency and effectiveness of the health care system, by encouraging the development of a health information system through the establishment of uniform standards and requirements for the electronic transmission of certain health information.· [126] As Congress recognized when it enacted HIPAA, protecting the security of ePHI is essential for accomplishing this goal. Members of Congress acknowledged at that time that the provisions of HIPAA would create electronic databases of PHI, enabling the PHI to be transmitted electronically with both the benefits and risks that accompany such electronic transactions. [127] Congressional statements leading up to HIPAA's enactment demonstrate Congress' recognition of the potential risks of the shift from paper recordkeeping to electronic: ·We need to be very careful about how safe and secure that information is from prying eyes. Some of it may be extremely sensitive and could be used in a malicious or discriminatory manner.· [128] Accordingly, HIPAA required the establishment of strict security standards for health information.

s e-mail servers are another likely source of information. Each of the server IP addresses listed in the e-mail header should contain some record of the e-mail, including the message ID value, which should facilitate quick identification of pertinent records. As mentioned previously, the final e-mail server in the list may contain a copy of the e-mail. Backups of that server may contain a copy of the e-mail, but only if it was held there for delivery for several hours or more. Other services associated with e-mail, such as antivirus software and spam filters, may also contain basic records of e-mail activity, but are unlikely to contain many details. Another possible source of information is authentication records. Although few e-mail servers require users to authenticate to send e-mail, they typically do require authentication to deliver e-mail to users. Because users often send and receive e-mail during a single session, authentication logs may contain records for receiving e-mail that can be helpful in determining who may have sent a particular e-mail. Another possible source of information is a record of the network traffic generated by sending or receiving the e-mail. Packet sniffers or network forensic analysis tools that were monitoring network activity might have captured the activity, including the actual IP addresses of the sending or receiving hosts, the contents and header of the e-mail, and any associated authentication activity. Ultimately, the incident handler should identify the hosts that were used to send and receive the e-mail, as well as all intermediate hosts that transferred the e-mail from sender to receiver.

Malicious cyber actors have targeted and continue to target the DIB sector that consists of approximately 220,000 small-to-large sized entities that support the warfighter. In particular, actors ranging from cyber criminals to nation-states continue to attack companies and organizations that comprise the Department's multi-tier supply chain including smaller entities at the lower tiers. From at least January 2020, through February 2022, the Federal Bureau of Investigation (FBI), National Security Agency (NSA), and Cybersecurity and Infrastructure Security Agency (CISA) observed regular targeting of U.S. cleared defense contractors (CDCs) by Russian state-sponsored cyber actors. The actors have targeted sensitive, unclassified information, as well as proprietary and export-controlled technology. The acquired information provides significant insight into U.S. weapons platforms development and deployment timelines, vehicle specifications, and plans for communications infrastructure and IT. By acquiring proprietary internal documents and email communications, adversaries may be able to adjust their own military plans and priorities, hasten technological development efforts, inform foreign policymakers of U.S. intentions, and target potential sources for recruitment. [50] In addition to stealing intellectual property for military gains, Russia may conduct cyber-attacks against the U.S. for retaliatory purposes. On March 21, 2022, that the Biden-Harris Administration stated intelligence indicates that the Russian Government and Russian-aligned cybercrime groups have threatened to conduct cyber operations in retaliation for perceived cyber offensives against the Russian Government or the Russian people. [51] The aggregate loss of intellectual property and CUI from the DoD supply chain severely undercuts U.S. technical advantage, limits, and disrupts business opportunities associated with technological superiority, and ultimately threatens our national defenses and economy. By incorporating heightened cybersecurity into acquisition programs, the CMMC Program provides the Department assurance that contractors and subcontractors are meeting DoD's cybersecurity requirements and provides a key mechanism to adapt to an evolving threat landscape. This is critically important to the Department because defense contractors are the target of increasingly frequent and complex cyberattacks by adversaries and non-state actors. Dynamically enhancing DIB cybersecurity to meet these evolving threats and safeguarding the information that supports and enables our warfighters is a top priority for the Department. The CMMC Program is a key component of

the Department's DIB cybersecurity effort.

Katerina Megas, the program manager for the NIST Cybersecurity for the IoT Program, gave a brief introductory presentation. She thanked participants for attending, provided a summary of the agenda, and presented information on the NIST Cybersecurity for IoT Program. Ms. Megas reviewed the goals of the program and five principles that guide its execution. She emphasized the importance of risk management in NIST's approach to IoT cybersecurity guidance, describing the view of the risk management hierarchy from enterprise down to systems, and then extending on to IoT devices that are components of federal information systems. Ms. Megas also pointed out that NIST guidance needn't have 'IoT' in the title to be applicable to IoT cybersecurity, noting that the NIST security controls contained in SP 800-53, and other guidance documents that address zero-trust architecture and supply chain security, among other topics, are also relevant and useful. She concluded by reminding participants that the workshop discussions were focused on cybersecurity for federal information systems, which guided the selection of topics in the agenda. Takeaway 3: Supply chain security and transparency are important but very complex. A number of challenges were identified regarding developing transparency and trust in IoT device supply chains. Participants noted the role of cloud systems in IoT devices as part of the supply chain, and that the constantly evolving nature of cloud implementations and business models could leave customers with no insight into any changes in the cloud that could alter what was an acceptable level of security at time of purchase. The provision of a software bill of materials (SBOM) ⁶ can help with visibility into an IoT device's implementation, but there are challenges both with the complexity of creating complete, accurate SBOMs and with trust that either the SBOM or the device has not been altered so that they no longer match.

AC.L2-3.1.11 · Session Termination CMMC Assessment Guide · Level 2 | Version 2.13 39 FURTHER DISCUSSION Configure the system to terminate user sessions based on the organization's policy. Session termination policies can be simple or sophisticated. Examples are inactivity (end the session after a specified duration (e.g., one hour ³³) of inactivity), day/time (all sessions are terminated at the end of the established workday), misbehavior (end the session due to an attempted policy violation), and maintenance (terminate sessions to prevent issues with an upgrade or service outage). If there is no automatic control of user sessions, an attacker can take advantage of an unattended session. Example 1 You manage systems containing CUI for your organization and configure the system to terminate all user sessions after 1 hour of inactivity [a]. As the session timeout approaches, the system prompts users with a warning banner asking if they want to continue the session. When the session timeout does occur, the login page pops up, and the users must log in to start a new session [b]. Example 2 A user is logged into a corporate database containing CUI but is not authorized to view CUI. The user has submitted a series of queries that unintentionally violate policy, as they attempt to extract CUI that the user is not authorized to view [a]. The session terminates with a warning as a result of a violation of corporate policy [b]. The user must reestablish the session before being able to submit additional legitimate queries. Potential Assessment Considerations · Are the conditions in which a user session must be terminated described (e.g., after a period of inactivity or after a defined time limit) [a]? · Are procedures documented that describe how to configure the system to enable automatic termination of user sessions after any of the defined conditions occur [b]? · Are user sessions terminated based on organization-defined conditions [a,b]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.1.11 33 Review DoD Cybersecurity FAQ Q53.2 for information on minimum values.

3.1.2 Supports Guidance for Control Selection... 3.1.2 Supports Guidance for Control Selection Informed and judicious decision making in security control selection requires an understanding of how security controls work together to achieve broader security protections.

3.2.5 Determine Updated Risk Assessment... 3.2.5 Determine Updated Risk Assessment With an understanding of the threat sources and vulnerabilities introduced by the IoT device, as well as the resulting likelihood of occurrence and magnitude of impact, organizations can perform an updated risk assessment of the information system using information available about the proposed IoT device.

The role of System Engineering and associated processes within the DoD acquisition process is beyond the scope of this rule. ITRA assessments provide a view of program technical risk and are not well-suited to the assessment of contractor owned information systems against standards for safeguarding CUI. CMMC Program requirements do not clash with Program Office responsibilities, but instead

provide Program Manager's with a mechanism for validating that contractors are compliant with the rules for protecting DoD CUI. b. FedRAMP Program and FedRAMP Equivalency Comment: Many commenters took issue with the requirements for FedRAMP Moderate Equivalency, as referenced in DFARS clause 252.204-7012 and defined in a separate DoD policy memo. Some merely highlighted discrepancies or highlighted concerns about their ability to meet the FedRAMP Moderate Equivalency requirements. Others recommended revisions to that policy, or to the DFARS clause 252.204-7012 clause, or both. Some recommended the FedRAMP Moderate Equivalency policy memo be incorporated into the DFARS clause 252.204-7012 clause. Other suggestions ranged from eliminating equivalency to meet requirements, allowing 3PAO attestation to equivalency, requiring all FedRAMP Moderate Equivalency candidates to be assessed by the same C3PAO or allowing equivalency to be established through other industry certifications or third-party security assessments, i.e., SOC, ISO/IEC 27001. One commenter requested that applications hosted on a FedRAMP Moderate environment only need to meet the CMMC level of the data the application will process. Another suggested that all Cloud Service Providers be required to meet the same CMMC requirement as the OSCs they support. One commenter recommended expanding the scope of CMMC Program to include assessing other security requirements in DFARS clause 252.204-7012, to include the use of FedRAMP Moderate cloud environment. Comments also expressed that it is unreasonable to expect any cloud provider to share security documentation with a customer or C3PAO since they limit dissemination of this information due to operational security needs. Another commenter noted that the proposed rule does not cover all types of information that contractors may handle, such as classified information, export-controlled information, or proprietary information and they recommended the DoD clarify applicability of the CMMC program for these types of information. Response:

) requires agencies to assess anticipated costs and benefits before issuing any rule whose mandates require spending in any one year of \$100 million in 1995 dollars, updated annually for inflation. This rule will not mandate any requirements for State, local, or tribal governments, nor will it affect private sector costs. E. Public Law 96-511, 'Paperwork Reduction Act' (44 U.S.C. Chapter 35) It has been determined that this amendment rule does not impose additional reporting or recordkeeping requirements under the Paperwork Reduction Act of 1995. There is an (printed page 55283) existing information collection for 32 CFR part 159 that has been reviewed and approved by the OMB under OMB Control Number 0704-0549, 'Defense Federal Acquisition Regulation Supplement, part 225, Foreign Acquisition, and Defense Contractors Performing Private Security Functions Outside the United States.' The amendments to this rule neither increase nor decrease the public burden nor cost to the Federal Government associated with this collection. F. Executive Order 13132 , 'Federalism' Executive Order 13132 establishes certain requirements that an agency must meet when it promulgates a proposed rule (and subsequent final rule) that imposes substantial direct requirement costs on State and local governments, preempts State law, or otherwise has federalism implications. This rule will not have a substantial effect on State and local governments. G. Executive Order 13175 , 'Consultation and Coordination With Indian Tribal Governments' Executive Order 13175 establishes certain requirements that an agency must meet when it promulgates a proposed rule (and subsequent final rule) that imposes substantial direct compliance costs on one or more Indian tribes, preempts tribal law, or effects the distribution of power and responsibilities between the Federal Government and Indian tribes. This rule will not have a substantial effect on Indian tribal governments. List of Subjects in 32 CFR Part 159 Government contracts Reporting and recordkeeping requirements Security measures Accordingly, 32 CFR part 159 is amended as follows: PART 159-PRIVATE SECURITY CONTRACTORS (PSCs) OPERATING IN CONTINGENCY OPERATIONS, HUMANITARIAN OR PEACE OPERATIONS, OR OTHER MILITARY OPERATIONS OR EXERCISES 1. The authority citation for part 159 is revised to read as follows: Authority: Sec. 862, Pub. L. 110-181 , 122 Stat. 253; Sec. 832, Sec 853, Pub. L. 110-417 , 122 Stat. 4535; Sec. 831-833, Pub L. 111-383 , 124 Stat. 4276. 2. Revise the heading for part 159 to read as set forth above. 3. Amend §-159.2 by: a. In paragraph (a)(1): i. Adding '(CJCS)' after 'Office of the Chairman of the Joint Chiefs of Staff'. ii. Adding '(DoD)' after 'the Office of the Inspector General of the Department of Defense'. iii. Removing 'organizational entities in the Department of Defense' and adding in its place 'organizational entities in the DoD'. b. Revising paragraph (a)(2). c. Adding paragraph (a)(3). d. Revising paragraph (b)(1). e.

for those FOIA requests for data not deemed clearly exempt from disclosure under Exemption 4. The submitter notice letter should include, as an attachment, a copy of the requested information. Any objections to release provided by the submitter shall be evaluated. The final decision to disclose information claimed to be exempt under Exemption 4 shall be made by an official equivalent in rank

to the official who would make the decision to withhold that information under the FOIA. When a substantial issue has been raised or when the objections submitted lack specificity, the DoD Component may seek additional information from the submitter and afford the submitter a reasonable opportunity to present arguments on the legal and substantive issues involved prior to making an agency determination. If the Component and submitter cannot come to agreement as to what information is exempt from release under Exemption 4, the Component shall provide the submitter a date on which the information in question will be released to the FOIA requester. This date should provide the submitter sufficient time to block the release of the information by obtaining an injunction in Federal Court (which is known as a reverse FOIA lawsuit), if the submitter so chooses. If no response is forthcoming the component shall release the information on the date provided to the submitted. (ii) The requester shall be notified when: (A) The Component notifies the submitter of the FOIA request and asks for comments. (B) The Component advises the submitter that the requested information will be released over the submitter's objections. (iii) The submitter shall be notified immediately whenever the requester (printed page 71859) brings suit seeking to compel disclosure of the submitter's information. (iv) If the submitted information is a proposal provided in response to a solicitation for a competitive proposal, and the proposal is in DoD possession and control and meets the requirements of 10 U.S.C. 2305(g) , the proposal shall not be disclosed, and no submitter notification and subsequent analysis is required. The proposal shall be withheld from public disclosure pursuant to Reference (m) and Exemption 3. This statute does not apply to bids, unsolicited proposals, or any proposal that is set forth or incorporated by reference in a contract between the DoD Component and the offeror that submitted the proposal. In such situations, normal submitter notice and analysis shall be conducted in accordance with § 286.18 (l) except sealed bids that are opened and read to the public. The term "proposal" means information contained in or originating from any proposal, including a technical, management, or cost proposal submitted by an offeror in response to solicitation for a competitive proposal. The term "proposal" does not include an offeror's name, total price, or unit prices when set forth in a record other than the proposal itself.

(2) A U.S. subsidiary of a foreign entity may be sponsored for a limited entity eligibility determination by a foreign government when the foreign government desires to award a contract or agreement to the U.S. subsidiary that involves access to only that classified information for which the foreign government is the OCA. (3) Limited entity eligibility determinations are specific to the classified information for the requesting GCA or foreign government and the single narrowly defined contract, agreement, or circumstance the request was based on. The limited entity eligibility determination will only be verified to that GCA or foreign government for the authorized level of access to classified information and any limitations to that access to classified information. (4) A limited entity eligibility determination is not an option for contractors that require access to proscribed information when a foreign government has ownership or control over the entity. (5) Release of classified information must be in conformity with the U.S. National Disclosure Policy-1 (provided to designated disclosure authorities on a need-to-know basis from the Office of the Under Secretary of Defense for Policy, Defense Technology Security Administration). (6) A limited entity eligibility determination will be administratively terminated when there is no longer a need for the contractor to access the classified information for which it was sponsored. Administrative termination of one limited entity eligibility determination does not impact a contractor's other limited entity eligibility determinations. (7) If there is no industrial security agreement with the foreign government of the country from which the FOCI is derived, in extraordinary circumstances, a limited entity eligibility determination may also be granted if there is a compelling need to do so consistent with U.S. national security interests and the GCA has informed the applicable CSA that access to classified information by the contractor is essential to contract or agreement performance. Under this circumstance, the entity must follow all provisions of this rule. (f) Qualifications of trustees, proxy holders, and outside directors. Individuals who serve as trustees, proxy holders, or outside directors must meet the following criteria: (1) Trustees and proxy holders must be resident U.S. citizens who can exercise governance and management prerogatives relating to their position in a way that ensures that the foreign owner can be effectively insulated from the entity. (2) Outside directors must be resident U.S. citizens who can exercise governance and management prerogatives relating to their position in a way that ensures that the foreign owner can be effectively separated from the entity's classified work. (3) New trustees, proxy holders, and outside directors must be completely disinterested individuals with no prior involvement with the entity, the entities with which it is affiliated, or the foreign owner.

(Comment 102) Several comments object to the requirement to name a responsible individual as duplicative of a requirement in the registration interim final rule. The majority of these comments ask that FDA use the emergency contact information required in the registration interim final rule in place of the responsible individual. The comments suggest that using the emergency contact information would give the agency rapid access to the information and provide the industry with flexibility. The comments state that there is no demonstrated need for the record of each commercial transaction involving the distribution of food to contain the name of a responsible individual, and that the requirement for a responsible individual is too rigid, as there is a high turnover of employees in many companies and the naming of a specific person as the responsible individual would require frequent updating. (Response) FDA agrees with the comments that there is little utility from requiring that the record of each commercial transaction involving the distribution of food contain the name of a responsible individual, due to the fact that individuals change jobs within and among companies very often, making it unlikely that the person named in the record will have responsibility for the food at issue when FDA seeks to effect a traceback. FDA further notes that, for those facilities required to register under part 1, subpart H, FDA already has the emergency contact designated in the registration under §§ 1.232(d) and (e) and 1.233(d) or § 1.233(e). As explained previously, FDA does not believe this information is necessary for those facilities not required to register under 21 CFR part 1, subpart H, because including an emergency contact telephone number in records being kept will not assist the Secretary in locating the records because FDA would not have the emergency number until it had already accessed the records. (Comment 103) Some comments suggest that, rather than requiring a specific individual, the agency require a department such as a quality assurance department. (Response) As explained in response to comment 63 of this document, FDA has deleted the proposed requirement that a responsible individual be listed in each record. 4. Adequate Description of Type of Food (Comment 104) One comment notes that ·specific variety· is not appropriate (printed page 71599) for many food ingredients and should be changed to ·common name·.

to accept alternate forms of security for PBPs instead of taking title. According to these respondents, such alternate forms of security are common in the commercial marketplace, and allowing contractors without Government-unique accounting systems to provide an alternate form of security is the only way to implement the mandate from Congress to open PBP access to all contractors with GAAP-compliant systems. Response: While title to the property described in paragraph (f) of the clause at FAR 52.232-32, Performance-Based Payments, is the preferred security for receipt of progress payments, the final rule (DFARS 252.232-7012 and 252.232-7013) addresses the concerns and comments expressed concerning title by allowing the use of other forms of security if the contractor's accounting system is not capable of identifying and tracking through the build cycle the property that is allocable and properly chargeable to the contract. 6. Definition of ·Nontraditional Defense Contractor· Comment: Two respondents stated that the DFARS does not define ·nontraditional defense contractor· and recommended inclusion in the DFARS of the definition at 10 U.S.C. 2302(9) . Response: The definition of ·nontraditional defense contractor· at 10 U.S.C. 2302(9) is incorporated in the DFARS at 212.001. However, since the term is now used in part 232, this final rule moves the definition from DFARS 212.001 to DFARS 202.101, so that the definition is applicable throughout the DFARS. 7. Ceiling of 90 Percent Comment: One respondent recommended revision to the proposed rule to provide clarity on the financial ceiling of 90 percent provided for in the FAR. According to the respondent, the DFARS should clearly state that performance-based payments will be based on a percentage of price, and that the ceiling for the basis will be 90 percent (FAR 32.1004(b)(2)(ii)). Response: The DFARS does not restate the 90 percent ceiling that is already stated in FAR 32.1004(b)(2)(ii) and doing so is unnecessary because the DFARS supplements the FAR. Further, performance-based payments are not based on a percentage of price. The bases for performance-based payments are clearly defined in FAR 32.1002. 8. Selection and Valuation of Milestone Events Comment: One respondent recommended that the final rule should clarify in the DFARS that a PBP payment associated with a particular milestone should reflect the value of all work accomplished by the contractor at the time it meets the milestone. This is consistent with current guidance in the PBP Guide, but the respondent has still encountered widespread confusion. According to the respondent, clarifying this interpretation can reduce the administrative burden by allowing flexibility to choose fewer and more meaningful milestones. Response:

DFARS 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting, authorizes DoD to release information that is obtained from the contractor (or derived from information obtained from the contractor) under this clause that is not created by or for DoD. It

further states that: (1) The Government will protect against the unauthorized use or release of information obtained from the contractor (or derived from information obtained from the contractor) under this clause that includes contractor attributional/proprietary information; and (2) in making an authorized release of such information, the Government will implement appropriate procedures to minimize the contractor attributional/proprietary information that is included in such authorized release, seeking to include only that information that is necessary for the authorized purpose(s) for which the information is being released. A foundational element of the mandatory reporting requirement is the recognition that the information being shared between the parties may include extremely sensitive information that requires protection. Information regarding the Government's safeguarding of information received from the contractors that require protection can be referenced in the DoD Privacy Impact Assessment (PIA). The PIA provides detailed procedures for handling personally identifiable information (PII), attributional information about the strengths or vulnerabilities of specific covered contractor information systems, information providing a perceived or real competitive advantage on future procurement action, and contractor information marked as proprietary or commercial or financial information (see OMB Control Number 0704-0489, DoD's Defense Industrial Base (DIB) Cybersecurity (CS) Activities Cyber Incident Reporting). Additionally, 32 CFR part 236 implements mandatory information sharing requirements of 10 U.S.C. 391 and 393 by requiring DoD contractors to report key information regarding cyber incidents, and to provide access to equipment or information enabling DoD to conduct forensic analysis to determine if or how DoD information was impacted in a cyber incident. The rule's implementation of these requirements is tailored to minimize the sharing of unnecessary information (whether sensitive or not), including by carefully tailoring the information required in the initial incident reports (32 CFR 236.4(c))

CMMC-Custom Terms CMMC Assessment Guide · Level 2 | Version 2.13 6 · Monitoring: The act of continually checking, supervising, critically observing, or determining the status in order to identify change from the performance level required or expected at an organization-defined frequency and rate.⁶ · Operational plan of action : As used in security requirement CA.L2 -3.12.2, means the formal artifact which identifies temporary vulnerabilities and temporary deficiencies in implementation of requirements and documents how and when they will be mitigated, corrected, or eliminated. The OSA defines the format (e.g., document, spreadsheet, database) and specific content of its operational plan of action. An operational plan of action is not the same as a POA&M associated with an assessment. · Organization-defined: As determined by the OSA being assessed except as defined in the case of Organization-Defined Parameter (ODP). This can be applied to a frequency or rate at which something occurs within a given time period, or it could be associated with describing the configuration of an OSA's solution. · Periodically: Occurring at a regular interval as determined by the OSA that may not exceed one year . As used in many requirements within CMMC, the interval length is organization-defined to provide OSA flexibility, with an interval length of no more than one year. · Security Protection Data (SPD): As defined in 32 CFR § 170.4 means data stored or processed by Security Protection Assets (SPA) that are used to protect an OSC's assessed environment. SPD is security relevant information and includes, but is not limited to: configuration data required to operate an SPA, log files generated by or ingested by an SPA, data related to the configuration or vulnerability status of in-scope assets, and passwords that grant access to the in-scope environment. · System Security Plan (SSP): As defined in 32 CFR § 170.4 means the formal document that provides an overview of the security requirements for an information system or an information security program and describes the security controls in place or planned for meeting those requirements. The system security plan describes the system components that are included within the system, the environment in which the system operates, how the security requirements are implemented, and the relationships with or connections to other systems, as defined in NIST SP 800-53 Rev 5. · Temporary deficiency: As defined in 32 CFR § 170.4 means a condition where remediation of a discovered deficiency is feasible and a known fix is available or is in process. The deficiency must be documented in an operational plan of action. A temporary deficiency is not based on an in-progress initial implementation of a CMMC security requirement but arises after implementation. A temporary deficiency may apply during the initial implementation of a security requirement if, during roll-out, specific issues with a very limited subset of equipment is discovered that must be separately addressed. There is no standard duration for which a temporary deficiency may be active. For example, FIPS-validated cryptography that requires a patch and the patched version is no longer the validated version may be a temporary deficiency.

6 NIST SP 800-160 Vol. 1 R1, Engineering Trustworthy Secure Systems, 2022, Appendix B., p. 55

Given the evolving cybersecurity threat, DoD's best interests are served by ensuring that POA&Ms remain open for no longer than 180 days, regardless of which controls are included or the plan for remediation. The 180-day period starts when the CMMC assessment results are finalized and submitted to SPRS or eMASS, as appropriate. As addressed in §§ 170.17(a)(1)(ii)(B) and 170.18(a)(1)(ii)(B), if the POA&M is not closed out within the 180-day timeframe, the Conditional Certification will expire. If the Conditional Certification expires within the period of performance of a contract, standard contractual remedies will apply, and the OSC will be ineligible for additional awards with CMMC Level 2 or 3 requirements for the information systems within the same CMMC Assessment Scope. The scoring methodology created by the DoD reflects the relative risk to DoD information when a security requirement is NOT MET. As defined in § 170.17(c)(2), a security requirement that is NOT MET may be re-evaluated during the Level 2 certification assessment and for 10 business days following the active assessment period under certain conditions. Likewise, when an OSC executes a contract with a C3PAO it may account for the timeliness of any re-assessments. The language in DFARS clause 252.204-7012 describing the DoD CIO's authority to approve variances is beyond the scope of this rule. A POA&M for CMMC Level 2 can include up to 22 security requirements that have a value of 1, excluding those in § 170.21(a)(2)(iii), or may include non-FIPS-validated encryption and up to 19 security requirements that have a value of 1. The OSA is responsible for maintaining the POA&M that resulted from a CMMC assessment; however, those security requirements that were NOT MET and placed on a POA&M are recorded in eMASS. The OSA is responsible for validating the close-out of the security requirements on the POA&M within 180 days of a self-assessment. The C3PAO or DCMA (as applicable) must perform the POA&M Close-out Assessment for a Final certification assessment. An affirmation of compliance is required upon the completion of any assessment-Conditional, Close-out, or Final-and annually after the completion of a Final assessment. The requirement outlined in § 170.21 for POA&M close out does not apply to Service Level Agreement (SLA) severity levels. The Department declines to include recommended POA&M examples in the rule, as they are already available in existing NIST guidance, or make other word changes to § 170.21. This section of the CMMC rule has been updated to add clarity when discussing the POA&M regarding security requirements that were assessed as NOT MET during a CMMC assessment. These POA&Ms are distinct from an operational plan of action.

g. Assessment Activities and Reporting

1. Data Entry Comment:

spp. detection, a previously unclassified preamendments device, into class II (special controls). On March 7, 2002, the Microbiology Devices Advisory Panel (the panel) recommended that in vitro diagnostic devices for *Yersinia* spp. detection be classified into class II. The panel believed that class II with the special controls (guidance document and limitations on the distribution) would provide reasonable assurance of the safety and effectiveness of the device. After the panel meeting, FDA found one additional in vitro diagnostic device for *Yersinia* spp. detection to be substantially equivalent to another device within that type. This device has the same intended use as its predicate device but makes use of newer nucleic acid amplification technology (NAAT). While the NAAT detection devices exhibit technological differences from the preamendments *Yersinia* spp. detection devices, FDA has determined that they are as safe and effective as, and do not raise different questions of safety and effectiveness than, their predicates. (See section 513(i) of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 360c(i)).) This draft guidance document identifies the proposed classification regulation, the product code, identifies issues of safety and effectiveness that require special controls, and proposes distribution limitations. FDA believes that the special controls described in the draft guidance when combined with the general controls will be sufficient to provide reasonable assurance of the safety and effectiveness of these devices.

II. Significance of Guidance This draft guidance is being issued consistent with FDA's good guidance practices regulation (21 CFR 10.115). The draft guidance, when finalized will represent the Agency's current thinking on in vitro diagnostic devices for *Yersinia* spp. detection. It does not create or confer any rights for or on any person and does not operate to bind FDA or the public. An alternative approach may be used if such approach satisfies the requirements of the applicable statute and regulations. III. Electronic Access Persons interested in obtaining a copy of the draft guidance may do so by using the Internet. A search capability for all CDRH guidance documents is available at

<http://www.fda.gov/MedicalDevices/DeviceRegulationandGuidance/GuidanceDocuments/default.htm> .

Guidance documents are also available at <http://www.regulations.gov> . To receive Class II Special Controls Guidance Document: In Vitro Diagnostic Devices for *Yersinia* spp. Detection, you may either send an email request to dsmica@fda.hhs.gov to receive an electronic copy of the document or send a fax request to (301) 847-8149 to receive a hard copy. Please use the document number 1714 to identify the guidance you are requesting. IV. Paperwork Reduction Act of 1995

(C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsections (e)(4)(G) and (H) because there is no necessity for such publication since the system of records will be exempt from the underlying duties to provide notification about and access to information in the system and to make amendments to and corrections of the information in the system. (E) From subsection (e)(4)(I) because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. NSA will, nevertheless, continue to publish such a notice in broad generic terms, as is its current practice. (9) System identifier and name. GNSA 10, Personnel Security File. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (c)(9)(i)(A). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. (B) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (C) Testing or examination material used solely to determine individual qualifications for appointment or promotion in the Federal service may be exempt pursuant to 5 U.S.C. 552a(k)(6) , if the disclosure would compromise the objectivity or fairness of the test or examination process. (D) All portions of this system of records which fall within the scope of 5 U.S.C. 552a(k)(2) , (k)(5), and (k)(6) may be exempt from the provisions of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I) and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) , (k)(5), and (k)(6). (iii) Reasons.

(Comment 182) Several comments suggest that the number of trucking entities covered by the rule was substantially underestimated. One comment suggests that while 20 percent of the specialized carriers transport food products at any specific time, most specialized carriers transport food at one time or another. Another comment suggests that FDA's estimate of the number of covered trucking entities was low; the comment cites information obtained from the U.S. DOT that indicated close to 600,000 operating authorities on file, which includes Mexican, Canadian, and domestic carriers. Moreover, the comment suggests that if half of the general carrier population (600,000 carriers) transports food on an occasional basis, then over 300,000 companies would be affected. These numbers suggest an estimate of covered trucking facilities much larger than FDA's estimate. To support the assertion of an underestimate, the comment suggests that FDA-regulated Mexican carriers alone likely account for 12,000 facilities. Another comment states that individual transporters, not only transportation firms, will hold food while it is in transit and that transportation vehicles do not appear to be exempt from the recordkeeping requirements. (Response) FDA agrees with the concerns underlying many of these comments and revises its estimates of the number of transportation entities in a way that is consistent with the data and framework used in the PRIA. Although FDA does not dispute the comment that most specialized carriers transport food items at one time or another, the ease with which transporters enter and leave the food industry is considered in the PRIA. That analysis already accounts for the additional learning, records access, and planning costs incurred by new entrants. In the PRIA, FDA estimated that there would be approximately a 10 percent rate of entry and exit of new and existing firms for all sectors. FDA calculated the startup costs for these new entrants and added them to the compliance costs incurred by existing facilities. The County Business Pattern and NES used by FDA in the analysis include all potentially covered transporters (except foreign-based carriers that transport food in the United States), including individual carriers. However, in the PRIA, FDA neglected to include the number of establishments under North American Industry Classification System (NAICS) code 4841 for general freight trucking as well as for NAICS code 488510 for freight transportation arrangement. In the analysis of the final rule, we include entities that fall under both of these categories. The combined data from the County Business Pattern and NES contain 384,358 establishments under code 4841 for general freight

trucking. In addition, the County Business Pattern data contain 15,177 establishments for code number 488510 for freight transportation arrangement. To estimate the number of facilities under code 488510 in the NES data, we calculated (printed page 71631)

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System [Docket Number DARS-2019-0020; OMB Control Number 0704-0478] **AGENCY:** Defense Acquisition Regulations System, Department of Defense (DoD). **ACTION:** Notice and request for comments regarding a proposed extension of an approved information collection requirement. **SUMMARY:** In compliance with section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995, DoD announces the proposed extension of a public information collection requirement and seeks public comment on the provisions thereof. DoD invites comments on: Whether the proposed collection of information is necessary for the proper performance of the functions of DoD, including whether the information will have practical utility; the accuracy of the estimate of the burden of the proposed information collection; ways to enhance the quality, utility, and clarity of the information to be collected; and ways to minimize the burden of the information collection on respondents, including the use of automated collection techniques or other forms of information technology. The Office of Management and Budget (OMB) has approved this information collection for use through July 31, 2019. DoD proposes that OMB extend its approval for use for three additional years beyond the current expiration date. **DATES:** DoD will consider all comments received by July 22, 2019. **ADDRESSES:** You may submit comments, identified by OMB Control Number 0704-0478, using any of the following methods: · Federal eRulemaking Portal: <http://www.regulations.gov> · Follow the instructions for submitting comments. · Email: osd.dfars@mail.mil · Include OMB Control Number 0704-0478 in the subject line of the message. · Fax: 571-372-6094. · Mail: Defense Acquisition Regulations System, Attn: Ms. Kimberly Ziegler, OUSD(A&S)DPC(DARS), 3060 Defense Pentagon, Room 3B941, Washington, DC 20301-3060. Comments received generally will be posted without change to <http://www.regulations.gov> , including any personal information provided. **FOR FURTHER INFORMATION CONTACT:** Ms. Kimberly Ziegler, at 571- 372-6095. **SUPPLEMENTARY INFORMATION:** Title, Associated Form, and OMB Number: Safeguarding Covered Defense Information, Cyber Incident Reporting, and Cloud Computing; OMB Control Number 0704-0478. **Needs and Uses:** Offerors and contractors must report cyber incidents on unclassified networks or information systems, within cloud computing services, and when they affect contractors designated as providing operationally critical support, as required by statute. (

. However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. Any portions of this system which fall under the provisions of 5 U.S.C. 552a(k)(2) may be exempt from the following subsection of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (H), and (I). (ii) Authority. 5 U.S.C. 552a(k)(2) . (iii) Reasons. (A) From subsection (c)(3) because disclosures from this system could interfere with the just, thorough and timely resolution of the compliant or inquiry, and possibly (printed page 14801) enable individuals to conceal their wrongdoing or mislead the course of the investigation by concealing, destroying or fabricating evidence or documents. (B) From subsection (d) because disclosures from this system could interfere with the just thorough and timely resolution of the compliant or inquiry, and possibly enable individuals to conceal their wrongdoing or mislead the course of the investigation by concealing, destroying or fabricating evidence or documents. Disclosures could also subject sources and witnesses to harassment or intimidation which jeopardize the safety and well-being of themselves and their families. (C) From subsection (e)(1) because the nature of the investigation function creates unique problems in prescribing specific parameters in a particular case as to what information is relevant or necessary. Due to close liaison and working relationships with other Federal, state, local and foreign country law enforcement agencies, information may be received which may relate to a case under the investigative jurisdiction of another government agency. It is necessary to maintain this information in order to provide leads for appropriate law enforcement purposes and to establish patterns of activity which may relate to the jurisdiction of other cooperating agencies. (D) From subsection (e)(4) (G) through (H) because this system of records is exempt from the access

provisions of subsection (d). (E) From subsection (f) because the agency's rules are inapplicable to those portions of the system that are exempt and would place the burden on the agency of either confirming or denying the existence of a record pertaining to a requesting individual might in itself provide an answer to that individual relating to an on-going investigation. The conduct of a successful investigation leading to the indictment of a criminal offender precludes the applicability of established agency rules relating to verification of record, disclosure of the record to that individual, and record amendment procedures for this record system. (4) System identifier and name. CIG-16, DOD Hotline Program Case Files. (i) Exemption.

- Establish security responsibility (e.g. security officers) (Priority A). - Develop and maintain site security policy and procedures, including a policy for handling security incidents. - Support comprehensive security education programs for users. - Establish Forum of Incident Response Security Teams (FIRST) point of contacts. We have security policy that we are willing to share with others; it has already been shared it with NCSA. We have an incident response team (such that it is) of about three people. We maintain a contact in the local FBI office so they will not be taken by surprise if we call them for help on a computer security problem. STEINAUER; The Forum of Incident Response Security Teams (FIRST) is a cooperative effort involving a number of organizations. The concept of FIRST arose as the result of the 'Internet Worm' incident, along with a number of things that were going on in that period of time. It was clear that the basic nature of security threats had substantially changed and there were new requirements.

Are minimum performance standards for cybersecurity necessary to protect individual and collective security interests? If so, how should those minimum standards be determined and what could be done to promote their adoption? Would a collaborative government-private sector partnership be appropriate here? What are the merits of providing legal safe-harbors to those individuals and commercial entities that meet a specified minimum security level? By contrast, what would be the merits or implications of enhancing existing frameworks that hold entities accountable for failure to exercise reasonable care and that results in a loss due to inadequate security measures? Should an entity be required to implement a cybersecurity plan or meet a set of minimum security standards prior to receiving government financial guarantees or assistance? Would it be beneficial to utilize government procurement policies to stimulate cybersecurity research, development, and investment generally? How do national security requirements affect the commercial sector's adoption of cybersecurity protection measures? In addition, companies traditionally carry insurance protection to mitigate various business, natural disaster, and political risks. The growth of the Internet has begun to create a demand for new insurance products that specifically address the risk of Internet connectivity. [24] While there is growth in the adoption of cyber insurance, a compelling economic case for large scale underwriting of cyber risk insurance, apparently, has not been made. As noted above, metrics for establishing the basis for underwriting appear inadequate. (printed page 44223) What role could/should public policy play, if any, in the development of a cyber-risk measurement framework that would be useful in developing insurance products? In the face of growing risk from the increasing volume of cyber threats and vulnerabilities, what data can be made available to companies to support decisions regarding protection through the purchase of insurance products or investing more in cybersecurity protection controls? If companies were able to predictably limit financial risk through specific cyber-insurance coverage at a reliably predictable cost, how would this affect investment in cyber-security programs and infrastructure? To what extent might insurance providers create incentives or requirements for such investment? In the absence of empirical data to quantify losses from certain types of cyber incidents, what criteria could be used to most accurately and effectively determine premium costs? What, if any, quantitative relationship can be established between investment in security controls and the cost of insurance? Dated: July 22, 2010. Gary Locke, Secretary of Commerce. Patrick Gallagher, Director, National Institute of Standards and Technology. Francisco J. Sánchez, Under Secretary of Commerce for International Trade, International Trade Administration. Lawrence E. Strickling,

(Comment 13) One comment requests clarification regarding the level of recordkeeping that will be expected at each facility maintained by a vertically integrated company. The comment explains that a vertically integrated company has various facilities involved in the growing and processing of bulk ingredients as well as the manufacturing and marketing of finished products. Some of the requirements for recordkeeping could result in duplication of effort if each facility within the company is required to (printed page 71569) maintain separate records, even though the overall records are available at company headquarters or some central location. One comment requests that

the final rule clarify what is meant by the term "released" and the relationship of this term to holding legal title, or ownership of the food. Another comment suggests that FDA clarify that only at such time as the food leaves the possession and control of one firm and enters into the possession and control of another firm, whether or not via a transporter, would the recordkeeping requirement apply. The comment maintains that any other interpretation of the statute would impose a crushing burden of internal tracking systems and paperwork that would detract from most firms' abilities to do business and is well beyond the intent of the Bioterrorism Act. (Response) The records required by these regulations are those that FDA needs for inspection to identify the immediate previous sources and the immediate subsequent recipients of food. "Immediate previous source" has been defined in § 1.328 of the final rule to mean "a person who owns food or who holds, processes, packs, imports, receives, or distributes food or food packaging, and that last had an article of food before transferring it to another person." Unless otherwise exempt (i.e., a farm), a "vertically integrated company" would be required to identify the sources of all food received from its immediate previous sources. Once the vertically integrated company receives the food and keeps information on its immediate previous sources, that vertically integrated company does not need to keep additional records until it releases the food to another person. Unless otherwise exempt, at the time the vertically integrated company releases the food, it is required to identify the immediate subsequent recipients of that food. As an example, if a company buys food from its immediate previous source (company A), then the company further processes the food, holds the food, transports the food, and distributes the food to a grocery store, then the vertically integrated company would only have to keep records on its immediate previous source (company A) and its immediate subsequent recipient (grocery store). The vertically integrated company need not keep records of all the covered activities (manufacturing, processing, packing, transporting, etc.) conducted by that company while it has the food.

(6) SP 800-82r3, Guide to Operational Technology (OT) Security, September 2023 (NIST SP 800-82r3); IBR approved for § 170.4(b). (7) SP 800-115, Technical Guide to Information Security Testing and Assessment, September 2008 (NIST SP 800-115 Sept2008); IBR approved for § 170.4(b). (3) ISO/IEC 17024:2012(E), Conformity assessment-General requirements for bodies operating certification of persons, second edition, July 1, 2012 (ISO/IEC 17024:2012(E)); IBR approved for §§ 170.8(b)(2) and 170.10(a) and (b)(4), (7), and (8). Note 1 to paragraph (b): The ISO/IEC standards incorporated by reference in this part may be viewed at no cost in "read only" format at <https://ibr.ansi.org>. § 170.3 Applicability. (a) The requirements of this part apply to: (1) All DoD contract and subcontract awardees that will process, store, or transmit information, in performance of the DoD contract, that meets the standards for FCI or CUI on contractor information systems; and, (2) Private-sector businesses or other entities comprising the CMMC Assessment and Certification Ecosystem, as specified in subpart C of this part. (printed page 83216)

We seek comment on the following matters. Do current U.S. Government (printed page 44222) product assurance requirements inhibit production of timely security components and/or security-enhanced IT products and systems? Do current assurance processes inhibit innovation? If so, what

would be the best way to improve the current U.S. product assurance scheme? What, if any, changes need to be made with respect to international product assurance institutions, standards, and processes (e.g., the Common Criteria Recognition Arrangement)? Should the Common Criteria Recognition Arrangement, the basis for international mutual recognition of cybersecurity product assurance, be expanded to include some of those countries which increasingly stray from international norms? Can useful U.S. Government or international product assurance guidelines be crafted for the current real-world software development environment? To what extent can a security oriented software assurance 'tool' be useful in software validation? What elements would be necessary to develop an effective industry-government dialogue to clarify the product assurance goals and challenges, and identify workable solutions?

7. Research and Development The U.S. Government has a continuing interest in cybersecurity research and development and has funded research on various aspects of security in computing, networking, and data processing for decades. Together with research and development programs at NIST, DOD, and several other agencies, the current unclassified Federal funding in Cyber Security and Information Assurance Research and Development is approximately \$350 million per year. One of the goals of the Comprehensive National Cybersecurity Initiative (CNCI) initiated in January 2008 is to develop 'leap-ahead' technologies that would achieve orders-of-magnitude improvements in cybersecurity. Based on this directive, in 2009, the agencies of the NITRD Program identified three initial research and development themes to exemplify and motivate future federal cybersecurity game-change research activities. [23] In addition to eliminating redundancies in federally funded cybersecurity research, identifying research gaps, and prioritizing research and development efforts, the Federal government has actively sought to create incentives for private industry and academic institutions to increase their research and development efforts. The following questions should be considered from the perspective of the Department of Commerce. How can the federal government best promote additional commercial and academic research and development in cybersecurity technology? What particular research and development areas do not receive sufficient attention in the private sector? What cybersecurity disciplines most need research and development resources (e.g.,

may be exempt pursuant to 5 U.S.C. 552a(k)(5) are subsections (d)(1) through (d)(5). (ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons. From (d)(1) through (d)(5) because the agency is required to protect the confidentiality of sources who furnished information to the Government under an expressed promise of confidentiality or, prior to September 27, 1975, under an implied promise that the identity of the source would be held in confidence. This confidentiality is needed to maintain the Government's continued access to information from persons who otherwise might refuse to give it. (8) System identifier and name. DWHS P29, Personnel Security Adjudications File. (i) Exemption. Portions of this system of records that fall within the provisions of 5 U.S.C. 552a(k)(5) may be exempt from the following subsections (d)(1) through (d)(5). (ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons. From (d)(1) through (d)(5) because the agency is required to protect the confidentiality of sources who furnished information to the Government under an expressed promise of confidentiality or, prior to September 27, 1975, under an implied promise that the identity of the source would be held in confidence. This confidentiality is needed to maintain the Government's continued access to information from persons who otherwise might refuse to give it. This exemption is limited to disclosures that would reveal the identity of a confidential source. At the time of the request for a record, a determination will be made concerning whether a right, privilege, or benefit is denied or specific information would reveal the identity of a source. (9) System identifier and name. JS004SECDIV, Joint Staff Security Clearance Files. (i) Exemption. Portions of this system of records are exempt pursuant to the provisions of 5 U.S.C. 552a(k) (5) from subsections 5 U.S.C. 552a(d)(1) through (d)(5) . (ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons. From subsections (d)(1) through (d)(5) because the agency is required to protect the confidentiality of sources who furnished information to the Government under an expressed promise of confidentiality or, prior to September 27, 1975, under an implied promise that the identity of the source would be held in confidence. This confidentiality is needed to maintain the Government's continued access to information from persons who otherwise might refuse to give it. This exemption is limited to disclosures that would reveal the identity of a confidential source. At the time of the request for a record, a determination will be made concerning whether a right, privilege, or benefit is denied or specific information would reveal the identity of a source. (10) System identifier and name. DFMP 26, Vietnamese Commando Compensation Files. (i) Exemption. Information classified under E.O. 12958 , as implemented by DoD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1) . (ii) Authority. 5 U.S.C. 552a(k)(1) . (iii) Reasons. From subsection 5 U.S.C. 552a(d)

OMB approved publishing the CMMC rule as a Proposed Rule. It has undergone a required notice-and-comment process to give the public an opportunity to submit comments. The Proposed Rule and the comments received informed the final rule. Issues with the Federal Register or www.regulations.gov functionality for submitting comments via attachment of pdf or other file type were raised with the appropriate help desk and resolved before conclusion of the public comment period. The public comment period for this rule permitted review and feedback from any member of the public. This rule follows the format and includes all sections required in OMB guidelines for formal rulemaking. The length of this rule is necessary to ensure all affected parties have sufficient information to understand and comply with the rule. Federal Register page numbers are visible when viewing the PDF version of the rule published Tuesday, December 26, 2023 (88 FR 89058 ; www.govinfo.gov/content/pkg/FR-2023-12-26/pdf/2023-27280.pdf). Material published in the Federal Register contains numerous sections, including portions that do not amend the CFR. Specifically, the preamble for this rule, is written in a summary format and is not intended to provide the detailed information that is in the regulatory text. DoD declines to delete reserved sections because the editorial standard for orderly codification is that for every (a) there must be at least a (b), and for every (1) there must be at least a (2), etc. 'Reserved' meets this standard when there is no additional text required. The DoD declined to make other administrative changes, because the recommendations did not result in a substantive change. One commenter correctly identified that the initial 32 CFR part 170 CMMC Program proposed rule included discussion and analysis of comments made against prior publication of a 48 CFR CMMC interim final rule. The decision to include that material was made for the public's convenience and to facilitate greater understanding of the 32 CFR part 170 CMMC Program proposed rule and the CMMC Program. Codification of the CMMC Program requires publication of both the 32 CFR part 170 CMMC Program final rule and the 48 CFR part 204 CMMC Acquisition final rule. Each of those final rules will include a discussion and analysis of public comments received during their respective comment periods. The DoD CIO worked in conjunction with OUSD(A&S) to ensure that the 32 CFR part 170 CMMC Program rule and the 48 CFR part 204 CMMC Acquisition rule are in sync. The preamble is not regulatory text. The preamble includes a response to the significant, relevant issues raised in previous public comments on the original CMMC program. DoD declines to adopt recommendations to move content from the 32 CFR part 170

3.5.2 Provide Recommendations and Implementation Plan The Contractor shall prepare a recommendations report on whether <product name> will meet the organization requirement.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. - 56 of 90 agencies were using IoT, especially to control or monitor systems, control access to facilities, and track physical assets (vehicles, property). - 25 agencies were currently using IoT and planned to expand their use. - 13 agencies were neither using nor planning to use IoT, based on lack of return on investment, internal administrative hurdles, or the lack of a business case.

Maintenance. Review and test the effectiveness of the technology assets and/or technical controls required by this paragraph (d) at least once every 12 months or in response to environmental or operational changes, whichever is more frequent, and modify as reasonable and appropriate. (e) Standard: Integrity. Deploy technical controls to protect electronic protected health information from improper alteration or destruction, both at rest and in transit; and review and test the effectiveness of such technical controls at least once every 12 months or in response to environmental or operational changes, whichever is more frequent, and modify as reasonable and appropriate. (f) Standard: Authentication ·(1) General. Deploy technical controls to verify that a person or technology asset seeking access to electronic protected health information and/or the covered entity's or business associate's relevant electronic information systems is the one claimed. (2) Implementation specifications ·(i) Information access management policies. Deploy technical controls in accordance with the covered entity's or business associate's information access management policies and procedures under §.164.308(a)(10), including technical controls that

require users to adopt unique passwords that are consistent with the current recommendations of authoritative sources. (ii) Multi-factor authentication. (A) Deploy multi-factor authentication to all technology assets in the covered entity's or business associate's relevant electronic information systems to verify that a person seeking access to the relevant electronic information system(s) is the user that the person claims to be. (B) Deploy multi-factor authentication for any action that would change a user's privileges to the covered entity's or business associate's relevant electronic information systems in a manner that would alter the user's ability to affect the confidentiality, integrity, or availability of electronic protected health information. (iii) Exceptions. Deployment of multi-factor authentication is not required in any of the following circumstances. (A) The technology asset in use does not support multi-factor authentication, and the covered entity or business associate establishes and implements a written plan to migrate electronic protected health information to a technology asset that supports multi-factor authentication within a reasonable and appropriate period of time.

(q) The Chief, National Guard Bureau, is authorized to act on requests for all personnel and medical records of retired, separated, discharged, deceased, and active Army National Guard military personnel, including technician personnel, unless such records clearly fall within another Denial Authority's responsibility. This authority includes, but is not limited to, National Guard organization and training files; plans, operations, and readiness files, policy files, (printed page 24509) historical files, files relating to National Guard military support, drug interdiction, and civil disturbances; construction, civil works, and ecology records dealing with armories, facilities within the States, ranges, etc.; Equal Opportunity investigative records; aviation program records and financial records dealing with personnel, operation and maintenance, and equipment budgets. (r) The Chief, Army Reserve and Commander, U.S. Army Reserve Command are authorized to act on requests for all personnel and medical records of retired, separated, discharged, deceased, and reserve component military personnel, and all U.S. Army Reserve (USAR) records, unless such records clearly fall within another Denial Authority's responsibility. Records under the responsibility of the Chief, Army Reserve and the Commander, U.S. Army Reserve Command include records relating to USAR plans, policies, and operations; changes in the organizational status of USAR units; mobilization and demobilization policies, active duty tours, and the Individual Mobilization Augmentation program; and all other Office of the Chief, Army Reserve (OCAR) records and Headquarters, U.S. Army Reserve Command records. (s) The Commander, United States Army Materiel Command (AMC) is authorized to act on requests for the records of AMC headquarters and to subordinate commands, units, and activities that relate to procurement, logistics, research and development, and supply and maintenance operations. (t) The Provost Marshal General is authorized to act on all requests for provost marshal activities and law enforcement functions for the Army, all matters relating to police intelligence, physical security, criminal investigations, corrections and internment (to include confinement and correctional programs for U.S. prisoners, criminal investigations, provost marshal activities, and military police support. The Provost Marshal General is responsible for the Office of Security, Force Protection, and Law Enforcement Division and is the functional proponent for AR 190-series (Military Police) and 195-series (Criminal Investigation), AR 630-10 Absent Without Leave, Desertion, and Administration of Personnel Involved in Civilian Court Proceedings, and AR 633-30, Military Sentences to Confinement.

Limits on the use of organization -controlled portable storage devices in external systems include complete prohibition of the use of such devices or restrictions on how the devices may be used and under what conditions the devices may be used. Note that while -external- typically refers to outside of the organization's direct supervision and authority that is not always the case. Regarding the protection of CUI across an organization, the organization may have systems that process CUI and others that do not. Among the systems that process CUI there are likely access restrictions for CUI that apply between systems . Therefore, from 52 NIST SP 800-171A, p. 18. 53 NIST SP 800-171 Rev. 2, p. 16.

The Department requests comment on the foregoing proposals, including any benefits, drawbacks, or unintended consequences. We also request comment on the following considerations in particular: a. Whether every 12 months is an appropriate frequency for review of a regulated entity's written policies and procedures for physical safeguards. If not, please explain. b. Whether the written policies and procedures for physical safeguards should be reviewed at different intervals, based on the specific standard or implementation specification. If so, please explain. c. Whether the Department should include additional examples in regulatory text at proposed 45 CFR

164.310(a)(2)(iv) of physical components of a facility related to security for which there should be written policies and procedures to document repairs and modifications. d. Whether the standard at proposed 45 CFR 164.310(d)(1) and its associated implementation specifications at paragraph (d)(2) should apply to technology assets that do not maintain ePHI, but do access the regulated entity's relevant electronic information systems. F. Section 164.312·Technical Safeguards 1. Current Provisions Section 164.312 includes five standards for technical safeguards, which are the requirements concerning the implementation of technology and technical policies and procedures to protect the confidentiality, integrity, and availability of ePHI and related information systems. A regulated entity must comply with the standards for technical safeguards in accordance with 45 CFR 164.306(c) , the provision that describes the general rules for the security standards. Under 45 CFR 164.312(a)(1) , a regulated entity is required to establish policies and procedures for electronic information systems to allow access only to those persons or software programs that have been granted access rights as specified in 45 CFR 164.308(a)(4) . Regulated entities may comply with this standard by implementing a combination of access control methods and technical controls, consistent with the implementation specifications for this standard. The Security Rule does not identify a specific access control method or technology to implement. Regardless of the technology or information system used, access controls should be appropriate for the workforce member's role and/or function. [659] For example, a workforce member responsible for monitoring and administering information systems with ePHI, such as an administrator or a superuser, [660] should only have access to ePHI as appropriate for their role and/or job function. The implementation specifications that provide instructions for satisfying the access control standard are found at 45 CFR 164.312(a)(2) . Two are required and two are addressable. [661] The implementation specifications address unique user identifiers, [662] emergency access procedures, [663] automatic logoff, [664] and encryption and decryption. [665] The implementation (printed page 963)

A configuration of 16 rounds in series is the "guts" of the algorithm; the only significant difference is in the key schedule (Figure 6). This analysis model is based on a 768 bit key, each 48 bit segment is used as a key for one of the 16 rounds. This series configuration is invertible. The average number of corresponding plaintext-ciphertext pairs required to recover a key is still four. In the DES algorithm the beginning and ending permutations are now included with the previous configuration. The effect of the key schedule is that the 16 previous independent operations are no longer independent of one another. The number of plaintext-ciphertext pairs that must be tested to recover a key uniquely is unknown, but may well be larger than one. The statistical properties of the output in the complete algorithm, considered as a pseudorandom number generator, are substantially improved over the properties exhibited by the output of the sixteen independent-operation model

(C) From subsections (d) and (f) because requiring DSS to grant access to records and agency rules for access and amendment of records would unfairly impede the agency's investigation of allegations of unlawful activities. To require DSS to confirm or deny the existence of a record pertaining to a requesting individual may in itself provide an answer to that individual relating to an on-going investigation. The investigation of possible unlawful activities would be jeopardized by agency rules requiring verification of record, disclosure of the record to the (printed page 14780) subject, and record amendment procedures. (5) System identifier and name. V5-04, Counterintelligence Issues Database (CII-DB). (i) Exemption. (A) Information specifically authorized to be classified under E.O. 12958 , as implemented by DoD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1) . (B) Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (C) Records maintained in connection with providing protective services to the President and other individuals under 18 U.S.C. 3506 , may be exempt pursuant to 5 U.S.C. 552a(k)(3) . (D) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (E) Any portion of this system that falls within the provisions of 5 U.S.C. 552a(k)(1) , (k)(2), (k)(3) and (k)(5) may be exempt from the following subsections (c)(3); (d)(1) through

(d)(5); (e)(1); (e)(4)(G), (H), and (I); and (f). (ii) Authority. 5 U.S.C. 552a(k)(1) , (k)(2), (k)(3) and (k)(5). (iii) Reasons. (A) From subsection (c)(3) because giving the individual access to the disclosure accounting could alert the subject of an investigation to the existence and nature of the investigation and reveal investigative or prosecutive interest by other agencies, particularly in a joint-investigation situation. This would seriously impede or compromise the investigation and case preparation by prematurely revealing its existence and nature; compromise or interfere with witnesses or make witnesses reluctant to cooperate with the investigators; lead to suppression, alteration, fabrication, or destruction of evidence; and endanger the physical safety of confidential sources, witnesses, law enforcement personnel and their families.

A key difference between the DFARS 252.204-7012 and CMMC Level 2 requirements is that compliance with NIST SP 800-171 under DFARS 252.204-7012 has not been consistently verified. Under CMMC, compliance will be checked by independent third-party assessors certified by DoD. When this 32 CFR CMMC Program rule is finalized, solicitations for defense contracts involving the processing, storing, or transmitting of FCI or CUI on a non-Federal system will, in most cases, have a CMMC level and assessment type requirement a contractor must meet to be eligible for a contract award. CMMC-related contractual processes will be addressed in DoD's DFARS Case 2019-D041, Assessing Contractor Implementation of Cybersecurity Requirements, which will be proposed by the Department in a separate rulemaking. [12] This rule establishes the CMMC Program and defines requirements both in general and based on the specific CMMC level and assessment type required by the contract and applicable subcontract. Each CMMC level and assessment type is described. 1. Contracts or Subcontracts With a CMMC Level 1 Self-Assessment Requirement a. Security Requirements For CMMC Level 1, contractors and applicable subcontractors are already required to implement the 15 security requirements currently required by the FAR clause 52.204-21. (printed page 89060) b. Assessment Requirements (New) At Level 1, CMMC adds a requirement for contractors and applicable subcontractors to verify through self-assessment that all applicable security requirements outlined in FAR clause 52.204-21 have been implemented. This self-assessment must be performed annually and the results must be entered electronically in the Supplier Performance Risk System (SPRS) (see §.170.15 for details on CMMC Level 1 Self-Assessment requirements and procedures, and specifically

§ 170.15(a)(1)(i) for the information collection). c. Affirmation Requirements (New) A senior official from the prime contractor and any applicable subcontractor will be required to annually affirm continuing compliance with the specified security requirements. Affirmations are entered electronically in SPRS (see § 170.22 for details on Affirmation requirements and procedures). 2. Contracts or Subcontracts With a CMMC Level 2 Self-Assessment Requirement a. Security Requirements For CMMC Level 2, contractors and applicable subcontractors are already required to implement the 110 security requirements currently required by the DFARS clause 252.204-7012, which are aligned with NIST SP 800-171 Rev 2. b. Assessment Requirements (New)

(15) Neither disclose nor allow any CAICO training support service providers, as applicable, to disclose CMMC data or metrics related to authorization or certification activities to any entity other than the Accreditation Body and DoD, except as required by law. (16) Require retraining and redesignation of PIs upon significant change to DoD's CMMC Program requirements. Require retraining and recertification of CCPs, CCAs, and CCIs upon significant change to DoD's CMMC Program requirements, as determined by the DoD or the CAICO. (17) Require CMMC Ecosystem members to report to the CAICO within 30 days of convictions, guilty pleas, or no contest pleas to crimes of fraud, larceny, embezzlement, misappropriation of funds, misrepresentation, perjury, false swearing, conspiracy to conceal, or a similar offense in any legal proceeding, civil or criminal, whether or not in connection with activities that relate to carrying out their role in the CMMC Ecosystem.

§ 170.11 CMMC Certified Assessor (CCA). (a) Roles and responsibilities. CCAs, in support of a C3PAO, conduct Level 2 certification assessments of OSCs in accordance with NIST SP 800-171A Jun2018 (incorporated by reference, see § 170.2), the assessment processes defined in § 170.17, and the scoping requirements defined in § 170.19(c). CCAs must meet all of the requirements set forth in paragraph (b) of this section. A CCA may conduct Level 2 certification assessments and participate on a C3PAO Assessment Team. (b) Requirements. CCAs shall: (1) Obtain and maintain certification from the CAICO in accordance with the requirements set forth in § 170.10. Certification is valid for 3 years from the date of issuance. (2) Comply with the Accreditation Body policies for Conflict of Interest, Code of Professional Conduct, and Ethics set forth in § 170.8(b)(17). (3) Complete a Tier 3 background investigation resulting in a determination of national security eligibility. This Tier 3 background investigation will not result in a security clearance and is not being executed for the purpose of government employment. The Tier 3 background investigation is initiated using the Standard Form (SF) 86 (www.gsa.gov/reference/forms/questionnaire-for-national-security-positions). These positions are designated as non-critical sensitive with a risk designation of 'Moderate Risk' in accordance with 5 CFR 1400.201(b) and (d) and the investigative requirements of 5 CFR 731.106(c)(2) . (4) Meet the equivalent of a favorably adjudicated Tier 3 background investigation when not eligible for a Tier 3 background investigation. DoD will determine the Tier 3 background investigation equivalence for use with the CMMC Program only. (5) Provide all documentation and records in English.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System [OMB Control Number 0704-0225; Docket Number DARS-2016-0041] AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Notice and request for comments regarding a proposed revision of an approved information collection requirement. SUMMARY: In compliance with section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 (44 U.S.C. chapter 35), DoD announces the proposed revision of a public information collection requirement and seeks public comment on the provisions thereof. DoD invites comments on: (a) Whether the proposed collection of information is necessary for the proper performance of the functions of DoD, including whether the information will have practical utility; (b) the accuracy of the estimate of the burden of the proposed information collection; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the information collection on respondents, including the use of automated collection techniques or other forms of information technology. The Office of Management and Budget (OMB) has approved this information collection for use through March 31, 2017. DoD proposes that OMB extend its approval for use for three additional years beyond the current expiration date. DATES: DoD will consider all comments received by December 19, 2016. ADDRESSES: You may submit comments, identified by OMB Control Number (printed page 71712)

0704-0225, using any of the following methods: Federal eRulemaking Portal: <http://www.regulations.gov> . Follow the instructions for submitting comments. Email: osd.dfars@mail.mil . Include OMB Control Number 0704-0225 in the subject line of the message. Fax: 571-372-6094. Mail: Defense Acquisition Regulations System, Attn: Ms. Carrie Moore, OUSD (AT&L) DPAP (DARS), 3060 Defense Pentagon, Room 3B941, Washington, DC 20301-3060. Comments received generally will be posted without change to <http://www.regulations.gov> , including any personal information provided. FOR FURTHER INFORMATION CONTACT: Ms. Carrie Moore, at 571-372-6093. The information collection requirements addressed in this notice are available on the World Wide Web at: <http://www.acq.osd.mil/dpap/dars/dfarspgi/current/index.html> . Paper copies are available from Ms. Carrie Moore, OUSD (AT&L) DPAP (DARS), 3060 Defense Pentagon, Room 3B941, Washington, DC 20301-3060. SUPPLEMENTARY INFORMATION: Title and OMB Number:

) A potential contractor which is located in the United States or [insert applicable country] has been approved for access to classified information and material by the USG or [insert applicable country] security authorities; or (2) If located in a third country, prior written USG consent is obtained. (G) Upon completion of the contract, all classified material furnished or generated pursuant to the contract will be [insert whether the material is to be returned or destroyed, or provide other instructions]. (H) The recipient contractor will insert terms that substantially conform to the language of these provisions, including this one, in all subcontracts under this contract that involve access (printed page 83350) to classified information furnished or generated under this contract. (c) FGI. (1) General. The contractor will notify the csa when awarded contracts by a foreign interest that will involve access to classified information. The csa will oversee and ensure implementation of the security requirements of the contract on behalf of the foreign government, including the establishment of channels for the transfer of classified material. (2) Contract security requirements. The foreign entity that awards a classified contract is responsible for providing appropriate security classification guidance and any security requirements clauses. The contractor will report to the CSA when a foreign entity fails to provide classification guidance. (3) Marking foreign government classified material. Foreign government classified material will be marked in accordance with § 117.14(l). (4) Foreign Government RESTRICTED Information and In Confidence Information. Foreign government RESTRICTED information and in confidence information will be marked in accordance with § 117.14(m). (5) Marking U.S. documents containing FGI. U.S. documents containing FGI will be marked in accordance with § 117.14(n). (6) Marking documents prepared for foreign governments. Marking documents prepared for foreign governments will be marked in accordance with § 117.14(o). (7) Storage and control. Contractors will store foreign government material and control access generally in the same manner as U.S. classified material of an equivalent classification. Contractors will store foreign government material in a manner that will separate it from other material. Separation can be accomplished by establishing distinct files in a storage container or on an information system. (8) Disclosure and use limitations. (i) FGI is provided by the foreign government to the United States. The contractor will: (A) Not disclose FGI to nationals of a third country, or to any other third party, or use it for any purpose other than that for which it was provided without the prior written consent of the originating foreign government. (B) Submit requests for other uses or further disclosure to the GCA for U.S. contracts, and through the CSA for direct commercial contracts.

(4) Obtain access to DoD's secure voice and data transmission systems supporting the voluntary DIB CS Program. Dated: April 25, 2023. Aaron T. Siegel, Alternate OSD Federal Register Liaison Officer, Department of Defense. The Department anticipates that regulated entities would need to develop new or modified policies and procedures for the proposed new requirements to obtain or provide verification of business associates' compliance with the Security Rule's requirements for technical safeguards, conducting a Security Rule compliance audit, and reporting the activation of a contingency plan, as well as other proposed changes, depending on the regulated entities' existing policies and procedures. The Department estimates that the costs associated with developing such policies and procedures would be the labor of a computer and information systems manager for an average of 3.5 hours (with 2.5 hours as a low estimate and 6 hours as a high estimate, depending on the number of entities with written policies and procedures, and their degree of specificity). This would result in total annual costs of \$1,108,432,416 [= 1,822,600 regulated entities × 3.5 hours × \$173.76], with a low estimated total of \$791,737,440 [= 1,822,600 regulated entities × 2.5 hours × \$173.76] and high estimated total of \$1,900,169,856 [= 1,822,600 regulated entities × 6 hours × \$173.76]. The existing rule requires updates to policies and procedures in response to environmental or operational changes affecting the security of the ePHI, and as a result, the Department is estimating additional costs for new policies related to this proposed rule as an incremental increase.

I. Costs Associated With Training Workforce Members The Department anticipates that regulated entities would be able to incorporate new content into existing Security Rule training programs and that the costs associated with doing so would be attributed to the labor of a training specialist for an estimated 2 hours for total annual costs of \$252,247,840 [= 1,822,600 regulated entities × 2 hours × \$69.20]. The low estimate for this activity is \$126,123,920 [= 1,822,600 regulated entities × 1 hour × \$69.20], and the high estimate is \$378,371,760 [= 1,822,600 regulated entities × 3 hours × \$69.20]. Many of the changes in the NPRM require the (printed page 1000) adoption of standard cybersecurity practices as applied specifically to address the confidentiality, integrity, and availability of ePHI, so we expect that an information security analyst would be familiar with this content. These estimated costs would address any required revisions to training for workforce members within the first year of compliance with a final rule. Any further recurring component is likely to be implemented into regularly scheduled employee training and thus would not be directly attributable to the proposals in this NPRM.

m. Revising Business Associate Agreements The NPRM proposes to provide a transition period in proposed 45 CFR 164.318

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 204, 209, 212, and 252 [Docket DARS-2019-0065] RIN 0750-AK58 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Final rule. SUMMARY: DoD is issuing a final rule amending the Defense Federal Acquisition Regulation Supplement (DFARS) to remove a provision that is no longer necessary, pursuant to action taken by the Regulatory Reform Task Force. DATES: Effective October 31, 2019. FOR FURTHER INFORMATION CONTACT: Ms. Carrie Moore, telephone 571-372-6093. SUPPLEMENTARY INFORMATION: I. Background DoD is amending the DFARS to remove DFARS provision 252.204-7013, Limitations on the Use or Disclosure of Information by Litigation Support Contractors, its associated prescription at 204.7403 and related text at 209.505-4(b)(ii) and 212.301. This provision is included in solicitations for the acquisition of litigation support

services. The provision includes a representation that, by submission of its offer, the offeror agrees to handle and protect all litigation information and documentation as described in the provision, indemnify the Government from any liability or claim that arises from the offeror's misuse of the litigation information, and ensure its employees are subject to the same use and nondisclosure obligations stated in the provision prior to accessing any litigation information. The provision also notifies offerors that third parties holding proprietary rights or any other legally protectable interest in the provided litigation information have the right of direct action against the offeror for any unauthorized use or disclosure by the offeror. DFARS provision 252.204-7013 is unnecessary. The same information is provided to offerors by including DFARS clause 252.204-7014, Limitations on the Use or Disclosure of Information by Litigation Support Contractors, in a solicitation. II. Discussion and Analysis DFARS clause 252.204-7014 implements the authority and requirements of 10 U.S.C. 129d

The DIB CS/IA program focuses on sharing cyber security related information and minimizes the collection of information from participating DIB companies, seeking only the information that is necessary to support this cyber security program. The PIA for the DIB CS/IA program details the comprehensive processes to safeguard PII. The operational implementation of the DIB CS/IA program receives PII from DIB Companies in two ways: (i) For program administration and management purposes, the DIB companies share with DoD the typical business contact information for its personnel that are serving as company points of contact for the program activities or specific cyber incidents; and (ii) for cyber incident response and analysis purposes, DIB companies may share PII as a necessary part of the information that they have determined is relevant to cyber incident response, analysis, or damage assessment. In addition, DIB companies are prohibited from sharing any information unless they have determined that the information has been lawfully collected and is authorized to be shared with DoD. The DIB CS/IA Program restricts access to such PII and attribution information only to those authorized personnel who have a need-to-know such information for duties in support of the DIB CS/IA Program and are subject to strict nondisclosure obligations. The PII is only maintained as long as necessary for DIB CS/IA Program activities, and is managed and disposed of in accordance with applicable records management requirements. No change is made to the rule. Comment: One comment stated that the rule allows a number of private companies to sell and share private citizens' data including to other Governments, including any data that 'transits' any government system. Response: The voluntary DIB CS/IA program does not authorize participating companies to sell any information, to anyone, in any context whatsoever. The program also does not authorize DIB companies to share any information with anyone other than program participants. The program does not permit the sharing of information with any governments other than authorized U.S. Government participants. No change is made to the rule. Comment: One comment stated that the rule does not properly ensure implementation of the new Controlled Unclassified Information (CUI) framework from Executive Order 13556 into its treatment of covered defense information. Response: As stated in the Background Section above, the program is designed to ensure consistency with and support for, federal activities related to the handling and safeguarding of controlled unclassified information that are being led by the National Archives and Records Administration pursuant to Executive Order 13556. As CUI implementation evolves in the Government, the rule will be modified as necessary to ensure compliance. No change is made to the rule. Comment:

Comments which suggest that enrollment in the DoD's DIB CS Program can be an alternative means of meeting the objectives of CMMC misinterpret the services that the DIB CS Program provides. The DIB CS Program does not provide any mechanism for verifying whether those participants have secured their contractor owned information systems to the standards required by DFARS clause 252.204-7012. Likewise, the recommended NSA cybersecurity offerings also do not provide the same verification mechanism that CMMC will provide. CMMC Program requirements apply to contractor-owned information systems that process, store, or transmit FCI and CUI. Hardware and software approving authorities for GFE are not relevant to this CMMC rule. The DoD declined to adopt the recommendation to provide GFE to DIB contractors to maintain security, ownership of data and support Clinger-Cohen Act compliance. Some comments received reflect a misinterpretation of the cost estimates that accompany this rule, which are intended to inform the rulemaking process. The cost estimates are not indicative of a funded budget line which could be reprogrammed to fund a new agency to meet the objectives of the CMMC Program. Comments recommending that funding be appropriated (by Congress) to provide the DIB with security solutions are beyond the scope of this rule. b. Alternate Standards Comment: One commenter recommended aligning requirements to DoD policies rather than to NIST standards and relying on FISMA compliance assessments in lieu of the CMMC model. Another commenter

recommended the DoD and NIST work with other international standards organizations to incorporate CMMC requirements (really NIST standards) into existing ISO/IEC and CMMI standards. In general, these commenters recommended DoD accept alternate assessments conducted against alternate standards by assessors with alternate training and qualifications. They further recommended that DoD issue an RFI seeking recommendation of alternate third-party assessment schemes. One commenter recommended the rule be modified to require that contracts with a CMMC level 3 requirement also require use of a FedRAMP moderate or higher CSP, and that contracts with a CMMC level 2 requirement permit use of CSPs with either FedRAMP Moderate authorization (or higher) or CMMC level 2 or 3 certification assessment. Response: CMMC is based on the executive branch's CUI Program as the authoritative source, as codified in 32 CFR part 2002. The definition of CUI and general requirements for its safeguarding are included in 32 CFR 2002.4 and 2002.14, respectively. 32 CFR 2002.14(h)(2) specifically requires that Agencies must use NIST SP 800-171 when establishing security requirements to protect CUI's confidentiality on non-Federal information systems. . . . The CMMC (printed page 83157)

(2) The requirements for defining the CMMC Assessment Scope for CMMC Levels 1, 2, and 3 are set forth in this section. Additional guidance regarding scoping can be found in the guidance documents listed in paragraphs (e) through (g) of appendix A to this part. (b) CMMC Level 1 scoping. Prior to performing a Level 1 self-assessment, the OSA must specify the CMMC Assessment Scope. (1) Assets in scope for Level 1 self-assessment. OSA information systems which process, store, or transmit FCI are in scope for CMMC Level 1 and must be self-assessed against applicable CMMC security requirements. (2) Assets not in scope for Level 1 self-assessment. (i) Out-of-Scope Assets. OSA information systems which do not process, store, or transmit FCI are outside the scope for CMMC Level 1. An endpoint hosting a VDI client configured to not allow any processing, storage, or transmission of FCI beyond the Keyboard/Video/Mouse sent to the VDI client is considered out-of-scope. There are no documentation requirements for out-of-scope assets. (ii) Specialized Assets. Specialized Assets are those assets that can process, store, or transmit FCI but are unable to be fully secured, including: Internet of Things (IoT) devices, Industrial Internet of Things (IIoT) devices, Operational Technology (OT), Government Furnished Equipment (GFE), Restricted Information Systems, and Test Equipment. Specialized Assets are not part of the Level 1 CMMC Assessment Scope and are not assessed against CMMC security requirements. (3) Level 1 self-assessment scoping considerations. To scope a Level 1 self-assessment, OSAs should consider the people, technology, facilities, and External Service Providers (ESP) within its environment that process, store, or transmit FCI. (c) CMMC Level 2 Scoping. Prior to performing a Level 2 self-assessment or Level 2 certification assessment, the OSA must specify the CMMC Assessment Scope. (1) The CMMC Assessment Scope for CMMC Level 2 is based on the specification of asset categories and their respective requirements as defined in table 3 to this paragraph (c)(1). Additional information is available in the guidance document listed in paragraph (f) of appendix A to this part. Table 3 to § 170.19 (c)(1) CMMC Level 2 Asset Categories and Associated Requirements

Asset category	Asset description	OSA requirements	CMMC assessment requirements
Assets that are in the Level 2 CMMC Assessment Scope	Controlled Unclassified Information (CUI) Assets	Assets that process, store, or transmit CUI	Document in the asset inventory
	Document asset treatment in the System Security Plan (SSP).	Document in the network diagram of the CMMC Assessment Scope.	Prepare to be assessed against CMMC Level 2 security requirements.
	Assess against all Level 2 security requirements.	Security Protection Assets	Assets that provide security functions or capabilities to the OSA's CMMC Assessment Scope

(1) Obtain and maintain certification from the CAICO in accordance with the requirements set forth in § 170.10. Certification is valid for 3 years from the date of issuance. (2) Comply with the Accreditation Body policies for Conflict of Interest, Code of Professional Conduct, and Ethics set forth in § 170.8(b)(17). (3) Provide all documentation and records in English. (4) Provide the Accreditation Body and the CAICO with the most up-to-date and accurate information detailing their qualifications, training experience, professional affiliations, and certifications, and, upon reasonable request, submit documentation verifying this information. (5) Not provide CMMC consulting services while serving as a CMMC instructor. (6) Not participate in the development of exam objectives and/or exam content or act as an exam proctor while at the same time serving as a CCI. (7) Keep confidential all information obtained or created during the performance of CMMC training activities, including trainee records, except as required by law. (8) Not disclose any CMMC-related data or metrics to anyone without prior coordination with and approval from DoD. (9) Notify the Accreditation Body or the CAICO if required by law or authorized by contractual

commitments to release confidential information. (10) Not share with anyone any CMMC training-related information not previously publicly disclosed. § 170.13 CMMC Certified Professional (CCP).

(a) Roles and responsibilities. A CMMC Certified Professional (CCP) completes rigorous training on CMMC and the assessment process to provide advice, consulting, and recommendations to their clients. Candidate CCPs are certified by the CAICO after successful completion of the CCP training and testing requirements set forth in paragraph (b) of this section. CCPs are eligible to become CMMC Certified Assessors and can participate as a CCP on CMMC Level 2 Certification Assessments with CCA oversight where the CCA makes all final determinations. (b) Requirements. CCPs shall: (1) Obtain and maintain certification from the CAICO in accordance with the requirements set forth in § 170.10. Certification is valid for 3 years from the date of issuance. (2) Comply with the Accreditation Body policies for Conflict of Interest, Code of Professional Conduct, and Ethics as set forth in § 170.8(b)(17). (3) Complete a Tier 3 background investigation resulting in a determination of national security eligibility. This Tier 3 background investigation will not result in a security clearance and is not being executed for the purpose of government employment. The Tier 3 background investigation is initiated using the Standard Form (SF) 86. These positions are designated as non-critical sensitive with a risk designation of 'Moderate Risk' in accordance with title 5 CFR 1400.201(b) and (d) and the investigative requirements of title 5 CFR 731.106(c)(2).

Under the CMMC Program, CMMC contract requirements include self-assessments and third-party assessments for CMMC Level 2, predicated on program criticality, information sensitivity, and the severity of cyber threat. Based on the type and sensitivity of the information to be protected, a defense contractor must achieve the appropriate CMMC Status and demonstrate implementation of the associated set of information protection requirements. If the CMMC Status of Level 1 (Self) or Level 2 (Self) is a contract requirement, the defense contractor will be required to self-assess its compliance with the CMMC Level 1 or Level 2 security requirements and submit both the self-assessment results and an affirmation of conformance in SPRS. Level 1 self-assessment and associated

affirmation is required annually. Level 2 self-assessment is required every three years with an affirmation following the self-assessment and annually after the Final CMMC Status Date. If the CMMC Status of Level 2 (C3PAO) is a contract requirement, the Level 2 certification assessment must be performed by an authorized or accredited CMMC Third Party Assessment Organization (C3PAO). When the CMMC Status of Level 3 (DIBCAC) is a contract requirement, the Level 3 certification assessment by DCMA DIBCAC is required following the achievement of the CMMC Status of Final Level 2 (C3PAO). Upon achievement of the CMMC Status of Level 2 (C3PAO) or Level 3 (DIBCAC), the offeror will be issued a Certificate of CMMC Status. The assessment results are documented in SPRS to enable contracting officers to verify the CMMC Status and CMMC Status Date (i.e., not more than three years old) of an offeror prior to contract award. The offeror must also submit an affirmation of conformance in SPRS following the assessment and annually after the Final CMMC Status Date. CMMC allows the use of a Plan of Action and Milestones (POA&Ms) for specified CMMC Level 2 and Level 3 security requirements. Each POA&M must be closed (i.e., all requirements completed), within 180 days of the initial assessment. (printed page 83170) The details of the requirements for self-assessment, certification assessment, and affirmation for each CMMC Level, are provided in §§ 170.15 through 170.18. POA&M requirements and affirmation requirements are provided in §§ 170.21 and 170.22.

CIS Safeguard 4.4 · Implement and Manage a Firewall on Servers Implement and manage a firewall on servers, where supported. Example implementations include a virtual firewall, operating system firewall, or a third-party firewall agent. Implementation Groups: 1,2,3 Asset Type: devices Security Function: protect Parent Control: Secure Configuration of Enterprise Assets and Software

IR.L2-3.6.1 · Incident Handling CMMC Assessment Guide · Level 2 | Version 2.13 137 DISCUSSION [NIST SP 800-171 REV. 2]121 Organizations recognize that incident handling capability is dependent on the capabilities of organizational systems and the mission/business processes being supported by those systems. Organizations consider incident handling as part of the definition, design, and development of mission/business processes and systems. Incident-related information can be obtained from a variety of sources including audit monitoring, network monitoring, physical access monitoring, user and administrator reports, and reported supply chain events. Effective incident handling capability includes coordination among many organizational entities including mission/business owners, system owners, authorizing officials, human resources offices, physical and personnel security offices, legal departments, operations personnel, procurement offices, and the risk executive. As part of user response activities, incident response training is provided by organizations and is linked directly to the assigned roles and responsibilities of organizational personnel to ensure that the appropriate content and level of detail is included in such training. For example, regular users may only need to know who to call or how to recognize an incident on the system; system administrators may require additional training on how to handle or remediate incidents; and incident responders may receive more specific training on forensics, reporting, system recovery, and restoration. Incident response training includes user training in the identification/reporting of suspicious activities from external and internal sources. User response activities also includes incident response assistance which may consist of help desk support, assistance groups, and access to forensics services or consumer redress services, when required. NIST SP 800-61 provides guidance on incident handling. SP 800-86 and SP 800-101 provide guidance on integrating forensic techniques into incident response. SP 800-161 provides guidance on supply chain risk management. FURTHER DISCUSSION Incident handling capabilities prepare your organization to respond to incidents and may: · identify people inside and outside your organization you may need to contact during an incident; · establish a way to report incidents, such as an email address or a phone number; · establish a system for tracking incidents; and · determine a place and a way to store evidence of an incident. Software and hardware may be required to analyze incidents when they occur. Incident prevention activities are also part of an incident-handling capability. The incident-handling team provides input for such things as risk assessments and training. OSAs detect incidents using different indicators. Indicators may include: · alerts from sensors or antivirus software; 121 NIST SP 800-171 Rev. 2, p. 26.

Control UM-1: authentication use cases is shown in Table A.3 below. This approach is possible because of the granularity of description of each PIV Authentication Use Case in the FIPS 201-2 specification document. In this context, an observation is in order regarding the functionality provided by the primitive authentication mechanism PUM-1. PUM-1 provides the assurance that the person identifier in the smart token has been issued by the authorized card issuer and has since not

been tampered with. It accomplishes this objective by verifying the digital signature associated with a CHUID object that is dedicated for carrying this person identifier value and its associated attributes. However, the same assurance is also provided by PUM-2.1, PUM-2.2 and PUM-6 primitive authentication use cases. This is the underlying logic for including PUM-1 (and its associated verified bindings) as a constituent primitive authentication mechanism whenever the above three primitive authentication mechanisms (i.e., PUM-2.1, PUM-2.2 and PUM-6) are part of constituent primitive authentication mechanisms in any PIV authentication use case. This is the case with PIV authentication mechanisms PKI-CAK, BIO, BIO-A and PKI-AUTH and is appropriately shown in Table A.3. In PUM-2.1 and PUM-2.2, the origin and integrity of the person identifier are ensured by validating the digital certificate that includes this value. In PUM-6, the same assurance is provided by verifying the digital signature of the signed biometric object that contains the person identifier. Table A.3.

) The requested information is specified in agency regulations as being information the release of which would have an adverse effect on the ability of the Government to obtain the same or similar information in the future. (D) To qualify for withholding, the information must meet the following limitations: (1) If the information came into the possession or under the control of the U.S. Government prior to October 30, 2000, and more than 25 years prior to receipt of the FOIA request, the DoD Component shall notify the foreign government or international organization of the request for disclosure. The information then qualifies for withholding only if the foreign government or international organization requests in writing that the information not be disclosed for a specific period of time. This date can be extended with a later request by the foreign government or international organization. (2) If the information came into the possession or under the control of the U.S. Government after October 30, 2000, the information cannot be withheld after the release date specified by the foreign government or international organization. In the case where one or more foreign governments or international organizations provided the information, the latest date specified by any of them will be used. If no release date was specified, and the information came into the possession of the DoD Component more than 10 years prior to receipt of the FOIA request, the procedures set forth in § 286.18(d)(1)(i) apply. § 286.19 Initial determinations. (a) IDA. (1) The determination whether to withhold information responsive to a FOIA request shall be made by any suitable official designated in writing as an IDA by the DoD Component. In designating IDAs, the DoD Component shall balance the goals of centralization of authority to promote uniform decisions, and decentralization to facilitate responding to each request within the time limitations of the FOIA. The IDA shall review all withheld information to determine whether it meets the criteria for withholding under one or more of the FOIA exemptions. This determination may be made upon the recommendation of a review official. (2) IDAs and review officials shall not use the existence of classification markings, distribution limiting statements, such as ·For Official Use Only· markings, as justification to withhold information. Information so marked must be reviewed after the receipt of a FOIA request to determine if the markings still apply. (3) To deny, in whole or in part, a requested record that is in the possession and control of the DoD Component, the IDA must determine that one or more of the FOIA exemptions justify withholding all or part of the record.

Some comments received lacked relevance to the rule's content, which is limited to specific CMMC Program requirements. The DoD declines to address speculation about lobbying activities. Verifying compliance with applicable security requirements may increase financial cost to the DoD due to increased contract costs but it is necessary for the protection of DoD CUI. The cost of lost technological advantage over potential adversaries is greater than the costs of such enforcement. The value of information (and impact of its loss) does not diminish when the information moves to contractors. The trade-off is between protecting sensitive information from our nation's adversaries and accepting the fact that security costs increase for numerous reasons. Many of those cost-drivers are completely independent of CMMC. While CMMC compliance adds to an organization's cost, no member of the DIB can assume the status-quo in today's ever-changing cyber security environment. Increasing costs to protect the nation's data and industries from (printed page 83151) emerging threats is simply a component of doing business anywhere in the world. Processing, storing, or transmitting sensitive Government information comes with a handling cost that needs to be built into each organization's business model. Some comments included suggestions about how workflow should occur between prime and subcontractors to decrease or eliminate the transfer of CUI to subcontractors. The DoD cannot dictate these business practices but encourages prime contractors to work with its subcontractors to flow down CUI with the required security and the least burden.

Questions regarding what to mark as CUI are out of scope of this rule. At the time of award, the DoD may have no visibility into whether the awardee will choose to further disseminate DoD's CUI, but DFARS clause 252.204-7012 and DFARS clause 252.204-7021 require that the prime contractor to flow down the information security requirement to any subcontractor with which the CUI will be shared. Decisions regarding which DoD information must be shared to support completion of which subcontractor tasks takes place between the prime contractor and the subcontractors chosen to complete the specific tasks. c. Phasing the Cost To Comply Comment: Two comments suggested a phased compliance would help offset financial burden while working toward full compliance. One comment expressed concern that Managed Service Providers (MSPs), many of which are small businesses, will not have time to achieve Level 2 certification before their OSA and OSC customers need them to be certified and recommended extending the phased timeline.

However, an organization that receives a product from a custom development team and/or a commercial off-the-shelf (COTS) supplier can register the contained (trusted) software files, and - Identify software files through the use of trusted digital fingerprint repositories; - Link products to software files through a SWID tag; - Whitelist authorized software and block all other software by default; - Blacklist (and block by default) unauthorized and/or known malicious or unsafe software; - Graylist (and block by default or allow by exception) until a determination is made of whether to authorize particular software; - Require installation media to be digitally signed by a trusted source early in the supply chain to prevent tampering in the supply chain. Installation media can also include a signed SWID tag; - Require all mobile code to be digitally signed by a trusted source; and - Use a trusted platform module to verify the software used to boot the system.

gs and relationships between the security standards and guidelines developed by NIST, the International Organization for Standardization (ISO), and the International Electrotechnical Commission (IEC). Identify determination statements for organization-defined parameters (ODPs) first and separately from the determination statements for each control item; Improve the readability of the assessment procedures; Provide a structured schema for automated tools when assessment information is imported into such tools; Provide greater flexibility in conducting assessments by giving organizations the capability to target certain aspects of controls (highlighting the particular weaknesses and/or deficiencies in controls), Improve the efficiency of security and privacy control assessments; Support continuous monitoring and ongoing authorization programs by

providing a greater number of component parts of security and privacy controls that can be assessed at organization-defined frequencies and degrees of rigor.

) (§ 20.84), its contractors (§ 20.90), other Federal government agencies (§ 20.85), or foreign government agencies (§ 20.89). Procedural and other safeguards must be followed for FDA to share nonpublic information with other persons. For FDA to share confidential commercial information with CBP under § 20.85, CBP must sign a written agreement that it will not further disclose the information except with FDA's written permission. (Comment 158) Several comments express concern about the risk of disclosure of information about a formula or recipe. One of these comments noted that, even if the complete formula may not be disclosed, listing the source of each ingredient in a product would reveal the recipe for that product. Other comments ask how FDA would handle commercially sensitive information that might be derived if FDA provides information about a one-up source nontransporter for each of the ingredients in a recipe. (Response) As discussed in response to comment 74 of this document, several statutes and the agency's information disclosure regulations at parts 20 and 21 govern the agency's ability to disclose information to the public, including information obtained under section 306 of the Bioterrorism Act. For example, section 301 of the FD&C Act prohibits any person from using *** to his own advantage, or revealing, other than to the Secretary or officers or employees of the Department, or to the courts ***, any information acquired under authority of [section 414 or 704] concerning any method or process which as a trade secret is entitled to protection ***. FDA follows these laws in determining the proper treatment of the information it receives. N. Comments on What Are the Consequences of Failing to Establish and Maintain Records or Make Them Available to FDA as Required by This Subpart? (Proposed § 1.363) (Comment 159) Three comments state that imposition of criminal liability would be inappropriate and excessive if they performed to the best of their abilities. The comments state that taking time beyond 4 hours to locate, compile, and provide records on a detained article's manufacture should not be viewed as a prohibited act. (Response) As noted previously, FDA has changed the proposed times in § 1.361 of this final rule for responding to a request for access to records to a requirement that all records be made available as soon as possible, not to exceed 24 hours from the time of receipt of the official request. Failure to establish or maintain records or refusal to permit access to or verification or copying of any record is a prohibited act under section 301 of the FD&C Act.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 201, 245, and 252 RIN Number 0750-AG38 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Final rule. SUMMARY: DoD is issuing a final rule amending the Defense Federal Acquisition Regulation Supplement (DFARS) regarding Government Property, to reflect the recent revisions to Government Property elsewhere in the Code of Federal Regulations. DATES: Effective Date: August 19, 2011. FOR FURTHER INFORMATION CONTACT: Ms. Meredith Murphy, 703-602-1302. SUPPLEMENTARY INFORMATION: I. Background DoD is revising subparts 245.6 and 245.7 to be consistent with the changes to FAR subparts 45.6 and 45.7, published in the Federal Register at 72 FR 27364 on May 15, 2007. A proposed DFARS rule was published in the Federal Register at 75 FR 75444 on December 3, 2010. The public comment period for the proposed rule closed February 1, 2011. Comments were received from three respondents. A discussion and analysis of the comments is provided in section II of this notice. Any revisions to the final rule based on public comments are addressed in the DoD responses to the comments received. II. Discussion and Analysis Comments received in response to the proposed rule are organized into six categories and are discussed in the paragraphs that follow. A. Clarifying Responsibilities Comment: A respondent recommended that * * * or the head of the contract administration office be added to DFARS 201.670(a). DoD response: DFARS 201.670(a) has been revised to specify that the appropriate agency authority may delegate contract administration functions to the cognizant contract administration office, in which case the contract administration office appoints the property administrators and plant clearance officers in writing. This language was formerly found at DFARS 245.70. Comment: A respondent recommended that DFARS 252.245-70XX(i) be revised to make the contractor's responsibility for compliance with export control law and regulations a due diligence responsibility. DoD Response:

the check system specific result file and check name within the result file using the @href and @name attributes, respectively. This approach provides traceability between XCCDF and check results. 9. Where applicable to the target system, each of the following <xccdf:fact> elements SHALL be provided:

Apply and document appropriate sanctions against workforce members who fail to comply with the security policies and procedures of the covered entity or business associate in accordance with the written policies and procedures for sanctioning workforce members required by paragraph (a)(6)(ii)(A) of this section. (7) Standard: Information system activity review ·(i) General. Implement written policies and procedures for regularly reviewing records of activity in the covered entity's or business associate's relevant electronic information systems. (ii) Implementation specifications ·(A) Policies and procedures. Establish written policies and procedures for retaining and reviewing records of activity in the covered entity's or business associate's relevant electronic information systems by persons and technology assets, including the frequency for reviewing such records. (B) Scope. Records of activity in the covered entity's or business associate's relevant electronic information systems by persons and/or technology assets include but are not limited to audit trails, event logs, firewall logs, system logs, data backup logs, access reports, anti-malware logs, and security incident tracking reports. (C) Record review. Review records of activity in a covered entity's or business associate's relevant electronic information systems by persons and technology assets as often as reasonable and appropriate for the type of report or log and document such review. (D) Record retention. Retain records of activity in the covered entity's or business associate's relevant electronic information systems by persons and technology assets for a period of time that is reasonable and appropriate for the type of report or log. (E) Response. Where a suspected or known security incident is identified during the review required by paragraph (a)(7)(ii)(C) of this section, respond in accordance with the covered entity's or business associate's security incident response plan required by paragraph (a)(12)(ii)(A)(1) of this section. (F) Maintenance. Review and test the written policies and procedures required by paragraph (a)(7)(ii)(A) of this section at least once every 12 months and modify as reasonable and appropriate. (8) Standard: Assigned security responsibility. In writing, identify the security official who is responsible for the development and implementation of the policies and procedures, written or otherwise, and deployment of technical controls required by this subpart for the covered entity or business associate. (9) Standard: Workforce security ·(i) General. Implement written policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information and relevant electronic information systems, and to prevent those workforce members who are not authorized to have access from obtaining access to electronic protected health information and relevant electronic information systems. (ii) Implementation specifications ·(A)

(Comment 142) Some comments state that the proposed time is reasonable for record production if the requested records are onsite and of recent transactions (i.e., within the last 3 months). One comment urges the agency to clarify that, although companies must make the records available within 4 hours, the agency does not expect companies to link the sources of each ingredient with every finished lot of product within that timeframe. Another comment states that, within the 4-hour proposed time, a firm will not be able to make records available that are stored offsite and currently are subject to contracts that allow the vendors to deliver records on the next business day. The comment recommends that FDA consider the possibility of allowing records stored offsite to be produced at locations more convenient than the manufacturing facility, such as FDA offices, headquarters, or other locations mutually agreed upon to expedite record examination. Some comments also state that the cost of renegotiating record storage contracts would cost thousands of dollars, more than the \$151 per firm cost that FDA estimated. They recommend that FDA allow companies to provide records ·within a reasonable period of time· or that the final rule (printed page 71606) give companies 24 hours to make records available to FDA from the time of receipt of FDA's official request. Several comments state that the proposed time does not reasonably reflect the following: The scope of requested records; the accessibility, degree of compatibility and number of recordkeeping systems involved; the limitations on record maintenance of some systems; the limited physical access to nonelectronic records; and the presence or absence of a quality assurance system. Comments further state that, with millions of foods transported annually, many firms utilize various data systems and have implemented records maintenance procedures to meet their specific company needs. Compliance with this new rule requires establishing new protocols and developing new database systems, which would require a substantial capital investment.

In calendar year (CY) 2021 DoD paused the planned CMMC rollout to conduct an internal review of the CMMC Program. The internal review resulted in a refined and streamlined set of requirements that addressed many of the concerns identified in the public comments received relating to CMMC 1.0. These changes have been incorporated into the CMMC Program structure and policies, now referred to as CMMC 2.0. In July 2022, the CMMC PMO met with the Office of Advocacy for the United States Small Business Administration (SBA) to address the revisions planned in CMMC 2.0 that are responsive to prior SBA concerns. The CMMC Program will enhance the ability of the DoD to safely share sensitive unclassified information with (printed page 89081) defense contractors and know the information will be suitably safeguarded. Once fully implemented, CMMC will incorporate a set of cybersecurity requirements into acquisition contracts to provide verification that applicable cyber protections have been implemented. Under the CMMC Program, defense contractors and subcontractors will be required to implement certain cybersecurity protection requirements tied to a designated CMMC level and either perform a self-assessment or obtain an independent assessment from either a third-party or DoD as a condition of a DoD contract award. CMMC is designed to validate the protection of sensitive unclassified information that is shared with and generated by the Department's contractors and subcontractors. Through protection of information by adherence to the requirements verified in CMMC 2.0, the Department and its contractors will prevent disruption in service and the loss of intellectual property and assets, and thwart access to sensitive unclassified information by the nation's adversaries. The CMMC Program is intended to: (1) align cybersecurity requirements to the sensitivity of unclassified information to be protected, and (2) add a certification element, where appropriate, to verify implementation of cybersecurity requirements. As part of the program, DoD also intends to provide supporting resources and training to defense contractors to help support companies who are working to achieve the required CMMC level. The CMMC Program provides for assessment at three levels: basic safeguarding of FCI at CMMC Level 1, broad protection of CUI at CMMC Level 2, and enhanced protection of CUI against risk from Advanced Persistent Threats (APTs) at CMMC Level 3. The CMMC Program is designed to provide increased assurance to the Department that a defense contractor can adequately protect sensitive unclassified information (i.e., FCI and CUI) in accordance with prescribed security requirements, accounting for information flow down to its subcontractors in a multi-tier supply chain.

In addition, FDA should acknowledge the unique, closed distribution model of the direct selling business and exempt independent distributors in a direct selling organization from the requirement to maintain records concerning the immediate previous source. In the closed distribution model of direct selling, the direct selling company is the source of all products sold by its distributors. Distributors typically obtain the products they redistribute directly from the direct selling company with which they are associated. Under the proposed regulations, the direct selling company will maintain records that identify the carriers and the distributors who are the immediate subsequent recipients of the product. Any records maintained by the distributor regarding the immediate previous source for such shipments would be wholly duplicative of the records held by the direct selling company. (Response) Whether these independent distributors are subject to the requirement to establish and maintain records to identify the immediate subsequent recipients depends on the nature of their customers. Section 1.327(d) of this final rule excludes persons who distribute food directly to consumers from the requirement in § 1.345 of this final rule to establish and maintain records of the nontransporter and transporter immediate subsequent recipients. As discussed in response to comment 37, FDA concluded that to require such records would be too burdensome and not necessary to help address credible threats of serious adverse health consequences or death to humans or animals. Thus, independent distributors are not required to maintain records of subsequent recipients who are consumers. Independent distributors, however, are required to keep records of subsequent recipients who are not consumers. However, an independent distributor who qualifies as a retail food establishment under § 1.327(e) of the final rule that also distributes food to persons who are not consumers is required to identify the nontransporter and transporter immediate subsequent recipients as to those transactions only to the extent the information is reasonably available. FDA needs such records to quickly and effectively traceback and trace forward in the event of a food-related emergency. However, an independent distributor who qualifies as a retail food establishment that employs 10 or fewer full-time equivalent employees is excluded from all of the requirements in this subpart, except the record access provisions for existing records under §§ 1.361 and 1.363.

According to FedRAMP data and subject matter experts, there are approximately 280 unique FedRAMP-

authorized and ready cloud service offerings available to the Federal Government. For this estimate, the Government will award approximately 280 contracts for cloud services impacted by this rule over a five-year period (20 percent each year). Based on the number of FedRAMP-authorized offerings, the Government estimates that there are approximately 56 new or revised FIS offerings (20 percent * 280 cloud service offerings) each year for which the Government contracts. For this estimate, the Government assumes: the number of new or revised FIS offerings the Government contracts for each year is equivalent to the number new FIS impacted by this rule annually; one service provider is responsible for executing all the requirements of this rule for a FIS; and that each FIS is being serviced by a different contractor. Therefore, the Government estimates that 56 unique entities will be awarded a contract annually for the development, implementation, operation, or maintenance of a cloud FIS on behalf of the Government. Based on the input of subject matter experts, the Government further estimates that: Of the 28 contractors that will be awarded a contract each year to operate or maintain a non-cloud FIS, approximately three (10 percent) are small businesses and 25 (90 percent) are other than small businesses. Of the 56 contractors that will be awarded a contract each year to operate or maintain a cloud FIS, approximately three (five percent) are small businesses and 53 (95 percent) are other than small businesses.

B. Contractor Compliance Requirements and Estimate of Cost The total estimated annualized public costs associated with this FAR rule over a ten-year period (calculated at a 7-percent discount rate) are approximately \$55 million annually, or \$388 million in net present value, based on the discussion in paragraphs IV.B.1. through IV.B.7 below. The following compliance requirements in FAR clause 52.239-YY and 52.239-XX are considered new to the FAR for all Federal contractors that develop, implement, operate, or maintain a FIS using cloud or non-cloud computing services, as applicable:

1. Regulatory Familiarization The new FAR clauses are prescribed for use in solicitations and contracts for services to develop, implement, operate, or maintain a FIS. It is expected that all 84 contractors (28 non-cloud FIS contractors + 56 cloud FIS contractors) awarded a contract annually for these services will need, to some degree, to become familiar with the various compliance requirements of the FAR, as well as the requisite and applicable NIST SP guidelines, FIPS Publication standards, CISA BODs and EDs, and FedRAMP requirements, to be prepared to implement and maintain the cybersecurity standards and requirements for a FIS in performance of a Federal contract. It is assumed that most contractors will be familiar with, to some degree, some or all these documents.

Program makes no change to the CUI program or its implementing policies. Contractually, DFARS clause 252.204-7012, effective since December 2017, requires contractors to implement the NIST SP 800-171 security requirements to provide adequate security applicable for processing, storing, or transmitting CUI in support of the performance of a DoD contract. That requirement applies, regardless of the number of computers or components in a non-Federal information system. The CMMC Program provides an assessment mechanism to verify that prospective offerors comply with the applicable information security requirements. All executive agencies are required to follow the policies described in 32 CFR 2002.14. DoD aligned CMMC requirements with NIST SP 800-171 R2 because it is enterprise focused and is already required in DoD contracts when DFARS clause 252.204-7012 is applicable. DFARS clause 252.204-7012 and NIST SP 800-171 R2 provide the cybersecurity requirements, whereas CMMC validates implementation of those requirements. CMMC does not duplicate these documents. The DoD publishes Security Technical Implementation Guides (STIGs) for specific products, primarily to guide secure implementation in DoD systems. The OSA is responsible for creating the implementation guidance they will use to meet the CMMC security requirements. OSAs are free to use the DoD STIGs if they feel they are appropriate. The DoD does not want to limit the choices available to the OSA for implementation guidance. In addition, the DoD declines to create STIGs for all products that might be used in the OSA's environment. Some comments lacked relevance to the rule's content, which is limited to specific CMMC program requirements. Changes to DFARS clause 252.204-7012 are outside the scope of this rule. DoD declines to modify CMMC Level 2 or Level 3 requirements related to use of Cloud Service Providers (CSP). A CSP is assessed against the FedRAMP Moderate baseline. This is required when a CSP, regardless of the component or type of CSP, processes, stores, or transmits CUI. The DoD declines to align CMMC requirements to alternate standards or accept compliance with alternate standards in lieu of the NIST SP 800-171 standard mandated by 32 CFR part 2002 for the protection of CUI. CMMI is focused on improving the software development process, while CMMC is focused on verifying the proper implementation of DIB cybersecurity requirements. Incorporating requirements into new or other existing standards would unacceptably delay action to improve DIB cybersecurity. The DoD must take action to improve DIB cybersecurity, regardless of the global state of cybersecurity. DoD's publication of this rule

follows completion of OMB's formal rulemaking process, which includes both DoD internal coordination and Interagency coordination. The recommendation for the DoD to establish a voluntary DIB Cyber Protection Program is beyond the scope of this rule.

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analysis to advance the development and productive use of information technology. ITL's responsibilities include the development of technical, physical, administrative, and management standards and guidelines for the cost-effective security and privacy of sensitive unclassified information in Federal computer systems. This Interagency Report discusses ITL's research, guidance, and outreach efforts in computer security, and its collaborative activities with industry, government, and academic organizations. This report received the support of many individuals. The author is grateful to Tim Grance for suggesting the topic and encouraging its development. The author also wishes to thank colleagues who reviewed drafts of this document and contributed to its technical content, as well as the individuals who reviewed the public-release draft of this document and provided comments during the review period. Improvements to the content would not have been possible without their feedback and valuable suggestions. In particular, Paul Black, Lee Badger, and Russell Cameron Thomas offered useful and thought-provoking insight on the subject matter. However, the author takes full responsibility for any remaining errors or omissions in the report. - GLYPH<c=31;font=/AGOCAF+Webdings> Strategic support - Assessments of security properties can be used to aid different kinds of decision making, such as program planning, resource allocation, and product and service selection.

- 5]. 6. An attacker can obtain sensitive data by evaluating and probing shared microarchitectural resources in contexts that should be isolated (e.g., caches and branch prediction logic) [CWE-1303].
7. Malicious software can take advantage of incorrectly assigned default permissions to obtain unauthorized access [CWE-276].

CMMC flow down requirements are designed to apply consistent assessment requirements to all contractors, whether prime or subcontractor and regardless of company size, who are required to adequately safeguard CUI. The DoD cannot dictate DIB business practices and encourages prime contractors to carefully consider the necessity of sharing CUI information and to work with its subcontractors to flow down CUI with the required security and the least burden. Defense contractors may share information about their CMMC Status with other DIB members to facilitate effective teaming arrangements when competing for DoD contract opportunities. In addition, CMMC requirements apply for prime contractors and their subcontractors as outlined in § 170.23. For additional information about flow down of contractual requirements, see the 48 CFR part 204 CMMC Acquisition rule, RIN 0750-AK81, Assessing Contractor Implementation of Cybersecurity Requirements (DFARS Case 2019-D041). (printed page 83202) 12. International. Commenters expressed concern about international partners' use of cloud services that do not have FedRAMP or GovCloud equivalency. Also concerns that the draft language [in the proposed rule] did not explain reciprocity of cybersecurity standards between the U.S. and International Partners. One commenter recommended exempting foreign businesses from assessment requirements. DoD Response: A domestic or international business seeking a contract that includes DFARS clause 252.204-7012, and using a cloud service provider to process, store, or transmit covered defense information in performance of that DoD contract, must meet FedRAMP authorization or equivalency requirements. As the FedRAMP program and FedRAMP equivalency are available to international organizations, foreign partners do not need to develop their own FedRAMP program. The DoD leverages FedRAMP to provide the requirements for the adoption of secure cloud services across the Federal Government by providing a standardized approach to security and risk assessment for cloud technologies and Federal agencies. The Implementation of CMMC Program requirements described in § 170.3(e) of the rule does not promote assessments of any contractors over any other contractors. All companies, regardless of size, location, or nationality, will have access to authorized C3PAOs for certification assessments. The rule does not preclude non-U.S. citizens or foreign-owned C3PAOs from operating in the U.S. Additionally, U.S.-owned C3PAOs may operate in a foreign nation. Section 170.20 states that OSCs that have completed a DCMA DIBCAC High Assessment aligned with CMMC Level 2 Scoping will be given the CMMC Status of Final Level 2 (C3PAO). International standards acceptance is not addressed in this rule. Any consideration of reciprocity between foreign partner protected information and CUI and FCI would require a formal government to government international arrangement or agreement and is outside the scope of this 32

a new requirement. DCMA is leading an effort to revise and update the sales terms and conditions found today at 245.7309. Once completed, and in coordination with the Services, the sales terms and conditions will be incorporated into the DFARS. It should be noted that sales terms and conditions specific to demilitarization, mutilation, and destruction will remain within the clause at 252.245-7004 due to the general sensitivity of demilitarization, mutilation, and destruction actions.

D. Demilitarization, Mutilation, and Destruction Comment: A respondent recommended that 252.245-70XX(e)(8) be deleted in its entirety and that special conditions be placed into the PGI, including that the agency must provide direction and funding. DoD Response: It is incumbent upon the Government to provide the contractor, as part of contract terms and conditions, any demilitarization, mutilation, or destruction requirements (reference DoD 5000.2-R, paragraph C2.8.7., Demilitarization and Disposal Planning). No additional clarification is necessary.

Comment: A respondent requested confirmation that the requirement to validate disposal of contractor inventory in foreign countries at paragraph (d) of the clause at 252.245-70XX is a Government responsibility. The respondent also asked if validation takes place when the plant clearance officer reviews and accepts the bid and whether DCMA International should get involved. The respondent recommended indicating who has the responsibility, specifying that State Department approval is required, and adding a certification statement to the SF 1428 providing the validation to the contractor. DoD Response: The language at DFARS 252.245-70XX(d) pertaining to disposal of contractor inventory overseas has been removed from the final rule. DFARS 252.245-7004, paragraph (g), has been clarified to ensure that disposal of contractor inventory located overseas is governed by contract terms and conditions. Additionally, the DoD responsibilities contained in the PGI sufficiently address this issue. Comment: A respondent expressed concern that the language at DFARS 252.245-70XX could be interpreted as requiring the contractor to determine the appropriate level of demilitarization required; the respondent suggested clarifying the intent. DoD Response: It is incumbent upon the Government to provide the contractor with, as part of contract terms and conditions, any demilitarization, mutilation, or destruction requirements (reference DoD 5000.2-R, paragraph C2.8.7., Demilitarization and Disposal Planning). No additional clarification is needed.

E. Scrap Procedures Comment: A respondent recommended deleting DFARS 252.245-70XX(j)(1), Contractor with an approved scrap procedure, in its entirety because the scrap procedures are typically incorporated within the contractor's property management system. DoD Response:

(3) Unmarked or mismarked CUI is not considered a CUI incident unless the mismarking or lack of marking has resulted in the mishandling or improper dissemination of the information. The contracting officer shall consult with the appropriate agency personnel concerning any unmarked or mismarked CUI in accordance with agency procedures. 4.403-7 Solicitation provision and contract clauses. (a) Insert the provision at 52.204-WW, Notice of Controlled Unclassified Information Requirements, in solicitations that contain the clause at 52.204-XX or the clause at 52.204-YY. (b) Except for solicitations and contracts solely for the acquisition of COTS items, insert the clause at 52.204-XX, Controlled Unclassified Information, and include an SF XXX Controlled Unclassified Information (CUI) Requirements, in solicitations and contracts if the requiring activity has marked the 'Yes' box in Part A of the SF XXX. (c) Insert the clause at 52.204-YY, Identifying and Reporting Information That Is Potentially Controlled Unclassified Information, in solicitations and contracts if the requiring activity has marked the 'No' box in Part A of SF XXX, excluding solicitations and contracts solely for the acquisition of COTS items. 12. Revise section 4.404 and add sections 4.404-1 through 4.404-3 to read as follows: 4.404 Basic Safeguarding of Covered Contractor Information Systems. 4.404-1 Definitions. As used in section 4.404- Covered contractor information system means an information system owned or operated by a contractor on which the contractor processes, stores, or transmits covered Federal information. Covered Federal information means information provided by or created for the Government, when that information is other than- (1) Simple transactional information (such as that necessary to process payments); (2) Information already publicly released (such as on public websites), or marked for public release, by the Government; (3) Federally-funded basic and applied research in science, technology, and engineering at colleges, universities, and laboratories in accordance with National Security Decision Directive 189; (4) Controlled unclassified information (CUI); or (5) Classified information. 4.404-2 Applicability. (a) This section applies to all acquisitions, including acquisitions of commercial services or commercial products other than commercially available off-the-shelf (COTS) items, when a contractor's information system may contain covered Federal information as part of performance on the contract. (b) While covered Federal information is not

required to be marked or identified by the Government, some (printed page 4294) administrative markings (e.g., draft, deliberative process, predecisional, not for public release) can indicate that the information is covered Federal information. 4.404-3 Contract clause.

From the NIST SP 800-172 Rev 3 Final Public Draft: The continued need for an internal system connection is reviewed from the perspective of whether it provides support for organizational missions or NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 business functions. This requirement is sourced to a control tailored out of the SP 1742

the invasion of the privacy of individuals only incidentally related to an investigation. The exemption of the individual's right of access to portions of these records, and the reasons therefore, necessitate the exemption of this system of records from the requirement of the other cited provisions. (B) [Reserved] (iv) Exemptions. (A) Information specifically authorized to be classified under E.O. 12958 , as implemented by DOD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1) . (B) Records maintained in connection with providing protective services to the President and other individuals under 18 U.S.C. 3506 , may be exempt pursuant to 5 U.S.C. 552a(k)(3) . (C) Records maintained solely for statistical research or program evaluation purposes and which are not used to make decisions on the rights, benefits, or entitlement of an individual except for census records which may be disclosed under 13 U.S.C. 8 , may be exempt pursuant to 5 U.S.C. 552a(k)(4) . (D) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, military service, Federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (E) Testing or examination material used solely to determine individual qualifications for appointment or promotion in the Federal service may be exempt pursuant to 5 U.S.C. 552a(k)(6) , if the disclosure would compromise the objectivity or fairness of the test or examination process. (F) Portions of this system of records are exempt from the following subsections of the Privacy Act: (c)(3), (d), (e)(1), (e)(4)(G) through (I), and (f). (v) Authority. 5 U.S.C. 552a(k)(1) , (k)(3), (k)(4), (k)(5) and (k)(6). (vi) Reasons. (A) The release of disclosure accountings would permit the subject of an investigation to obtain valuable information concerning the nature of that investigation, and the information contained, or the identity of witnesses or informants, would therefore present a serious impediment to law enforcement. In addition, disclosure of the accounting would amount to notice to the individual of the existence of a record. (B) Access to the records contained in this system would inform the subject of the existence of material compiled for law enforcement purposes, the premature release of which could prevent the successful completion of investigation, and lead to the improper influencing of witnesses, the destruction of records, or the fabrication of testimony. Exempt portions of this system also contain information that has been properly classified under E.O. 12958 , and that is required to be kept secret in the interest of national defense or foreign policy.

The rule also defines ·security incident· as the attempted or successful unauthorized access, use, disclosure, modification, or destruction of information or interference with system operations in an information system. The existing definition does not make clear that a security incident may result from two types of behaviors: those related to attempted or successful but unauthorized access, use, disclosure, modification, or destruction of information in an information system, and those that are related to the attempted or successful unauthorized interference with system operations in an information system. In other words, a security incident may directly touch upon information in a system or interfere with the operations of the system itself. The Department believes that it is necessary to clearly convey the distinct types of incidents to regulated entities to ensure that regulated entities implement and deploy safeguards that address both concerns. b. Proposal The Department proposes to modify the definition of ·security or security measures· to clarify that security or security measures may not only exist in information systems but may also be applied to information systems. [386] This clarification would better reflect the multi-layered approach to cybersecurity recommended by experts to address the concerns facing regulated entities today. For example, a regulated entity may determine that it is necessary to apply access controls and encryption mechanisms through an external mechanism, such as added firewall technology, [387] that is applied to the system, rather than technical controls that are embedded within the system or components of the system. The Department believes that the proposed definition would provide a more complete instruction. The Department proposes to reorganize the definition of ·security incident·

into two numbered paragraphs to delineate the two separate categories of security incidents. We also propose to clarify that in both instances, the definition applies when the described action affects an information system and regardless of whether an attempt to affect the information in the system or interfere with system operations is successful or not. 16. Adding Definitions of Technical Controls

a. Issues To Address Throughout the technical safeguards provisions in 45 CFR 164.312, the Department directs regulated entities to implement technical policies and procedures. The court in *M.D. Anderson* interpreted technical policies and procedures as written policies and procedures on technical matters. [388] This interpretation does not reflect the Department's intent for technical safeguards to include policies and procedures that rely on technology or technological solutions for implementation. [389] We believe that the court's interpretation could have significant consequences for the confidentiality, integrity, and availability of ePHI.

b. Proposal

The Security Rule, in conjunction with the Privacy and Breach Notification Rules, protects the privacy and security of individuals' PHI, that is, individually identifiable health information (IIHI). The Security Rule's protections are limited to ePHI, while the Privacy and Breach Notification Rules protect both electronic and non-electronic PHI. The Security Rule establishes standards to protect individuals' ePHI and requires reasonable and appropriate administrative, physical, and technical safeguards. The Security Rule specifies a series of administrative, physical, and technical security requirements that must be performed or implemented for regulated entities to safeguard ePHI. Specifically, entities regulated by the Security Rule must: (1) ensure the confidentiality, integrity, and availability of all ePHI they create, receive, maintain, or transmit; (2) protect against reasonably anticipated threats to the security and integrity of the information; (3) protect against reasonably anticipated impermissible uses or disclosures; and (4) ensure compliance by their workforce. A major goal of the Security Rule is protecting the security of individuals' health information while allowing for the development of a health information system to improve the efficiency and effectiveness of the health care system. The Administrative Simplification provisions of HIPAA (title II) provide the Secretary of HHS with the authority to publish standards for the privacy and security of health information. The Department first proposed standards for the security of ePHI on August 12, 1998, and published a final rule on February 20, 2003. The Department modified the Security Rule in 2013. Recently, as the preamble to this NPRM discusses, changes in the health care environment and insufficient compliance by regulated entities with the existing Security Rule require the modifications proposed here. For purposes of this Regulatory Impact Analysis (RIA), the proposed rule adopts the list of covered entities (with an updated count) and certain cost assumptions identified in the Department's Information Collection Request (ICR) associated with the HIPAA Privacy Rule to Support Reproductive Health Care Privacy (2024 ICR). [940] The Department also relies on certain estimates and assumptions from the 1998 Proposed Rule [941] that remain relevant, the 2003 Final Rule, [942] and the 2013 Omnibus Rule, [943] as referenced in the analysis that follows.

Because of its nature, the use of connection-separation destroys any assurance of continuity of connection (one aspect of the maintenance of service security service) that might be provided by any lower level protocol (such a service can be provided at the transport layer). When connection-separation is used above the transport layer it also effectively prevents access to the frozen references function that could otherwise be made available. The latter point would be a greater disadvantage if it were not for the likelihood of such code requiring verification for other purposes (such as maintenance of data integrity).

- The measures taken to protect data from accidental, unauthorized, intentional, or malicious modification, destruction, or disclosure. - A condition that results from the establishment and maintenance of protective measures.

(k) NIST SP 800-172, titled "Enhanced Security Requirements for Controlled Unclassified Information" provides federal agencies with recommended enhanced security requirements for protecting the confidentiality of CUI: (1) when the information is resident in nonfederal systems and organizations; (2) when the nonfederal organization is not collecting or maintaining information on behalf of a federal agency or using or operating a system on behalf of an agency; and (3) where there are no specific safeguarding requirements for protecting the confidentiality of CUI prescribed by the authorizing law, regulation, or government-wide policy for the CUI category listed in the CUI Registry. The enhanced requirements apply only to components of nonfederal systems that process, store, or transmit CUI or that provide security protection for such components when the designated CUI is associated with a critical program or high value asset. The enhanced requirements supplement

the basic and derived security requirements in NIST SP 800-171 and are intended for use by federal agencies in contractual vehicles or other agreements established between those agencies and nonfederal organizations. This document is incorporated by reference as a foundational source for security requirements. (l) NIST SP 800-172A, titled "Assessing Enhanced Security Requirements for Controlled Unclassified Information" provides federal agencies and nonfederal organizations with assessment procedures that can be used to carry out assessments of the requirements in NIST SP 800-172. The assessment procedures are flexible and can be tailored to the needs of organizations and assessors. Assessments can be conducted as (1) self-assessments; (2) independent, third-party assessments; or (3) government-sponsored assessments. The assessments can be conducted with varying degrees of rigor based on customer-defined depth and coverage attributes. The findings and evidence produced during the assessments can be used to facilitate risk-based decisions by organizations related to the CUI enhanced security requirements. This document is incorporated by reference as a foundational source for definitions and assessment. (m) Committee on National Security Systems (CNSS) Instruction No. 4009 provides a glossary of terms and applies to all U.S. Government Departments, Agencies, Bureaus and Offices, supporting contractors and agents that collect, generate, process, store, display, (printed page 89063) transmit or receive classified or controlled unclassified information, or that operate, use, or connect to National Security Systems (NSS). This document is incorporated by reference as a source for definitions.

For each non-cloud FIS developed, implemented, operated, or maintained, paragraph (f) of the clause 52.239-YY requires contractors to apply NIST SP guidance on various topics when performing or managing certain activities related to the FIS, including: managing information system risk when supporting agency risk management activities; developing risk management processes; conducting and communicating the results of risk assessments; designing zero trust architecture approaches; considering security when executing within the context of systems engineering; selecting, adapting, and using cyber resiliency constructs for new systems, system upgrades, or repurposed systems; implementing continuous monitoring strategies for FISs; and implementing digital identity services and requirements. Further, paragraph (f)(7) requires contractors to provide the Government with a copy of their continuous monitoring strategy for the FIS that demonstrates an ongoing awareness of information security, vulnerabilities, and threats in order to support risk management decisions, and applies the use of automation, wherever possible; protects vulnerability scan data, logs, and telemetry; and applies the guidance of NIST SP 800-137, "Information Security Continuous Monitoring (ISCM) for Federal Information Systems and Organizations." Cyber supply chain risk management. Paragraph (g) of the clause 52.239-YY advises that contractors may implement alternative, additional, or compensating cyber supply chain risk management security controls from those stated in the contract, when authorized in writing to do so by the contracting officer. Notifiable incident reporting, incident response, and threat reporting. Paragraph (h) of the clause 52.239-YY reminds contractors that they must refer to FAR clause 52.239-ZZ, "Incident and Threat Reporting and Incident Response Requirements for Products or Services Containing Information and Communications Technology" (see FAR case 2021-017), for guidance on handling security incident and cyber threat reporting. Other protections. Paragraph (i) of the clause 52.239-YY specifies the limitations on contractor access to, use, and disclosure of Government data, Government-related data, and metadata under the contract, and requires contractors to notify the contracting officer of any requests from an entity other than the contracting activity (including warrants, seizures, or subpoenas the contractor receives from another Federal, State, or local agency) for access to Government data, Government-related data, or any associated metadata. The clause also notifies contractors that they must also comply with applicable clauses, regulations, and laws regarding unauthorized disclosure. Cryptographic Key Services.

, but only to the extent that such material would reveal the identity of a confidential source. (C) Portions of this system of records are exempt from the following subsections of 5 U.S.C. 552a : (d)(1-5). (ii) Authority. 5 U.S.C. 552a(k)(1) and (k)(5) . (iii) Reasons. (A) Granting individuals access to information collected and maintained in this system of records could result in the disclosure of classified material; and jeopardize the safety of informants, and their families. Further, the integrity of the system must be ensured so that complete and accurate records of all adjudications are maintained. Amendment could cause alteration of the record of adjudication. (B) [Reserved] (15) System identifier and name. N05580-1, Security Incident System. (i) Exemption. (A) Parts of this system may be exempt pursuant to 5 U.S.C. 552a(j)(2) if the information is compiled and maintained by a component of the agency which performs as its principal function any activity pertaining to the enforcement of criminal laws. (B) Portions of this system of records are

exempt from the following subsections of the Privacy Act: (c)(3), (c)(4), (d), (e)(2), and (e)(4)(G) through (I), (e)(5), (e)(8), (f) and (g). (ii) Authority. 5 U.S.C. 552a(j)(2) . (iii) Reasons.

(A) Granting individuals access to information collected and maintained by this component relating to the enforcement of criminal laws could interfere with orderly administration of justice, and possibly enable suspects to avoid detection or apprehension. Disclosure of this information could result in concealment, destruction, or fabrication (printed page 14768) of evidence, and jeopardize the safety and well being of informants, witnesses and their families, and of law enforcement personnel and their families. Disclosure of this information could also reveal and render ineffectual investigative techniques, sources, and methods used by this component, and could result in the invasion of privacy of individuals only incidentally related to an investigation. The exemption of the individual's right of access to his or her records, and the reason therefore, necessitate the exemption of this system of records from the requirements of other cited provisions.

(B) [Reserved] (16) [Reserved] (17) System identifier and name. N05800-1, Legal Office Litigation/Correspondence Files. (i) Exemptions. (A) Information specifically authorized to be classified under E.O. 12958 , as implemented by DOD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1) . (B) Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source.

ays. This project has resulted in The Computer Forensics Tool Testing Program (CFTT) is a project of ITL's Software and Systems Division (SSD) and is supported by the Special Programs Office and DHS. In FY 2019, several key advances were made to help address a critical need in the law enforcement community to ensure the reliability of computer forensic tools.

In an open-ended question, we also asked what other job functions or roles the participants had in addition to their security awareness responsibilities. All but two participants had other substantial cybersecurity duties beyond awareness training, for example, incident response, supply chain risk management, audits and compliance, policy, information systems security management, privacy awareness and training, cybersecurity role-based training, and project management.

Allowance for outsourced IT services Increased total time for the contractor to prepare for the assessment, including limited time for learning the reporting and affirmation processes Allowance for use of consulting firms to assist with the assessment process Time for a senior level manager to review the assessment and affirmation before submitting the results into SPRS Updated government and contractor labor rates that include applicable burden costs As a result, some CMMC 2.0 costs may be higher than those included in CMMC 1.0. (b) Assumptions for CMMC 2.0 Cost Analysis In estimating the public cost for a small defense contractor to achieve CMMC compliance or certification at each CMMC level, DoD considered non-recurring engineering costs, recurring engineering costs, assessment costs, and affirmation costs for each CMMC Level. These costs include labor and consulting. Estimates include size and complexity assumptions to account for typical organizational differences between small companies and others with respect to the handling of Information Technology (IT) and cybersecurity: small entities are likely to have a less complex, less expansive operating environment and IT/Cybersecurity infrastructure compared to larger defense contractors small entities are likely to outsource IT and cybersecurity to an External Service Provider (ESP) entities (small and other than small) pursuing CMMC Level 2 Self-Assessment are likely to seek consulting or implementation assistance from an ESP to either help them prepare for the assessment technically or participate in the assessment with the C3PAOs. Estimates do not include implementation (Non-recurring Engineering Costs (NRE)) or maintenance costs (Recurring Engineering (RE) [55]) for requirements prescribed in current regulations. For CMMC Levels 1 and 2, cost estimates are based upon assessment, reporting, and affirmation activities which a contractor will take to validate conformance with existing cybersecurity requirements from the FAR clause 52.204-21, effective June 15, 2016, to protect FCI, and the DFARS clause 252.204-7012 which required implementation of NIST SP 800-171 Rev 2 not later than December 31, 2017, to protect CUI. As such, cost estimates are not included for an entity to implement the CMMC Level 1 or 2 security requirements, maintain compliance with current security requirements, or remediate a Plan of Action for unimplemented requirements. For CMMC Level 3, the cost estimates factor in the assessment, reporting, and affirmation activities in addition to estimates for NRE and RE to implement and

maintain CMMC Level 3 security requirements. CMMC Level 3 security requirements are a selection of NIST SP 800-172 Enhanced Security Requirements as described in 32 CFR 170.14(c)(4) and are not currently required through other regulations. DoD expects that CMMC Level 3 will apply only to a small subset of defense contractors and subcontractors. The Cost Categories used for each CMMC Level are described:

The DoD certifies that this final rule would not, if promulgated, have a significant economic impact on a substantial number of small business entities in accordance with the Regulatory Flexibility Act (5 U.S.C. 601) requirements since a contractor cleared legal entity may, in entering into contracts requiring access to classified information, negotiate for security costs determined to be properly chargeable by a GCA. The DoD invites comment from members of the public who believe there will be a significant impact. Small entities to which this rule will apply provide products and services to the executive branch, e.g., in the areas of administration, consulting, information security and technology, cybersecurity, research and development, design, production and manufacturing, including circumstances where physical security measures cannot preclude aural or visual access to classified information. These small business entities, as well as non-small business entities, have entered into a contract, license or grant for which access to classified information is required. Compliance with this rule, also referred to as the NISPOM, is levied by a FAR security requirements clause or equivalent. The requirements for an entity eligibility determination do not include USG collection of applicable North American Industry Classification System (NAICS) codes. While this type of information is available in the Federal Procurement Data System (FPDS), entity eligibility determinations (often referred to as facility clearances) are not available in FPDS. DoD has no efficient mechanism to cross check NAICS codes from FPDS with facility clearance data. DoD assesses there are a wide variety of NAICS codes associated with contracts requiring access to classified information. For example, the following NAICS codes may be associated with contracts requiring access to classified information: 561720 janitorial services; 561210 facility support services; 541611 administrative management and general management services; 561110 office administrative services; 541690 other scientific and technical consulting services; 541330 engineering services; 561611 investigation services; and likely many others, since contracts that require a facility clearance for access to classified information are not industry specific.

(1) Contractor personnel make derivative classification decisions when they incorporate, paraphrase, restate, or generate in new form, information that is already classified. They must mark the newly developed material consistently with the classification markings that apply to the source information. (2) Derivative classification is the classification of information based on guidance from an OCA, which may be either a properly marked source document or a current security classification guide provided by a GCA in accordance with E.O. 13526 . The duplication or reproduction of existing classified information is not derivative classification. (3) A source document that does not contain portion markings, due to an ISOO-approved waiver, must contain a warning statement that it may not be used as a source for derivative classification in accordance with 32 CFR 2001.24(k)(4) . (4) Classified information in email messages is marked pursuant to E.O. 13526 and 32 CFR part 2001 . If an email is transmitted on a classified system, includes a classified attachment, and contains no classified information within the body of the email itself, the email serves as a transmittal document and is not a derivatively classified document. The email's overall classification must reflect the highest classification level present in the attachment. (c) Derivative classification responsibilities. Contractors will provide employees with pertinent classification guidance to fulfill their derivative classification responsibilities. All contractor employees authorized to make derivative classification decisions will: (1) Mark the face of each derivatively classified document with a classification authority block that includes the employee's name and position or personal identifier, the entity name, and when applicable, the division or the branch. Figure 1 to Paragraph (c)(1) Example of Industry Classification Authority Block UNCLASSIFIED: CLASSIFICATION MARKINGS FOR ILLUSTRATION PURPOSES ONLY Classified by: John Doe, Security Specialist, Entity ABC Security Division Derived From: SecDef Memo, dtd 20101024, Subj: ____ Declassify On: 20201024 (2) Observe and respect original classification decisions. (3) Carry forward the pertinent classification markings to any newly created documents. For information derivatively classified based on multiple sources, the derivative classifier will carry forward: (i) The date or event for declassification that corresponds to the longest period of classification among the sources. (ii) A listing of the source materials. (4) Be trained, in accordance with §.117.12(h), in the proper application of the derivative classification principles at least once every two years. (5) Whenever possible, use a classified addendum if classified

information constitutes a small portion of an otherwise unclassified document. (d) Security classification guidance. (1) Contractors should be aware the GCA will:

(c)(1) Providing a classified or unclassified notice of the determination made under paragraph (b) of this section. (i) In the case of a covered system included in the National Intelligence Program or the Military Intelligence Program, to the Select Committee on Intelligence of the Senate, the Permanent Select Committee on Intelligence of the House of Representatives, and the congressional defense committees; and (printed page 69272) (ii) In the case of a covered system not otherwise included in paragraph (a) of this section, to the congressional defense committees; and (2) The notice shall include. (i) The following information (see 10 U.S.C. 2304(f)(3)): (A) A description of the agency's needs. (B) An identification of the statutory exception from the requirement to use competitive procedures and a demonstration, based on the proposed contractor's qualifications or the nature of the procurement, of the reasons for using that exception. (C) A determination that the anticipated cost will be fair and reasonable. (D) A description of the market survey conducted or a statement of the reasons a market survey was not conducted. (E) A listing of the sources, if any, that expressed in writing an interest in the procurement. (F) A statement of the actions, if any, the agency may take to remove or overcome any barrier to competition before a subsequent procurement for such needs; (ii) The joint recommendation by the Under Secretary of Defense for Acquisition, Technology, and Logistics and the Chief Information Officer of the Department of Defense as specified in paragraph (a); (iii) A summary of the risk assessment by the Under Secretary of Defense for Intelligence that serves as the basis for the joint recommendation specified in paragraph (a); and (iv) A summary of the basis for the determination, including a discussion of less intrusive measures that were considered and why they were not reasonably available to reduce supply chain risk. 239.7305 Exclusion and limitation on disclosure. Subject to 239.7304, the individuals authorized in 239.7303 may, in the course of conducting a covered procurement. (a) Exclude a source that fails to meet qualification standards established in accordance with the requirements of 10 U.S.C. 2319 , for the purpose of reducing supply chain risk in the acquisition of covered systems; (b) Exclude a source that fails to achieve an acceptable rating with regard to an evaluation factor providing for the consideration of supply chain risk in the evaluation of proposals for the award of a contract or the issuance of a task or delivery order; (c) Withhold consent for a contractor to subcontract with a particular source or direct a contractor for a covered system to exclude a particular source from consideration for a subcontract under the contract; and

The Department declines to adopt the recommendation to allow DIB members to assist in designing the DoD's mechanism for assessing DIB compliance with DoD's contractual requirements. In developing the CMMC program, the DoD sought and considered DIB input. DoD disagrees with the comment that there is a lack of scalability in the CMMC program. The phased implementation plan described in §.170.3(e) is intended to address any CMMC Ecosystem ramp-up issues, provide time to train the necessary number of

assessors, and allow companies the time needed to understand and implement CMMC requirements. The rule has been updated to add an additional six months to the Phase 1 timeline. As with all its programs, the Department intends to effectively oversee the CMMC Program and act as needed to manage its effective implementation. Although the full extent of DoD's oversight process is beyond the scope of this rule, the rule text addresses DoD's authority to waive the application of CMMC requirements when warranted in accordance with all applicable policies, procedures, and approval requirements. DoD has utilized a phased approach to the rollout to reduce implementation risk. CMMC Program requirements make no changes to existing policies for information security requirements implemented by the DoD. It is beyond the scope of this rule for DoD to determine the order in which organizations are assessed. (printed page 83158) d. Alternate Assessors or Assessments (Including Self-Assessment Only) Comment: One commenter submitted numerous recommendations based on an opinion that skills required for conducting CMMC compliance assessments are like those required for conducting Independent Technical Risk Assessments (ITRAs) on Major Defense Acquisition Programs (MDAPs). Such assessments are conducted by the Office of the Undersecretary of Defense for Research & Engineering (OUSD(R&E)) in accordance with Defense Technical Risk Assessment Methodology (DTRAM) criteria. These criteria extend beyond compliance with cybersecurity requirements and include characteristics such as modular open systems architecture, software, manufacturing, reliability, availability, maintainability, and others. This commenter noted the DoD's Adaptive Acquisition Framework applies to both Information Systems and National Security Systems and suggested that existing acquisition requirements pertaining to ITRA and DTRAM should suffice in lieu of CMMC assessments. The commenter recommended that DoD use existing ITRA teams to perform compliance assessments of contractor-owned information systems. In addition, they recommended aligning requirements to DoD policies rather than to NIST standards. Other comments made similar suggestions to synchronize cybersecurity requirements with DoD policies rather than NIST standards but cited FISMA compliance assessments as the appropriate model rather than the DTRAM.

In response to public comments received in the initial 48 CFR CMMC interim final rule public comment period, DoD streamlined the CMMC model to ease the assessment burden. At the same time, estimates were increased for the time and cost of self-assessment based on industry and DIBCAC input. DoD estimates are based on defensible assumptions and documented labor rates. Therefore, DoD declines to modify the self-assessment estimates. The DoD has streamlined CMMC requirements to align directly to NIST guidelines and eliminated unique security practices to ease the burden on smaller companies, included an analysis of costs to meet CMMC requirements in the regulatory impact analysis for this rule. The DoD declined to modify the estimates, which are intended to be representative and to inform rulemaking. Verifying compliance with applicable security requirements may increase cost and is necessary for the protection of DoD CUI. The cost of lost technological advantage over potential adversaries is greater than the costs of such enforcement. The value of information (and impact of its loss) does not diminish when the information moves to contractors. DoD rejected the recommendation to adjust the annual requirement for senior affirmations to a triennial requirement to decrease senior affirmation costs. The requirement for annual affirmations is to ensure the Affirming Official responsible for CMMC requirements are monitoring compliance with the requirements. If compliance is being maintained as required, this should not require more time or cost than provided in the estimates. Further, DFARS clause 252.204-7012 already requires NIST SP 800-171 continuous monitoring via requirement 3.12.3. DoD also declined to make the recommended edits to further delineate a company's internal review of self-assessments and reaffirmations in the cost assumptions. The cost estimates provided for this rule represent average costs for (printed page 83155) companies to comply with the CMMC requirement, including the need for self-assessment or independent assessment against the specified standards. Whether the OSA elects to satisfy those requirements themselves, or by using one ESP for many requirements, or by using several ESPs for individual requirements, is a decision to be made by the OSA. That decision does not change DoD's estimate of average costs to meet CMMC requirements. The DoD declined to recalculate cost estimates using lower costs for ESP assessments.

by adding part 117 to read as follows: PART 117·NATIONAL INDUSTRIAL SECURITY PROGRAM OPERATING MANUAL (NISPOM) 117.1 Purpose. 117.2 Applicability. 117.3 Definitions. 117.4 Policy. 117.5 Information collections. 117.6 Responsibilities. 117.7 Procedures. 117.8 Reporting requirements. 117.9 Entity eligibility determination for access to classified information. 117.10 Determination of eligibility for access to classified information for contractor employees. 117.11 Foreign Ownership, Control, or Influence (FOCI). 117.12 Security training and briefings. 117.13 Classification. 117.14 Marking requirements. 117.15 Safeguarding classified information. 117.16

(also known as the ·Central Intelligence Agency Act of 1949,· as amended); Public Law 108-458 (also known as the ·Intelligence Reform and Terrorism Prevention Act of 2004·); and 32 CFR part 2004 : (1) Prescribes industrial security procedures and practices, under E.O. 12829 or successor orders, to safeguard USG classified information that is developed by or disclosed to contractors of the USG.

stock purchase, asset purchase), the identity of the potential foreign interest investor, and a plan to negate or mitigate the FOCI by a method outlined in paragraph (d) of this section. (ii) The entity will submit copies of loan, purchase, and shareholder agreements, annual reports, bylaws, articles of incorporation, partnership agreements, other organizational documents, and reports filed with other Federal agencies to the CSA. (d) FOCI action plans. (1) When FOCI factors not related to ownership are present, the CSA will determine if positive measures will assure the CSA that the foreign interest can be effectively mitigated and cannot otherwise adversely affect performance on classified contracts. Examples of such measures include: (i) Modification or termination of loan agreements, contracts, and other understandings with foreign interests. (ii) Diversification or reduction of foreign-source income. (printed page 83332) (iii) Demonstration of financial viability independent of foreign interests. (iv) Elimination or resolution of problem debt. (v) Assignment of specific oversight duties and responsibilities to board members. (vi) Formulation of special executive-level security committees to consider and oversee issues that affect the performance of classified contracts. (vii) Physical or organizational separation of the contractor component performing on classified contracts. (viii) Adoption of special board resolutions. (ix) Other actions that negate or mitigate foreign control or influence. (x) A combination of these methods, as determined by the CSA. (2) When FOCI factors related to ownership are present, methods the CSA may apply to negate or mitigate the risk of foreign ownership include, but are not limited to: (i) Board resolution. (A) When a foreign interest does not possess voting interests sufficient to elect, or otherwise is not entitled to representation on the entity's governing board, a resolution(s) by the governing board may be adequate. In the resolution, the governing board will: (1) Identify the foreign shareholder. (2) Describe the type and number of foreign-owned shares. (3) Acknowledge the entity's obligation to comply with all industrial security program requirements. (4) Certify that the foreign owner does not require, will not have, and can be effectively precluded from unauthorized access to all classified information entrusted to or held by the entity. (B) The governing board will provide for annual certifications to the CSA acknowledging the continued effectiveness of the resolution. (C) The entity will distribute to members of its governing board and to its KMP copies of such resolutions, and report in the entity's corporate records the completion of such distribution. (ii) Security control agreement (SCA). When a foreign interest does not effectively own or control an entity (i.e.,

The intent is to increase the effectiveness, efficiency, and cost-effectiveness of the RMF by establishing a closer connection to the organization's missions and business functions and

(d) The Deputy Assistant Secretary of the Army (Civilian Personnel Policy)/Director of Civilian Personnel, Office of the Assistant Secretary of the Army (Manpower and Reserve Affairs) is authorized to act on requests for civilian personnel records, personnel administration and other civilian personnel matters, except for EEO (civilian) matters which will be acted on by the Administrative Assistant to the Secretary of the Army. The Deputy Assistant Secretary of the Army (Civilian Personnel Policy)/Director of Civilian Personnel has delegated this authority to the Chief, Policy and Program Development Division (Note: Requests from former civilian employees to amend a record in an Office of Personnel Management system of records, such as the Official Personnel Folder, should be sent to the Office of Personnel Management, Assistant Director for Workforce Information, Compliance, and Investigations Group: 1900 E. Street, NW., Washington, DC 20415-0001). (e) The Chief Information Officer G-6 is authorized to act on requests for records pertaining to Army Information Technology, command, control communications and computer systems and the Information Resources Management Program (automation, telecommunications, visual information, records management, publications and printing). (f) The Inspector General is authorized to act on requests for all Inspector General Records. (g) The Auditor General is authorized to act on requests for records relating to audits done by the U.S. Army Audit Agency under AR 10-2. This includes requests for related records developed by the Audit Agency. (h) The Director of the Army Staff is authorized to act on requests for all records of the Chief of Staff and its Field Operating Agencies. The Director of the Army Staff has delegated this authority to the Chief Attorney and Legal Services Directorate, U.S. Army Resources & Programs Agency (See The Judge Advocate General for the General Officer Management Office actions). The Chief Attorney and Legal Services Director, U.S. Army Resources & Programs Agency acts on requests for records of the Chief of Staff and its Field Operating Agencies (See The Judge Advocate General for the General Officer Management Office actions). (i) The Deputy Chief of Staff, G-3/5/7 is authorized to act on requests for records relating to International Affairs policy, planning, integration and assessments, strategy formulation, force development, individual and unit training policy, strategic and tactical command and control systems, nuclear and chemical matters, use of DA forces. (j) The Deputy Chief of Staff, G-8 is authorized to act on requests for records relating to programming, material integration and externally directed reviews.

Management provides mechanisms for maintaining attributes to ensure the efficiency and consistent use of attributes, including metadata, hierarchical structures for attribute grouping, minimization and transformation methods for attribute performance, and additional support capabilities (e.g., attribute integration with authentication, logs for recording attribute access and updates). | |

In accordance with laws, Executive Orders, directives, policies, regulations, or standards, the public is not authorized access to nonpublic information (e.g., information protected under the Privacy Act, CUI, and proprietary information). This requirement addresses systems that 54 NIST SP 800-171A, p. 18. 55 NIST SP 800-171 Rev. 2, p. 16.

ounting for developing country interests). 12 - - The International Strategy for Cyberspace 13 lays out an approach to unify USG engagement with international partners on a full range of cyber issues. The International Strategy highlights the need to develop and use international cybersecurity

standards and conformity assessment schemes, and the importance of public-private sector collaboration. The Strategy establishes the goal that '[t]he United States will work internationally to promote an open, interoperable, secure, and reliable information and communications infrastructure that supports international trade and commerce, strengthens international security, and fosters free expression and innovation.' The strategy contains policy priorities for the economy; protecting our networks; law enforcement; military; internet governance; international development; and internet freedom. This includes steps to enhance confidence in cyberspace and pursue those who would exploit online systems, and a commitment from the USG to participate actively in discussions about how international norms and measures on cybercrime are developed bilaterally and multilaterally, in fora with proven expertise and a history of promoting effective cybercrime policies. This also includes promoting processes to permit states to investigate, apprehend, and prosecute those who intrude or disrupt networks. - - The National Cooperative Research Act of 1984 14 first allowed organizations to collaborate to carry out joint research and development ventures and not be deemed illegal per se under federal antitrust laws or similar State laws. One result has been a rapid growth in IT consortia developing standards. In developing their standards, many of these consortia follow the WTO TBT Committee Decision principles. However, consortia are also formed that are not open, with membership by invitation.

Most compliance activities would be performed by a workforce member at the hourly wage rate of an information security analyst (\$119.94), while documentation of maintenance would be performed at the rate of a management analyst (\$111.08) and notification of termination or change of workforce members' access to ePHI would be performed by an office administrative assistant (\$46.10). This would result in estimated total first year costs for health plan sponsors of \$4,658,781,219 as shown in detail in table 7. o. Total Quantifiable Costs The Department summarizes in tables 6 and 7 the estimated costs that regulated entities (approximately \$4,655 million) and plan sponsors (approximately \$4,659 million), respectively, would experience in the first year of implementing the proposed regulatory changes. The Department anticipates that these costs would be for the following activities: conducting a Security Rule compliance audit; obtaining verification of business associates' and subcontractors' compliance with technical safeguards; providing verification of business associates' compliance with technical safeguards; providing notification of termination or change of workforce members' access to ePHI; deploying MFA and penetration testing; segmenting networks; disabling unused ports; removing extraneous software; notifying covered entities or business associates, as applicable, upon activation of a contingency plan; and updating health plan documents, policies and procedures, workforce training, and business associate agreements. These costs would also include health plan sponsors deploying safeguards for their relevant electronic information systems to meet Security Rule standards and notifying group health plans upon activation of a plan sponsor's contingency plan. Table 6-First Year Cost Estimates for Regulated Entities' Proposed Compliance Obligations

Activity	Wage rate	Burden hours	Frequency	Respondents	Total annual cost (millions)
Security Rule Compliance Audit	\$119.94	2	1	1,822,600 Regulated Entities	\$437
BA Verification of Technical Safeguards	\$119.94	2	1	1,000,000 Business Associates	240
Obtain BA Compliance Verification	\$119.94	.5	1	822,600 Covered Entities	49
Obtain Subcontractors' Compliance Verification	\$119.94	.083	1	1,000,000 Business Associates	10
Notification of Workforce Members' Termination of access to ePHI	\$119.94	1	1	1,822,600 Regulated Entities	46.10
Multi-factor Authentication	\$119.94	1.5	1	1,822,600 Regulated Entities	\$328
Network Segmentation	\$119.94	4.5	1	1,822,600 Regulated Entities	984
Configuration Management	\$119.94	.5	1	1,395,396 Regulated Entities	69.20
Penetration Testing	\$119.94	3	1	1,822,600 Regulated Entities	656
Notification of Contingency Plan Activation	\$119.94	.5	1	1,000,000 Business Associates	60
Update Health Plan Documents	\$119.94	.5	120	3,102,851 Health Plan Documents	145.14
Update Policies and Procedures	\$119.94	3.5	1	1,822,600 Regulated Entities	173.76
Update Workforce Training	\$119.94	2	1	1,822,600 Regulated Entities	252

SUPPLEMENTARY INFORMATION: I. Description of the System of Records The UFS is a billing and collections system that maintains information about the individuals, organizations, and companies required to pay user fees.

Information maintained in the UFS includes: Contact person's name, phone number, fax number, and email address; Federal Employer Identification Number (FEIN) for entity remitters; Taxpayer Identification Number (TIN) for individual remitters, which is encrypted with only the last four characters visible (in some circumstances individual remitters may use a Social Security Number as the TIN); Company name or the Organization name; and Data Universal Numbering System (DUNS) number and business address. The UFS also stores application details as the fee remitter (submitter) creates coversheets to pay user fees. These details include, but are not limited to, the type of application, waiver and exemption status, and Small Business Decision (SBD) Number. When a submitter generates a coversheet the UFS will only print the last four characters of the FEIN/TIN along with the organization name and address. Additionally, the UFS stores billing details, adjustments to invoices, and payment receipt information including date, mode, and amount of payment.

II. Routine Use Disclosures of Information in the System The Privacy Act allows FDA to disclose information without an individual's consent if the information is to be used for a purpose that is compatible with the purpose(s) for which the information was collected. Any such compatible use of data is known as a routine use. The routine uses in this system meet the compatibility requirement of the Privacy Act.

(C) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5), but only to the extent that such material would reveal the identity of a confidential source. (D) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(1), (k)(2) and (k)(5) from subsections 5 U.S.C. 552a(c)(3), (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I), and (f). (E) To the extent that copies of exempt records from external systems of records are entered into A0381-10b DAMI, the Army hereby claims the same exemptions for those records as claimed for the original primary system of which they are a part. (ii) Authority. 5 U.S.C. 552a(j)(2), and (k)(1) through (k)(7). (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (d), because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement. (C) From subsection (e)(1) because in the course of criminal investigations, information is often obtained concerning the violation of laws or civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this valuable information be retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought. (D) From subsections (e)(4)(G) and (e)(4)(H) because portions of this system of records have been exempted from the access provisions of subsection (d), making these subsections not applicable. (E) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (F) From subsection (f) because portions of this system of records have been exempted from the access provisions of subsection (d). (G) For records that are copies of exempt records from external systems of records, such records are only exempt from pertinent provisions of 5 U.S.C. 552a

An Authority to Operate (ATO) is a formal declaration by an authorizing official that a federal information system is approved to operate at an acceptable level of risk. ATOs are part of the NIST Risk Management Framework (SP 800-37). In the context of defense contractors and CMMC: - Federal agencies issue ATOs for their own systems - FedRAMP issues ATOs (or Provisional ATOs / P-ATOs) for cloud service providers - CMMC certification is analogous to an ATO for contractor systems handling CUI A FedRAMP ATO/P-ATO indicates that a cloud service has been assessed against NIST SP 800-53 controls and authorized for federal use. Contractors using cloud services for CUI should verify the CSP has a FedRAMP Moderate (or equivalent) ATO per DFARS 252.204-7012.

(9) Provide the CMMC PMO with current data on C3PAOs, including authorization and accreditation records and status in the CMMC instantiation of eMASS. This data shall include the dates associated with the authorization and accreditation of each C3PAO. (10) Provide the DoD with information about aggregate statistics pertaining to operations of the CMMC Ecosystem to include the authorization and

accreditation status of C3PAOs or other information as requested. (11) Provide inputs for assessor supplemental guidance to the CMMC PMO. Participate and support coordination of these and other inputs through DoD-led Working Groups. (12) Ensure that all information about individuals is encrypted and protected in all Accreditation Body information systems and databases. (13) Provide all plans that are related to potential sources of revenue, to include but not limited to: fees, licensing, processes, membership, and/or partnerships to the Department's CMMC PMO. (14) Ensure that the CMMC Assessors and Instructors Certification Organization (CAICO) is compliant with ISO/IEC 17024:2012. If ISO/IEC 17024:2012 is revised or superseded, the Accreditation Body shall require full compliance with the updated standard within 12 months of the date of revision. (15) Ensure all training products, instruction, and testing materials are of high quality and subject to CAICO quality control policies and procedures, to include technical accuracy and alignment with all applicable legal, regulatory, and policy requirements. (16) Render a final decision on all elevated appeals. (17) Develop and maintain a comprehensive plan and schedule to comply with all ISO/IEC 17011:2017, or subsequent revisions, and DoD requirements for Conflict of Interest, Code of Professional Conduct, and Ethics policies as set forth in the DoD contract. All policies shall apply to the Accreditation Body, and other individuals, entities, and groups within the CMMC ecosystem who provide CMMC assessments, CMMC instruction, CMMC training materials, or CMMC certification on behalf of the Accreditation Body. All policies in this section must be approved by the CMMC PMO prior to effectivity in accordance with the following requirements. (i) Conflict of Interest (CoI) Policy. The CoI policy shall: (A) Include a detailed risk mitigation plan for all potential conflicts of interest that may pose a risk to compliance with ISO/IEC 17011:2017, or subsequent revisions. (B) Require members of the Accreditation Body to disclose to the CMMC PMO, in writing, as soon as it is known or reasonably should be known, any actual, potential, or perceived conflict of interest with sufficient detail to allow for assessment. (C) Require members of the Accreditation Body who leave the board or organization to enter a ·cooling off period· of six (6) months whereby they are prohibited from working with the Accreditation Body or participating in CMMC activities.

One comment states that it is a member of the International Flight Catering Association and International Inflight Food Service Association and adheres to practices of the ·World Food Safety Guideline· as set forth by the two associations of inflight food services. Another comment states that all employees have been certified by the FAA through fingerprinting and 10-year background checks, and inhouse security personnel are responsible for checking what is placed on aircraft. Another comment maintains control of all inputs and outputs of production and states that documentation is in place for all items received and for all items produced. (Response) For the reasons stated in response to comment 76 of this document, FDA continues to believe that facilities that provide food to interstate conveyances should not be covered by the restaurant exclusion because they do not provide food directly to consumers for immediate consumption. However, these final regulations state that duplication of existing records is not required if those records contain all of the information required by subpart J of this final rule. Therefore, if a covered person keeps records of all of the information as required by subpart J in order to comply with other Federal, State, or local regulations, or for any other reason, then those records may be used to meet these requirements. As the comment notes, the airline catering industry currently has the capability to trace all food products on their flights. These regulations do not dictate the format or system in which the required records are maintained. The airline catering industry can use existing tracing mechanisms to comply with these regulations to the extent those mechanisms contain the required information.

SC.L2-3.13.8 · Data in Transit CMMC Assessment Guide · Level 2 | Version 2.13 227 SC.L2-3.13.8 · DATA IN TRANSIT Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards. ASSESSMENT OBJECTIVES [NIST SP 800-171A]201 Determine if: [a] cryptographic mechanisms intended to prevent unauthorized disclosure of CUI are identified; [b] alternative physical safeguards intended to prevent unauthorized disclosure of CUI are identified; and [c] either cryptographic mechanisms or alternative physical safeguards are implemented to prevent unauthorized disclosure of CUI during transmission. POTENTIAL ASSESSMENT METHODS AND OBJECTS [NIST SP 800-171A]

KENT: There are two basic methods of using the DES, each having certain advantages and disadvantages. The first is block mode, or "electronic code book" mode. In this mode 64 bits of data are encrypted at a time and each such 64-bit block is encrypted independent of any other block. The second method is cipher feedback mode in which normally a character at a time is encrypted by using

the last 64 bits of cipher that were generated as input to the DES and using a number of the output bits to XOR with the character to produce the cipher. This cipher is used as input for the next encryption operation. Cipher feedback is most useful for character oriented communications or for the encryption of serial data for storage. Cipher feedback cannot be used to encrypt storage files that are to be randomly accessed. It cannot be used for encryption across packets in packet switching networks since decryption is serial dependent and packets often arrive out of order. Block mode is faster than cipher feedback, but cipher feedback is self synchronizing and provides message integrity. There was considerable give and take discussion during and following some of the presentations. To preserve the integrity of the presentations, this discussion is grouped together in this section. Following Mr. Pyke's presentation on the preceeding workshop concerning a hardware device to do 'brute force' key searching, the discussion was particularly wide ranging.

, the Department estimates that business associates that handle ePHI would need to spend an average of 2 hours (with a low estimate of 0.25 hours and high estimate of 2.5 hours) analyzing how their cybersecurity measures comply with the proposed requirements for technical safeguards and producing a verification report for covered entities at the hourly wage rate of an information security analyst. This estimate assumes that business associates have already documented existing safeguards, policies, and procedures, so that the costs attributable to the new requirement are incremental and would total approximately \$239,880,000 [1 million business associates × 2 hours × \$119.94], with a low estimate of \$29,985,000 [1 million business associates × 0.25 hours × \$119.94] and high estimate of \$299,850,000 [1 million business associates × 2.5 hours × \$119.94]. c. Costs Arising From Covered Entities and Business Associates Obtaining Verification From Business Associates of Compliance With Technical Safeguards Under 45 CFR 164.308(b) , the Department further estimates that each covered entity would need to spend an average of 30 minutes (with 15 minutes as a low estimate and 90 minutes as a high estimate) requesting and obtaining compliance reports from its business associates about their deployment of technical safeguards required by the Security Rule at the hourly wage of an information security analyst. This assumes that in most instances, business associates would produce the required verification for covered entities without being prompted by a request because they would be required to do so by the Security Rule, as proposed in the NPRM. It further assumes that covered entities have readily available means of contacting business associates, such as via email, and that the contact could be a single email draft sent in a batch. The average time burden per entity depends on verification frequency, likely influenced by entities' average number of business associates and how frequently entities change business associates. The low estimate assumes that entities verify less frequently, whereas the high estimate assumes entities verify more frequently. At the wage rate of an information security analyst, this would result in estimated total costs for covered entities of \$49,331,322 [= 822,600 covered entities × 0.5 hours × \$119.94], with a low estimate of \$24,665,661 [= 822,600 covered entities × 0.25 hours × \$119.94] and high estimate of \$147,993,966 [= 822,600 covered entities × 1.5 hours × \$119.94].

means a transportation protective service provided by a commercial carrier qualified by the Surface Deployment and Distribution Command to transport CONFIDENTIAL shipments. The service requires constant surveillance of the shipment at all times by a qualified carrier representative; however, an FCL is not required for the carrier. The carrier providing the service must maintain a signature and tally record for the shipment. Consultant means an individual under contract, and compensated directly, to provide professional or technical assistance to a contractor in a capacity requiring access to classified information. Continuous evaluation as defined in SEAD 6 is a personnel security investigative process to review the background of a covered individual who has been determined to be eligible for access to classified information or to hold a sensitive position at any time during the period of eligibility. Continuous evaluation leverages a set of automated records checks and business rules, to assist in the ongoing assessment of an individual's continued eligibility. It supplements, but does not replace, the established personnel security program for scheduled periodic reinvestigations of individuals for continuing eligibility. Continuous monitoring program means a system that facilitates ongoing awareness of threats, vulnerabilities, and information security to support organizational risk management decisions. Contracting officer means a USG official who, in accordance with departmental or agency procedures, has the authority to enter into and administer contracts, licenses or grants and make determinations and findings with respect thereto, or any part of such authority. The term also includes the designated representative of the contracting officer acting within the limits of his or her authority. Contractor means any industrial, educational, commercial, or other entity that has been granted an entity eligibility determination by a CSA. This term also includes licensees, grantees, or certificate holders of the

USG with an entity eligibility determination granted by a CSA. As used in this rule, ·contractor· does not refer to contractor employees or other personnel. Cooperative agreement means a legal instrument which, consistent with 31 U.S.C. 6305, is used to enter into the same kind of relationship as a grant (see definition of ·grant· in this subpart), except that substantial involvement is expected between USG and the recipient when carrying out the activity contemplated by the cooperative agreement. The term does not include ·cooperative research and development agreements· as defined in 15 U.S.C. 3710a. (printed page 83315) Cooperative research and development agreement

National intelligence is under the jurisdiction and control of the DNI, who establishes security policy for the protection of national intelligence and intelligence sources, methods, and activities. In addition to the guidance in this rule, contractors will follow Intelligence Community directives, policy guidance, standards, and specifications for the protection of classified national intelligence and SCI. (c) ACCM. Contractors may participate in ACCMs, or be directed to participate, only when such access and the associated security plan are identified in DD Form 254 or equivalent. Care must be taken to ensure identification of the security plan does not disclose ACCM-protected data. (1) ACCM contracts. DoD contractors will implement the security requirements for ACCMs, when established by contract, in accordance with applicable statutes, E.O.s, CSA directives, instructions, manuals, regulations, standards, and memorandums. (2) Non-DoD with ACCMs. Contractors performing on ACCM contracts issued by other than DoD GCAs will implement ACCM protection requirements imposed in their contracts. (d) SAPs. (1) DoD SAP contracts. Contractors will implement the security requirements for SAPs codified in SAP-related policy, when established by contract. These documents include, but are not limited to, statutes, E.O.s, CSA directives, instructions, manuals, regulations, standards, memorandums, and other SAP security related policy documents. (2) Non-DoD SAPs. Contractors performing on SAP contracts issued by non-DoD GCAs will implement SAP protection requirements imposed in their contracts. These requirements may be from, but are not limited to, statutes, E.O.s, CSA directives, instructions, manuals, regulations, standards, memorandums, and other SAP security related policy documents. (e) RD, FRD, and TFNI. (1) General. This section describes some of the requirements for nuclear-related information designated RD, FRD, or TFNI in accordance with the AEA and 10 CFR part 1045. 10 CFR part 1045 contains the full requirements for classification and declassification of RD, FRD, and TFNI. Information on safeguarding of RD by access permittees is contained in 10 CFR part 1016. For RD that is NNPI, the additional provisions of paragraph (f) of this section apply. (i) The DOE is the sole authority for establishing requirements for classifying, accessing, handling, securing, and protecting RD. The DOE and the DoD share authority for the requirements for FRD. The DOE and ODNI share authority for establishing requirements for TFNI. (ii) RD, FRD, and TFNI categories are distinguished from the NSI category, which is governed in accordance with E.O. 13526. (A) RD, FRD, and TFNI have unique marking requirements and are not subject to automatic declassification. In addition, RD and FRD have special restrictions regarding foreign release. (B) It is necessary to differentiate between the handling of this information and NSI because of its direct relationship to our nation's nuclear deterrent.

information technology (IT)) and those that run the vital machinery that ensures its safety (e.g., operational technology (OT)). The Government contracts with IT and OT service providers to conduct an array of day-to-day functions on Federal Information Systems (FIS). A FIS is an information system used or operated by an agency, by a contractor of an agency, or by another organization, on behalf of an agency. All FISs require protection as part of good risk management practices. Agencies are responsible for determining what information systems are FIS, in accordance with the definition provided in this rule. Currently, contractual requirements for the cybersecurity standards of unclassified FISs are largely based on agency-specific policies and regulations. The risks associated with agency-specific policies can result in inconsistent security requirements across contracts, as well as be unclear, add costs, and restrict competition. To address these risks, paragraph (i) of section 2 of E.O. 14028 requires the DHS Secretary, acting through the Director of CISA, to review agency-specific cybersecurity requirements that currently exist as a matter of law, policy, or contract and recommend to the FAR Council standardized contract language for appropriate cybersecurity (printed page 68403) requirements. Paragraph (j) of section 2 of E.O. 14028 then directs that FAR Council to consider the contract language received from DHS and publish for public comment any proposed updates to the FAR. This proposed rule would implement the DHS recommendations across all Federal agencies to streamline requirements and improve compliance for contractors and the Government. By standardizing a set of minimum cybersecurity standards to be applied

consistently to FISS, the proposed rule would ensure that such systems are better positioned in advance to protect from cyber threats. In addition, and as required by paragraph (k) of section 2 of E.O. 14028, upon issuance of a final rule, agencies shall update their agency-specific requirements to remove any requirements that are duplicative of such FAR updates. II. Discussion and Analysis This proposed rule provides cybersecurity policies, procedures, and requirements for contractor services to develop, implement, operate, or maintain a FIS. This rule underscores that compliance with these requirements is material to eligibility and payment under Government contracts. A contract to develop, implement, operate, or maintain a FIS may require contractors to utilize cloud computing services, services other than cloud computing services (i.e., non-cloud computing services, also known as on-premises computing services), or a hybrid of both approaches when providing services under the contract. As such, this rule specifies the policies, procedures, and requirements that apply to each service approach (i.e.,

This rule retains the reference to DFARS clause 252.204-7012 that implements NIST SP 800-171 as the basis for the requirement to create and update an SSP. The DoD has considered the recommended changes to the rule regarding the SSP content and declines to make the revision. The NIST SP 800-171 R2 requirement for an SSP is foundational to performing a NIST SP 800-171 R2 self-assessment and its purpose is to provide critical information for performing the assessment. The SSP should detail the policies and procedures that support . . . how security requirements are implemented . . . for all NIST SP 800-171 R2 controls. DoD declines to establish a specific SSP format, as OSAs should define the best format for their organizations. The Overview section of the rule has been updated to remove the statement indicating SSPs will outline the roles and responsibilities of security personnel. DoD does not plan to provide document templates for SSPs and POA&Ms, as they are already available (printed page 83132) in existing NIST guidance. Templates and schemas for the pre-assessment and assessment results documents are available to authorized CMMC eMASS users at <https://cmmc.emass.apps.mil>. Commenter concerns about artifact retention reflect misunderstanding of the assessment process. Assessors and C3PAOs do not retain OSC artifacts, they only retain the hash value captured during the assessment process. Assessors will retain documents created during the assessment such as their notes and the Assessment Findings Reports. To facilitate the protection of these documents, authorized C3PAOs are required to go through a DIBCAC conducted CMMC Level 2 assessment and CMMC Assessors are only authorized to use C3PAO issued equipment that was within the scope of the DIBCAC assessment. Separately, the DIBCAC processes, stores, and transmits its assessment related data on DoD networks. Assessment Reports are submitted to DoD via eMASS, which is a government-owned, secured database. Sharing of this information is subject to DoD policies. The OSC is responsible for maintaining and hashing all artifacts that supported the assessment. The rule has been modified to clarify C3PAOs do not maintain artifacts from the OSC. The OSC's artifacts must be hashed, and the value provided to the assessor for submission into CMMC eMASS. That hash value contains no sensitive information. An OSC's System Security Plan (SSP) will be reviewed as part of a CMMC certification assessment, but not shared outside of the OSC. Assessors will not retain copies of the SSP or any other proprietary OSC information. Assessors will retain the name, date, and version of the SSP for uploading in SPRS or eMASS, as appropriate for the level of assessment. Assessors will upload assessment information (e.g.,

Added a caveat in the clause at 252.245-7004(b)(1) to use the Plant Clearance Automated Reutilization Screening System unless disposition instructions are otherwise included in the contract; Relocated paragraph (e) of the 252.245 clause to paragraph (j) to better align language with actual process; Deleted ~~Commerce control list~~ and ~~Munitions list items~~ from the definitions and added definitions of ~~Export-controlled items~~ and ~~Ineligible transferees~~ to the clause at 252.245-7004(a); Added the terms ~~mutilation/destruction~~ and ~~mutilate/destroy~~, as appropriate, after each instance of the term ~~demilitarization~~ for consistency with DoD policy; Deleted supply condition codes from 252.245-7004(b)(1), and added a hyperlink to DoD 4000.25-2-M; Added clarifying language for disposition of contractor inventory located in foreign countries to the clause at 252.245-7004; Modified language at 252.245-7004(h)(2) to allow the plant clearance (printed page 52142) officer discretion in requiring scrap warranties; Added clarifying language at 252.245-7004(j)(9)(i) on verification of demilitarization actions by Government representatives, including use of DRMS Form 145 or equivalent; and Renumbered the DFARS text and clauses, as necessary. III. Executive Orders 12866 and 13563 Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563

emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is a significant regulatory action and, therefore, was subject to review under section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804. IV. Regulatory Flexibility Act DoD certifies that this final rule will not have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601, et seq., because this final rule imposes no new requirements on small entities. The rule revises DFARS part 245, Government Property, to reflect the recent revisions to FAR part 45, Government Property. It makes no significant change to DoD policy for the management of Government property in the possession of contractors. No comments were received on the expected impact of this rule on small entities in response to publication of the proposed rule. V. Paperwork Reduction Act

The NIST Risk Management Framework (RMF), described in NIST Special Publication 800-37 Revision 1, Guide for Applying the Risk Management Framework to Federal Information Systems: a Security Life Cycle Approach, is a methodology for implementing risk management at the information systems tier. The RMF (depicted in Figure 2) identifies six distinct steps that provide a disciplined and structured process to integrate information security risk management activities into the system development life cycle. The RMF addresses security concerns of organizations related to the design, development, implementation, operation, and disposal of information systems and the environments in which those systems operate. The criteria for whether a security control is assurance- or functionality-related is based on the overall characteristics of the control. In general, assurance-related controls are controls that: (i) define processes, procedures, techniques, or methodologies for designing and developing information systems and system components; (ii) provide supporting operational processes including improving the quality of systems, components, or processes; (iii) produce security evidence from developmental or operational activities; (iv) determine security control effectiveness or risk; or (v) improve personnel skills, expertise, and understanding. Many organizations use well-known international information security standards as the basis or as a supplemental source of security controls for risk management. To aid in selection and comparison, SP 800-53 Rev. 4 provides mapping tables to provide organizations with a general indication of security control coverage with respect to ISO/IEC 27001, Information technology Security techniques-- Information security management systems--Requirements and ISO/IEC 15408, Information technology -- Security techniques -- Evaluation criteria for IT security.

3.2.5 Develop Recommendations ... 3.2.5 Develop Recommendations This step results in a plan of action to address recommended implementation approaches. 3.2.5.

Accordingly, the White House has directed Federal agencies to take specific steps to mitigate the threat of [cryptanalytically relevant quantum computers] through a timely and equitable transition of the Nation's cryptographic systems to interoperable quantum-resistant cryptography. [888] NCVHS examined these security issues and provided recommendations to the Department for applying the safeguards of the HIPAA Rules to potential quantum computing threats. Specifically, NCVHS declared that incorporation of recent Administration guidance for Federal agencies on vulnerable cryptographic systems is necessary to strengthen the Technical Safeguards within the Security Rule. [889] This joint guidance, developed by NIST, CISA, and NSA, encourages the early planning for migration to post-quantum cryptographic standards by developing a Quantum-Readiness Road map. [890] It also recommends that organizations prepare a cryptographic inventory, discuss post-quantum roadmaps with technology vendors, consider their supply chain's readiness for quantum computing, and consider the responsibilities of their technology vendors with respect to preparing for quantum readiness. [891] The Department encourages regulated entities to incorporate these activities as part of their ongoing risk management programs. For example, the steps presented in the joint guidance--surveying the environment for potential risks and vulnerabilities that endanger ePHI, identifying workforce members with responsibility for addressing them, inventorying quantum-vulnerable systems, including that inventory in its risk analysis and risk management, and working with technology vendors to ensure their readiness--are all activities that already are required by the administrative safeguards of the Security Rule.

ton-Micali Signature (LMS) system [2] and the eXtended Merkle Signature Scheme (XMSS) [1], along with their multi-tree variants, the Hierarchical Signature System (HSS) and multi-tree XMSS (XMSS MT). All of the digital signature schemes specified in FIPS 186 will be broken if largescale quantum computers are ever built. The security of the stateful HBS schemes in this publication depends only

on the security of the underlying hash functions-in particular, the infeasibility of finding a preimage or a second preimage-and it is believed that the security of hash functions will not be broken by the development of large-scale quantum computers [20].

Executive Order (EO) 14028, 'Improving the Nation's Cybersecurity,' tasks the National Institute of Standards and Technology (NIST), in coordination with the Federal Trade Commission (FTC) and other agencies, to initiate pilot programs for cybersecurity labeling. NIST is, among other actions, directed ' to identify IoT cybersecurity criteria for a consumer labeling program.' This document seeks to fulfill this directive by recommending consumer IoT product label criteria, label design and consumer education considerations, and conformity assessment considerations for use by a scheme owner to inform a consumer Internet of Things (IoT) product labeling program. | Introduction

(f) NIST SP 800-82, revision 2, titled 'Guide to Industrial Control Systems (ICS) Security' provides guidance on how to secure ICS, including Supervisory Control and Data Acquisition (SCADA) systems, Distributed Control Systems (DCS), and other control system configurations such as Programmable Logic Controllers (PLC), while addressing their unique performance, reliability, and safety requirements. The document provides an overview of ICS and typical system topologies, identifies typical threats and vulnerabilities to these systems, and provides recommended security countermeasures to mitigate the associated risks. This document is incorporated by reference as a source for definitions. (g) NIST SP 800-115, titled 'Technical Guide to Information Security Testing and Assessment' assists organizations in planning and conducting technical information security tests and examinations, analyzing findings, and developing mitigation strategies. The guide provides practical recommendations for designing, implementing, and maintaining technical information security test and examination processes and procedures. These can be used for several purposes, such as finding vulnerabilities in a system or network and verifying compliance with a policy or other requirements. The guide is not intended to present a comprehensive information security testing and examination program but rather an overview of key elements of technical security testing and examination, with an emphasis on specific technical techniques, the benefits and limitations of each, and recommendations for their use. This document is incorporated by reference as a source for definitions. (h) NIST SP 800-160, Volume 2, revision 1, titled 'Developing Cyber-Resilient Systems: A Systems Security Engineering Approach' focuses on cyber resiliency engineering-an emerging specialty systems engineering discipline applied in conjunction with systems security engineering and resilience engineering to develop survivable, trustworthy secure systems. Cyber resiliency engineering intends to architect, design, develop, implement, maintain, and sustain the trustworthiness of systems with the capability to anticipate, withstand, recover from, and adapt to adverse conditions, stresses, attacks, or compromises that use or are enabled by cyber resources. From a risk management perspective, cyber resiliency is intended to help reduce the mission, business, organizational, enterprise, or sector risk of depending on cyber resources. This document is incorporated by reference as a source for definitions.

For the final rule, FDA has changed the record retention requirements in § 1.360(b) to require record retention by nontransporters for: (1) 6 months for food for which a significant risk of spoilage, loss of value, or loss of palatability occurs within 60 days after the date you receive or release the food; (2) 1 year for food for which a significant risk of spoilage, loss of value, or loss of palatability occurs only after a minimum of 60 days, but within 6 months, after the date you receive or release the food; and (3) 2 years for food for which a significant risk of spoilage, loss of value, or loss of palatability does not occur sooner than 6 months after the date you receive or release the food, including foods preserved by freezing, dehydrating, or being placed in a hermetically sealed container. Transporters or nontransporters retaining records on behalf of a transporter are required to retain 6 months records for food having a significant risk of spoilage, loss of value, (printed page 71605) or loss of palatability within 60 days after the date the

food is received or released and 1 year all food having a significant risk of spoilage, loss of value, or loss of palatability after a minimum of 60 days after the date the food is received or released. FDA chose this approach because: (1) The food industry already is familiar with classification of foods into these three categories due to existing regulations and practices and (2) it will mitigate the problem raised by some comments of inadequate infrastructure for long term storage of records for the shorter shelf life foods. FDA believes that a tracing investigation involving food for which a significant risk of spoilage or significant loss of value occurs within 60 days under normal shipping and storage conditions will not be compromised by providing for the reduced record retention of 6 months because most of these tracebacks are initiated within 6 months of the outbreak. In addition, FDA has excluded the distribution of food directly to consumers from the requirement to keep records of immediate subsequent recipients of food because FDA can obtain information from consumers and notify them when necessary. Often, consumer illness is the first common indicator that food may be adulterated and present a threat of serious adverse health consequences or death. Requiring retailers to retain records for only weeks or months would greatly impede FDA's ability to conduct a rapid and effective traceback. FDA has selected those timeframes for record retention based on the amount of time perishable and nonperishable food may remain in commerce, and thus, may be the subject of a traceback investigation. FDA further notes its understanding that many retailers currently maintain records for 2 years.

(2) Prescribes requirements, restrictions, and other safeguards to prevent unauthorized disclosure of classified information and protect special classes of classified information. (3) Prescribes that contractors will implement the provisions of this rule no later than 6 months from the effective date of this rule. § 117.2 Applicability. (a) This rule applies to: (1) The Office of the Secretary of Defense, the Military Departments, the Office of the Chairman of the Joint Chiefs of Staff and the Joint Staff, the Combatant Commands, the Office of the Inspector General of the Department of Defense, the Defense Agencies, the DoD Field Activities, and all other organizational entities within the DoD (referred to collectively in this rule as the 'DoD Components'). (2) All executive branch departments and agencies. (3) All industrial, educational, commercial, or other non-USG entities granted access to classified information by the USG executive branch departments and agencies or by foreign governments. (4) The release of classified information by the USG to contractors, who are required to safeguard classified information released during all phases of the contracting, agreement (including cooperative research and development agreements), licensing, and grant processes, i.e., the preparation and submission of bids and proposals, negotiation, award, performance, and termination. Also, it applies in situations involving a contract, agreement, license, or grant when actual knowledge of classified information is not required, but reasonable physical security measures cannot be employed to prevent aural or visual access to classified information, because there is the ability and opportunity to gain knowledge of classified information. It also applies to any other situation in which classified information or FGI that is furnished to a contractor requires protection in the interest of national security, but which is not released under a contract, license, certificate or grant. (b) This rule does not: (1) Limit in any manner the authority of USG executive branch departments and agencies to grant access to classified information under the cognizance of their department or agency to any individual designated by them. The granting of such access is outside the scope of the NISP and is accomplished pursuant to E.O. 12968, E.O. 13526, E.O. 13691, the AEA, and applicable disclosure policies. (2) Apply to criminal proceedings in the courts or authorize contractors or their employees to disclose classified information in connection with any criminal proceedings. Defendants and their representative in criminal proceedings in U.S. District Courts, Courts of Appeal, and the U.S. Supreme Court may gain access to classified information in accordance with 18 U.S.C. Appendix 3, Section 1, also known as and referred to in this rule as the 'Classified Information Procedures Act,' as amended. § 117.3 Acronyms and Definitions.

Portions of this system of records that fall within the provisions of 5 U.S.C. 552a(k)(5) may be exempt from the following subsections (d)(1) through (d)(5). (ii) Authority. 5 U.S.C. 552a(k)(5). (iii) Reasons. From subsections (d)(1) through (d)(5) because the agency is required to protect the confidentiality of sources who furnished information to the Government under an expressed promise of confidentiality or, prior to September 27, 1975, under an implied promise that the identity of the source (printed page 14804) would be held in confidence. This confidentiality is needed to maintain the Government's continued access to information from persons who otherwise might refuse to give it. This exemption is limited to disclosures that would reveal the identity of a confidential source. (2) System identifier and name. DWHS P28, The Office of the Secretary of

Defense Clearance File. (i) Exemption. This system of records is exempt from subsections (c)(3) and (d) of 5 U.S.C. 552a, which would require the disclosure of investigatory material compiled solely for the purpose of determining access to classified information but only to the extent that disclosure of such material would reveal the identity of a source who furnished information to the Government under an expressed promise that the identity of the source would be held in confidence or, prior to September 27, 1975, under an implied promise that the identity of the source would be held in confidence. A determination will be made at the time of the request for a record concerning the specific information which would reveal the identity of the source. (ii) Authority. 5 U.S.C. 552a(k)(5). (iii) Reasons. This exemption is required to protect the confidentiality of the sources of information compiled for the purpose of determining access to classified information. This confidentiality helps maintain the Government's continued access to information from persons who would otherwise refuse to give it. (3) System identifier and name. DGC 04, Industrial Personnel Security Clearance Case Files. (i) Exemption. All portions of this system which fall under 5 U.S.C. 552a(k)(5) are exempt from the following provisions of title 5 U.S.C. 552a: (c)(3); (d). (ii) Authority. 5 U.S.C. 552a(k)(5). (iii) Reasons.

Although this section currently addresses policies and procedures and documentation, it does not require or include standards to govern how regulated entities must implement, maintain, and document implementation of all security measures. Implementing, maintaining, and documenting implementation of all security measures is important to ensure that regulated entities make well-reasoned decisions about implementing the requirements of this rule. Just as the Department believes that it is necessary to consider expanding the definition of "security measures" to better reflect that security measures should be multi-layered, we also believe that it is necessary to consider providing a more complete instruction concerning how regulated entities must implement, maintain, and document their implementation of the required security measures. Additionally, OCR's own experience in investigations and audits leads us to believe that many regulated entities may not be documenting their security measures or their implementation of those measures. [864] It is critical for a regulated entity to commit to writing the security measures required by the Security Rule to ensure consistent implementation and compliance with the Security Rule. Verbal instructions may be forgotten or misconstrued, and what the regulated entity believes to be common knowledge may not be or may be relayed incorrectly between workforce members. Additionally, based on OCR's enforcement experience, the Department believes that regulated entities may not be periodically reviewing and updating their documentation when they modify their security measures in response to environmental or operational changes affecting the security of their ePHI. Given the constant evolution of technology and the everchanging behavior of cybercriminals in response to technological evolution, the Department believes that regular review of cybersecurity-related security measures is essential for protecting the confidentiality, integrity, and availability of ePHI and relevant electronic information systems. 3. Proposals As discussed above, the Department has proposed to revise other provisions of the Security Rule to clarify the differences between administrative and technical safeguards and between policies and procedures on the one hand and technical controls on the other hand. We have also proposed to revise other provisions of the Security Rule to clarify that a regulated entity is required to implement and maintain its administrative, physical, and technical safeguards, including its policies and procedures. These proposals clarify that such maintenance requires the review, testing, and modification of the regulated entity's security measures on a regular cadence, meaning that the regulated entity's security measures can be modified at any time. Given these proposals, the Department believes that we must also propose to revise 45 CFR 164.316

In newly redesignated paragraph (g): i. Removing the heading. ii. Removing "DIB participants" and adding in its place "DIB CS Program participants". i. Revising newly redesignated paragraphs (h) and (i). j. Removing "DIB participants" and adding in its place "DIB CS Program participants" in newly redesignated paragraph (j) introductory text. k. In newly redesignated paragraph (k): i. Removing "DIB participants" and adding in its place "DIB CS Program participants". ii. Removing "DIB participant" and adding in its place "DIB CS Program participant". l. Removing "DIB participants" and adding in its place "DIB CS Program participants" in newly redesignated paragraph (l). m. Removing "DIB participants" and adding in its place "DIB CS Program participants" in newly redesignated paragraph (m). n. In newly redesignated paragraph (n): i. Removing "DIB participant" and adding in its place "DIB CS Program participant" wherever it appears. ii. Removing "DIB participant's FA" and adding in its place "DIB CS Program participant's FA". o. In newly redesignated paragraph (o): i. Removing "DIB participant" and adding in its place "DIB CS Program

participant wherever it appears. ii. Removing paragraph (m) of this section and adding in its place paragraph (n) of this section. The revisions and addition read as follows: §-236.5 DoD's DIB CS Program. (a) All defense contractors that meet the requirements set forth in §-236.7 are eligible to join the DIB CS Program as a DIB CS Program participant. Defense contractors meeting the additional eligibility requirements in §-236.7 can elect to access and receive classified information electronically. * * * * (f) As participants of the DIB CS Program, defense contractors are encouraged to share cyber threat indicators and information that they believe are valuable in alerting the Government and other DIB CS Program participants to better counter threat actor activity. Cyber activity that is not covered under §-236.4 may be of interest to DIB CS Program participants and DoD. * * * * (h) Prior to receiving GFI, each DIB CS Program participant shall provide the requisite points of contact information, to include U.S. citizenship and security clearance information, as applicable, for the designated personnel within their company in order to facilitate the DoD-DIB interaction in the DIB CS Program. The Government will confirm the accuracy of the information provided as a condition of that point of contact being authorized to act on behalf of the DIB CS Program participant for this program. (i) GFI will be issued via both unclassified and classified means. DIB CS Program participants handling and safeguarding of classified information shall be in compliance with 32 CFR part 117. The Government shall specify transmission and distribution procedures for all GFI, and shall inform DIB CS Program participants of any revisions to previously specified transmission or procedures. * * * * §-236.6 [Amended] 8. Amend §-236.6 by: a.

This draft guidance refers to previously approved collections of information found in FDA regulations. These collections of information are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (the PRA) (44 U.S.C. 3501-3520). The collections of information in 21 CFR part 807, subpart E have been approved under OMB control number 0910-0120, and the collections of information in 21 CFR part 801 and 21 CFR 809.10 have been approved under OMB control number 0910-0485. The labeling requirement listed in sections 5 and 8; Intended Use, is not subject to review under the PRA because it is a public disclosure of information originally supplied by the Federal Government to the recipient for the purpose of disclosure to the public (5 CFR 1320.3(c)(2) and 21 CFR 1040.10(g)). V. Comments Interested persons may submit to the Division of Dockets Management (see ADDRESSES) either electronic or written comments regarding this document. It is only necessary to send one set of comments. It is no longer necessary to send two copies of mailed comments. Identify comments with the docket number found in brackets in the heading of this document. Received comments may be seen in the Division of Dockets Management between 9 a.m. and 4 p.m., Monday through Friday. (printed page 69041) Dated: November 1, 2011. Leslie Kux, Acting Assistant Commissioner for Policy. [FR Doc. 2011-28725 Filed 11-4-11; 8:45 am] BILLING CODE 4160-01-P

Section 170.9 addresses the roles, responsibilities, and requirements for C3PAOs, which are the organizations that perform CMMC Level 2 certification assessments for OSCs. The C3PAOs will submit assessment data into the CMMC instantiation of government owned and operated system called eMASS, [22] a CMMC instance of the Enterprise Mission Assurance Support Service. C3PAOs issue Certificates of CMMC Status, in accordance with the requirements in §-170.17 of this part. Section 170.9 addresses detailed requirements for C3PAOs with regards to national security background checks, foreign ownership, reporting, records management, information protection, quality assurance, and appeals. The information systems used by C3PAOs to process Level 2 certification assessment information have to meet all of the security requirements for CMMC Level 2 and will be assessed by DCMA DIBCAC. C3PAOs need to comply with ISO/IEC 17020:2012(E), as well as with the Accreditation Body's policies for CoI, CoPC, and Ethics. Prior to a C3PAO being compliant with ISO/IEC 17020:2012(E), the C3PAO may be authorized but not accredited. After a C3PAO is compliant with ISO/IEC 17020:2012(E), the C3PAO may be accredited. Section 170.10-CMMC Assessor and Instructor Certification Organization (CAICO) Section 170.10 addresses the roles, responsibilities, and

requirements for the CAICO, the organization that trains, tests, designates Provisional Instructors (PIs), and certifies CMMC Certified Professionals (CCPs), CMMC Certified Assessors (CCAs), CMMC Certified Instructors (CCIs). There is only one CAICO for the DoD CMMC Program at any given time. The CAICO must comply with ISO/IEC 17024:2012(E), as well as with the Accreditation Body's policies for Col, CoPC, and Ethics. Section 170.10 addresses detailed requirements for the CAICO with regards to certification examinations, quality assurance, appeals, records management, reporting, separation of duties, and information protection. Section 170.11-CMMC Certified Assessor (CCA) Section 170.11 addresses the roles and responsibilities of a CMMC Certified Assessor (CCA) who conduct Level 2 certification assessments. In order to be a CCA, a candidate must first be a CCP, must adhere to the requirements set forth in § 170.10, § 170.8(b)(17), and complete a Tier 3 background investigation or equivalent. The required cybersecurity experience for different CCA roles is addressed in § 170.11(b)(6) and (10). Section 170.11 addresses CCA requirements with respect to security breaches; completion of a Tier 3 background investigation or equivalent; reporting; sharing assessment information; and permitted use of C3PAO equipment, devices, and services. Section 170.12-CMMC Instructor

only one or several), the ability of a regulated entity to execute the remaining implementation specification(s) depends on whether the remaining implementation specifications are dependent on one another or operate together to impose requirements on regulated entities. For example, several proposed implementation specifications under the standard for facility access controls at 45 CFR 164.310(a)(1) would require a regulated entity to both establish and implement written procedures pertaining to specific requirements such as contingency operations, facility security planning and access control and validation, and then subsequently review the written policies and procedures every 12 months. Should a court invalidate or deem inapplicable the implementation specification to establish and implement written policies procedures, the secondary specification requiring review of said procedures would also become invalid. The Department believes that each definition is independent of all other definitions. This list of examples is not intended to be exhaustive. The absence from this list of any particular provision should not be construed to mean that the Department considers that provision to be not severable from other parts of the rule. To ensure that our intent for severability of provisions is clear in the CFR, the Department proposes to add a section on severability at 45 CFR 164.320. Proposed 45 CFR 164.320 would state our intent that if any provision of this subpart is held to be invalid or unenforceable, it shall be construed to give maximum effect to the provision permitted by law unless the holding shall be one of utter invalidity or unenforceability, in which case the provision shall be severable from this subpart and shall not affect the remainder thereof or the application of the provision to other persons not similarly situated or to other dissimilar circumstances. The Department requests comment on the foregoing proposal, including any benefits, drawbacks, or unintended consequences. K. New and Emerging Technologies Request for Information Technology is constantly evolving, able to perform increasingly complex tasks, including those with the potential to improve health care and communication between individuals and care providers. These new and evolved technologies will continue to transform health care in a variety of ways, including providing regulated entities with new tools for faster and more accurate diagnoses, effective treatments, and more efficient administration. As a regulated entity considers the application of new technologies or the use of existing tools in innovative ways, it also must consider whether these technologies create, receive, maintain, or transmit ePHI, and, if so, how to secure them. The Security Rule was designed to be technology-neutral for this very reason and continues to provide the foundation for ensuring the confidentiality, integrity, and availability of all ePHI as technology changes. [877]

As stated in § 170.20(a), DoD intends to allow qualified standards acceptance of High confidence assessment using NIST SP 800-171 Rev 2 for CMMC Level 2. However, the CMMC Program requirements proposed in this rule will be implemented in the DFARS, as needed, which may result in changes to current DoD solicitation provisions and contract clauses relating to cybersecurity assessments. b. Cloud Standards Comment: Many commenters expressed concerns regarding CMMC recognition of Federal Risk and Authorization Management Program (FedRAMP) and requested guidance on which FedRAMP baselines, if any, would be granted standards acceptance at each CMMC Level. A few commenters sought assurance that DoD Cloud Computing Security Requirements Guide (SRG) Impact Levels 4 and 5 would not be applied to CMMC Level 3. Response: CMMC does not offer comprehensive acceptance of FedRAMP. The CMMC Program allows the acceptance of FedRAMP environments in some cases to meet CMMC requirements in connection with use of a Cloud Service Provider (CSP). If an OSC uses an external CSP to process, store, or transmit CUI or to provide security protection for any such component, the OSC must ensure

the CSP's product or service offering either (1) is authorized as FedRAMP Moderate or High on the FedRAMP Marketplace; or (2) meets the security requirements equivalent to those established by the Department for the FedRAMP Moderate or High baseline. The CSP will provide evidence that its product or service offering meets the security requirements equivalent to FedRAMP Moderate or High by providing a body of evidence (BOE) that attests to and describes how the CSP's product or service offering meets the FedRAMP baseline security requirements. Note that for any portion of the on-premises (internal) network (printed page 89071) that interacts with the cloud service offering and is within the CMMC Assessment Scope, the OSC is required to meet all applicable CMMC requirements to achieve certification. The DoD Cloud Computing SRG applies to DoD-provided cloud services and those provided by a contractor on behalf of the department, i.e., a commercial cloud service provider or integrator. Cloud Computing SRG does not apply to CMMC. c. Other Standards

Comment:

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Office of the Secretary 32 CFR Part 159 [Docket ID: DoD-2020-OS-0016] RIN 0790-AK87 AGENCY: Office of the Under Secretary of Defense for Acquisition and Sustainment, Department of Defense (DoD). ACTION: Final rule. SUMMARY: The DoD is finalizing updates to this rule resulting from changes from the National Defense Authorization Act (NDAA) for Fiscal Years (FY) 2017 and 2020 as well as DoD policy updates. These changes include administrative updates and clarifications to private security contractors (PSCs) performing duties while under contract to DoD in support of a contingency operations, humanitarian or peace operations, or other military operations or exercises. DATES: This rule is effective on October 11, 2022. FOR FURTHER INFORMATION CONTACT: Ms. Donna M. Livingston, 703-692-3032, donna.m.livingston.civ@mail.mil . SUPPLEMENTARY INFORMATION: Legal Authority This section of the CFR was last updated in a final rule published in the Federal Register (76 FR 49650) on August 11, 2011. DoD is finalizing this rule to meet the mandates of NDAA for FY 2017 and 2020 and updates to DoD policy that require the Department to propose additional guidance on inherently governmental functions, PSC compliance with national and international recognized quality assurance management standards, and to add new definitions for total force and arming authorities. DoD also added language requiring PSCs to cooperate with DoD on all U.S. Government investigations. Additional language is also provided to state DoD is responsible for providing the appropriate contract administration oversight of PSCs. The corresponding internal DoD policy is established in DoD Instruction 3020.50, 'Private Security Contractors (PSCs) Operating in Contingency Operations, Humanitarian or Peace Operations, or Other Military Operations or Exercises,' published on July 22, 2009, and last updated on August 31, 2018. This Instruction will be updated based on publication of this final rule. For additional information, DoD Instruction 3020.50 can be accessed at <https://www.esd.whs.mil/Portals/54/Documents/DD/issuances/dodi/302050p.pdf> . Discussion of Comments A proposed rule titled 'Private Security Contractors (PSCs) Operating in Contingency Operations, Humanitarian or Peace Operations, or Other Military Operations or Exercises' was published in the Federal Register (86 FR 28042) on May 25, 2021. Two commenters provided comments and the Department's responses are as follows. (printed page 55282) Comment:

(4) Nothing in the amendment process is intended or designed to permit a collateral attack upon what has already been the subject of a judicial or quasi-judicial determination. However, while the individual may not attack the accuracy of the judicial or quasi-judicial determination under this part, he or she may challenge the accuracy of the recording of that action. (printed page 14733)

(c) An individual requesting amendment or correction of records will receive a written acknowledgment of receipt of the request within 10 days (excluding Saturdays, Sundays, and legal public holidays), as required by the Privacy Act. The response to the request may be made in lieu of the acknowledgment of receipt provided the response is made within 10 days (excluding Saturdays, Sundays, and legal public holidays). The response to the request must be made promptly and indicate whether the request is granted or denied. (d) If the request for amendment or correction is granted in whole or in part, the response to the individual will receive a description or copy of the amendment or correction made and, if a copy of the amended or corrected record is not included in the response, notification of the right to obtain a copy of the corrected or amended record in disclosable form. (e) If the request for amendment or correction is denied in whole or in part, the

response to the individual will include a signed letter stating: (1) The reason(s) for the denial; and (2) The procedure for appeal of the denial under paragraph (f) of this section, including the name, position title and business address of the official who will act on the appeal. (f) An individual may appeal the denial of a request for amendment or correction to the individual's record to the appellate authority at the address listed in the notification of denial letter, in the same manner as for a denial of a request for access to records (see § 310.6). The appeal determination shall be made within 30 working days (excluding Saturdays, Sundays, and legal public holidays) from the date of the appeal, unless the period is extended for good cause. If the appeal is denied in whole or in part, the individual will be advised of the right to file a Statement of Disagreement as described in paragraph (g) of this section, and of the right under the Privacy Act for judicial review of the decision.

1. Current Provisions a. Section 164.308(a) Section 164.308(a) contains most of the standards and associated implementation specifications that are categorized as administrative safeguards. The standards for administrative safeguards are as follows: Security management process. Assigned security responsibility. Workforce security. Information access management. Security awareness and training. Security incident procedures. Contingency plan. Evaluation. The standard for security management process at 45 CFR 164.308(a)(1)(i) requires regulated entities to implement policies and procedures to prevent, detect, contain, and correct security violations. The Security Rule directs regulated entities as to how they are to comply with the standard for security management process through four implementation specifications. Section 164.308(a)(1)(ii)(A) requires regulated entities to conduct a risk analysis that accurately and thoroughly assesses potential risks and vulnerabilities to the confidentiality, integrity, and availability of ePHI they hold. The implementation specification for risk management at 45 CFR 164.308(a)(1)(ii)(B) requires regulated entities to implement measures to reduce risks and vulnerabilities, such as those identified in the risk analysis, to a reasonable and appropriate level. Under 45 CFR 164.308(a)(1)(ii)(C), regulated entities are required to apply appropriate sanctions against workforce members who fail to comply with applicable security policies and procedures, while the implementation specification for information system activity review at 45 CFR 164.308(a)(1)(ii)(D) requires regulated entities to implement procedures to regularly review information system activity records. The standard for assigned security responsibility at 45 CFR 164.308(a)(2) requires regulated entities to identify a security official who is responsible for the development and implementation of the policies and procedures that are required by this section. There are no implementation specifications associated with this standard. Section 164.308(a)(3)(i) contains the standard for workforce security and requires regulated entities to implement policies and procedures to ensure that their workforce members have appropriate access to ePHI, which includes preventing workforce members who do not have authorized access from (printed page 935) obtaining it. The implementation specifications associated with this standard address the need to implement certain procedures regarding workforce member access to ePHI. Section 164.308(a)(3)(ii)(A) addresses the implementation of procedures for the authorization and/or supervision of workforce members who work with ePHI or in locations where it might be accessed. The implementation specification for workforce clearance procedure at 45 CFR 164.308(a)(3)(ii)(B) addresses the implementation of procedures to determine that a workforce member's access to ePHI is appropriate, while 45 CFR 164.308(a)(3)(ii)(C)

and follow the instructions on the site. All items submitted must cite OMB Control No. 9000-XXXX, Controlled Unclassified Information. Comments submitted in response to this rule will be made publicly available and are subject to disclosure under the Freedom of Information Act. For this reason, please do not include in your comments information of a confidential nature, such as sensitive personal information or proprietary information, or any information that you would not want publicly disclosed unless you follow the instructions below for confidential comments. Summary information of the public comments received, including any specific comments, will be posted on <https://www.regulations.gov>. All filers using the portal should use the name of the person or entity submitting comments as the name of their files, in accordance with the instructions below. Anyone submitting business confidential/proprietary information should clearly identify any business confidential/proprietary portion at the time of submission, file a statement justifying nondisclosure and referencing the specific legal authority claimed, and provide a non-confidential/non-proprietary version of the submission. Any business confidential information should be in an uploaded file that has a file name beginning with the characters ·BC·. Any page containing business confidential information must be clearly marked ·BUSINESS CONFIDENTIAL/PROPRIETARY· on the top of that page. The corresponding non-confidential/non-proprietary version of those comments must

be clearly marked ·PUBLIC·. The file name of the non-confidential version should begin with the character ·P·. The ·BC· and ·P· should be followed by the name of the person or entity submitting the comments or rebuttal comments. All filers should name their files using the name of the person or entity submitting the comments. Any submissions with file names that do not begin with a ·BC· will be assumed to be public and will be made publicly available through <https://www.regulations.gov>. To confirm receipt of your comment(s), please check <https://www.regulations.gov>, approximately two-to-three days after submission to verify posting. If there are difficulties submitting comments, contact the GSA Regulatory Secretariat Division at 202-501-4755 or GSARegSec@gsa.gov. Public comments are particularly invited on: The necessity of this collection of information for the proper performance of the functions of Federal Government acquisitions, including whether the information will have practical utility; The accuracy of the estimate of the burden of this collection of information; Ways to enhance the quality, utility, and clarity of the information to be collected; and Ways to minimize the burden of the collection of information on respondents, including the use of automated collection techniques or other forms of information technology.

(xi) All written correspondence with the USG on the export. (xii) All information relating to political contributions, fees, or commissions furnished or obtained, offered, solicited, or agreed upon, as outlined in the ITAR parts 126.16(m) or 126.17(m). (xiii) Purchase order, contract, or letter of intent. (xiv) Technical data actually exported. (xv) The internal transaction number for the electronic export information filing in the automated export system. (xvi) All shipping documentation (including, but not limited to, the airway bill, bill of lading, packing list, delivery verification, and invoice). (xvii) Statement of registration (Department of State Form DS-2032 (available at: https://www.pmddtc.state.gov/sys_attachment.do?sysparm_referring_url=tear_off&view=true&sys_id=dabc05f6db6be344529d368d7c961984)). §.117.20 Critical Nuclear Weapon Design Information (CNWDI). (a) General. This section contains the special requirements for protection of CNWDI. The sensitivity of DoD CNWDI is such that access shall be granted to the absolute minimum number of employees who require it for the accomplishment of assigned responsibilities on a classified contract. Because of the importance of such information, special requirements have been established for its control. DoDI 5210.02, ·Access to and Dissemination of Restricted Data and Formerly Restricted Data· (available at: <https://www.esd.whs.mil/Portals/54/Documents/DD/issuances/dodi/521002p.pdf?ver=2019-01-14-072742-700>) establishes these controls in the DoD. (b) Briefings. Prior to having access to CNWDI, employees will be briefed on its sensitivity by the FSO or his or her alternate. The FSO will be initially briefed by a USG representative. (1) The briefing will include: (i) The definition of CNWDI. (ii) A reminder of the extreme sensitivity of the information. (iii) An explanation of the individual's continuing responsibility for properly safeguarding CNWDI and for ensuring that dissemination is strictly limited to other personnel who have been authorized for access and have a need-to-know for the particular information. (2) The briefing will also be tailored to cover any special local requirements. Upon termination of access to CNWDI, the employee will be given an oral debriefing. (c) Markings. In addition to any other required markings, CNWDI material will be clearly marked in accordance with DoDI 5210.02. At a minimum, CNWDI documents will show such markings on the cover or first page. Portions of documents that contain CNWDI will be marked with an (N) or (CNWDI) following the classification of the portion; for example, TS (RD)(N) or TS(RD)(CNWDI). (d) Subcontractors. Contractors will not disclose CNWDI to subcontractors without the prior written approval of the GCA. This approval may be included in a contract security classification specification, or equivalent, other contract-related document, or by separate correspondence. (e) Transmission outside the facility.

CUI handling is governed by 32 CFR Part 2002 and the ISOO CUI Marking Handbook (Version 1.1). Organizations must implement NIST SP 800-171 controls to protect CUI and follow marking requirements: - Banner markings (CUI designation at top and bottom of pages/documents) - Portion markings (optional, marking individual sections with (CUI)) - Dissemination controls where applicable - Proper handling, storage, and destruction procedures For specific marking guidance, consult the ISOO CUI Marking Handbook and your organization's CUI handling procedures. Under DFARS 252.204-7012, any incident involving potential CUI compromise must be reported to DC3 within 72 hours.

- Create clear standards and guidelines from a cybersecurity and privacy perspective for IoT device manufacturers and solution providers. - Certification and labeling programs are emerging for both

devices and overall solutions. - Data standards, integration, and communication protocols can help facilitate ecosystem compatibility to ensure devices can communicate. - Dependable supply chains are important. - Clear and consistent standards increase device interoperability and decrease cost. - Providing direction on 'mandatory' requirements would benefit manufacturers. - Educating the workforce and/or future workforce for the digital transformation of the economy, such as developing training initiatives to increase skilled resources to implement and maintain IoT solutions. - Public and private partnerships strengthen IoT security by leveraging the strengths, knowledge, and resources from both industry and government. When discussing IoT cybersecurity, the participants frequently returned to the challenge of the varying information and visibility available to different roles across the IoT ecosystem. Manufacturers are best positioned to understand the cybersecurity capabilities of their IoT products including the cybersecurity capabilities of components from across the supply chain that are used to create the IoT product. Customers have highly varying cybersecurity knowledge depending on a number of factors such as whether they are a home consumer, small business, or large enterprise. Participants noted that additional roles are often needed in heterogeneous systems where components from various manufacturers must function securely together. System integrators, brand owners, retailers and other specialized support services can be mediators between the manufacturer and customer. These discussions also emphasized the role of third-party platform providers.

paragraph (b)(1) to provide that regulated entities are to apply reasonable and appropriate security measures to implement the standards and implementation specifications of the Security Rule. This proposal, if adopted, would replace the existing paragraph providing for regulated entities' reasonable and appropriate implementation of standards and implementation specifications, which could be misinterpreted to mean that a regulated entity may determine that implementation itself is unreasonable or inappropriate in some circumstances. That has never been the case. Thus, the proposed modification would clarify that implementation is not optional based on whether a regulated entity believes it is reasonable and appropriate; to the contrary, a regulated entity is required to implement the standards and implementation specifications and must adopt reasonable and appropriate security measures that allow the entity to achieve such implementation. The proposed clarification would comport more precisely with the statute, which requires regulated entities to maintain 'reasonable and appropriate' safeguards. [425] The Department also proposes to add a new element to the list of factors that regulated entities must take into account when deciding whether a particular security measure (e.g., a technical control) is reasonable and appropriate for implementing a standard and its associated implementation specifications: the effectiveness of the security measure in supporting the resiliency of the regulated entity. A regulated entity would be required to consider this factor, in addition to the existing factors, for example, when choosing a specific encryption solution that allows the entity to meet the proposed requirement to encrypt ePHI, which will help prevent an unauthorized user from accessing the entity's ePHI; or when developing its security incident plan or disaster recovery plan, which will help ensure that the regulated entity can recover data or reestablish data integrity after a security incident or disaster. The Department proposes at 45 CFR 164.306(b)(2)(v) to require a regulated entity to take into account how effectively its application of a particular security measure to achieve compliance with a standard and its associated implementation specifications would support its resiliency in the face of an event that adversely affects the entity. According to NIST, 'information system resilience' addresses how well information systems 'continue to (i) operate under adverse conditions or stress, even if in a degraded or debilitated state, while maintaining essential operational capabilities; and (ii) recover to an effective operational posture in a time frame consistent with mission needs.' [426] Recently, in this era of rising cybercrime, NIST described 'cyber resiliency' as 'the ability to anticipate, withstand, recover from, and adapt to adverse conditions, stresses, attacks, or compromises on systems that use or are enabled by cyber resources.' [427]

32 CFR part 170 CMMC Program rule, which outlines program requirements rather than contracting procedures. This rule has no disproportionate impact on Native American owned businesses. Once identified as a requirement, the CMMC Program requirements will apply uniformly to all prospective contractors. DoD must enforce safeguarding requirements uniformly across the DIB for all contractors and subcontractors who process, store, or transmit CUI. The value of information and impact of its loss does not diminish when the information moves to DoD contractors and DoD subcontractors, regardless of their status as Native American or small disadvantaged businesses. The purpose of the CMMC Program is to ensure that DoD contracts that require contractors to

safeguard FCI and CUI (i.e., contracts that include FAR clause 52.204-21 and DFARS clause 252.204-7012) will be awarded to contractors with the ability to protect that information appropriately. Accordingly, all contractor owned information systems that process, store, or transmit FCI or CUI in the performance of a contract are subject to the requirements of FAR clause 52.204-21 and NIST SP 800-171 as implemented by DFARS clause 252.204-7012. The CMMC Program rule does not include threatened penalties. If a requirement of a DoD contract is not met, then standard contractual remedies applicable to that contract may apply. The phased implementation plan described in § 170.3(e) is intended to address ramp-up issues, provide time to train the necessary number of assessors, and allow companies the time needed to understand and implement CMMC requirements. The self-assessment requirements build on the existing DFARS clause 252.204-7020 requirement as part of basic safeguarding of CUI. CMMC Level 3 requires advanced implementation, and the phase-in period provides additional time for an OSC to achieve the higher standard. 11. Flow down. Commenters expressed concern that the CMMC rule language was not clear enough regarding when self-assessments are allowed. One commenter believed requiring prime contractors to validate the compliance of those they transmit CUI to was too onerous and that the rule language was not clear on how to determine what level of CUI is being passed. DoD Response: DoD policies guide Program Managers to appropriately apply CMMC Status requirements in DoD solicitations and resulting contracts, to include when Level 2 self-assessment rather than Level 2 certification assessment is appropriate. The commenter misinterprets the text of § 170.23, which states: If a subcontractor will process, store, or transmit CUI in performance of the subcontract and the associated prime contractor has a requirement for a CMMC Status of Level 2 (C3PAO), then the CMMC Status of Level 2 (C3PAO) is the minimum requirement for the subcontractor.

The term 'Top Secret' is an example of a classification that is appropriate for the defense community. The term 'Company Proprietary' is appropriate for commercial users. Words such as 'accounting' and 'personnel' are good examples of commercial compartments, whereas 'nato' and 'crypto' are examples of compartments related to defense. due to the widely varying needs of widely disparate interest groups. The categorization, marking, protection required and personnel clearances required differ wildly from firm to firm and nation to nation, if in fact a formal policy exists at all. This contrasts to the extremely stable, well defined world of classified information with a very small, universally recognized set of levels of hierarchical sensitivities. Given the nature of the realm of unclassified but sensitive information, it may be assumed that modelling such a policy to conform with frameworks developed for the classified realm will be problematic, if even possible.

- 2.2.4 The addition of designated information caused additional changes in more than just document marking and storage. Personnel clearances were affected as the rationale for requiring a security clearance changed. The former practice of requiring a security clearance had to be limited to only those requiring access, on a regular basis, to classified information. There was no longer as many positions requiring clearances since there was no longer the vast numbers of employees with a "need to know" requirement for classified information. This was perceived as a cost saving measure, since it would reduce the number of security clearance investigations required to be conducted by security staffs.

- 2.2.5 A requirement existed, however, to establish a level of trust for employees who did not require access to classified information but had access to designated information and valuable assets. Personnel screening was established at two levels.

One commenter has misinterpreted the answer to a public comment on a previous version of the rule, which responded to the initial CMMC Program requirements. Specialized Assets are not evaluated at Level 1. Specialized Assets at Level 2 need to be documented in the SSP and included in the asset inventory and network diagrams. They also are to be managed using the contractor's risk-based security policies, procedures, and practices. At Level 2, Specialized Assets do not need to be assessed against other CMMC security requirements. At Level 3, Specialized Assets should be prepared to be assessed against CMMC security requirements. CMMC also provides for the use of intermediary devices to safeguard OT and IOT devices that otherwise would be difficult or expensive to protect. The phrase 'or information systems not logically or physically isolated from all such systems' only appears in answers to public comments on the original 48 CFR CMMC interim final rule publication, therefore the inclusion of the phrase is not relevant to the rule. Specialized Assets span a broad spectrum of components and have different limitations on the application of security controls. Processes and practices to implement and assess security requirements on these devices are outside the scope of the CMMC rule. The Level 3 assessment is designed to provide additional safeguards to protect the most sensitive CUI against advanced persistent threats (APTs). DoD estimates that only one percent of defense contractors will require a CMMC Level 3 assessment. DoD has judged that the

risks associated with the exposure of this CUI are sufficient to justify the increased cost of a Level 3 assessment on the small percentage of the DIB that is processing, storing, or transmitting this type of data. CMMC also provides for the use of intermediary devices to safeguard OT and IOT devices that otherwise would be difficult or expensive to protect. This difference between how a Specialized Asset is assessed at Level 2 and Level 3 is risk-based and affords a reduction in cost for a Level 2 certification. The CMMC Assessment Scope for a CMMC Level 2 certification assessment is discussed between the OSC and the C3PAO. If the OSC has a goal to undergo a CMMC Level 3 certification assessment for the same assessment scope, it may be good business practice for the OSC to disclose this information to the C3PAO and be assessed based on the Level 3 scoping, however this is not required. e. Intermediary Devices Comment: One comment asks for additional information on intermediary devices as referenced in table 5 to § 170.19(d)(1). Another comment asks for direction in situations where the comment asserts intermediary devices are not practical. Response:

means any contract entered into by a contractor to furnish supplies or services for performance of a prime contract or a subcontract. It includes a contract, subcontract, purchase order, lease agreement, service agreement, request for quotation (RFQ), request for proposal (RFP), invitation for bid (IFB), or other agreement or procurement action between contractors that requires or will require access to classified information to fulfill the performance requirements of a prime contract. Subcontractor means a supplier, distributor, vendor, or firm that enters into a contract with a prime contractor to furnish supplies or services to or for the prime contractor or another subcontractor. For the purposes of this rule, each subcontractor will be considered as a prime contractor in relation to its subcontractors. Subsidiary means an entity in which another entity owns at least a majority of its voting securities. System software means computer programs that control, monitor, or facilitate use of the information system; for example, operating systems, programming languages, communication, input-output controls, sorts, security packages, and other utility-type programs. Also includes off-the-shelf application packages obtained from manufacturers and commercial vendors, such as for word processing, spreadsheets, data base management, graphics, and computer-aided design. Technical data means: (1) Information, other than software, which is required for the design, development, production, manufacture, assembly, operation, repair, testing, maintenance or modification of defense articles. This includes information in the form of blueprints, drawings, photographs, plans, instructions or documentation. (2) Classified information relating to defense articles and defense services on the U.S. Munitions List and 600-series items controlled by the Commerce Control List. (3) Information covered by an invention secrecy order. (4) Software directly related to defense articles. TFNI means classified information concerning the nuclear energy programs of other nations (including subnational entities) removed from the RD category under section 142(e) of the AEA after the DOE and the Director of National Intelligence jointly determine that it is necessary to carry out intelligence-related activities under the provisions of the National Security Act of 1947, as amended, and that it can be adequately safeguarded as NSI instead. This includes information removed from the RD category by past joint determinations between DOE and the CIA. TFNI does not include information transferred to the United States under an Agreement for Cooperation under the Atomic Energy Act or any other agreement or treaty in which the United States agrees to protect classified information. TOP SECRET

An ESP that is not an CSP and processes, stores, or transmits CUI, is considered an extension of the OSA's environment and the ESP services used to meet OSA requirements are within the scope of the OSA's CMMC assessment. As part of that environment, the ESP will be assessed against all applicable requirements and accountable for all users who have access to CUI as part of the ESP's service, not just OSA employees. ESPs that are not CSPs and do NOT process, store, or transmit CUI, do not require CMMC assessment. Nothing in the rule precludes an ESP, that is not a CSP, from voluntarily requesting a C3PAO assessment, and a C3PAO from performing such an assessment, if the ESP makes that business decision. Similarly, the ESP can request a Level 3 certification assessment from the DCMA DIBCAC if they have successfully met all the requirements during a Level 2 certification assessment. ESPs can be part of the same corporate/organizational structure but still be external to the OSA such as a centralized SOC or NOC which supports multiple business units. An ESP that is used as staff augmentation and the OSA provides all processes, technology, and facilities does not need a CMMC assessment. An ESP (not a CSP) that provides technical support services to its clients would be considered an MSP, since it does not host its own cloud platform (printed page 83200) offering. An ESP may utilize cloud offerings to deliver services to clients without being a CSP. An ESP that manages a third-party cloud service on behalf of an OSA would not be considered a CSP. 6. POA&M. Commenters expressed concern regarding the limited nature of POA&Ms in CMMC as well as the

timeline and lack of flexibility in remediating the POA&Ms. DoD Response. The DoD did not accept the recommendation to change the criteria in § 170.21 for POA&M requirements or the timeline allowed to remediate open POA&M items. The 180-day timeline and the determination of which weighted practices can be placed on a POA&M were risk-based decisions. The determination factored into account for the relative risk DoD is willing to accept when a particular practice is not met and the amount of risk the DoD is willing to accept for those security practices that remain ·NOT MET· for the extended period of time. The phased implementation plan in § 170.3(e) is intended to address ramp-up issues, provide time to train the necessary number of assessors, and allow companies the time needed to understand and implement CMMC requirements. DoD has updated the rule to add an additional six months to the Phase 1 timeline, now one year. Phase 2 will start one calendar year after the start of Phase 1. 7. Incorporation by Reference. Commenters expressed concern about the confusion between the NIST 800-171 R2 being included in the CMMC rule and not the recently published Rev 3. DoD Response. The Office of the Federal Register regulations (1 CFR part 51

3.3.3 Industry-recognized Certifications ## Focus Groups In an open-ended question, participants were asked what, if any, industry-recognized certifications they held (Figure 16). 3.3.3).

Numerous respondents commented that the estimates by DoD of the costs and economic impact of this rule are inadequate. One of these respondents commented that the rule creates costs beyond the supply chain risk management a responsible company would undertake in the course of ordinary business. Further, the scope of application of the interim rule, which requires compliance at all levels of the DoD supply chain, would require significant, costly, additional investments in supplier management and compliance mechanisms by industry. Another respondent suggested that absent a public comment period before implementation of the rule, industry has no opportunity to provide input regarding the costs and benefits of the approach DoD has taken. One respondent commented that the cumulative economic effect of the exclusion of any one company from any one contract would result in reductions in both Government and commercial business, and the loss of employment at the excluded company and the corresponding loss of payroll. Other losses would be incurred as a result of the ripple effect on primes, subcontractors, or suppliers to the excluded company, which will lose that source of supply and must then incur the expense of identifying and vetting new sources. One respondent commented that by not advising what standard DoD will use to evaluate supply chain risks, the interim rule is likely to increase the time and cost of pursuing and performing Government contracts. Response: DoD does not expect the rule to have a significant economic impact on a substantial number of entities. Companies have an existing interest in having a supply chain that they can rely on to provide it with material and supplies that allow the contractor to ultimately supply its customers with products that are safe and that do not impose threats or risks to Government information systems. The rule does not require contractors to deploy additional supply

chain risk protections. Section 806 authority applies to a specific contract, task order, or delivery order only. b. Small Business Comment: One respondent commented that the rule will drive up costs for smaller businesses by requiring significant increase in investments in compliance. Another respondent commented that the rule could prompt prime contractors to exclude new or small businesses in order to improve the evaluation of their supply chain risk profile. Response: The rule does not require contractors to deploy additional supply chain risk protections. c. Barriers to the Federal Market Comment: Two respondents commented that the rule creates significant new barriers to the Federal market, further suggesting that the interim regulation poses significant burdens for existing companies in the market and will only further dissuade new and innovative companies from entering the market. Response:

Report of the Workshop on Cryptography in Support of Computer Security ## REPORT OF THE WORKSHOP ON CRYPTOGRAPHY IN SUPPORT OF COMPUTER SECURITY Report of the Workshop on Cryptography in Support of Computer Security

During the course of assessment, DCMA DIBCAC will focus on assessing compliance with all 24 selected requirements derived from NIST SP 800-172 Feb2021, but limited checks may be performed on the 110 requirements from NIST SP 800-171 R2. If DCMA DIBCAC identifies that all 24 requirements from NIST SP 800-172 Feb2021 are satisfied, the OSA will have achieved a CMMC Status of Final Level 3 (DIBCAC) and is eligible for contract award as long as all other contractual requirements are met. Not all requirements must immediately be MET to be eligible for contract award. If the minimum score is achieved on the assessment (equal to 80% of the maximum score of 24) and certain critical requirements are met, OSAs will achieve a CMMC Status of Conditional Level 3 (DIBCAC), and all NOT MET requirements must be noted in a POA&M. At this point the OSA will have satisfied the CMMC requirements needed for contract award. OSAs must have met all 24 selected security requirements of NIST SP 800-172 Feb2021 within 180 days of receiving their Conditional CMMC Status, which must be verified with a POA&M closeout assessment by DCMA DIBCAC. If the POA&M closeout assessment finds that all requirements have been met, then the OSA will achieve a CMMC Status of Final Level 3 (DIBCAC). However, if a POA&M closeout assessment does not find that all requirements have been met by the end of 180 days, then the CMMC Status of Conditional Level 3 (DIBCAC) will expire. At this point, standard contractual remedies will apply. The OSA should submit an affirmation into SPRS after achieving a CMMC Status of Conditional Level 3 (DIBCAC) if applicable and once a CMMC Status of Final Level 3 (DIBCAC) is achieved. Being eligible for contracts subject to CMMC Level 3 (DIBCAC) also indicates eligibility for contracts subject to Level 1 (Self), Level 2 (Self), and Level 2 (C3PAO), assuming all other contractual requirements are met. To maintain CMMC Level 3 (DIBCAC) status, an OSA must undergo both a Level 2 certification assessment and a Level 3 certification assessment every three years and separately affirm compliance with Level 2 and Level 3 requirements in SPRS annually. These deadlines are based on the CMMC Status Date of the Conditional certification if applicable or the CMMC Status Date of the Final determination. CMMC Status Date is not based on the date of a POA&M closeout assessment. Flow-Down If the OSA employs subcontractors to fulfill the contract, those subcontractors must also have a minimum CMMC Status as shown in table 2. Table 2-Minimum Flow-Down Requirements Prime contractor requirement Minimum subcontractor requirement If the subcontractor will process, store, or transmit FCI CUI Level 1 (Self) Level 1 (Self) N/A. Level 2 (Self) Level 1 (Self) Level 2 (Self). Level 2 (C3PAO) Level 1 (Self) Level 2 (C3PAO). Level 3 (DIBCAC) Level 1 (Self) Level 2 (C3PAO). (printed page 83097) Summary of Provisions Contained in This Rule Section 170.1-Purpose

- Ubiquitous access: users want access to applications from multiple client devices (e.g., browsers, mobile devices). - Scalability: applications must be highly scalable to maintain availability in the face of an increasing number of users and/or increased rate of usage from the existing user base. - Agile development: organizations want frequent updates to quickly respond to organizational (process and structural) changes and market demands. Publish-Subscribe : This pattern is used when microservices need to collaborate for the realization of a complex business process or transaction. This is also called a business domain event-driven approach or domain event subscription approach. In this pattern, a microservice registers itself or subscribes to business domain events (e.g., interested in specific information or being able to handle certain requests), which are published to a message broker through an eventbus interface. These microservices are built using event-driven APIs and use asynchronous messaging protocols, such as Message Queuing Telemetry Transport (MQTT), Advanced Message Queuing Protocol (AMQP), and Kafka Messaging, which enable support for notifications and subscriptions. In asynchronous protocols, the message sender does not typically

uirements. When deciding whether to require and implement C-SCRM practices and controls, acquirers should consider both the costs of implementing these controls and the risks of not implementing them. applicable existing data and documentation that may provide evidence | Levels | Level Name | Generic Stakeholder | Activities | |-----|-----|-----|-----|

_____|| 3 |

On August 21, 1992 and January 28, 1994, notices were published in the Federal Register (57 FR 37948 and 59 FR 4031, respectively) that a Federal Information Processing Standard for Standard Security Label for the Government Open Systems Interconnection Profile was being proposed for Federal use. The written comments submitted by interested parties and other material available to the Department relevant to this standard were reviewed by NIST. On the basis of this review, NIST recommended that the Secretary approve the standard as a Federal Information Processing Standards Publication, and prepared a detailed justification document for the Secretary's review in support of that recommendation. The detailed justification document which was presented to the Secretary is part of the public record and is available for inspection and copying in the Department's Central Reference and Records Inspection Facility, Room 6020, Herbert C. Hoover Building, 14th Street between Pennsylvania and Constitution Avenues NW., Washington, DC 20230. This FIPS contains two sections: (1) An announcement section, which provides information concerning the applicability, implementation, and maintenance of the standard; and (2) a specifications section which deals with the technical requirements of the standard. Only the announcement section of the standard is provided in this notice.

(Response) ·Holding· means storage of food. Holding facilities include warehouses, cold storage facilities, storage silos, grain elevators, and liquid storage tanks. The recordkeeping requirements in §§ 1.337 and 1.345 of this final rule apply to persons who ·hold· food for purposes other than transportation. As defined in § 1.328 of this final rule, a ·transporter· is: * * * a person who has possession, custody, or control of an article of food in the United States for the sole purpose of transporting the food, whether by road, rail, water, or air. Transporter also includes a foreign person that transports food in the United States, regardless of whether that person has possession, custody, or control of that food for the sole purpose of transporting the food.* * * Truck terminals or similar facilities that are part of the transportation process and merely provide a location for trucks to transfer possession, custody, or control to another entity are not subject to the requirements in §§ 1.337 and 1.345 of the final rule, unless possession, custody, or control is transferred to that terminal or facility. (Comment 21) One comment seeks clarification on whether a ·customer,· such as an office complex, would be required to maintain records if it receives and stores a food, such as bottled water, in the customer's own storage area for subsequent distribution to the various offices within the complex. The comment also asks whether, for bottled water, such a customer would also be the immediate previous source for bottles that are returned to the bottler for reuse. (Response) FDA has added an exclusion to the final rule for persons who receive or hold food on behalf of specific individual consumers and who are not also parties to the transaction and who are not in the business of distributing food. This exclusion covers person such as a hotel concierge, the reception desk in an apartment building, and an office complex that (printed page 71571) receives bottled water as described by the comment. FDA has added this exclusion because

such persons are not parties to the transaction and records from such person are not necessary to identify the immediate previous sources and immediate subsequent recipients of food to address credible threats of serious adverse health consequences or death. The comment also asks whether, for bottled water, such a customer would also be the immediate previous source for bottles that are returned to the bottler for reuse. A customer who returns bottles to the bottler would be the nontransporter immediate previous source of the bottles (§ 1.328 of the final rule). As with other sources of its bottles (e.g., a bottle manufacturer), the bottler would be required to keep records of bottles received from customers for reuse.

, a regulated entity would be required to establish written policies and procedures for sanctioning workforce members who fail to comply with the regulated entity's security policies and procedures. The proposed implementation specification for modifications at paragraph (a)(6)(ii)(B) would require a regulated entity to review its written sanctions policies and procedures at least once every 12 months, and, based on that review, modify such policies and procedures as reasonable and appropriate. The proposed implementation specification for application at proposed paragraph (a)(6)(ii)(C) would direct a regulated entity to apply appropriate sanctions against workforce members who fail to comply with such security policies and procedures and to document when it sanctions a workforce member and the circumstances in which it applies such sanctions. The policy choices represented in this NPRM are informed by the compliance challenges OCR has observed through its enforcement activities. These challenges demonstrate that regulated entities would benefit from greater precision and clarity about their legal obligations in the proposed standard. Additionally, according to a recent survey of IT and IT security practitioners in healthcare, careless users were the top cause of data loss and exfiltration, while accidental loss was the second highest cause. Thirty-one percent of respondents indicated that the data loss or exfiltration was caused by a failure of workforce members to follow organizational policies. [511] As described in existing Department guidance, an organization's sanction policies can be an important tool for supporting accountability and improving cybersecurity and data protection. [512] Sanction policies can be used to address the intentional actions of malicious insiders, such as a workforce member that accesses the ePHI of a public figure or steals ePHI to sell as part of an identity-theft ring, as well as the failure of workforce members to comply with policies and procedures, such as failing to secure data on a network server or investigate a potential security incident. Sanction policies that are appropriately applied can improve a regulated entity's general compliance with the HIPAA Rules. Imposing consequences on workforce members who violate a regulated entity's policies and procedures implemented as required by the Security Rule or the HIPAA Rules generally can be effective in creating a culture of HIPAA compliance and improved cybersecurity. Knowledge that there is a negative consequence to noncompliance enhances the likelihood of compliance. [513] Training workforce members on a regulated entity's sanction policy can also promote compliance and greater cybersecurity vigilance by informing workforce members in advance which actions are prohibited and punishable. [514]

(D) From subsections (e)(4)(G) and (e)(4)(H) because portions of this system of records have been exempted from the access provisions of subsection (d), making these subsections not applicable. (E) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (F) From subsection (f) because portions of this system of records have (printed page 14760) been exempted from the access provisions of subsection (d). (31) System identifier and name. A0601-210a USAREC, Enlisted Eligibility Files. (i) Exemption. Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k) (5) from subsections 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (d), because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or

apprehension, and would present a serious impediment to law enforcement. (C) From subsection (e)(1) because in the course of criminal investigations, information is often obtained concerning the violation of laws or civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this valuable information be retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought. (D) From subsections (e)(4)(G) and (e)(4)(H) because portions of this system of records have been exempted from the access provisions of subsection (d), making these subsections not applicable. (E) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants.

Two commenters recommended the DoD fully implement CMMC requirements to standardize contract requirements to avoid proliferation of unique contract clauses across the Department. One comment suggested the rule should state explicitly that CMMC requirements do not apply to other agencies and advise DoD contractors to seek legal guidance before complying with CMMC requirements if other agency requirements also apply. In addition, several commenters thought the 32 CFR part 170 CMMC Program rule requirements lacked sufficient information about the associated 48 CFR part 204 CMMC Acquisition rule requirements to implement them. One person erroneously identified the DFARS clause 252.204-7021 as part of the 32 CFR part 170 CMMC Program rule, and one person asked what additional rulemaking is needed to implement CMMC requirements. Another person recommended close coordination and synchronization between the two rules. One comment recommended the contract clauses be simplified to be -stand alone-, rather than requiring cognizance of the 32 CFR part 170 CMMC Program rule content. One commenter asked whether contractors must meet CMMC requirements during the solicitation phase, or to view RFPs that contain CUI. Another asked how DoD plans to integrate CMMC requirements into DoD's Adaptive Acquisition Framework. One contractor disagreed with CMMC's pre-award approach, and worried it could create a need to become compliant in anticipation of future solicitations. This commenter posited that any information designated as CUI after contract award will create a -chicken and egg- dilemma for CMMC compliance. Other comments asked whether conditional certifications would be weighted differently than final certifications in the proposal evaluation and award process and suggested that DoD provide 6 months advance notice for all solicitations containing a CMMC requirement. Some comments urged the DoD to describe how DoD will identify CUI in solicitations and when CUI markings should apply in CSP or ESP scenarios. They also requested modification of DoD contracting procedures to provide criteria for identifying CUI information in each contract award along with the corresponding CMMC assessment level. One commenter inquired about the difference between implementing security requirements and assessing compliance. Some comments pertained to other DFARS contractual requirements, rather than CMMC requirements. For example, some recommended changing DFARS clause 252.204-7012 to remove the definition (printed page 83109) of Covered Defense Information and to deviate from a requirement to comply with the NIST SP 800-171 version current at the time of solicitation. In addition, they asked about cost allowability for time and materials or cost type contracts. Some comments posited that costs for reassessment or recertification should be explicitly identified as reimbursable in the 48 CFR part 204

Several comments stated that recouping compliance costs could take years, forcing SMBs into financial debt, contract termination, and exclusion from the market for DoD contracts. One commenter expressed concern about implementation of CMMC as a condition of contract award and the implication that compliance costs are incurred prior to receiving a DoD contract. Response: DoD declined to implement a small entity specific -phased compliance-. Since December 2017, DFARS clause 252.204-7012 has required contractors to implement the NIST SP 800-171 security requirements to provide adequate security applicable for processing, storing, or transmitting CUI in support of the performance of a DoD contract. DoD received numerous comments about the use of ESPs, including MSPs, which do not process, store, or transmit CUI. In response to comments, the DoD has reduced the assessment burden on External Service Providers (ESPs). ESP assessment, certification, and authorization requirements in §§ 170.19(c)(2) and (d)(2) have been updated. ESPs that are not CSPs and do NOT process, store, or transmit CUI, do not require CMMC assessment or certification. Services provided by an ESP are in the OSA's assessment scope. CMMC has taken several steps to keep the cost of compliance with the rule commensurate with the risk to the DoD's information. Level 1 only requires self-assessment, and many contracts with CUI will only require a Level 2 self-assessment. Companies that currently attest that they meet DFARS clause 252.204-7012 should not have

difficulty completing a Level 2 self-assessment. In accordance with the rulemaking process, this rule was reviewed by both DoD cost analysts and OMB economists for realism and completeness. This is a 32 CFR part 170 CMMC Program rule, not an acquisition rule. The 48 CFR part 204 CMMC Acquisition rule will address implementation of CMMC as it pertains to DoD contracts. d. Detailed Cost Analysis Comment: A few comments suggested a detailed cost analysis should consider SMBs of various sizes, types, and challenges to ensure compliance is sustainable. One comment asked whether a profit margin analysis was performed, while another asserted that other third-party assessments are less expensive than the estimates for CMMC assessment. Another stated CMMC Level 3 cost estimates are too low and suggested using costs associated with SECRET-level networks for calculation. Response: The DoD provided an analysis of costs to meet CMMC Level 1 and 2 requirements in the regulatory impact analysis for this rule. The cost estimates provided for this rule represent average costs for companies to comply with CMMC requirements, including the need for self-assessment or independent assessment against the specified standards. Comparing costs with other third-party security audits presumes that the security and assessment requirements are identical, and DoD disagrees with that assumption.

Since section 806 decisions rely on intelligence information, the operation of the rule presents no barrier to participation in the DoD market for either existing participants or new entrants. (printed page 67249) d. De Facto Debarment/Suspension Comment: Several respondents stated that the exercise of the exclusionary authority in the rule could result in a de facto debarment or suspension without any due process for the affected offeror. Response: Risk will be evaluated on case-by-case basis, and any exclusion will be for a particular source selection and not a blanket exclusion. Offerors are eligible to compete for future solicitations even after section 806 has excluded them from a particular source selection. e. Security Comment: One respondent commented that the rule could unintentionally but negatively impact the Federal Government's security because it prevents DoD from informing suppliers about supply chain risks that DoD believes exist and prevents any consultation with offerors. Response: This will be taken into consideration in any instance that the section 806 authority is utilized. 7. Qualification standard Comment: Three respondents commented that the interim rule should provide more guidance regarding the qualification standard(s) that may be established to reduce supply chain risk. One respondent urged DoD to develop the systems and data security requirements for covered procurements and issue them to potential offerors during the procurement process as a requirement for bid eligibility. This approach would focus the use of this clause to procurements for covered systems or covered items of supply and would increase competition by limiting unnecessary disqualification of offerors (and contractors and subcontractors/suppliers) that could meet the Government's requirements. Another respondent commented that the rule should be amended to provide more specificity as to the type of qualification standards that may be established for the purposes of reducing supply chain risk in the acquisition of covered systems. Response: DoD has no present plans to use section 806 authority to exclude a source based on failure to meet a qualification standard to reduce supply chain risk. To use this authority DoD must first develop qualification standards in accordance with the requirements of 10 U.S.C. 2319, which include providing the qualification requirements to potential offerors. 8. Synchronize/Harmonize With Related Rules/Initiatives Comment:

In CMMC 1.0, there was no intent to change the meaning of NIST requirements except those referenced as modified. These minor discrepancies are now resolved as all FCI requirements use the exact FAR language and all CUI requirements use the exact language from the relevant NIST guidelines. The requirements in CMMC Level 3 are derived from NIST SP 800-172 with DoD-approved parameters. Commenters requesting revisions to NIST guidelines should respond to the NIST public comment periods. There is no CMMC-specific cyber incident reporting requirement or need for associated medium assurance certificate. Comment: Several comments sought clarification on the alignment and relative authority or precedence of the CMMC requirements to Federal, Legislative, Statutory, Regulatory, or DoD Organizational policy, DoD instructions, and FAQs. Response: The CMMC Program requirements will be required once implemented in the DFARS and will have the same relative authority of any other DoD contract requirement. The CMMC Program relates to and incorporates elements of the following authorities: Executive Order No. 13556, Controlled Unclassified Information, 75 FR 68675 (November 4, 2010), which establishes an open and uniform program for managing [unclassified] information that requires safeguarding or dissemination controls; 32 CFR part 2002, which describes the executive branch's Controlled Unclassified Information Program and establishes policy for designating, handling, safeguarding, and decontrolling information that qualifies as CUI when processed, stored, or transmitted on a federal or non-federal information

system; FAR clause 52.204-21, Basic Safeguarding of Covered Contractor Information Systems, which, as applicable, requires contractors to apply certain basic safeguarding procedures on covered contractor information systems that process, store, or transmit FCI; and DFARS clause 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting, which, as applicable, requires defense contractors to implement NIST SP 800-171 Rev 2 requirements on unclassified covered contractor information systems that process, store, or transmit covered defense information. Additional DoD instructions and manuals address DoD information security policy, including DoDI 5200.48 CUI which establishes policy, assigns responsibilities, and prescribes procedures for CUI throughout the DoD for federal and on non-federal information systems to include the implementation of NIST SP 800-171 Rev 2. A requirement for CMMC assessments provides DoD assurance that contractors have implemented required cybersecurity protections. The requirements of this rule will be implemented in an associated 48 CFR acquisition rule regarding CMMC. 21. CMMC Assessment Comment:

DoD agrees that a separate approval of contractor scrap procedures is neither practical nor necessary; however, the basic minimum requirements of an adequate scrap procedure are integral to proper application of the clause. Accordingly, the language referring to scrap procedure approvals at DFARS 252.245-70XX(j)(1) has been deleted from the final rule; the remaining language has been retained at paragraph (h) of 252.245-7004. Comment: In reference to DFARS 252.245-70XX(j)(i)(ii), a respondent recommended retaining the current language found in DFARS 245.610-3(1)(iv)(B), as follows: 'When commingling is approved, the net proceeds for contractors with an approved scrap procedure will ensure (that sales) proceeds are appropriately applied to an overhead account.' DoD Response: While the requirement is still relevant, it is a normal part of a property administrator's oversight function; therefore, the language is more suitable to internal DoD component guidance, e.g., DCMA instructions. Comment: A respondent recommended deleting the requirement for a scrap warranty at DFARS 252.245-70XX(j)(3). DoD Response: The referenced language has been modified to allow Government discretion in requiring a scrap warranty. Comment: A respondent recommended moving the requirements of DFARS 252.245-70XX(k), Disposal of contractor inventory for NATO cooperative services, to DFARS part 245 or providing clarification that its requirements are a Government responsibility. DoD Response: The language has been deleted from the final rule clause, as DoD support to NATO cooperative projects is already covered under DFARS 225.871. F. Other Changes 1. Comment: A respondent identified 'untability' as a typographical error at DFARS 252.245-70XX(j)(1)(i). DoD Response: The term has been changed to 'accountability.' 2. Comment: A respondent stated that the proposed changes do a good job of cleaning up and consolidating the plant clearance process and that the new PGI for DFARS Case 2009-D008 also looks good. DoD Response: Noted. 3. The following changes have been incorporated into the final rule based on internal DoD coordinations: Deleted the reference to FAR 52.245-2 at 245.107 because the FAR clause 52.245-2 is not a stand-alone clause and can only be used in conjunction with FAR 52.245-1; Added clarifying language on property condition at 245.602-1(3); Clarified that 245.602-1 applies only to termination inventory and that such inventory may be verified by appropriate technical personnel; Added clarifying language at 245.602-3 on disposition of contractor inventory in overseas locations; arrangement of inspection of property and security requirements; and consideration by the plant clearance officer of any special disposition requirements, such as demilitarization; and trade security requirements; Added 245.7101-5(d), Other disposal actions, to conform to the DD Form 1641;

STEP itself does not imply any particular implementation form or security policy. Certain policies are more easily implemented with the SQL/STEP architecture than others. In Section 4, three broad classes of security policies are briefly described, accompanied by a comparison of particular requirements with the facilities of SQL. The policy classes are: a role based policy, a mandatory access control policy for confidentiality, and a mandatory access control policy for integrity. Inference and aggregation are usually considered threats to mandatory access control policies, but they are threats in any environment. There are also a number of DBMS specific security issues, such as referential integrity and polyinstantiation. Classic OS problems such as deadlock and transaction completion must also be considered. - Database Schema: The database schema must be well designed to ensure that aggregation and inference are not threats. - Transaction Management: The SQL processor must prevent denial of service due to deadlock. The SQL processor must provide appropriate transaction management features: incomplete transactions can result in loss of external consistency, i.e., the tables and elements are not 'synchronized.' - Modification: The SQL processor is responsible for maintaining access control for SQL level objects. The SQL processor is responsible for enforcing external consistency issues, such as type checking and ranges. - Retrieval: The SQL

processor is responsible for maintaining access control for SQL level objects.

(vii) Develop and maintain security documentation of the security authorization request to the CSA. Documentation may include: (A) SSPs. (B) Security assessment reports. (C) Plans of actions and milestones. (D) Risk assessments. (E) Authorization decision letters. (F) Contingency plans. (G) Configuration management plans. (H) Security configuration checklists. (I) System interconnection agreements. (3) Information systems security officer (ISSO). The ISSM may assign an ISSO. If assigned, the ISSO will: (i) Verify the implementation of the contractor's information system security program as delegated by the ISSM. (ii) Ensure continuous monitoring strategies and verify corrective actions to the ISSM. (iii) Conduct self-inspections and verify corrective actions to the ISSM. (4) Information system users. All information system users will: (i) Comply with the information system security program requirements as part of their responsibilities for protecting classified information. (ii) Be accountable for their actions on an authorized information system. (iii) Not share any authentication mechanisms (including passwords) issued for the control of their access to an information system. (iv) Protect authentication mechanisms at the highest classification level and most restrictive classification category of information to which the mechanisms permit access. (v) Be subject to monitoring of their activity on any classified network, understanding that the results of such monitoring can be used against them in a criminal, security, or administrative proceeding or action. (vi) Notify the ISSM or ISSO when access to a classified system is no longer required. (d) Information system security life-cycle. The CSA-provided guidance on the information system security life-cycle is based on the risk management framework outlined in NIST special publication 800-37 that emphasizes: (1) Building security into information systems during initial development. (2) Maintaining continuous awareness of the current state of information system security. (3) Keeping contractor management informed to facilitate risk management decisions. (4) Supporting reciprocity of information system authorizations. (e) Risk management framework. The risk management framework is a seven-step process used for managing information system security-related risks. These steps will be used to help ensure security capabilities provided by the selected security controls are implemented, tested, validated, and approved by the USG authorizing official with a degree of assurance appropriate for the information system. This process accommodates an on-going risk mitigation strategy. (1) Prepare. The contractor will execute essential activities at the organization, mission and business process, and system levels of the organization to help prepare the organization to manage its security and privacy risks using the Risk Management Framework. (2) Categorize.

CIS Control 3 · Data Protection Develop processes and technical controls to identify, classify, securely handle, retain, and dispose of data. Data is no longer only contained within an enterprise's border, it is in the cloud, on portable end-user devices where users work from home, and is often shared with partners or online services who might have it anywhere in the world. In addition to sensitive data an enterprise holds related to finances, intellectual property, and customer data, there also might be numerous international regulations for protection of personal data. Data privacy has become increasingly important, and enterprises are learning that privacy is about the appropriate use and management of data, not just encryption. Data must be appropriately managed through its entire lifecycle. These privacy rules can be complicated for multi-national enterprises, of any size, however there are fundamentals that can apply to all. Once attackers have penetrated an enterprise's infrastructure, one of their first tasks is to find and exfiltrate data. Enterprises might not be aware that sensitive data is leaving their environment because they are not monitoring data outflows. While many attacks occur on the network, others involve physical theft of portable end-user devices, attacks on service providers or other partners holding sensitive data. Other sensitive enterprise assets may also include non-computing devices that provide management and control of physical systems, such as Supervisory Control and Data Acquisition (SCADA) systems. The enterprise's loss of control over protected or sensitive data is a serious and often reportable business impact. While some data is compromised or lost as a result of theft or espionage, the vast majority are a result of poorly understood data management rules, and user error. The adoption of data encryption, both in transit and at rest, can provide mitigation against data compromise, and more importantly, is a regulatory requirement for most controlled data.

According to nist_sp800-66r2: <!-- image --> ## NIST Special Publication 800 NIST SP 800-66r2 ## Implementing the Health Insurance Portability and Accountability Act (HIPAA) Security Rule A Cybersecurity Resource Guide Jeffrey A. 800-66r2 ## Implementing the Health Insurance Portability and Accountability Act (HIPAA) Security Rule A Cybersecurity Resource Guide Jeffrey A. Marron Applied Cybersecurity Division Information Technology Laboratory This publication is available free of charge from: <https://doi.org/10.6028/NIST.SP.800-66r2> February 2024 <!-- image --> U.S. Department of Commerce Gina M. Raimondo, Secretary National Institute of Standards and Technology Certain commercial equipment, instruments, software, or materials, commercial or non-commercial, are identified in this paper in order to specify the experimental procedure adequately. Such identification does not imply recommendation or endorsement of any product or service by NIST, nor does it imply that the materials or equipment identified are necessarily the best available for the purpose. There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. Organizations are encouraged to review all draft publications during public comment periods and provide feedback to NIST.

- GLYPH<math>\text{c}=31, \text{font}=\text{HHCKCL+Webdings}> The types of threats for which the IDPS should provide protection. Evaluators should state, as specifically as possible, the concerns that the organization has regarding the types of threats that originate both outside the organization and inside the organization (insider threats). Insider threats should encompass not only users who attack the system from within, but also authorized users who overstep their privileges, thereby violating organizational security policy or laws. - GLYPH<math>\text{c}=31, \text{font}=\text{HHCKCL+Webdings}> Any needs to monitor system and network usage for acceptable use violations or non-security reasons. In some organizations, there are system use policies that target user behaviors that may be considered personnel management rather than system security issues. These might include accessing Web sites that provide content of questionable taste or value (such as pornography) or using the organization's systems to send email or other messages to harass individuals. Some IDPSs provide features that accommodate detecting such events. Monitoring usage can also assist organizations in determining when systems and networks are reaching capacity and might need to be upgraded or replaced. IDPSs can protect the systems of an organization, but at a price. It makes little sense to incur additional expense for IDPS features if the organization does not have sufficient systems or personnel to use them. Evaluators should consider the following: - GLYPH<math>\text{c}=31, \text{font}=\text{HHCKCL+Webdings}> The budget for acquisition and life cycle support of IDPS hardware, software, and infrastructure. The total cost of ownership of IDPSs well exceeds acquisition costs. Other costs may be associated with acquiring systems on which to run software components, deploying additional networks, providing sufficient storage for IDPS data, obtaining specialized assistance in installing and configuring the system, and training personnel.

(6) Description of goods; or (e) Entering into an agreement with the nontransporter immediate previous source located in the United States and/or the nontransporter immediate subsequent recipient located in the United States to establish, maintain, or establish and maintain, the information in § 1.352(a), (b), (c), or (d). The agreement must contain the following elements: (1) Effective date; (2) Printed names and signatures of authorized officials; (3) Description of the records to be established and/or maintained; (4) Provision for the records to be maintained in compliance with § 1.360, if the agreement provides for maintenance of records; (5) Provision for the records to be available to FDA as required by § 1.361, if the agreement provides for maintenance of records; (6) Acknowledgement that the nontransporter assumes legal responsibility under § 1.363 for establishing and/or maintaining the records as required by this subpart; and (7) Provision that if the agreement is terminated in writing by either party, responsibility for compliance with the applicable establishment, maintenance, and access provisions of this subpart reverts to the transporter as of the date of termination. § 1.360 What are the record retention requirements? (a) You must create the required records when you receive and release food, except to the extent that the information is contained in existing records. (b) If you are a nontransporter, you must retain for 6 months after the dates you receive and release the food all required records for any food having a significant risk of spoilage, loss of value, or loss of palatability within 60 days after the date you receive or release the food. (c) If you are a nontransporter, you must retain for 1 year after the dates you receive and release the food all required records for any food for which a significant risk of spoilage, loss of value, or loss of palatability occurs only after a

minimum of 60 days, but within 6 months, after the date you receive or release the food. (d) If you are a nontransporter, you must retain for 2 years after the dates you receive and release the food all required records for any food for which a significant risk of spoilage, loss of value, or loss of palatability does not occur sooner than 6 months after the date you receive or release the food, including foods preserved by freezing, dehydrating, or being placed in a hermetically sealed container. (e) If you are a nontransporter, you must retain for 1 year after the dates you receive and release the food all required records for animal food, including pet food.

relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided the President and others are not compromised, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, to preserve the confidentiality and integrity of Federal testing materials, and to safeguard evaluation materials used for military promotions when furnished by a confidential source. The exemption rule for the original records will identify the specific reasons why the records are exempt from specific provisions of 5 U.S.C. 552a . (7) System identifier and name. CIG 23, Public Affairs Files. (i) Exemption. During the course of processing a General Counsel action, exempt materials from other systems of records may in turn become part of the case records in this system. To the extent that copies of exempt records from those 'other' systems of records are entered into the Public Affairs Files, the Office of the Inspector General hereby claims the same exemptions for the records from those 'other' systems that are entered into this system, as claimed for the original primary systems of records which they are a part. (ii) Authority. 5 U.S.C. 552a(j)(2) , (k)(1), (k)(2), (k)(3), (k)(4), (k)(5), (k)(6), and (k)(7). (iii) Reasons. Records are only exempt from pertinent provisions of 5 U.S.C. 552a to the extent (A) such provisions have been identified and an exemption claimed for the original record and (B) the purposes underlying the exemption for the original record still pertain to the record which is now contained in this system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided the President and others are not compromised, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, to preserve the confidentiality and integrity of Federal testing materials, and to safeguard evaluation materials used for military promotions when furnished by a confidential source. The exemption rule for the original records will identify the specific reasons why the records are exempt from specific provisions of 5 U.S.C. 552a . (8) System identifier and name. CIG-29, Privacy and Civil Liberties Complaint Reporting System. (i) Exemption. Any portion of this record system which falls within the provisions of 5 U.S.C. 552a (j)(2), (k)(2) and (k)(5) may be exempt from the following subsections of 5 U.S.C. 552a : (c)(3), (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I). (ii) Authority. 5 U.S.C. 552a(j)(2) , (k)(2), and (k)(5). (iii) Reasons.

If an individual asks for his or her records and does not cite or reasonably imply either the Privacy Act or the Freedom of Information Act, and another prescribing directive or regulation authorizes the release, the records should be released under that other directive or regulation and not the PA or the FOIA. Examples of functional requests are military members asking to see their Official Military Personnel Records or civilian employees asking to see their Official Personnel Folder. (i) Procedures for denying or limiting an individual's right to access or amendment and the role of the Denial Authority. (1) The only officials authorized to deny a request for records or a request to amend records in a PA system of records pertaining to the requesting individual, are the appropriate Denial Authorities, their designees, or the Secretary of the Army who will be acting through the General Counsel. (2) Denial Authorities are authorized to deny requests, either in whole or in part, for notification, access and amendment of Privacy Act records contained in their respective areas of responsibility. (i) The Denial Authority may delegate all or part of their authority to a division chief under his supervision within the Agency in the grade of 0-5/GS-14 or higher. All delegations must be in writing. (ii) The Denial Authority will send the names, office names, and telephone numbers of their delegates to the DA Freedom of Information and Privacy Office. (iii) If a Denial Authority delegate denies access or amendment, the delegate must clearly state that he or she is acting on behalf of the Denial Authority, who must be identified by name and position in the written response to the requester. Denial Authority designation will not delay processing privacy requests/actions. (iv) The official Denial Authorities are for records under their authority (See appendix B of this part). The individuals designated as Denial Authorities

under this part are the same individuals designated as Initial Denial Authorities under AR 25-55, the Department of the Army Freedom of Information Act Program. However, delegation of Denial Authority pursuant to this part does not automatically encompass delegation of Initial Denial Authority under AR 25-55. Initial Denial Authority must be expressly delegated pursuant to AR 25-55 for an individual to take action on behalf of an Initial Denial Authority under AR 25-55. (3) The custodian of the record will acknowledge requests for access made under the provisions of the Privacy Act within 10 working days of receipt.

According to Cybersecurity Framework Profile for Liquefied Natural Gas, Category Prioritization Summary: Workshop participants were asked to identify Categories most relevant to each mission objective, and then to prioritize those Categories as high-priority, medium-priority, or starred-priority using the following descriptions: - High-Priority Categories were considered the most critical for accomplishing a mission objective. - Medium-Priority Categories were considered important to a mission objective, although not as important as high-priority Categories. - Starred-Priority Categories were identified as being relevant to a mission objective, but not with the same urgency as other priority Categories. Profiles should be tailored to individual operating environments and organizational risk tolerances. The identified Category priorities, shown in Sec. 6.1, are intended to help focus resources on cybersecurity activities that participants identified as particularly relevant. The intent of this Profile is to suggest areas of focus priority pertinent to the LNG lifecycle. A user of this Profile could repeat the workshop steps to develop their own Profile based on their organization's unique needs and resource considerations. The tables in Sec. 6.1 do not include the following Categories: Awareness and Training (PR.AT), Detection Processes (DE.DP), Communications (RS.CO), Analysis (RS.AN), Mitigation (RS.MI), Improvements (RS.IM), Improvements (RC.IM), and Communications (RC.CO). The workshop participants did not identify these Categories as relevant during the workshop. An organization should review all Categories when identifying high-priority, medium-priority, and starred-priority Categories on which it needs to focus.

Subpart B-Requests for Access and Amendment to Records 310.3 Requesting access to records. 310.4 Access exemptions. 310.5 Responses to requests for access to records. 310.6 Appeals from denials of requests for access to records. 310.7 Requests for amendment or correction of records. 310.8 Civil remedies. 310.9 Requests for an accounting of record disclosures. 310.10 Fees. 310.11 Other rights and services. Subpart C-Exemption Rules 310.12 Types of exemptions. 310.13 Exemptions for DoD-wide systems. 310.14 Department of the Air Force exemptions. 310.15 Department of the Army exemptions. 310.16 Department of the Navy exemptions. 310.17 Exemptions for specific Marine Corps record systems. 310.18 Defense Contract Audit Agency (DCAA) exemptions. 310.19 Defense Information Systems Agency (DISA) exemptions. 310.20 Defense Intelligence Agency (DIA) exemptions. 310.21 Defense Logistics Agency (DLA) exemptions. 310.22 Defense Security Service (DSS) exemptions. 310.23 Defense Threat Reduction Agency (DTRA) exemptions. 310.24 National Geospatial-Intelligence Agency (NGA) exemptions. 310.25 National Guard Bureau (NGB) exemptions. 310.26 National Reconnaissance Office (NRO) exemptions. 310.27 National Security Agency (NSA) exemptions. 310.28 Office of the Inspector General (OIG) exemptions. 310.29 Office of the Secretary of Defense (OSD) exemptions. Authority: 5 U.S.C. 552a . Subpart A-General Provisions §-310.1 Purpose. This part contains the rules that the Department of Defense (Department or DoD) follows under the Privacy Act of 1974, 5 U.S.C. 552a . These rules should be read together with the Privacy Act. The rules in this part apply to all records in Privacy Act systems of records maintained by the Department. They describe the procedures by which individuals may request access to records about themselves, request amendment or correction of those records, and request an accounting of disclosures of those records by the Department to other entities outside the Department. In addition, the Department processes all Privacy Act requests for access to records under the Freedom of Information Act (FOIA), 5 U.S.C. 552 , following the rules contained in 32 CFR part 286 , giving individuals the benefit of both statutes. §-310.2 Definitions. DoD Components means the Office the Office of the Secretary of Defense (OSD), the Military Departments, the Office of the Chairman of the Joint Chiefs of Staff and the Joint Staff, the Combatant Commands, the Office of the Inspector General of the Department of Defense, the Defense Agencies, the DoD Field Activities, and all other organizational entities within the DoD (referred to collectively in this part as the ·DoD Components·). Individual means a citizen of the United States or an alien lawfully admitted for permanent residence, as defined in the Privacy Act. Maintain includes maintain, collect, use or disseminate, as defined in the Privacy Act. Record

because this rule will only have an impact on a firm, or a subsidiary of a firm, in which the government of a country that is a state sponsor of terrorism has a significant interest. The number of domestic entities significantly impacted by this rule will be minimal, if any. For the definition of "small business," the Regulatory Flexibility Act refers to the Small Business Act, which in turn allows the U.S. Small Business Administration (SBA) Administrator to specify detailed definitions or standards (5 U.S.C. 601(3) and 15 U.S.C. 632(a)). The SBA regulations at 13 CFR 121.105 discuss who is a small business: "(a)(1) Except for small agricultural cooperatives, a business concern eligible for assistance from SBA as a small business is a business entity organized for profit, with a place of business located in the United States, and which operates primarily within the United States or which makes a significant contribution to the U.S. economy through payment of taxes or use of American products, materials or labor." V. Paperwork Reduction Act The rule contains information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C chapter 35); however, these changes to the DFARS do not impose additional information collection requirements to the paperwork burden previously approved under OMB Control Number 0704-0187, entitled "Information Collection in Support of the DoD Acquisition Process (Various Miscellaneous Requirements)." This final rule removes provision 252.209-7001, Disclosure of Ownership or Control by the Government of a Terrorist Country, and replaces it with provision 252.225-7050, Disclosure of Ownership or Control by the Government of a Country that is a State Sponsor of Terrorism. The burden in clearance 0704-0187 previously associated with the provision 252.209-7001, which is now associated with provision 252.225-7050, remains unchanged and is estimated at 1 hour, because such disclosure occurs rarely, if ever. 10 U.S.C. prohibits award to a firm or a subsidiary of a firm if the government of country that is a state sponsor of terrorism has a significant interest in the firm or subsidiary, unless the Secretary of Defense grants a waiver. (printed page 73489) List of Subjects in 48 CFR Parts 204 , 209 , 212 , 225 , and 252 Government procurement Manuel Quinones, Editor, Defense Acquisition Regulations System. Therefore, 48 CFR parts 204 , 209 , 212 , 225 , and 252 are proposed to be amended as follows: 1. The authority citation for parts 204, 209, 212, 225, and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1 . PART 204-ADMINISTRATIVE MATTERS 2. Amend section 204.1202 by: a. Removing paragraph (2)(i); b. Redesignating paragraphs (2)(ii) through (x) as (2)(i) through (ix), respectively; and c. Adding new paragraph (2)(x) to read as follows: 204.1202 Solicitation provision. * * * * * (2) ** *

Any portions of this system of records which fall under the provisions of 5 U.S.C. 552a(k)(2) and (k)(5) may be exempt from the following subsections of 5 U.S.C. 552a : (c)(3), (d), (e)(1), (e)(4)(G), (H), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5) . (iii) Reasons. (A) From subsection (c)(3) because disclosures from this system could interfere with the just, thorough and timely resolution of the complaint or inquiry, and possibly enable individuals to conceal their wrongdoing or mislead the course of the investigation by concealing, destroying or fabricating evidence or documents. (B) From subsection (d) because disclosures from this system could interfere with the just, thorough and timely resolution of the complaint or inquiry, and possibly enable individuals to conceal their wrongdoing or mislead the course of the investigation by concealing, destroying or fabricating evidence or documents. Disclosures could also subject sources and witnesses to harassment or intimidation which jeopardize the safety and well-being of themselves and their families. (C) From subsection (e)(1) because the nature of the investigation functions creates unique problems in prescribing specific parameters in a particular case as to what information is relevant or necessary. Due to close liaison and working relationships with other Federal, state, local, and foreign country law enforcement agencies, information may be received which may relate to a case under the investigative jurisdiction of another government agency. It is necessary to maintain this information in order to provide leads for appropriate law enforcement purposes and to establish patterns of activity which may relate to the jurisdiction of other cooperating agencies. (D) From subsection (e)(4)(G) through (H) because this system of records is exempt from the access provisions of subsection (d). (E) From subsection (f) because the agency's rules are inapplicable to those portions of the system that are exempt and would place the burden on the agency of either confirming or denying the existence of a record pertaining to a requesting individual might in itself provide an answer to that individual relating to an on-going investigation. The conduct of a successful investigation leading to the indictment of a criminal offender precludes the applicability of established agency rules relating to verification of record, disclosure of the record to that individual, and record amendment procedures for this record system. (5) System identifier and name. CIG 01, Privacy Act and Freedom of Information Act Case Files.

(i) Exemption.

(ii) The Board shall review and approve all computer matching agreements between the Department of Defense and the other Federal, State or local governmental agencies, as well as memoranda of understanding when the match is internal to the Department of Defense, to ensure, under 5 U.S.C. 552a, OMB Circular A-130, and DoD 5400.11-R, appropriate procedural and due process requirements shall have been established before engaging in computer matching activities. (c) The Defense Privacy Board Legal Committee. (1) Membership. The Committee shall consist of the Director, DPO, DA&M, who shall serve as the Chair and the Executive Secretary; the GC, DoD, or designee; and civilian and/or military counsel from each of the DoD Components. The General Counsels (GCs) and The Judge Advocates General of the Military Departments shall determine who shall provide representation for their respective Department to the Committee. This does not preclude representation from each office. The GCs of the other DoD Components shall provide legal representation to the Committee. Other DoD civilian or military counsel may be appointed by the Executive Secretary, after coordination with the DoD Component concerned, to serve on the Committee on those occasions when specialized knowledge or expertise shall be required. (2) Responsibilities. (i) The Committee shall serve as the primary legal forum for addressing and resolving all legal issues arising out of or incident to the operation of the DoD Privacy Program. (ii) The Committee shall consider legal questions regarding the applicability of 5 U.S.C. 552a, OMB Circular A-130, and DoD 5400.11-R and questions arising out of or as a result of other statutory and regulatory authority, to include the impact of judicial decisions, on the DoD Privacy Program. The Committee shall provide advisory opinions to the Defense Privacy Board and, on request, to the DoD Components. (d) The DPO. (1) Membership. It shall consist of a Director and a staff. The Director also shall serve as the Executive Secretary and a member of the Defense Privacy Board; as the Executive Secretary to the Defense Data Integrity Board; and as the Chair and the Executive Secretary to the Defense Privacy Board Legal Committee. (2) Responsibilities. (i) Manage activities in support of the Privacy Program oversight responsibilities of the DA&M. (ii) Provide operational and administrative support to the Defense Privacy Board, the Defense Data Integrity Board, and the Defense Privacy Board Legal Committee. (iii) Direct the day-to-day activities of the DoD Privacy Program. (iv) Provide guidance and assistance to the DoD Components in their implementation and execution of the DoD Privacy Program. (v) Review DoD legislative, regulatory, and other policy proposals which implicate information privacy issues relating to the Department's collection, maintenance, use, or dissemination of personal information, to include any testimony and comments having such implications under DoD Directive 5500.1.

regarding Supply Chain Risk Management. The commenter further requested a DoD-level working group outline how DoD program offices might identify which components are mission or safety critical or which associated production processes should be identified as CTI. That commenter recommended this rule be held in abeyance until AT&L [sic] has reviewed and provided their insight into the impacts of CMMC on existing DoD acquisition documentation and deliverables. Yet another comment recommended that this proposed DFARS ruling be vetted through AT&L, ASD and OUSD [sic] as a minimum to determine if changes would be required in the Program Protection Improvement Plan and System Security Plan. Lastly, this commenter recommended the DoD engage with NDIA and ISO/IEC to develop alternate standards for securing data and supply chains. Response: CMMC Program requirements apply to contractor-owned information systems that process, store, or transmit FCI and CUI and do not apply to systems developed or acquired for DoD through the formal Defense Acquisition System (DAS). Therefore, integrating the CMMC assessment process and internal DAS processes (including technical reviews prior to RFP development) is not appropriate and is beyond the scope of this rule. Note that CMMC applicability is broader than just the Major Defense Acquisition Programs. DoD's organizational alignment of responsibilities (between OSBP and SBA military offices) for assisting small businesses or establishing new offices within OSD is beyond the scope of this rule. Due to national security concerns, DoD declines the recommendation to further delay implementation of the CMMC Program. Each passing day in delay of implementing the security requirements for safeguarding DoD FCI and CUI increases the risk for exfiltration of non-public information on unsecured nonfederal systems that (printed page 83106) may result in the loss of DoD's technological advantages in its warfighting capabilities and programs. Discussions regarding acquisition strategies and frameworks are beyond the scope of this CMMC rule. The CMMC Program does not alleviate or supersede any existing requirements of the Adaptive Acquisition Framework, nor does it alter any statutory or regulatory requirement for acquisition program documentation or deliverables. Note that CMMC Program requirements do not apply to systems delivered to DoD. DoD Instructions for

required acquisition program documentation are beyond the scope of this rule. CMMC assessment certifications are not integrated into System Security Plans (SSPs).

146 NARA, CUI Notice 2019-01: Controlled Unclassified Information (CUI) Coversheets and Labels MP.L2-3.8.4 · Media Markings CMMC Assessment Guide · Level 2 | Version 2.13 164 Example You were recently contacted by the project team for a new DoD program. The team said they wanted the CUI in use for the program to be properly protected. When speaking with them, you realize that most of the protections will be provided as part of existing enterprise cybersecurity capabilities. They also mentioned that the project team will use several USB drives to share specific data. You explain that the team must ensure the USB drives are externally marked to indicate the presence of CUI [a]. The project team labels the outside of each USB drive with an appropriate CUI label following NARA guidance [a]. Further, the labels indicate that distribution is limited to those employees supporting the DoD program [a]. Potential Assessment Considerations · Are all media containing CUI identified [a,b]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.8.4

·\$121,500,000 Nonrecurring Engineering cost (\$2,700,000 per entity × 45 entities being certified), and ·\$23,520,000 Recurring Engineering cost (\$490,000 per entity × 45 entities being certified) + (\$490,000 per entity × 3 entities performing affirmations) ·\$145,432,897 Total Cost = Certification and Affirmation Cost (printed page 83209) (\$412,897) + Nonrecurring Engineering cost (\$121,500,000) + Recurring Engineering cost (\$23,520,000), or \$145,432,897. Projected Reporting, Recordkeeping, and Compliance Requirements The CMMC Program provides for the assessment of contractor implementation of cybersecurity requirements to enhance confidence in contractor protection of unclassified information within the DoD supply chain. CMMC contractual requirements are implemented under the 48 CFR part 204 CMMC Acquisition rule, with associated rulemaking for the CMMC Program requirements (e.g., CMMC Scoring Methodology, certificate issuance, information accessibility) under the 32 CFR part 170 CMMC Program rule. The 32 CFR part 170 CMMC Program rule includes two separate information collection requests (ICR), one for the CMMC Program and one for CMMC eMASS. This information collection is necessary to support the implementation of the CMMC assessment process for Levels 2 and 3 certification assessment, as defined in §§ 170.17 and 170.18 respectively. The CMMC Level 2 certification assessment process is conducted by Certified Assessors, employed by CMMC Third-Party Assessment Organizations (C3PAOs). During the assessment process, Organizations Seeking Certification [66] (OSCs) hire C3PAOs to conduct the third-party assessment required for certification. The CMMC Level 3 certification assessment process is conducted by the Defense Contract Management Agency (DCMA) Defense Industrial Base Cybersecurity Assessment Center (DIBCAC). Use of the Information Level 1 and Level 2 CMMC Self-Assessments. Organizations Seeking Assessment [67] (OSAs) follow procedures as defined in §§ 170.15(a)(1) and 170.16(a)(1) to conduct CMMC Level 1 and Level 2 self-assessments on their information systems to determine conformance with the information safeguarding requirements associated with the CMMC level requirements. The Level 1 and Level 2 self-assessment information collection reporting and recordkeeping requirements will be included in a modification of an existing Defense Federal Acquisition Regulation Supplement (DFARS) collection approved under OMB Control Number 0750-0004, Assessing Contractor Implementation of Cybersecurity Requirements. Modifications to this DFARS collection will be addressed as part of the 48 CFR part 204 CMMC Acquisition final rule. CMMC Level 2 Certification Assessment The Level 2 certification assessment information collection burden for reporting and recordkeeping requirements are included in the 32 CFR part 170 CMMC Program rule. The information collection burden for the OSCs to upload affirmations in SPRS is included in the 48 CFR part 204

HIPAA Security Rule section 164.308 (Administrative Safeguards) addresses security incident procedures. Covered entities and business associates must implement appropriate safeguards to protect electronic protected health information (ePHI). For security incident procedures, organizations should:

1. Establish and document policies specific to security incident procedures
2. Implement technical and procedural controls
3. Train workforce members on their responsibilities
4. Conduct periodic risk assessments addressing security incident procedures
5. Maintain documentation of compliance efforts

Under 45 CFR 164.308, this is a administrative safeguards requirement that applies to all covered entities and business associates that create, receive, maintain, or transmit ePHI.

- Identify and develop 'security standards for open systems - Specify a key management system that supports these security standards - Encourage the development of interoperable equipment

The SDNS architecture, and its associated specifications, were developed as a cooperative project between government and industry. The project was sponsored by the National Security Agency, and supported by the National Institute of Standards and Technology (formerly the National Bureau of Standards) and the Defense Communications Agency. Twelve leading U.S. companies in computers and telecommunications made significant contributions of their technical talents and development resources. The combined efforts of these organizations produced the basis for improved security technology, interoperable security standards, and costeffective security for computers and telecommunications. This document provides the framework for the SDNS Security Protocol at layer three (SP3). This document is being circulated for comment and approval. It is subject to change during the development phase of SDNS.

December 31, 2017, was the DoD deadline for contractors to implement, as applicable, the cybersecurity protection requirements set forth in NIST SP 800-171 Re2, Protecting Controlled Unclassified Information in Nonfederal Systems and Organizations, in accordance with requirements of DFARS clause 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting. NIST SP 800-171A Jun2018 states, ·For the CUI security requirements in NIST Special Publication 800-171 Rev 2, nonfederal organizations describe in a system security plan, how the specified requirements are met or how organizations plan to meet the requirements.· [61] The NIST process provides contractors with a tool to assess their security posture and decide if or when to mitigate the risks based upon the organizational risk tolerance. When the DoD implemented the NIST SP 800-171 requirements with a not-later-than date of December 2017, the policy intent was to permit contractors some flexibility to remediate lagging NIST requirements, and document them in plans of action, and resolve those deficiencies within a reasonable period. An unintended consequence of this flexibility was that some contractors far exceeded the intention to secure systems that must adequately safeguard CUI in a timely manner and instead created open-ended plans of action with undefined closure dates. The effect was to delay full compliance with safeguarding requirements for

years. As a result, the DoD's implementation of the NIST SP 800-171 requirements, as mandated by 32 CFR part 2002, has not been fully effective or validated. This necessitates implementation of the CMMC Program to enforce a finite timeline for full compliance of contractual requirements. Findings from DoD Inspector General report (DODIG-2019-105 -Audit of Protection of DoD Controlled Unclassified Information on Contractor-Owned Networks and Systems-) indicated that DoD contractors did not consistently implement mandated system security requirements for safeguarding CUI and recommended that DoD take steps to assess a contractor's ability to protect this information. CMMC adds an assessment requirement to verify defense contractors and subcontractors have implemented the applicable security requirements prior to award. CMMC also adds requirements at each CMMC level for contractors and subcontractors to affirm initial compliance with the specified CMMC security requirements and provide annual affirmations thereafter. (b) Comprehensive Implementation of Cybersecurity Requirements Although the security requirements in NIST SP 800-171 R2 address a range of threats, they do not sufficiently address Advanced Persistent Threats (APTs). An APT is an adversary that possesses sophisticated levels of expertise and significant resources, which allow it to create opportunities to achieve its objectives by using multiple attack vectors (e.g.,

This is not to suggest that all usability research is conducted in this manner (nor should it be, as different study designs and sample sizes are more appropriate to answer different research questions), nor is this to suggest that all usability researchers have the background and training to conduct such studies (just as there are many security specializations, so too are there many specializations in usability and human factors), but merely to give an example of experimental methodology with which other fields may already be more familiar. The final point is this: no matter the sample size, it is both possible and necessary to conduct human subjects research with rigor. We urge both usability and security practitioners to examine each other's work through the lens of experimental design and be critical consumers of others' research; many of the same principles apply regardless of whether one is measuring human behavior, system behavior, or combined human-system performance.

Cryptographic Module Validation Program; CMVP; FIPS 140 testing; FIPS 140-3; ISO/IEC 19790; ISO/IEC 24759; sensitive security parameter establishment methods; sensitive security parameter generation; testing requirement; vendor evidence; vendor documentation. This document is intended for use by vendors, testing labs, and the CMVP.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System [Docket Number DARS-2025-0006; OMB Control Number 0704-0478] AGENCY: Defense Acquisition Regulations System; Department of Defense (DoD). ACTION: Notice and request for comments regarding a proposed

extension of an approved information collection requirement. SUMMARY: In compliance with the Paperwork Reduction Act of 1995, DoD announces the proposed extension of a public information collection requirement and seeks public comment on the provisions thereof. DoD invites comments on: whether the proposed collection of information is necessary for the proper performance of the functions of DoD, including whether the information will have practical utility; the accuracy of DoD's estimate of the burden of the proposed information collection; ways to enhance the quality, utility, and clarity of the information to be collected; and ways to minimize the burden of the information collection on respondents, including the use of automated collection techniques or other forms of information technology. The Office of Management and Budget (OMB) has approved this information collection for use through October 31, 2025. DoD proposes that OMB approve an extension of the information collection requirement, to expire three years after the approval date. DATES: DoD will consider all comments received by August 5, 2025. ADDRESSES: You may submit comments, identified by OMB Control Number 0704-0478, using either of the following methods: · Federal eRulemaking Portal: <https://www.regulations.gov> . Follow the instructions for submitting comments. · Email: osd.dfars@mail.mil . Include OMB Control Number 0704-0478 in the subject line of the message. Comments received generally will be posted without change to <https://www.regulations.gov> , including any personal information provided. FOR FURTHER INFORMATION CONTACT: Ms. Heather Kitchens, at 571-296-7152. SUPPLEMENTARY INFORMATION: Title and OMB Number: Safeguarding Covered Defense Information, Cyber (printed page 24197) Incident Reporting, and Cloud Computing; OMB Control Number 0704-0478. Affected Public: Businesses or other for-profit and not-for-profit institutions. Respondent's Obligation: Required to obtain or retain benefits. Frequency: On occasion. Number of Respondents: 1,971. Responses per Respondent: 8.2, approximately. Annual Responses: 16,233. Average Burden per Response: 0.42 hour. Annual Burden Hours: 6,770. Needs and Uses:

(F) From subsection (f) because portions of this system of records have been exempted from the access provisions of subsection (d). (32) System identifier and name. A0608-18 DASG, Army Family Advocacy Program Files. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (B) Investigative material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (C) Therefore, portions of the system of records may be exempt pursuant to 5 U.S.C. 552a(k)(2) or (k) (5) from subsections 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I) and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5) . (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (d) because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement. (C) From subsection (e)(1) because in the course of criminal investigations, information is often obtained concerning the violation of laws or civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this valuable information be retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought. (D) From subsections (e)(4)(G) and (e)(4)(H) because the requirements in those subsections are inapplicable to the extent that portions of this system of records may be exempt from subsection (d), concerning individual access.

(1) Classified information in every Army system of records. Before denying any individual access to classified information, the Access and Amendment Refusal Authority must make sure that it was properly classified under the standards of Executive Orders 11652, 12065, or 12958 and that it must remain so in the interest of national defense or foreign policy (5 U.S.C. 552a(k)(1)). (2) Investigatory material compiled for law enforcement purposes (other than material within the scope

of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if this information has been used to deny someone a right, privilege or benefit to which the individual is entitled by Federal law, or for which an individual would otherwise be eligible as a result of the maintenance of the information, it must be released, unless doing so would reveal the identity of a confidential source. Note 1 to paragraph (d)(2). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. (3) Records maintained in connection with providing protective services to the President of the United States or other individuals protected pursuant to Title 18 U.S.C., section 3056 (5 U.S.C. 552a(k)(3)). (4) Records maintained solely for statistical research or program evaluation purposes and which are not used to make decisions on the rights, benefits, or entitlements of individuals, except for census records which may be disclosed under Title 13 U.S.C., section 8 (5 U.S.C. 552a(k)(4)). (5) Investigatory material compiled solely to determine suitability, eligibility, or qualifications for Federal service, Federal contracts, or access to classified information. This information may be withheld only to the extent that disclosure would reveal the identity of a confidential source (5 U.S.C. 552a(k)(5)). (6) Testing or examination material used solely to determine if a person is qualified for appointment or promotion in the Federal service. This information may be withheld only if disclosure would compromise the objectivity or fairness of the examination process (5 U.S.C. 552a(k)(6)). (7) Evaluation material used solely to determine promotion potential in the Armed Forces. Information may be withheld, but only to the extent that disclosure would reveal the identity of a confidential source (5 U.S.C. 552a(k)(7)). (e) Procedures. When a system manager seeks an exemption for a system of records, the following information will be furnished to the Chief Information Officer, 107 Army Pentagon, Room 3E608, Washington, DC 20310-0107; applicable system notice, exemptions sought, and justification. After appropriate staffing and approval by the Secretary of the Army, a proposed rule will be published in the Federal Register , followed by a final rule 60 days later. No exemption may be invoked until these steps have been completed.

DFARS 252.204-7008 (Compliance with Safeguarding CDI Controls) Requires offerors to represent that they will implement NIST SP 800-171 security requirements. Flow-down requirements: DFARS 252.204-7008 includes flow-down provisions requiring prime contractors to include the clause in subcontracts where CUI will be processed, stored, or transmitted. Subcontractors must meet the same security requirements as the prime.

). Section 307 of the Bioterrorism Act amends the FD&C Act by adding section 801(m) to the FD&C Act. Section 801(m) of the FD&C Act refers to an ‘article of food.’ However, the legislative history of section 307 of the Bioterrorism Act indicates that packaging materials are not subject to section 307, and can be read to imply that Congress was not relying on the definition of food in section 201(f) of the FD&C Act, thereby giving rise to ambiguity about which definition of ‘food’ applies to section 307 of the Bioterrorism Act. FDA also considered the meaning of ‘food’ in section 303 of the Bioterrorism Act, governing administrative detention, and concluded that it is ambiguous. FDA determined that use of the definition of ‘food’ in section 201(f) of the FD&C Act is consistent with the language of section 303 of the Bioterrorism Act. Section 303 repeatedly uses the term ‘food’ without adjectives, except for a reference to ‘perishable foods,’ which is not used to limit the reach of the section. FDA also determined that use of the definition of ‘food’ in section 201(f) of the FD&C Act is consistent with the use of the term in judicial enforcement actions (e.g., seizures and injunctions) that may be instituted under administrative detention. The ambiguity surrounding Congress’s use of ‘food’ in sections 303, 305, 306, and 307 of the Bioterrorism Act, coupled with the lack of a definition of the term in the Bioterrorism Act, support a conclusion that the meaning of ‘food’ in the Bioterrorism Act is ambiguous. Having concluded that the meaning of ‘food’ in the Bioterrorism Act and in section 306 of the Bioterrorism Act in particular is ambiguous, FDA has considered how to define the term to achieve a ‘permissible construction’ of the records establishment and maintenance provisions. *Chevron, USA, Inc. v. NRDC, Inc.*, supra at 843. In conducting this Chevron step two analysis, the agency has considered the same information it evaluated at step one of the analysis. *Bell Atlantic Telephone Co. v. FCC*, 131 F. 3d 1044, 1049 (D.C. Cir. 1997); *Chevron U.S.A., Inc. v. FERC*, 193 F. Supp. 2d 54, 68 (D.D.C. 2002). FDA has determined that it is permissible, for purposes of the records establishment and maintenance provisions, to use the definition of ‘food’ in section 201(f) of the FD&C Act.

This definition is based on the definition of ‘general support system’ or ‘system’ in the appendix to the 1996 version of OMB Circular A-130, Security of Federal Automated Information Systems. [

995] We considered proposing to remove the phrase “under the same direct management control” as a potential way to clarify the application of the definition to cloud-based computing. Cloud computing applications play an important role in health care today. For example, many health care providers have implemented cloud-based electronic health records (EHRs) and practice management systems. These applications are used to create, receive, maintain, and transmit ePHI, and as such, should be included as components of a covered entity's relevant electronic information system, a term which is based upon the term “information system.” After careful consideration, we have decided to retain the phrase “under the same direct (printed page 1006) management control” and instead clarify in the preamble how the definition of “information system” applies in cloud computing environments. The Department also requests comment on the definition of “information system” and the extent of control a regulated entity has with respect to applications in cloud computing environments. We also considered proposing to adopt the definition of “information system” in the Paperwork Reduction Act of 1995 (PRA) and the current operative version of OMB Circular A-130. [996] The PRA and OMB Circular A-130 define “information system” as “a discrete set of information resources organized for the collection, processing, maintenance, use, sharing, dissemination, or disposition of information.” The Department declined to adopt this definition because the existing definition in the Security Rule based on the definition of “system” in the 1996 version of OMB Circular A-130 more accurately reflects the typical components of an information system and the full extent of resources that are addressed by the Security Rule. Additionally, the definition of “information system” in the PRA and current operative version of OMB Circular A-130 contains some terms that are defined by the HIPAA Rules and some that are not. As a result, adopting this definition would require the Department to propose definitions to such additional terms and to ensure that the manner in which the terms with existing definitions are used is consistent with those existing definitions, and we are concerned that such change could cause significant confusion for regulated entities. We do not believe that either of the alternative definitions considered would have generated a quantifiable change in costs because the alternatives would be clarifications to existing requirements and would not have changed the scope of the Security Rule's applicability. Exception From Multi-Factor Authentication (MFA) Requirement

Most workshop participants agreed that manufacturers of IoT devices currently lack market incentives to prioritize cybersecurity as a concern when designing, marketing, and supporting their products. Some counterexamples were presented in which informed customers do recognize the advantages of enhanced security. This suggests that enhanced cybersecurity could demonstrably be a market advantage if it is emphasized. Workshop poll results showed strong support (71 %) for government mandates as a mechanism for enhancing IoT cybersecurity (poll #4), and general agreement (55 %) that developers of IoT devices currently lack appropriate incentives to secure their products (poll #2). Participants supported a mixture of regulatory guidance, customer education, supply chain pressures, and other considerations to create the economic incentives to shift the overall IoT device market toward enhanced cybersecurity.

full-time employees, and that are located in the same general physical location as farms that sell unprocessed food grown or raised on those farms. The comments note that the exclusion does not apply to processed foods, even if they are sold directly to the consumers from the retail facility in the same general location as the farm, unless all the ingredients in that processed food were grown or raised on that farm. Consequently, persons handling processed foods, such as baked goods, jams, jellies, maple syrup, and “processed” items such as hams and sausages from animals grown and processed into meat products on the farm would fall under the provisions of the final rule. Also, any persons handling products that were “imported” from off the farm would be subject to the final rule. The processed food provision is a burden for those involved in roadside stands that operate outside of the normal seasonal harvest period or sell processed foods. They could not purchase goods from neighbors or bring in goods from other areas under the exemption or include ingredients from a nonfarm source. The comment asks that this limitation affecting farm markets be removed from the final rule. (Response) FDA has changed the exclusion in proposed § 1.327(d)(2) and has now provided an exclusion for all retail food establishments that employ 10 or fewer full-time equivalent employees from all of the regulations in this final rule, except the record access provisions for existing records under §§ 1.361 and 1.363, regardless of whether the food being sold is processed or unprocessed. (See response to comment 38 of this document for a further discussion of FDA's rationale underlying this exclusion.) 7. Persons Under the Exclusive Jurisdiction of USDA (Comment 54) One comment states that proposed §§ 1.327 and 1.328 distinguish between those foods that will be subject to the requirements of the final rule, and those foods that will be exempt. In doing so, the

proposed rule refers to other federal statutes (e.g., the Federal Meat Inspection Act, the Poultry Products Inspection Act, and the Egg Products Inspection Act), as a means to provide the regulated community with the relevant details as to whether and when their conduct will come within the scope of the regulations being proposed. Although statutory references such as these may suffice to inform farms, food manufacturers, restaurants, and other food-related facilities that deal with these statutes on a daily basis whether and when they will be subject to FDA's final rule, that is clearly not the case with motor carriers. Therefore, the comment states that FDA should explain what food is subject to the final rule in layman's language to avoid any confusion. The comment further recommends that FDA attach a list of the applicable or the exempted foods as an appendix to the final rule.

Government procurement Michele P. Peterson, Editor, Defense Acquisition Regulations System. Therefore, 48 CFR part 252 is amended as follows: PART 252-SOLICITATION PROVISIONS AND CONTRACT CLAUSES 1. The authority citation for 48 CFR part 252 continues to read as follows: Authority: 41 U.S.C. 421 and 48 CFR Chapter 1 . 2. Section 252.204-7004 is amended as follows: a. By revising the section heading, clause title, and clause date; and b. In paragraph (a), by revising the definition of "Registered in the CCR database" to read as follows: 252.204-7004 Alternate A, Central Contractor Registration. ALTERNATE A, CENTRAL CONTRACTOR REGISTRATION (SEP 2007) * * * * (a) * * * "Registered in the CCR database" means that: (1) The Contractor has entered all mandatory information, including the DUNS number or the DUNS+4 number, into the CCR database; (2) The Contractor's CAGE code is in the CCR database; and (3) The Government has validated all mandatory data fields, to include validation of the Taxpayer Identification Number (TIN) with the Internal Revenue Service, and has marked the records "Active." The Contractor will be required to provide consent for TIN validation to the Government as part of the CCR registration process. [FR Doc. E7-17433 Filed 9-5-07; 8:45 am] BILLING CODE 5001-08-P

Commissioning records are maintained in accordance with FDA's Records Control Schedule and the applicable General Records Schedule and disposition schedules approved by NARA. Commissioning records fall under NARA approved citation N1-088-09-02 for Commissioning Documents, the Nationwide List of FDA Commissions, and Summary Reports of FDA Commissions. Commissioning documents are deleted/destroyed 5 years after the end of the fiscal year in which a commission is revoked or expires. Records within the nationwide list of FDA commissions are deleted/destroyed 5 years after the fiscal year when they become obsolete or are superseded. Summary reports of FDA commissions are deleted/destroyed after the nationwide list of FDA Commissions has been updated. L. System Manager(s) and Address Ryan Cates, Food and Drug Administration, Office of Partnerships, Element Building, 12420 Parklawn Dr., Rockville, MD 20857, 301-796-5390, FAX: 301-827-3588, OP-ORA@fda.hhs.gov . M. Notification Procedure In accordance with 21 CFR part 21 Subpart D , an individual may submit a request to the FDA Privacy Act Coordinator, with a notarized signature, to confirm whether records exist about him or her. Requests should be directed to the FDA Privacy Act Coordinator, Division of Freedom of Information, 12420 Parklawn Dr., ELEM-1029, Rockville, MD 20857. An individual requesting notification via mail should certify in his or her request that he or she is the individual who he or she claims to be and that he or she understands that the knowing and willful request for or acquisition of a record pertaining to an individual under false pretenses is a criminal offense under the Privacy Act subject to a \$5,000 fine, and indicate on the envelope and in a prominent manner in the request letter that he or she is making a "Privacy Act Request." Additional details regarding notification request procedures appear in 21 CFR part 21, subpart D . A commission holder may also request an opportunity to review his or her own file by contacting the appropriate Regional Food and Drug Director. N. Record Access Procedures Procedures are the same as above, in the Notification Procedure section. Requesters should also reasonably specify the record contents being sought. Some records may be exempt from access under 5 U.S.C. 552a(d)(5) , if they are "compiled in reasonable anticipation of a civil action or proceeding." If access to requested records is denied, the requester may appeal the denial to the FDA Commissioner. Additional details regarding record access procedures and identity verification requirements appear in 21 CFR part 21, subpart D . O. Contesting Record Procedures

(A) From subsections (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (d), because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the

subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement. (C) From subsection (e)(1) because in the course of criminal investigations, information is often obtained concerning the violation of laws or civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this valuable information be retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought. (D) From subsections (e)(4)(G) and (e)(4)(H) because portions of this system of records have been exempted from the access provisions of subsection (d), making these subsections not applicable. (E) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (F) From subsection (f) because portions of this system of records have been exempted from the access provisions of subsection (d). (25) System identifier and name. A0380-67 DAMI, Personnel Security Clearance Information Files. (i) Exemption. (A) Information specifically authorized to be classified under E.O. 12958, as implemented by DoD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1). (B) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2), may be exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (C) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5), but only to the extent that such material would reveal the identity of a confidential source. (D) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(1)

(4) Amendments to Component rules are submitted like the basic rules. (5) The DPO submits the rules and amendments thereto to the Federal Register for publication. (e) Submission of exemption rules for publication. (1) No system of records within the Department of Defense shall be considered exempt from any provision of this part until the exemption and the exemption rule for the system has been published as a final rule in the Federal Register. (2) Submit exemption rules in proper format to the DPO. All exemption rules are coordinated with the DoD Office of General Counsel. After coordination, the DPO shall submit the rules to the Federal Register for publication. (3) Exemption rules require publication both as proposed rules and final rules (see AI 102). (4) § 310.31(b) discusses the content of an exemption rule. (5) Submit amendments to exemption rules in the same manner used for establishing these rules. (f) Submission of system notices for publication. (1) System notices are not subject to formal rulemaking procedures. However, the Privacy Act (5 U.S.C. 552a) requires a system notice be published in the Federal Register of the existence and character of a new or altered system of records. Until publication of the notice, DoD Components shall not begin to operate the system of records (i.e., collect and use the information). The notice procedures require: (i) The system notice describes what kinds of records are in the system, on whom they are maintained, what uses are made of the records, and how an individual may access, or contest, the records contained in the system. (ii) The public be given 30 days to comment on any proposed routine uses before any disclosures are made pursuant to the routine use; and (iii) The notice contain the date on which the system shall become effective. (2) Submit system notices to the DPO in the Federal Register format (see AI 102 and Appendix E to this part). The DPO transmits the notices to the Federal Register for publication. (3) § 310.32 discusses the specific elements required in a system notice. § 310.31 Exemption rules. (a) General procedures. Subpart F of this part provides the general guidance for establishing exemptions for systems of records. (b) Contents of exemption rules. (1) Each exemption rule submitted for publication must contain the following: (i) The record system identifier and title of the system for which the exemption is claimed. (See § 310.32(b) and (c)); (ii) The specific sections of the Privacy Act under which the exemption for the system is claimed (for example, 5 U.S.C. 552a(j)(2), 5 U.S.C. 552a(k)(3); or 5 U.S.C. 552a(k)(7); (iii) The specific sections of the Privacy Act from which the system is to be exempted (for example, 5 U.S.C. 552a(c)(3), or 5 U.S.C. 552a(d)(l)-(5)) (see Appendix D)); and (iv) The specific reasons why an exemption is being claimed from each section of the Act identified.

DoD will also consider comments from small entities concerning the existing regulations in subparts affected by this rule in accordance with 5 U.S.C. 610. Interested parties must submit such comments separately and should cite 5 U.S.C. 610 (DFARS Case 2018-D043), in correspondence. XIII. Paperwork Reduction Act This rule affects the information collection requirements at DFARS subpart 232.10 (and associated clauses at DFARS 252.232-7012 and 252.232-7013, currently approved under OMB Control Number 0704-0359, DFARS Part 232, Contract Financing. The impact, however, is negligible, because only the last three lines of the table are deleted, which do not impose the predominance of the burden. This rule also adds a new information collection requirement that requires the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). Accordingly, DoD has submitted a request for approval of a new information collection requirement concerning the provision at 252.232-70XX, Performance-Based Payments-Representation to the Office of Management and Budget. A. Public reporting burden for this collection of information is estimated to average 0.1 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. The annual reporting burden estimated as follows: Respondents: 144. Responses per respondent: 1. Total annual responses: 144. Preparation hours per response: 0.1 hours. Total response Burden Hours: 14.4. B. Request for Comments Regarding Paperwork Burden. Written comments and recommendations on the proposed information collection, including suggestions for reducing this burden, should be sent to Ms. Jasmeet Seehra at the Office of Management and Budget, Desk Officer for DoD, Room 10236, New Executive Office Building, Washington, DC 20503, or email Jasmeet_K_Seehra@omb.eop.gov, with a copy to the Defense Acquisition Regulations System, Attn: Ms. Amy G. Williams, OUSD(A&S)DPC/DARS, Room 3B941, 3060 Defense Pentagon, Washington, DC 20301-3060. Comments can be received from 30 to 60 days after the date of this notice, but comments to OMB will be most useful if received by OMB within 30 days after the date of this notice. Public comments are particularly invited on: Whether this collection of information is necessary for the proper performance of functions of the DFARS, and will have practical utility; whether our estimate of the public burden of this collection of information is accurate, and based on valid assumptions and methodology; ways to enhance the quality, utility, and clarity of the information to be collected; and ways in which we can minimize the burden of the collection of information on those who are to respond, through the use of appropriate technological collection techniques or other forms of information technology.

I factors, including the expansion of packet size, ciphering latency, and a lack of QoS urgency in the cryptographic engine itself can cause an excessive amount of latency in the VOIP packet delivery. This leads to degraded voice quality, so once again there is a tradeoff between security and voice quality, and a need for speed. Fortunately, the difficulties are not insurmountable. NIST-sponsored testing [29] has shown that IPsec can be incorporated into a SIP network with roughly a three-second additional delay in call setup times, an acceptable delay for many applications. This section explains the issues involved in successfully incorporating IPsec encryption into VOIP services.

- (1) Data Integrity, - (2) Data Confidentiality, - (3) Data Origination Authentication, and - (4) Access Control. The SP4 standard identifies other security functions on which it depends. These functions include key management, security management, and cryptography. Key management is needed to establish and maintain keying material used by SP4; security management is needed for event reporting and auditing; and cryptography (i.e., employment of specific cryptographic algorithms) is needed to support Data Integrity, Data Confidentiality, and Authentication services. These functions are normally collocated in an end-system, with an SP4 entity. computer system operating environment. The objective of the security evaluation is to perform a technical assessment of the trust properties. Three general security issues that must be addressed are: the confidentiality of the data, the integrity of the data and the system, and the availability of service. The goal or main requirement is to assure that the system behaves according to an organization's security requirements that, in turn, reflect the defined security policy of the organization. To guarantee that this requirement is met, the security functionality of an implementation must work correctly and effectively.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current

requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. Organizations that are planning to use products that use the Bluetooth 4.0, 4.1, or 4.2 technologies should carefully consider the security implications. The 4.0 specification was released in mid-2010, and the 4.2 specification was released in December 2014. At the time of this writing, one significant security vulnerability related to 4.0 has been discovered (see Table 4-1 below). Additionally, few products that support the 4.2 specification are currently available for evaluation. As more compliant products become available, additional vulnerabilities will possibly be discovered, and additional recommendations will be needed for effectively securing Bluetooth low energy devices. Organizations planning to deploy Bluetooth low energy devices should carefully monitor developments involving new vulnerabilities, threats, and additional security control recommendations.

In March 2021, the Department initiated an internal assessment of CMMC 1.0 implementation that was informed by more than 850 public comments in response to the interim DFARS rule. This comprehensive, programmatic assessment of CMMC engaged cybersecurity and acquisition leaders within DoD to refine policy and program implementation. This review resulted in CMMC 2.0, which updates the program structure and the requirements to streamline and improve implementation of the CMMC program. Way Forward The changes reflected in the CMMC 2.0 framework will be implemented through the rulemaking process. DoD will pursue rulemaking in both: (1) Title 32 of the Code of Federal Regulations (CFR); and, (2) title 48 CFR, to establish CMMC 2.0 program requirements and implement any needed changes to the CMMC program content in 48 CFR. Both rules will have public comment periods. Publication of title 32 and title 48 CFR rules will implement DoD's requirements for the updated CMMC version 2.0, which include various modifications from CMMC 1.0. These modifications include: Eliminating levels 2 and 4, and renaming the remaining three levels in CMMC 2.0 as follows: Level 1 (Foundational) will remain the same as CMMC 1.0 Level 1; Level 2 (Advanced) will be similar to CMMC 1.0 Level 3; Level 3 (Expert) will be similar to CMMC 1.0 Level 5. Removing CMMC-unique practices and all maturity processes from all levels; For CMMC Level 1 (Foundational), allowing annual self-assessments with an annual affirmation by DIB company leadership; Bifurcating CMMC Level 2 (Advanced) assessment requirements: Prioritized acquisitions involving CUI will require an independent third party assessment; Non-prioritized acquisitions involving CUI will require an annual self-assessment and annual company affirmation; For CMMC Level 3 (Expert), requiring Government-led assessments. Developing a time-bound and enforceable Plan of Action and Milestone process; and, Developing a selective, time-bound waiver process, if needed and approved. The title 32 CFR rulemaking for CMMC 2.0 will be followed by additional title 48 CFR rulemaking, as needed, to implement any needed changes to the CMMC program content in 48 CFR. DoD will work through the rulemaking processes as expeditiously as possible. Until the CMMC 2.0 changes become effective through both the title 32 CFR and title 48 CFR rulemaking processes, the Department will suspend the CMMC Piloting efforts and will not approve inclusion of a CMMC requirement in DoD solicitations. The CMMC 2.0 program requirements will not be mandatory until the title 32 CFR rulemaking is complete, and the CMMC program requirements have been implemented as needed into acquisition regulation through title 48 rulemaking. Dated: November 8, 2021. Patricia L. Toppings, OSD Federal Register Liaison Officer, Department of Defense. [FR Doc. 2021-24880 Filed 11-16-21; 8:45 am] BILLING CODE 5001-06-P

3.5.1 Authorization Models... 3.5.1 Authorization Models... 3.5.1 Authorization Models The following subsections describe the authorization models most relevant to access management in a SOA, namely role-based, attribute-based, policy-based, and risk-adaptive access control.

) Contractor access to proscribed information will not be granted without the approval of the agency with control jurisdiction (i.e., National Security Agency (NSA) for COMSEC, whether the COMSEC is proscribed information or not; the Office of the Director of National Intelligence (ODNI) for SCI; and the Department of Energy (DOE) for RD in accordance with its policies). (4) In accordance with 32 CFR, part 2004 and the procedures in paragraph (b)(5) of this section, GCAs will forward a request for concurrence to NSA, ODNI, or DOE when a proposed NID involves access to COMSEC, SCI, or RD, respectively, within 30 calendar days of DSS advisement of the NID requirement. NSA, ODNI, and DOE, as appropriate, will then have 30 calendar days to render a decision. (D) VTA or PA. These FOCI negotiation agreements may be used when a foreign interest effectively owns or controls a company or corporate family. Under a VTA, PA and associated documentation, the foreign owner relinquishes most rights associated with ownership of the company to cleared U.S. citizens approved

by DSS. Both FOCI agreements can effectively negate foreign ownership and control; therefore, neither agreement imposes any restrictions on the company's eligibility to have access to classified information or to compete for classified contracts including contracts with proscribed information. Both FOCI agreements can also effectively negate foreign government control (see paragraph (b)(11) of this section which provides guidance and requirements regarding foreign government ownership or control, including with respect to 10 U.S.C. 2536 , Award of Certain Contracts to Entities Controlled by a Foreign Government Prohibition (available at <http://www.gpo.gov/fdsys/granule/USCODE-2010-title10/USCODE-2010-title10-subtitleA-partIV-chap148-subchapV-sec2536/content-detail.html>)). DSS retains the authority to deny a proposed VTA or PA. (iv) When DSS implements a FOCI mitigation or negation agreement at a contractor, the agreement may specify that the entire agreement, or that particular provisions of the agreement (e.g., the provisions restricting unauthorized access to classified information and unclassified export-controlled information and the provisions of the visitation policy) will apply to and will be made binding upon all present and future subsidiaries of the company. If a subsidiary requires and is eligible for an FCL at the TS level, the company executing the FOCI mitigation agreement and any intermediate parents must be formally excluded from TS access unless they have their own requirement and are otherwise eligible for TS access.

emphasizes the importance of retrospective analysis of rules with its 'look back' requirement, which states that 'within 120 days of the date of this order, each agency shall develop . . . a preliminary plan.' The plans should 'facilitate the periodic review of rules that may be outmoded, ineffective, insufficient, or excessively burdensome, and to modify, streamline, expand, or repeal them in accordance with what has been learned.' This rule updates policy and procedures for industry that are more than 20 years old. DoD's full plan and updates can be accessed at: <http://exchange.regulations.gov/exchange/topic/eo-13563> . Justification for Interim Final Rule Without this rule, the Components face an elevated risk of unauthorized disclosure of classified information to foreign interests resulting in potential economic losses or damage to U.S. national security. There is such an increased probability of unauthorized disclosure of classified information because the owner of a U.S. company has direct authority over all aspects of his company (e.g., who gets paid, what contracts, including classified contracts are pursued, and access to information/programs that those contracts include. If the U.S. company has a foreign owner and is awarded a contract requiring access to classified information, these procedures provide actions for the USG to take to keep that foreign owner from having direct authority over the disclosure of and access to classified information. If there are no procedures as set forth in this rule to evaluate and determine how to negate or mitigate the foreign ownership, there will be nothing to prevent unauthorized disclosures of classified information since the foreign owner will have unfettered control of the U.S. company. This proposed rule provides the baseline requirements for the USG to evaluate the foreign owner's rights and determine whether those rights can be mitigated to effectively protect classified information and preclude its unauthorized disclosure. Depending upon what a foreign-owned U.S. company is working on, unauthorized disclosure of classified information could have an adverse impact on national security. This rule allows fair and open competition among U.S. companies, including foreign-owned U.S. companies, who are vying for the opportunity to provide products and services to the Components when access to classified information is required. Also, without this rule, Components will not have the ability to consider innovative technologies developed by foreign-owned U.S. companies due to concerns with awarding a classified contract without a uniform process to assess and effectively mitigate or negate existing FOCI. Finally, the lack of a formal, uniform process has created significant delay in the completion of National Interest Determinations (NIDs) for foreign-owned U.S. contractors. These delays increase the costs to Components by preventing contract performance when access to classified information is required.

The Director of Defense Procurement is proposing to amend the Defense Federal Acquisition Regulation Supplement (DFARS) to add a requirement for contractor employees that are cleared for access to certain classified information to attest orally that they will comply with the security requirements associated with the information.

The Offeror shall appropriately identify information the Offeror owns and provides to the Government, which is contractor bid or proposal information, contractor-attributional information, or Offeror proprietary business information. The Government will determine in accordance with agency procedures whether the information provided by the Offeror is CUI or entitled to other protections (e.g., contractor-attributional information associated with a CUI incident). (d) Unmarked CUI or

mismarked CUI. The Offeror should notify the Contracting Officer within 8 hours of discovery if the Offeror discovers any CUI that is not marked, not properly marked, not identified on the SF XXX, or is involved in a suspected or confirmed CUI incident. The Offeror should take action to appropriately safeguard any information the Offeror believes is CUI that is not identified in the SF XXX or is not marked or properly marked as required in the SF XXX until a Contracting Officer makes a determination. (End of provision) 52.204-XX Controlled Unclassified Information. As prescribed in 4.403-7(b), insert the following clause: Controlled Unclassified Information (DATE) (a) Identifying controlled unclassified information. The SF XXX, Controlled Unclassified Information, that is incorporated into this contract identifies what controlled unclassified information (CUI) is involved in the contract. The Contractor is required to safeguard only the CUI that is identified in the SF XXX. However, see paragraph (c)(2) of this clause. (b) Definitions. As used in this clause: Adequate security means security protections commensurate with the risk of harm resulting from unauthorized access, use, disclosure, disruption, modification, or destruction of information. Contractor-attributional information means information that identifies the Contractor or its employees directly or identifies them indirectly by grouping information that can be traced back to the Contractor (e.g., program description or facility locations). Contractor bid or proposal information means any of the following information submitted to a Federal agency as part of or in connection with a bid or proposal to enter into a Federal agency procurement contract, if that information has not been previously made available to the public or disclosed publicly: (1) Cost or pricing data as defined by 10 U.S.C. 3701(1) , with respect to procurements subject to that section, and 41 U.S.C. 3501(a)(2) , with respect to procurements subject to that section. (2) Indirect costs and direct labor rates. (3) Proprietary information about manufacturing processes, operations, or techniques marked by the Contractor in accordance with applicable law or regulation. (4) Information marked by the Contractor as Contractor bid or proposal information in accordance with applicable law or regulation. (5) Information marked in accordance with 52.215-1(e). Controlled unclassified information (CUI)

Control RC-725: st of the other nodes that they want to connect with) or via smart contracts onchain. Changes to the list of validators may then be administered through onchain voting by administrators. Alternatively, an IDMS may form an open protocol and/or ecosystem that can be used and integrated by anyone. It can be a general purpose ecosystem or a more application-specific one (e.g., credit scoring with Bloom Protocol [60]). Furthermore, an IDMS can involve users authenticating at the application level or at the ecosystem level such as in Blockstack [49]. The latter differs from traditional single sign-on identity management in that identifier origination, credential issuance, and presentation disclosure are not necessarily controlled by a single entity. In some systems, tokens may be utilized to design an incentive structure and boost certain desired behaviors from the participants (e.g., through earning rewards) to facilitate ecosystem coordination, self-sustainability, and growth (can be based on various game theory techniques). The incentive structure can be extended to built-in monetization schemes to buy and sell services. More specifically, they may be coded directly as part of the functions that implement actions, such as credential issuance and presentation disclosure. 9 A second layer protocol can be used as an access control mechanism for permissioned blockchains. For example, the ChainAnchor scheme [59] offers this while allowing users to transact pseudonymously and maintain transaction unlinkability: users can selectively disclose their transactions if asked to (e.g., for regulatory purposes) without revealing their other transactions. This scheme makes use of the 'Enhanced Privacy ID' zero-knowledge protocol. ## Internal Rules Management : Every system has rules that dictate how participants interact with a given system.

Two comments asked how many current contract awardees had received notification or identification of CUI to be provided in performance of their contracts, and asked which CMMC level would theoretically apply to those contracts. Another asked the DoD to provide DIBCAC assessment results data as a more relevant justification for the CMMC program than the 2019 DoDIG report on DIB Cybersecurity. Response: DoD's response to the referenced GAO and DoD IG reports are beyond the scope of this rule. Likewise, the DoD does not comment on analysis methods supporting the DoD IG's conclusions. Publishing DIBCAC assessments results is also beyond the scope of this rule, as are CMMC Program effectiveness metrics and return on investment calculations. The DoD is establishing CMMC assessment requirements as part of a comprehensive effort to verify that underlying information security requirements are met, as required, for all contractor owned information systems that process, store, or transmit CUI or FCI in the performance of a DoD Contract. DoD's calculation of ROI for the security controls that CMMC will assess, and cost elasticity of the DIB are also beyond the scope of

this rule. 7. Phased Implementation of the Program Comment: Many comments asked for additional explanation of DoD's expected start and progression through phases of the CMMC implementation plan. Several asked that the phase-in plan be extended. One commenter asked whether contracts that would otherwise be associated with CMMC Level 3 would include a CMMC Level 2 requirement if issued prior to Phase 4 of the plan. Another misread the phase-in plan to mean that self-assessments would no longer be permitted at Full Implementation. One comment asked if the USG would be revisiting acquisition timelines to add more time for due diligence to ensure all entities meet CMMC requirements or have a POA&M in place. Some commenters observed that DoD's intended dates for CMMC implementation, as published in an earlier 48 CFR CMMC interim final rule, are unachievable and must be changed via another CMMC DFARS rule. Some commenters were confused by the differences between the dates of implementation phases in the rule, and the seven years described in cost estimates as necessary to complete implementation. Another commenter asked why the rule only applies to DoD.

Another major problem with shared key authentication is that pre-RSN IEEE 802.11 requires all devices on a WLAN to use the same WEP key or the same small set of keys. This reduces accountability and complicates troubleshooting and incident response efforts. If the WEP key is compromised, it needs to be replaced as quickly as possible to prevent further malicious acts, because WEP keys are used not only for access control, but also to protect confidentiality and integrity (as described in Sections 3.2.2 and 3.2.3). Unfortunately, IEEE 802.11 does not specify any support for key management. When a WEP key needs to be changed, the WLAN administrators have to implement their own methods for generating and distributing a new key. The key needs to be replaced on all STAs and APs, which is a manual process for many WLAN products. WLAN administrators also need to implement methods for archiving, auditing, and destroying keys. Key management problems often limit the scalability of IEEE 802.11 WLANs.

(definition of "Contrary"). Preemption also applies if the provision of State law stands as an obstacle to the accomplishment and execution of the full purposes and objectives and purposes of sec. 264 of HIPAA. Sec. 264 of HIPAA contains the provisions pertaining to the privacy of individually identifiable health information. Back to Citation 1031. (iv) If the export authorization specifies that additional security arrangements are necessary for performance on the contract, the contractor will incorporate those additional arrangements by appropriate provision in the contract or in a separate security document. (v) The contractor will prepare and maintain a written record that identifies the originator or source of classified information that will be used in providing classified defense articles, material or services to foreign customers. The contractor will maintain this listing with the contractor's record copy of the pertinent export authorization. (vi) The contractor will include the security provisions in accordance with paragraph (b)(5) in this section in all contracts and subcontracts involving classified information that are awarded to foreign contractors. Contractors must insert the bracketed contract specific information (e.g., applicable country and disposition of classified material) where noted, when using the following security clauses in the contract. (A) All classified information and material furnished or generated under the contract will be protected to ensure that: (1) The recipient will not release the information or material to any third party without disclosure authorization and export authorization, as appropriate. (2) The recipient will afford the information and material a degree of protection equivalent to that afforded it by the releasing government. (3) The recipient will not use the information and material for other than the purpose for which it was furnished without the prior written consent of the releasing government. (B) Classified information and material furnished or generated under this contract will be transferred through government channels or other channels specified in writing by the governments of the United States and [insert applicable country]. It will only be transferred to persons who have an appropriate security clearance and an official need for access to the information in order to perform on the contract. (C) Classified information and material furnished under the contract will be re-marked by the recipient with its government's equivalent security classification markings. (D) Classified information and material generated under the contract must be assigned a security classification as specified by the Contract Security Classification Specifications, or equivalent, provided with this contract. (E) All cases in which it is known or there is reason to

believe that classified information or material furnished or generated under the contract has been lost or disclosed to unauthorized persons will be reported promptly and fully by the contractor to its government's security authorities. (F) Classified information and material furnished or generated pursuant to the contract will not be further provided to another potential contractor or subcontractor unless: (1

CIS Safeguard 3.8 · Document Data Flows Document data flows. Data flow documentation includes service provider data flows and should be based on the enterprise's data management process. Review and update documentation annually, or when significant enterprise changes occur that could impact this Safeguard. Implementation Groups: 2,3 Asset Type: data Security Function: identify Parent Control: Data Protection

Note that option 1 is used as the baseline in the descriptions of all other options. The variation of the proposed rule with the relaxed lot code requirements is used as the baseline in this table because the high cost of requiring lot codes on all records (\$16.58 billion) is overwhelming. While the reduction in benefits from relaxing the lot code requirements is also large, we thought that the inclusion of that option in this table would confuse the presentation and add little practical value to the policy analysis. 2 Because this chart only reflects food safety, it does not include classified food security scenarios which envision intrastate shipments being targeted for tampering. 3 This option overstates the cost reduction from provisions in the final rule that exclude food contact substance entities since it assumes that they will not have to incur learning, records redesign, and additional records maintenance costs. In the final rule these entities will incur learning costs since they will still be subject to access requirements for records that they keep during the course of normal business activity. We constructed the policy options reported in the following tables to provide a range of net benefit and cost effectiveness measures for alternative coverage options. The records access, retention, and compliance date provisions, as well as the requirements for transporters for all options reported in the following tables, are the same as those reported for option 7 in the previous table. In addition, coverage for the option entitled ·all entities· is the same as that for option 7 in the previous table. Persons handling the finished container that contacts food are excluded from all of the following coverage options for the policy reasons stated previously. However, while persons handling the finished container that contacts food other than those who place food directly in contact with the finished container, are not required to establish and maintain records in the final rule, they are required to provide access to FDA to existing records if the conditions for access are satisfied. This requirement is implicit in all of the options with different coverage reported in the following tables. Table 17. Coverage of Different Policy Options

	Grocery Outlets	Importers and Wholesalers	Manufacturers	Mixed-Type Facilities	Warehouses	Transporters	Option	Adjusted	Comprehensive	All	All	All	All	All	All
(printed page 71644)	A	All	B	All	C	All	All	D	All	All	All	E	All	All	All

I	Exclude very small	Exclude very small	Exclude very small	Exclude very small	Exclude very small	Exclude very small	Exclude very small	Exclude very small	Exclude very small	Exclude very small	Exclude very small	Exclude very small	Exclude very small	Exclude very small	Exclude very small
	All	All	All	All	All	All	All	Only interstate	Note: Very small firms are defined as those with fewer than 10 full-time equivalent employees.						

The minimum security requirements cover seventeen security-related areas with regard to protecting the confidentiality, integrity, and availability of federal information systems and the information processed, stored, and transmitted by those systems. The security-related areas include: (i) access control; (ii) awareness and training; (iii) audit and accountability; (iv) certification, accreditation, and security assessments; (v) configuration management; (vi) contingency planning; (vii) identification and authentication; (viii) incident response; (ix) maintenance; (x) media protection; (xi) physical and environmental protection; (xii) planning; (xiii) personnel security; (xiv) risk assessment; (xv) systems and services acquisition; (xvi) system and communications protection; and (xvii) system and information integrity. The seventeen areas represent a broad-based, balanced information security program that addresses the management, operational, and technical aspects of protecting federal information and information systems. Certification, Accreditation, and Security Assessments (CA): Organizations must: (i) periodically assess the security controls in organizational information systems to determine if the controls are effective in their application; (ii) develop and implement plans of action designed to correct deficiencies and reduce or eliminate vulnerabilities in organizational information systems; (iii) authorize the operation of organizational information systems and any associated information system connections; and (iv) monitor information system security controls on an ongoing basis to ensure the continued

effectiveness of the controls.

From the NIST SP 800-172 Rev 3 Final Public Draft: system media cannot occur unless two technically qualified individuals conduct the 1295 designated task. Individuals who sanitize system media possess sufficient skills and expertise to determine whether the proposed sanitization reflects applicable federal and organizational standards, policies, and procedures. Dual authorization also helps to ensure that sanitization occurs as intended to protect against errors and false claims of having performed the sanitization actions. To reduce the risk of collusion, organizations consider rotating dual authorization duties to other individuals. Organizations consider the risks associated with implementing dual authorization when immediate responses are necessary to help ensure public and environmental safety. This requirement enhances SP 8

AC.L2-3.1.15 · Privileged Remote Access CMMC Assessment Guide · Level 2 | Version 2.13 48
organizational systems. Note that the ability to affect the integrity of the system is considered security-relevant as that could enable the means to by-pass security functions although not directly impacting the function itself. FURTHER DISCUSSION Privileged users are not necessarily allowed to perform their job functions from a remote location. Likewise, not all privileged commands may be executed remotely. Allowing remote execution of privileged commands or remote access to security-relevant information should be avoided if possible. If absolutely necessary, the p rileged commands authorized for remote execution should be identified and documented. Document which user roles have permissions to remotely execute privileged commands to make changes and to access security relevant information. Documentation must be used to establish security mechanisms that enforce the policy. This requirement, AC.L2 -3.1.15, requires authorization for privileged commands executed during a remote session and complements five other requirements dealing with remote access (AC.L2-3.1.12, AC.L2-3.1.14, AC.L2-3.1.13, IA.L2-3.5.3, and MA.L2-3.7.5): · AC.L2-3.1.12 requires the control of remote access sessions. · AC.L2-3.1.14 limits remote access to specific access control points. · AC.L2-3.1.13 requires the use of cryptographic mechanisms when enabling remote sessions. · IA.L2-3.5.3 requires multifactor authentication for network access to non- privileged accounts. · Finally, MA.L2-3.7.5 requires the addition of multifactor authentication for remote maintenance sessions. This requirement, AC.L2-3.1.15, also extends AC.L2-3.1.2, which limits the types of transactions and functions that authorized users are permitted to execute. Example Your company's Access Control Policy permits certain work roles to remotely perform a limited set of privileged commands from company-owned computers [a] . You implement controls to enforce who can remotely execute a privileged command , which privileged commands they can execute, and who is allowed access to security relevant information such as audit log configuration settings [a,c,d]. Potential Assessment Considerations · Does system documentation identify system administration or security functions that can be executed remotely [a]? · Is execution of the identified privileged commands via remote access only authorized for documented operational needs [c]?

The Department of Defense (DoD) proposes amending the Defense Federal Acquisition Regulation Supplement (DFARS) to add a new contract clause 252.204-70XX, Expediting Contract Closeout, to expedite contract closeout on contracts with a residual dollar amount of \$1,000 or less at the time of final closeout. The objective of the proposed clause is to facilitate expedited contract closeout and avoid excessive administrative costs for both the contractor and the Government to reconcile relatively small residual dollar amounts in order to close out a contract. The proposed rule will apply to small entities that have been or will be awarded contracts, including those under FAR part 12 procedures for the acquisition of commercial items. DoD is unable to estimate the total number of small entities that have DoD contracts with a residual amount of \$1,000 or less; however, the Defense Contract Management Agency (DCMA) was able to provide information on contracts administered by DCMA. According to data available in Mechanization of Contract Administration Services/Shared Data Warehouse as of June 2019, there were 11,831 flexibly-priced contracts with residual dollar amounts of \$1,000 or less, of which 3,507 contracts were awarded to small entities. The average residual amount on these contracts was \$70. The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). The rule does not duplicate, overlap, or conflict with any other Federal rules. There are no known, significant, alternative approaches to the proposed rule that would meet the requirements of the proposed rule. DoD invites comments from small business concerns and other interested parties on the expected impact of this rule on small entities. DoD will also consider comments from small entities concerning the existing regulations

in subparts affected by this rule in accordance with 5 U.S.C. 610 . Interested parties must submit such comments separately and should cite 5 U.S.C. 610 (DFARS Case 2017-D042), in correspondence.

VIII. Paperwork Reduction Act The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). List of Subjects in 48 CFR Parts 204 , 212 , and 252 Government procurement Jennifer Lee Hawes, Regulatory Control Officer, Defense Acquisition Regulations System. Therefore, 48 CFR parts 204 , 212 , and 252 are proposed to be amended as follows:

1. The authority citation for 48 CFR parts 204 , 212 , and 252 continues to read as follows:
Authority: 41 U.S.C. 1303 and 48 CFR chapter 1 . PART 204-ADMINISTRATIVE AND INFORMATION MATTERS 2. Add section 204.804-70 to read as follows: 204.804-70 Contract clause.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Commerce Office of the Secretary National Institute of Standards and Technology International Trade Administration National Telecommunications and Information Administration [Docket No.: 100721305-0305-01] AGENCY: Office of the Secretary, U.S. Department of Commerce; National Institute of Standards and Technology, U.S. Department of Commerce; International Trade Administration, U.S. Department of Commerce; and National Telecommunications and Information Administration, U.S. Department of Commerce. ACTION: Notice of inquiry. SUMMARY: The Department of Commerce's Internet Policy Task Force is conducting a comprehensive review of the nexus between cybersecurity challenges in the commercial sector and innovation in the Internet economy. The Department seeks comments from all stakeholders, including the commercial, academic and civil society sectors, on measures to improve cybersecurity while sustaining innovation. Preserving innovation, as well as private sector and consumer confidence in the security of the Internet economy, are important for promoting economic prosperity and social well-being overall. In particular, the Department seeks to develop an up-to-date understanding of the current public policy and operational challenges affecting cybersecurity, as those challenges may shape the future direction of the Internet and its commercial use, both domestically and globally. After analyzing comments on this Notice, the Department intends to issue a report that will contribute to the Administration's domestic and international policies and activities in advancing both cybersecurity and the Internet economy. DATES: Comments are due on or before September 13, 2010. ADDRESSES: Written comments may be submitted by mail to Diane Honeycutt, National Institute of Standards and Technology, 100 Bureau Drive, Stop 8930, Gaithersburg, MD 20899. Submissions may be in any of the following formats: HTML, ASCII, Word, rtf, or pdf. Online submissions in electronic form may be sent to cybertaskforce@doc.gov . Paper submissions should include a three and one-half inch computer diskette or compact disc (CD). Diskettes or CDs should be labeled with the name and organizational affiliation of the filer and the name of the word processing program used to create the document. Comments will be posted at <http://www.ntia.doc.gov/-internetpolicytaskforce> and <http://csrc.nist.gov> . FOR FURTHER INFORMATION CONTACT:

Because a notice of proposed rulemaking and an opportunity for public comment are not required to be given for this rule under 41 U.S.C. 1707(a)(1) (see section III. of this preamble), the analytical requirements of the Regulatory Flexibility Act (5 U.S.C. 601 et seq.) are not applicable. Accordingly, no regulatory flexibility analysis is required and none has been prepared.

VII. Paperwork Reduction Act The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). List of Subjects in 48 CFR Parts 204 , 212 , and 252 Government procurement Amy G. Williams, Deputy, Defense Acquisition Regulations System. Therefore, 48 CFR parts 204 , 212 , and 252 are amended as follows: 1. The authority citation for parts 204, 212, and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1 . (printed page 24887) PART 204-ADMINISTRATIVE MATTERS 2. Revise section 204.7109 to read as follows: 204.7109 Contract clause. Use the clause at 252.204-7006, Billing Instructions, in solicitations and contracts if Section G includes: (a) Any of the standard payment instructions at PGI 204.7108(d)(1) through (6); or (b) Other payment instructions, in accordance with PGI 204.7108(d)(12), that require contractor identification of the contract line item(s) on the payment request. PART 212-ACQUISITION OF COMMERCIAL ITEMS 212.301 [Amended] 3. Amend section 212.301 by: a. Removing paragraph (f)(ii)(C); and b. Redesignating paragraphs (f)(ii)(D) through (G) as

However, holders of patents are not obligated to respond to ITL calls for patents and ITL has not undertaken a patent search in order to identify which, if any, patents may apply to this publication. As of the date of publication and following call(s) for the identification of patent claims whose use may be required for compliance with the guidance or requirements of this publication, no such patent claims have been identified to ITL. No representation is made or implied by ITL that licenses are not required to avoid patent infringement in the use of this publication. \

_____ ##

CAUTIONARY NOTE The generalized assessment procedures described in this publication provide a framework and starting point for developing specific procedures to assess the enhanced security requirements in NIST Special Publication 800-172. The assessment procedures can be used to help generate and evaluate the relevant evidence needed to determine if the security safeguards employed by organizations are implemented correctly, operating as intended, and satisfy the enhanced security requirements. Organizations have the flexibility to tailor the assessment procedures by selecting the assessment methods and objects needed to achieve the assessment objectives. There is no expectation that every assessment method and object in an assessment procedure will be used for every assessment. In addition, there is significant flexibility in the scope of the assessment and the degree of rigor applied during the assessment process. The assessment procedures can support self-assessments, third-party assessments, or assessments conducted by sponsoring organizations (e.g., government agencies). Such approaches may be specified in contracts or in agreements by participating parties.

in't Mark-up Language (YAML) formats that provide machine-readable representations of security and privacy information relative to the implementation, assessment, and continuous monitoring of systems. NIST SP 800-53, SP 800-53A, and SP 800-53B are available in OSCAL format, and programs such as FedRAMP are leveraging OSCAL.

The bulk of the work defined here will be completed by NSA and NIST personnel, with input from contracted infcHination technology experts. However, review and input fi'om the information technology industry as a whole will be necessary as the Common Criteria development process proceeds. It is understood that the user and vendor community will remain an important source of technical informatiem as this project continues.

The definitions of Organization Seeking Assessment (OSA) and Organization Seeking Certification (OSC) are provided in §.170.4. It is important to note that OSC is a sub-set of OSA. g. Process, Store, or Transmit Comment: Several comments asked about use of the term, 'Process, store or transmit'. One asked about its application to a turnkey cloud based CMMC solution and whether the intent was to consider 'access' a subset of 'process'. Another recommended using the term 'Handle' in lieu of this term and noted that this would also require amendments to DFARS clause 252-204-7012. Another comment recommended rephrasing the definition to provide clarity while another asked that the definition of 'Process, store, or transmit' (§.170.4(b)) explicitly include residence of data in memory, which has not previously been identified in this context and could raise interpretation issues. Response: The phrase 'process, store, or transmit' is more specific than the term 'handle' and is consistent with DoD contract requirements for Non-Federal Information systems as specified in DFARS clause 252.204-7012. The DoD intended 'Access' to be included in the 'Process, store, or transmit definition as written in §.170.4(b). An organization offering a turnkey cloud based CMMC solution would be considered an ESP by this rule, and the rule was updated to address assessment and certification requirements of ESPs. The rule definitions are provided for additional clarity of the terms included in the rule and does not nor cannot include every potential instance of the term's application to a contractor's information systems. h. Clarification of Definitions for FCI and CUI Comment: Three comments requested clarification of and noted inconsistency between the terms 'FCI' and 'CUI'. One perceived '[FCI]' and '[CUI]' as new acronyms and asked why this rule includes them. One comment noted the inconsistent use of the terms 'CUI and FCI' and 'sensitive unclassified information' and recommended selecting one term for use throughout the rule. Another comment requested definitions for CMMC be distinguished with formatting or another notation. Response: FCI is defined in FAR clause 52.204-21. The definition of CUI and general requirements for its

safeguarding are included in 32 CFR 2002.4 and 2002.14, respectively. CUI is not a new acronym. The notation '[FCI]' is identified in table 2 to § 170.15(c)(1)(ii) to reflect its alignment to the requirements of FAR clause 52.204-21 for basic safeguarding of information. Similarly, '[CUI]' has been added to reflect the use of those requirements for CMMC Level 2, which is designed to protect CUI, not FCI. The DoD amended the rule such that 'sensitive unclassified information' will consistently be replaced with 'FCI and/or CUI' as appropriate. i. Use of Terms Information and Data Comment:

(F) From subsection (f) (agency rules for notifying subjects to the existence of records about them, for accessing and amending records, and for assessing fees) because the system is exempt from subsection (d) provisions regarding access and amendment of records by record subjects. Nevertheless, the Office of the Secretary of Defense has published agency rules concerning notification of a subject in response to his request if any system of records named by the subject contains a record pertaining to him and procedures by which the subject may access or amend the records. Notwithstanding exemption, the Office of the Secretary of Defense may determine it appropriate to satisfy a record subject's access request. (20) System identifier and name. DMDC 13 DoD, Defense Clearance and Investigations Index. (i) Exemption. Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is (printed page 14808) denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. Any portion of this system that falls under the provisions of 5 U.S.C. 552a(k)(2) may be exempt from the following subsections of 5 U.S.C. 552a(c)(3); (d); (e)(1); (e)(4)(G), (H), and (I) and (f). (ii) Authority. 5 U.S.C. 552a(k)(2). (iii) Reasons. (A) From subsection (c)(3) because it will enable OSD components to conduct certain investigations and relay law enforcement information without compromise of the information, protection of investigative techniques and efforts employed, and identities of confidential sources who might not otherwise come forward and who furnished information under an express promise that the sources' identity would be held in confidence (or prior to the effective date of the Act, under an implied promise). (B) From subsections (e)(1), (e)(4)(G), (H), and (I) because it will provide protection against notification of investigatory material including certain reciprocal investigations and counterintelligence information, which might alert a subject to the fact that an investigation of that individual is taking place, and the disclosure of which would weaken the on-going investigation, reveal investigatory techniques, and place confidential informants in jeopardy who furnished information under an express promise that the sources' identity would be held in confidence (or prior to the effective date of the Act, under an implied promise).

CM.L2-3.4.4 · Security Impact Analysis CMMC Assessment Guide · Level 2 | Version 2.13 99 FURTHER DISCUSSION Changes to complex environments are reviewed for potential security impact before implemented. Changes to IT systems can cause unforeseen problems and have unintended consequences for both users and the security of the operating environment. Analyze the security impact of changes prior to implementing them. This can uncover and mitigate potential problems before they occur. Example You have been asked to deploy a new web browser plug-in. Your standard change management process requires that you produce a detailed plan for the change, including a review of its potential security impact. A subject-matter expert who did not submit the change reviews the plan and tests the new plug-in for functionality and security. You update the change plan based on the expert's findings and submit it to the change control board for final approval [a]. Potential Assessment Considerations · Are configuration changes tested, validated, and documented before installing them on the operational system [a]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.4.4

3.3.5, 3. 3.3.5 | | with related policies, PR. 3.3.5 | | with related policies, PR.

From the NIST SP 800-172 Rev 3 Final Public Draft: Larger organizations may implement a dedicated SOC, while smaller organizations NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 may employ third-party organizations to provide this capability. This requirement 1201

(e) If the Government exercises the authority provided in 239.7305(d), the debriefing shall not reveal any information that is determined to be withheld from disclosure in accordance with section

806 of the National Defense Authorization Act for Fiscal Year 2011, as amended by section 806 of the National Defense Authorization Act for Fiscal Year 2013 (see subpart 239.73). PART 233-PROTESTS, DISPUTES, AND APPEALS 7. Add new section 233.102 to read as follows: 233.102 General. If the Government exercises the authority provided in 239.7305(d) to limit disclosure of information, no action undertaken by the Government under such authority shall be subject to review in a bid protest before the Government Accountability Office or in any Federal court (see subpart 239.73). PART 239-ACQUISITION OF INFORMATION TECHNOLOGY 8. Add new subpart 239.73 to read as follows: Subpart 239.73-Requirements for Information Relating to Supply Chain Risk 239.7300 Scope of subpart. 239.7301 Applicability. 239.7302 Definitions. 239.7303 Authorized individuals. 239.7304 Determination and notification. 239.7305 Exclusion and limitation on disclosure. 239.7306 Solicitation provision and contract clause. Subpart 239.73-Requirements for Information Relating to Supply Chain Risk 239.7300 Scope of subpart. (a) This subpart implements section 806 of the National Defense Authorization Act for Fiscal Year 2011 (Pub. L. 111-383) and elements of DoD Instruction 5200.44, Protection of Mission Critical Functions to Achieve Trusted Systems and Networks (TSN), at (<http://www.dtic.mil/whs/directives/corres/pdf/520044p.pdf>). (b) The authority provided in this subpart expires on September 30, 2018 (see section 806(a) of Pub. L. 112-239). 239.7301 Applicability. Notwithstanding FAR 39.001, this subpart shall be applied to acquisition of information technology for national security systems, as that term is defined at 44 U.S.C. 3542(b) , for procurements involving· (a) A source selection for a covered system or a covered item involving either a performance specification (see 10 U.S.C. 2305(a)(1)(C)(ii)), or an evaluation factor (see 10 U.S.C. 2305(a)(2)(A)), relating to supply chain risk; (b) The consideration of proposals for and issuance of a task or delivery order for a covered system or a covered item where the task or delivery order contract concerned includes a requirement relating to supply chain risk (see 10 U.S.C. 2304c(d)(3) and FAR 16.505(b)(1)(iv)(D)); or (c) Any contract action involving a contract for a covered system or a covered item where such contract includes a requirement relating to supply chain risk. 239.7302 Definitions. As used in this subpart· Covered item means an item of information technology that is purchased for inclusion in a covered system, and the loss of integrity of which could result in a supply chain risk for a covered system (see section 806(e)(6) of Pub. L. 111-383). Covered system means a national security system, as that term is defined at 44 U.S.C. 3542(b) (see section 806(e)(5) of Pub. L. 111-38

(4) Propose changes to this rule as deemed appropriate and provide them (printed page 83321) to the applicable CSA for submission to the OUSD(I&S) Counterintelligence, Law Enforcement and Security Directorate. (i) Director, ISOO. The Director, ISOO: (1) Oversees the NSIP and agency compliance with it, in accordance with E.O. 12829 . (2) Issues and maintains the NISP implementing directive (32 CFR part 2004), in accordance with E.O. 12829 , to provide guidance to the CSAs and USG agencies under the NISP. (3) Chairs the NISP Policy Advisory Committee. Addresses complaints and suggestions from contractors, as detailed in the NISP Policy Advisory Committee bylaws. § 117.7 Procedures. (a) General. Contractors will protect all classified information that they are provided access to or that they possess. This responsibility applies at both contractor and USG locations. (b) Contractor Security Officials. Contractors will appoint security officials who are U.S. citizens, except in exceptional circumstances (see § 117.9(m) and § 117.11(e)). (1) Appointed security officials listed in paragraphs (b)(2), (b)(3), and (b)(4) of this section must: (i) Oversee the implementation of the requirements of this rule. Depending upon the size and complexity of the contractor's security operations, a single contractor employee may serve in more than one position. (ii) Undergo the same security training that is required for all other contractor employees pursuant to § 117.12, in addition to their position specific training. (iii) Be designated in writing with their designation documented in accordance with CSA guidance. (iv) Undergo a personnel security investigation and national security eligibility determination for access to classified information at the level of the entity's eligibility determination for access to classified information (e.g., FCL level) and be on the KMP list for the cleared entity. (2) SMO. The SMO will: (i) Ensure the contractor maintains a system of security controls in accordance with the requirements of this rule. (ii) Appoint a contractor employee or employees, in writing, as the FSO and appoint the same employee or a different employee as the ITPSO. The SMO may appoint a single employee for both roles or may appoint one employee as the FSO and a different employee as the ITPSO. (iii) Remain fully informed of the facility's classified operations. (iv) Make decisions based on classified threat reporting and their thorough knowledge, understanding, and appreciation of the threat information and the potential impacts caused by a loss of classified information. (v) Retain accountability for the management and operations of the facility without delegating that accountability to a subordinate manager. (3) FSO. The FSO will: (i) Supervise

and direct security measures necessary for implementing the applicable requirements of this rule and the related USG security requirements to ensure the protection of classified information.

In the final rule, we develop a more comprehensive and detailed model to estimate the food safety benefits using information generated from FDA outbreak investigations (Ref. 2). We use this information to estimate the number of illnesses averted as improved recordkeeping practices lead to faster traceback investigations and higher rates of successful traceback completions. These estimates understate the true expected benefits from the rule, because they are derived solely from food safety data and do not take into account the expected benefits of this rule to food security. The estimate of strictly food security benefits is based on classified data and is not used in this analysis. A qualitative description of the security benefits is provided below under section IV.E.1 of this document, entitled "Bioterrorism Considerations." Although benefit-cost analysis is primarily a quantitative exercise, the existence of non-quantified benefits and costs, as well as uncertainty around the quantified measures, means that assessing whether costs justify benefits entails a qualitative element. Decision aids such as uncertainty analyses are used to help decision makers in these instances. (Comment 179) There were several comments stating that the costs of compliance for specific sectors, including foreign facilities, food contact suppliers, and transportation facilities, did not justify the benefits of reducing the risks of contamination posed by those sectors. (Response) In the final analysis that follows, we refine the analysis of the benefits of selected policy options including those expected from foreign firms, food contact substance suppliers, and transportation facilities. (Comment 180) One comment states the need to measure benefits from the regulation against the existing traceback and recall capability of the industry. This comment questions whether the provisions in the recordkeeping rule would improve response times for removing product from the market, and potentially reduce the number of illnesses from a foodborne outbreak. The comment suggests that FDA should consider what the savings would be in anticipated response times and records recovery times, as well as how this would translate into a reduction in illnesses and enhanced product recovery. Finally, the comment states that the burdensome exercise to produce records could actually slow and hinder the objectives of recalling a suspected product.

While the promise of these new technologies is exciting, they come with increased risks and vulnerabilities to ePHI and the information systems that create, receive, maintain, or transmit it. As noted by Executive Order (E.O.) 14110, “[AI] must be safe and secure. Meeting this goal requires [. . .] addressing AI systems’ most pressing security risks—including with respect to biotechnology, cybersecurity, critical infrastructure, and other national security dangers—while navigating AI’s opacity and complexity.” [203] For these reasons, the E.O. required the Secretary of HHS, in consultation with the Secretary of Defense and the Secretary of Veterans Affairs, to establish an HHS AI Task Force to develop a strategic plan that includes policies and frameworks on responsible deployment and use of AI and AI-enabled technologies in the health and human services sector, including the incorporation of safety, privacy, and security standards into the software-development lifecycle for the protection of personally identifiable information, such as measures to address AI-enhanced cybersecurity threats in the health and human services sector. [204] The Department has taken a number of actions to address the use of AI in health care, including establishing an AI Council, appointing a Chief AI Officer, [205] and taking steps to regulate the use of AI in health care. [206] Accordingly, regulated entities must be prepared to identify, mitigate, and remediate such risks and vulnerabilities. While the health care industry has generally shifted from paper record-keeping and non-interoperable electronic devices to an interconnected electronic health care system, it has led to an increasing vulnerability to breaches of unsecured PHI resulting from unauthorized uses and disclosures and cyberattacks. According to an article published by the American Hospital Association Center for Health Innovation, “Health care organizations are particularly vulnerable and targeted by cyberattacks because they possess so much information of high monetary and intelligence value to cyber thieves and nation-state actors.” [207] In fact, “[. . .] on the dark web, PHI is deemed more (printed page 913) valuable than credit card data, enabling cybercriminals to extract as much as [\$1,000] per stolen medical record.” [208] Before this shift to an interconnected electronic system, lost or misplaced paper records or even a laptop could lead to a breach of unsecured PHI affecting hundreds or thousands of individuals. [209] While a breach of that size remains significant, unauthorized access to a single workstation today could lead to a breach that affects millions of individuals because of the increase in interconnectivity. [210] Between 2018 and 2023, the number of breaches of unsecured PHI reported to the Department grew at an alarming rate (100 percent increase), as did the number of individuals affected by such breaches (950 percent increase). [211]

- The Government Performance and Results Act (GPRA) of 1993 establishes the foundation for budget decision making to achieve strategic goals in order to meet agency mission objectives. - The Paperwork Reduction Act (PRA) of 1995 requires agencies to perform their information resource management activities in an efficient, effective, and economical manner. - The Federal Financial Management Improvement Act (FFMIA) of 1996 requires accountability of financial and program managers for financial results of actions taken, control over the federal government’s financial resources, and protection of federal assets. - The Federal Managers Financial Integrity Act (FMFIA) of 1982 requires ongoing evaluations and reports from each executive on the adequacy of administrative control for internal accounting systems. - The Clinger-Cohen Act of 1996 requires agencies to use a disciplined capital planning and investment control (CPIC) process to acquire, use, maintain, and dispose of IT resources, and establishes a role of chief information officer (CIO) within each federal agency. - The E-Government Act of 2002 (Public Law 107-347) promotes better use of the Internet and other IT resources to improve government services for citizens and internal government operations, and provide opportunities for citizen participation in government. The Act also requires agencies to: - -Comply with FISMA, included as Title III of the E-Government Act; - -Support governmentwide e-government initiatives; - -Leverage cross-agency opportunities to further e-government through the Federal Enterprise Architecture (FEA) initiative; and Identifying and implementing security controls is vital in protecting the confidentiality, integrity, and availability of the connected systems and the data that is transferred between the systems.

These principles include making AI safe and secure and protecting privacy and civil liberties. For example, the Department finalized regulations earlier this year that improve transparency by health IT developers of certified health IT, including those that are business associates, that supply a particular type of AI-predictive decision support interventions (DSIs). [916] Specifically,

the regulations require such health IT developers to provide greater transparency about the design, development, training, evaluation, and use of such predictive DSIs. [917] This approach promotes responsible AI and makes it possible for covered entities to access a consistent, baseline set of information about the algorithms they use to support their decision making and to assess such algorithms for fairness, appropriateness, validity, effectiveness, and safety. [918] Additionally, the Department proposes to require that regulated entities monitor authoritative sources for known vulnerabilities and to remediate such vulnerabilities in accordance with their patch management program. We also propose to require that patches, updates, and upgrades that address critical and high risks be applied promptly. Together, these proposals would support the rapid response to vulnerabilities that will be necessary as AI becomes more prevalent. Thus, the Department believes that the adoption of the cybersecurity best practices proposed in this NPRM is an important first step to ensuring that AI tools are deployed by regulated entities in a manner that protects the confidentiality, integrity, and availability of ePHI. 3. Virtual and Augmented Reality (VR and AR) Research on VR and AR technologies is widespread and has produced numerous applications in the health care fields. Such technologies are being used in medical education and patient care, including AR-assisted surgeries, VR-based pain management therapies, and immersive patient education tools. [919] Additionally, innovators are working on ways to incorporate AI with VR and AR for improved diagnostics and treatment planning. [920] However, as with quantum computing and AI, VR and AR technologies raise new privacy and security concerns. VR and AR involve the use of diverse technologies and the collection of a wide array of sensitive information, including comprehensive biometric data. [921] According to experts, “[. . .] VR and AR present distinct security challenges, encompassing typical vulnerabilities associated with electronic devices, as well as potential risks of physical harm and leakage of highly sensitive data.” [922] VR, like any connected computing device, is susceptible to standard cybersecurity concerns and various types of cyberthreats, necessitating proactive anticipation. [923] These cybersecurity risks, such as hacking, social engineering, malicious software, and ransomware, can be mitigated through holistic risk analysis and risk management, consistent with the Security Rule administrative standards in 45 CFR 164.308

b. We determined that the estimate of cleared contractor personnel who would be required to submit foreign travel reports should also include TOP SECRET cleared employees rather than just SECRET cleared employees as indicated in the original rule. As a result, the estimated cost has increased from \$16.81 to \$19.25 million. The following provides details on the estimated increase. All cleared employees, rather than only SECRET cleared employees, must submit foreign travel reports, and receive any pre-travel threat briefings or post travel briefings from the FSO based on the threat according to this rule, SEAD 3, and CSA-provided guidance for unique mission requirements. It is estimated that the number of foreign travel reports submitted annually will increase from 483,681 as estimated in the original rule to 813,054 to comply with the amendment. That estimate is based on analysis of calendar year 2019 unofficial foreign travel reported by DoD civilians and military in the DoD Aircraft and Personnel Automated Clearance System (APACS), a web-based tool for the creation, submission, and approval of aircraft diplomatic clearances and personnel travel clearances (i.e., Country, Theater, and Special Area, as applicable with individual DoD Foreign Clearance Guide (FCG), <https://www.fcg.pentagon.mil> country pages) designed to aid USG travelers on official government and unofficial (e.g., leave) travel. For calendar year 2019, there were 126,131 travelers and 113,214 travel requests submitted into APACS. APACS requirements are published on the DoD FCG, <https://www.fcg.pentagon.mil> . Thus, an annual estimate of .89 expected foreign travel trips by traveler (113,214 divided by 126,131). In the small business analysis, there was a total of 18,242 cleared employees in the 658 small entities sampled and 63,598 cleared employees in the remaining 356 non-small businesses. Of the total cleared employees in the small business analysis (as reported in the National Industrial Security System), approximately 22.3% were at small entities, and 77.7% were at non-small businesses. Known number of new travelers expected to be affected by this proposed rule will increase from the initial estimate of 543,462 to 905,818 cleared contractor personnel, an increase of 362,356 to include TOP (printed page 86292)

but it also must be handled in accordance with the other applicable regulations and laws. Are there specific concerns not addressed in this proposed rule in this area? If so, please provide a relevant use case. VI. Executive Orders 12866 and 13563 Executive Orders (E.O.s) 12866 (as amended by E.O. 14094) and 13563 direct agencies to assess the costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects,

distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is a significant regulatory action and, therefore, was subject to review under section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. VII. Regulatory Flexibility Act DoD, GSA, and NASA expect this proposed rule, if finalized, to have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601-612. The Initial Regulatory Flexibility Analysis (IRFA) is summarized as follows: DoD, GSA, and NASA are proposing to revise the FAR to implement a NARA final rule on the Federal CUI Program as it relates to performance under Federal contracts (see 32 CFR part 2002). This proposed rule creates two new clauses at FAR 52.204-XX, Controlled Unclassified Information, and FAR 52.204-YY, Identifying and Reporting Information That Is Potentially Controlled Unclassified Information, and a new FAR provision at 52.204-WW, Notice of Controlled Unclassified Information Requirements. These clauses and the provision work together to implement a uniform way for Federal agencies, offerors, and contractors to manage CUI. The rule also creates a new standard form (SF) XXX to standardize the way in which the Government identifies CUI that will be managed and safeguarded by a contractor in performance of a contract. This rule is just one element of a larger strategy to improve the Government's efforts to identify, deter, protect against, detect, and respond to increasingly sophisticated attacks by criminals and our adversaries targeting Federal information and information systems. Promulgation of this FAR rule is authorized by 41 U.S.C. 1121(b); 41 U.S.C. 1303; 40 U.S.C. 121(c); 10 U.S.C. chapter 4 and 10 U.S.C. chapter 137 legacy provisions (see 10 U.S.C. 3016); and 51 U.S.C. 20113.

(A) Investigative material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (B) Investigative material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5), but only to the extent that such material would reveal the identity of a confidential source. (C) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(2) and/or (k)(5) from the following subsections of 5 U.S.C. 552a(c)(3), (d), (e)(1), (e)(4)(G), (H) and (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5). (iii) Reasons. (A) From subsection (c)(3) because to grant access to the accounting for each disclosure as required by the Privacy Act, including the date, nature, and purpose of each disclosure and the identity of the recipient, could alert the subject to the existence of the investigation or prosecutable interest by the NRO or other agencies. This could seriously compromise case preparation by prematurely revealing its existence and nature; compromise or interfere with witnesses or make witnesses reluctant to cooperate; and lead to suppression, alteration, or destruction of evidence. (B) From subsections (d)(1) through (d)(4), and (f) because providing access to investigative records and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that would make them difficult or impossible to reach in order to satisfy any Government claim growing out of the investigation or proceeding. (C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear.

NIST recommends that Federal agencies implement the following recommendations to assist in establishing and maintaining robust security for their IEEE 802.11i-based WLANs. Personnel responsible for their implementation and maintenance should read the corresponding sections of the document to ensure they have an adequate understanding of important related issues.

(b) The appellant will be notified of the decision on his or her appeal in writing. If the decision affirms the adverse determination in whole or in part, the notification will include a brief

statement of the reason(s) for the affirmation, including any exemptions applied, and will inform the appellant of the Privacy Act provisions for judicial review of the appellate authority's decision. If the adverse determination is reversed or modified, in whole or in part, the appellant will be notified in writing of this decision and the request will be reprocessed in accordance with that appeal decision. (c) In order to seek a judicial review of a denial of a request for access to records, a requester must first file an appeal under this section. (d) An appeal ordinarily will not be acted on if the request becomes a matter of litigation. § 310.7 Requests for amendment or correction of records. (a) If the record is not subject to amendment and correction as stated in paragraph (b) of this section, an individual may make a request for amendment or correction of a DoD Component's record about that individual by writing directly to the DoD Component that maintains the record as identified in the published SORN applicable to the record. The request should identify each particular record in question, state the amendment or correction that is sought, and state why the record is not accurate, relevant, timely, or complete without the correction. The individual will also need to verify identity in the same manner as described in §§ 310.3(c) through (d). Factual documentation that is helpful to the DoD Component privacy officials should be submitted with the request. If it is believed that the same record exists in more than one system of records, this should be stated in the request, and the request should be addressed to each DoD Component that maintains a system of records containing the record as noted in this paragraph. (b) Certain records are not subject to amendment or correction under the Privacy Act: (1) Proceedings and determinations of courts-martial, military tribunal, or Military Boards of Correction are not generally subject to amendment or correction under the Privacy Act. (2) Records in systems of records that have been exempted from amendment and correction under the Privacy Act, 5 U.S.C. 552a(j) or (k) are not subject to amendment or correction. (3) The amendment process is not intended to permit the alteration of records presented in the course of judicial or quasi-judicial proceedings such as the adjudication process for personnel security clearances or contesting grades in academic records. Any amendments or changes to these records normally are made through the specific procedures established for the amendment of such records.

Clarification was requested regarding C3PAOs' timelines for accreditation and their dependencies on the CMMC AB accreditation process. Some commenters requested additional time. Clarification was also requested on the current disposition of authorized C3PAOs. A few comments asked for simplification and clarification of the difference between the terms 'authorized' and 'accredited' with the establishment of C3PAOs. One comment requested that the rule be edited to require full compliance before C3PAOs can conduct certifications, and that duplicative language relating to ethics, record keeping, etc., be moved to a central location in the rule. One commentor questioned whether § 170.9(b)(16), which states 'Ensure that all CMMC assessment activities are performed on the information system within the CMMC Assessment Scope', applies to all C3PAO personnel or just those involved in the Quality Assurance process. Other comments objected to the requirement that C3PAOs obtain a CMMC Level 2 certification assessment because the assessment does not result in a Level 2 certification. They asked whether this would require two separate assessments every three years for C3PAOs that also conduct contractor work for DoD. Two comments requested clarification on determining the scope for a CMMC Level 2 assessment of a C3PAO to be used by DIBCAC, and if or when they would be required to obtain a FedRAMP Moderate certification. Also, clarification was requested on whether a C3PAO is permitted to (printed page 83121) possess OSC CUI and other artifacts during the assessment so long as they are destroyed upon completion of the assessment. One comment suggested that all information collected by the C3PAO be encrypted. Three comments asked for clarification on what constitutes a C3PAO assessment team and whether it can consist of solely a Lead CCA. One commentor asked whether entities accredited under ISO 17020:2012(E) by another accreditation body, rather than the CMMC AB, meets CMMC C3PAO requirements. A couple of comments asked for clarification on whether a C3PAO could be foreign owned and participate in the current CMMC AB Marketplace. Response: One commenter misinterpreted several sections of the CMMC rule. By defining the requirements in this rule to become a C3PAO, and defining a scoring methodology, the DoD is providing the authority and guidance necessary for C3PAOs to conduct assessments.

When the contract includes an SF XXX that identifies CUI to be safeguarded under the contract, the contract will include the CUI clause. The contractor or subcontractor will need to review the SF XXX to determine what information under the contract is considered CUI and subject to the compliance requirements of the CUI clause. If the contractor or subcontractor intends to flow down CUI in performance of the contract or subcontract, then the contractor or subcontractor will need to prepare an SF XXX, as appropriate for CUI that will flow down, and distribute it to the

subcontractor that will be handling CUI. Train Contractor Employees on Handling CUI. Per the CUI clause, a contractor shall not permit any contractor employee to have, retain access to, create, collect, use, process, store, maintain, disseminate, disclose, dispose of, or otherwise handle, CUI unless the employee has completed training on properly handling CUI that, at a minimum, includes the elements required in the SF XXX. The SF XXX will also specify the frequency at which a contractor must provide the training, which is dependent on the type of CUI being handled by the contractor's employees and the criticality of the program being supported. The contractor must provide evidence of employee training upon request by the contracting officer; however, such requests are expected to be limited to, for example, instances where the Government is dealing with a CUI incident, or where an agency determines that it is necessary to verify training based on the criticality of a program and the CUI being handled by the contractor. Comply with NIST SP 800-172. A limited number of contractors may be required under FAR clause 52.204-XX, Controlled Unclassified Information, to (printed page 4288) implement some or all requirements of NIST SP 800-172, Enhanced Security Requirements for Protecting Controlled Unclassified Information: A Supplement to NIST Special Publication 800-171, Revision 2. NIST SP 800-172 provides enhanced security requirements that apply only to components of nonfederal systems that process, store, or transmit CUI or that provide security protection for such components when the designated CUI is associated with a critical program or high-value asset. The enhanced requirements supplement the basic and derived security requirements in NIST Special Publication 800-171, Revision 2, and address the protection of CUI by promoting: penetration-resistant architecture, damage-limiting operations, and designs to achieve cyber resiliency and survivability. Submit Supporting Documentation to Verify Compliance.

From the NIST SP 800-172 Rev 3 Final Public Draft: defense-in-depth Information security strategy integrating people, technology, and operations capabilities to establish variable barriers across multiple layers and missions of the organization. NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 discussion 2895

is defined in § 170.17(a)(1)(ii). (CMMC-custom term) CMMC Level 2 Conditional Self-Assessment is defined in § 170.16(a)(1)(ii). (CMMC-custom term) CMMC Level 2 Final Certification Assessment is defined in § 170.17(a)(1)(iii). (CMMC-custom term) CMMC Level 2 Final Self-Assessment is defined in § 170.16(a)(1)(iii). (CMMC-custom term) CMMC Level 3 Conditional Certification Assessment is defined in § 170.18(a)(1)(ii). (CMMC-custom term) CMMC Level 3 Final Certification Assessment is defined in § 170.18(a)(1)(iii). (CMMC-custom term) CMMC Third-Party Assessment Organization (C3PAO) means an organization that has been accredited by the Accreditation Body to conduct CMMC Level 2 Certification Assessments and has the roles and responsibilities identified in § 170.9. (CMMC-custom term) Contractor is defined in 48 CFR 3.502-1. Contractor Risk Managed Assets are defined in table 3 to § 170.19(c)(1) CMMC Level 2 Scoping. (CMMC-custom term) Controlled Unclassified Information (CUI) is defined in 32 CFR 2002.4(h). Controlled Unclassified Information (CUI) Assets means assets that can process, store, or transmit CUI. (CMMC-custom term) DCMA DIBCAC High Assessment means an assessment that is conducted by Government personnel using NIST SP 800-171A, Assessing Security Requirements for Controlled Unclassified Information that: (i) Consists of: (A) A review of a contractor's Basic Assessment; (B) A thorough document review; (C) Verification, examination, and demonstration of a contractor's system security plan to validate that NIST SP 800-171 security requirements have been implemented as described in the contractor's system security plan; and (D) Discussions with the contractor to obtain additional information or clarification, as needed; and (ii) Results in a confidence level of 'High' in the resulting score. (Source: DFARS Clause 252.204-7020, see 48 CFR 252.204-7020). Defense Industrial Base (DIB) is defined in 32 CFR 236.2. Enterprise means an organization with a defined mission/goal and a defined boundary, using information systems to execute that mission, and with responsibility for managing its own risks and performance. An enterprise may consist of all or some of the following business aspects: acquisition, program management, financial management (e.g., budgets), human resources, security, and information systems, information and mission management. (Source: CNSSI 4009; <https://www.cnss.gov/CNSS/issuances/Instructions.cfm>).] External Service Provider (ESP) means external people, technology, or facilities that an organization utilizes for provision and management of comprehensive IT and/or cybersecurity services on behalf of the organization. In the CMMC Program, CUI or Security Protection Data (e.g., log data, configuration data), must be processed, stored, or transmitted on the ESP assets to be considered an ESP. (CMMC-custom term) Federal Contract Information (FCI) is defined in 48 CFR 4.1901. Federal Contract Information (FCI) Assets

The Accreditation Body is responsible for authorizing and ensuring the accreditation of CMMC Third-Party Assessment Organizations (C3PAOs) in accordance with ISO/IEC 17020:2012 (incorporated by reference, see § 170.2) and all applicable authorization and accreditation requirements set forth. At any given point in time, there will be only one Accreditation Body for the DoD CMMC Program. (b) Requirements. The Accreditation Body shall: (1) Become and remain a member in good standing of the Inter-American Accreditation Cooperation (IAAC) and become an International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA) signatory, with a signatory status scope of ISO/IEC 17020:2012. (2) Become and remain a member in good standing of the International Accreditation Forum (IAF) with mutual recognition arrangement signatory status scope of ISO/IEC 17024:2012 (incorporated by reference, see § 170.2). (3) Achieve and maintain full compliance with ISO/IEC 17011:2017 (incorporated by reference, see § 170.2) and complete a peer assessment by other ILAC signatories for competence in accrediting conformity assessment bodies to ISO/IEC 17020:2012, both within 24 months of DoD approval. If ISO/IEC 17011:2017 is revised or superseded, the Accreditation Body shall achieve full compliance with the updated standard within 12 months of the date of revision. (i) Prior to achieving full compliance as set forth in this paragraph (b)(3), the Accreditation Body shall: (A) Authorize, but not accredit, C3PAOs who meet all requirements set forth in § 170.9 to grant CMMC Level 2 Certification Assessments and issue certificates of assessment for OSCs. (B) Require all C3PAOs to achieve and maintain the ISO/IEC 17020:2012 requirements within 27 months of authorization. If ISO/IEC 17020:2012 is revised or superseded, the Accreditation Body shall require full compliance with the updated standard within 12 months of the date of revision. (ii) After achieving full compliance as set forth in this paragraph (b)(3), the Accreditation Body shall accredit C3PAOs, in accordance with ISO/IEC 17020:2012, or subsequent revisions, who meet all requirements set forth in § 170.9 to grant CMMC Level 2 Certification Assessments and issue certificates of assessment for OSCs.

Under CMMC Level 2 (NIST SP 800-171 Rev 3), organizations must implement specific controls addressing this area. Key considerations include: 1. The specific NIST SP 800-171 controls that apply to this scenario 2. Documentation requirements for the SSP 3. Evidence needed for C3PAO assessment 4. Cost-effective implementation options for different organization sizes Organizations should reference the specific control families in NIST SP 800-171 Rev 3 and consult the CMMC Assessment Guide Level 2 for detailed assessment objectives. A Registered Practitioner (RP) can provide organization-specific guidance.

The specific federal statute or Executive Order that authorizes collection of the requested information. (b) Principal Purpose(s): The principal purpose or purposes for which the information is to be used. (c) Routine Uses(s): Disclosure of the information outside DOD. (d) Disclosure: Whether providing the information is voluntary or mandatory and the effects on the individual if he or she chooses not to provide the requested information. (1) Example of a Privacy Act Statement (i) Authority: Emergency Supplement Act of 2000; Public Law 106-246 ; 5 U.S.C. 3013 , Secretary of the Army; 10 U.S.C. 5013 , Secretary of the Navy; 10 U.S.C. 8013 , Secretary of the Air Force; Department of Defense Directive 8500.aa, Information Assurance (IA); and E.O. 9397 (SSN). (ii) Principal Purpose(s): To control access to DOD information, information based systems and facilities by authenticating the identity of a person using a measurable physical characteristic(s). This computer system uses software programs to create biometrics templates and summary statistics, which are used for purposes such as assessing system performance or identifying problem areas. (iii) Routine Use(s): None. The DoD Blanket Routine Uses set forth at the beginning of the Army's Compilations of System of Records Notices applies to this system. (iv) Disclosure: Voluntary; however, failure to provide the requested information may result in denial of access to DOD information based systems and/or DOD facilities. (2) [Reserved]. Appendix D to Part 505-Exemptions; Exceptions; and DoD Blanket Routine Uses (a) Special Exemption. 5 U.S.C. 552a(d)(5) Denies individual access to any information compiled in reasonable anticipation of civil action or proceeding. (b) General and Specific Exemptions. The Secretary of the Army may exempt Army systems of records from certain requirements (printed page 46068) of the Privacy Act. The two kinds of exemptions that require Secretary of the Army enactment are General and Specific exemptions. The Army system of records notices for a particular type of record will state whether the Secretary of the Army has authorized a particular General and Specific exemption to a certain type of record. The Army system of records notices are published in DA Pam 25-51 and on the Defense Privacy Office's Web site <http://www.defenselink.mil/privacy/> . (c) Twelve Exceptions to the No Disclosure without Consent rule of the Privacy Act. (1) 5 U.S.C. 552a(b)(1) To DOD officers and employees who have a need for the record in the performance of their official duties.

This is the official need to know concept. (2) 5 U.S.C. 552a(b)(2) FOIA requires release of the information. (3) 5 U.S.C. 552a(b)(3) The Routine Use Exception. The Routine Use must be published in the Federal Register and the purpose of the disclosure must be compatible with the purpose for the published Routine Use. The applicable Routine Uses for a particular record will be listed in the applicable Army Systems Notice. (4) 5 U.S.C. 552a(b)(4)

Recommendations to add or modify requirements specified in NIST documentation should be submitted in response to NIST requests for public comment on the applicable guidelines. Federal and DoD requirements for delivery of software bills of material of secure software development are beyond the scope of this rule, which is limited to the assessment of compliance with requirements for adequate protection of FCI and CUI. Federal Contract Information is defined in FAR clause 52.204-21, which also provides the security requirements applicable for basic safeguarding of such information. The Department has no authority to modify definitions established in the FAR for application to all executive branch agencies. Any data that meets the definition of FCI, is subject to CMMC Level 1. It is beyond the scope of the CMMC rule to render decisions on specific elements of data. The OUSD(A&S) was not replaced by the DoD CIO, rather, CMMC Program management oversight has been realigned from the OUSD(A&S) to the Office of the DoD CIO for better integration with the Department's other DIB cybersecurity related initiatives. Comments pertaining to DoD's organizational structure are not relevant to the content of this rule. DoD's processing of FOIA requests is also not within the scope of this rule. The DoD declines to respond to speculative or editorial comments about private citizens or outside entities, all of which are beyond the scope of this rule. Likewise, the DoD will not comment here on other DoD cybersecurity related programs, such as Zero Trust. Some comments expressed appreciation for cybersecurity related services that DoD provides free of charge, including protected DNS, vulnerability scanning, and security alerts, but these programs are outside the CMMC program. The government cannot comment on specific implementation or documentation choices of an OSA. Comments on alternate risk mitigation strategies such as product monitoring or software testing are not within the scope of this rule text. d. DoD Policies Supporting CMMC Implementation Comment:

(Response) The proposed rule required large and small firms to provide access to records up to 4 hours after a request made during business hours, and up to 8 hours after a request made after business hours. FDA's current experience is that access to records generally takes 2 to 3 days and the requirements in the regulation will considerably increase the speed of traceback investigations. To acknowledge the concerns addressed by these comments, FDA has relaxed the records access requirement to as soon as possible, but within 24 hours. This longer requirement should provide regulatory relief to small businesses; however, FDA reiterates that it expects all businesses to provide access as soon as possible, given that an access request would only be made in a food-related emergency. (Comment 220) Several comments request an exemption for some specific categories of small business, because they believe the estimated costs of compliance for small businesses are inadequate. Furthermore, one comment states that the regulatory flexibility provisions in the proposed rule did not satisfy SBREFA obligations. (Response) FDA addresses SBREFA's regulatory flexibility issues by (printed page 71648) exempting very small retailers, and by staggering compliance dates so that small and very small businesses would have 18 and 24 months to comply with the regulation. Because food in commerce generally passes through at least one small business before reaching consumers, excluding small businesses in every sector from compliance with the regulation would risk severely compromising the effectiveness of the regulation due to breaks in the recordkeeping chain during traceback investigations. (Comment 221) Some comments argue that FDA should address the relatively large burden on small businesses due to the cumulative cost of the four bioterrorism regulations when considered together. The comments state that the proposed registration rule estimated that approximately 16 percent of foreign businesses might cease to export to the United States as a result of that rule. The comments note that this figure was used in the sensitivity analysis in the proposed recordkeeping rule to estimate the costs of the rule with 16 percent fewer foreign facilities. However, the comments stated that FDA did not consider the costs of all the bioterrorism regulations combined on small (or other) businesses. (Response) The cumulative costs of multiple regulations are rarely considered in regulatory impact analyses. However, costs of the other three regulations were analyzed in their respective regulatory impact analyses. To estimate the cumulative costs of the regulation one could add together the costs determined for all four regulations. VI. Unfunded Mandates Title II of the Unfunded Mandates Reform Act of 1995 (Public Law 104-4

- Applying a threat-centric approach to security requirements specification; - Employing system and security architectures that support logical and physical isolation using system and network segmentation techniques, virtual machines, and containers; 16 - Implementing dual authorization controls for the most critical or sensitive operations; - Limiting persistent storage to isolated enclaves or domains; - Implementing a comply-to-connect approach for systems and networks; - Extending configuration management requirements by establishing authoritative sources for addressing changes to systems and system components; - Periodically refreshing or upgrading organizational systems and system components to a known state or developing new systems or components; - Employing a security operations center with advanced analytics to support continuous monitoring and protection of organizational systems; and - Using deception to confuse and mislead adversaries regarding the information they use for decision-making, the value and authenticity of the information they attempt to exfiltrate, or the environment in which they are operating. | FAMILY | FAMILY |

DFARS 252.204-7012 (Safeguarding Covered Defense Information and Cyber Incident Reporting) Core CUI protection clause requiring NIST SP 800-171 implementation, cyber incident reporting within 72 hours, and preservation of evidence. Contractors should review the full text of DFARS 252.204-7012 in conjunction with their contracting officer and legal counsel to ensure full compliance. The clause should be read alongside the CMMC requirements at 32 CFR Part 170.

Email: pivtesting@nist.gov NIST Special Publication (SP) 800-157 contains technical guidelines for the implementation of standards-based, secure, reliable, interoperable Public Key Infrastructure (PKI)-based identity credentials that are issued for mobile devices by federal departments and agencies to individuals who possess and prove control over a valid Personal Identity Verification (PIV) Card. This document, SP 800-166, contains the requirements and test assertions for testing the Derived PIV Application and associated Derived PIV data objects implemented on removable hardware tokens and within mobile devices. The tests reflect the design goals of interoperability and interface functions. The authors (David Cooper, Hildegard Ferraiolo and Ramaswamy Chandramouli of NIST; Nabil Ghadiali of the National Gallery of Art; and Jason Mohler and Steven Brady of Electrosoft Services, Inc.), wish to thank their colleagues who reviewed drafts of this document and contributed to its development. Special gratitude to the General Services Administration (GSA) FIPS 201 Evaluation Program (GSA FIPS 201 EP) team for their review and contributions to the document.

(b) It does not apply to the National Guards of the States, Territories, and District of Columbia, except to the extent that they are in the possession of NGB records or relying on a System of Records Notice (SORN) published by NGB for their authority to maintain 5 U.S.C. 552a protected records. §-329.3 Definitions. All terms used in this part which are defined in 5 U.S.C. 552a shall have the same meaning herein. Access. Allowing individuals to review or receive copies of their records. Accuracy. Within sufficient tolerance for error to assure the quality of the record in terms of its use in making a determination. Agency. Any Executive department, military department, Government corporation, Government controlled corporation, or other establishment in the executive branch of the [federal] Government (including the Executive Office of the President), or any independent regulatory agency (as defined by 5 U.S.C. 552a). Amendment. The process of adding, deleting, or changing information in a System of Records (SOR) to make the data accurate, relevant, timely, and/or complete. Appellate Authority. The individual with authority to deny requests for access or amendment of records under 5 U.S.C. 552a . Breach. A loss of control, compromise, unauthorized disclosure, unauthorized acquisition, unauthorized access, or any similar term referring to situations where a person other than authorized users (with an official need to know), and for an other than authorized purpose has access or potential access to personally identifiable information, whether physical or electronic. A breach can include identifiable information in any form. (As defined by DoD Director of Administration and Management Memo, 5 Jun 2009 entitled ·Safeguarding Against and Responding to the Breach of Personally Identifiable Information (PII)· (Available at http://www.dod.mil/-pubs/-foi/-privacy/-docs/-DA_-M6_-5_-2009Responding_.toBreach_.of_.PII_.).) Chief, National Guard Bureau (CNGB). A principal advisor to the Secretary of Defense, through the Chairman of the Joint Chiefs of Staff, on matters involving non-federalized National Guard forces

and on other matters as determined by the Secretary of Defense; and the principal adviser to the Secretary of the Army and the Chief of Staff of the Army, and to the Secretary of the Air Force and the Chief of Staff of the Air Force, on matters relating to the National Guard, the Army National Guard of the United States, and the Air National Guard of the United States. The CNGB also represents the National Guard on the Joint Chiefs of Staff. Completeness. All elements necessary for making a determination are present before such determination is made. Computer Matching Program. A program that matches the personal records in computerized database of two or more Federal agencies. Denial Authority. The individual with authority to deny requests for access or amendment of records under 5 U.S.C. 552a . Determination.

s related to cybersecurity. The focus is on the science, technology, engineering, and math disciplines in order to help provide a pipeline of skilled workers for private sector and government; 3. Track 3: Federal Cybersecurity Workforce Structure which is led by Office of Personnel Management (OPM). The goal of this track is to define cybersecurity jobs in the federal government and skills and competencies required. They will also identify new strategies to ensure federal agencies attract, recruit, and retain skilled employees to accomplish cybersecurity missions; and 4. Track 4: Cybersecurity Workforce Training and Professional Development. This track is led by Department of Defense, Office of the Director of National Intelligence, and DHS. The goal of this track is to identify and manage the cybersecurity training and professional development required for federal government civilian, military, and contractor personnel.

Let df be the derivation function specified in Section 10.3.2. When instantiation is performed using this method, a nonce is required, whereas using the method in Section 10.2.1.3.1 does not require a nonce, since full entropy is provided when using that method. Let df be the derivation function specified in Section 10.3.2. Let df be the derivation function specified in Section 10.3.2.

Additional Guidance on Level 2 Scoping CMMC Assessment Scope · Level 2 | Version 2.13 5 Additional Guidance on Level 2 Scoping The OSA is required to document all asset categories that are part of the Level 2 self-assessment or certification assessment in an asset inventory and provide a network diagram of the CMMC Assessment Scope to facilitate scoping discussions during pre-assessment activities. CUI Assets CUI Assets process, store, or transmit CUI as follows: · Process · CUI can be used by an asset (e.g., accessed, entered, edited, generated, manipulated, or printed). · Store · CUI is inactive or at rest on an asset (e.g., located on electronic media, in system component memory, or in physical format such as paper documents). · Transmit · CUI is being transferred from one asset to another asset (e.g., data in transit using physical or digital transport methods). CUI Assets are part of the CMMC Assessment Scope and are assessed against all CMMC requirements. In addition, the OSA is required to: · document each asset in an asset inventory; there is no requirement to embed each asset in the System Security Plan (SSP); · document the treatment of these assets in the SSP; · provide a network diagram of the CMMC Assessment Scope (to include these assets) to facilitate scoping discussions during the pre-assessment. Security Protection Assets/Security Protection Data Security Protection Assets provide security functions or capabilities within the OSA's CMMC Assessment Scope. Security Protection Assets are part of the CMMC Assessment Scope and are assessed against Level 2 security requirements that are relevant to the capabilities provided. For example, an External Service Provider (ESP), defined in 32 CFR §170.4, that provides a security information and event management (SIEM) service may be separated logically and may not process CUI, but the SIEM does contribute to meeting the CMMC requirements within the OSA's CMMC Assessment Scope. Table 2 provides examples of Security

Protection Assets. Security Protection Data means data stored or processed by Security Protection Assets that are used to protect an OSA's assessed environment. Security Protection Data is security-relevant information which, if disclosed, could aid an attacker in the compromise of the system. It includes, but is not limited to:

- configuration data required to operate a security protection asset,

All submissions received must include the agency name and docket number or RIN for this Federal Register document. The general policy for comments and other submissions from members of the public is to make these submissions available for public viewing at <http://www.regulations.gov> as they are received without change, including any personal identifiers or contact information. FOR FURTHER INFORMATION CONTACT: Valerie Heil, 703-692-3754. SUPPLEMENTARY INFORMATION: I. Overview of the NISP and NISPOM In April 1990, President George Bush directed the National Security Council to explore the creation of a single, integrated industrial security program to improve security protection and provide cost savings. Prior to this, contractors doing business with different U.S. Government (USG) agencies which required access to classified information had to meet different requirements to protect the same levels of classified information, e.g., the type of safe to protect a specific classified item could vary across both contracts and agencies. The diversity of industrial security requirements levied on contractors by an estimated 21 USG agencies created a significant burden on both industry and government and increased the cost of the goods and services provided to the USG. Representatives from government and industry participated in an initiative which led to the creation of Executive Order (E.O.) 12829 National Industrial Security Program (NISP) (available at <https://www.archives.gov/files/isoo/policy-documents/eo-12829-with-eo-13691-amendments.pdf>). With the National Security Council providing overall policy direction, this E.O. established the NISP as the single integrated program to protect classified information and preserve our Nation's economic and technological interests. Nothing in the E.O. shall supersede the authority of the Secretary of Energy or the Nuclear Regulatory Commission under the Atomic Energy Act of 1954, as amended, or the authority of the Director of National Intelligence (or any Intelligence Community element) under the Intelligence Reform and Terrorism Prevention Act of 2004, the National Security Act of 1947, as amended, or Executive Order No. 12333 of December 8, 1981, as amended, or the authority of the Secretary of Homeland Security, as the Executive Agent for the Classified National Security Information Program established under Executive Order 13549 of August 18, 2010 (Classified National Security Information Program for State, Local, Tribal, and Private Sector Entities). The Information Security Oversight Office (ISOO), a component of the National Archives and Records Administration (NARA), was tasked with overseeing overall implementation of the NISP with the goal of: Holding classification activity to the minimum necessary to protect the national security; ensuring the safeguarding of classified national security information in both USG and industry in a cost-effective and efficient manner; and

- (1) STEP 1: DEFINE YOUR SYSTEM . The purpose of Step 1 is to produce a general definition of your system by looking at several key system features: composition, connections, size, cost(s), and back-ups. First, the current configuration of your system is established to ensure that you have fully identified all major system components and connections. Use of a system configuration diagram provides you a visual opportunity to record and review your system's current configuration. It also allows you to visualize potential vulnerabilities that may exist as a result of your system's connections and data flows. Second, Step 1 helps you in developing a general cost estimate for your system so that you are able to appreciate how much it would cost to replace it in its entirety. It is also important to have a general appreciation for the cost of your system in order to decide which countermeasures, if any, are justified based on the cost of your system. Step 1 also reviews the type of software and data used by your system, with the objective of understanding approximately how much labor went into the development of each and whether back-ups are available and necessary. GENERAL PURPOSE OF STEP 1 : The purpose of Step 1 is to develop a general definition of your system. The definition is developed by looking at several key system features: composition, connections, size, cost(s), and back-ups. First, the current configuration of your system is established to ensure that you have fully identified all system components and connections. Use of a diagram provides a visual record of your current system configuration. It also allows you to visualize potential vulnerabilities that may exist as a result of your system's connections and data flows. Second, Step 1 helps you in developing a general cost estimate for your system so that you are able to appreciate how much it would cost to replace it in its entirety.

There are no nonrecurring or recurring engineering costs associated with CMMC Level 2 C3PAO

Certification since it is assumed the contractor has implemented NIST SP 800-171 R2 requirements.

Assessment Costs and Initial Affirmation Costs: It is estimated that the cost to support a CMMC Level 2 C3PAO Certification and affirmation for a small entity is *\$101,752. The three-year cost is \$104,670 (as summarized in section 3(b) above, table 1), and includes the triennial assessment + affirmation plus two additional annual affirmations (\$101,752 + \$1,459 + \$1,459).

- Phase 1: Planning and preparing for the assessment: \$20,699 A director (MGMT5) for 54 hours (\$190.52/hr × 54hrs = \$10,288) An external service provider (ESP) for 40 hours (\$260.28/hr × 40hrs = \$10,411)
- Phase 2: Conducting the C3PAO assessment: \$45,509 A director (MGMT5) for 64 hours (\$190.52/hr × 64hrs = \$12,193) An external service provider (ESP) for 128 hours (\$260.28/hr × 128hrs = \$33,316)
- Phase 3: Reporting of C3PAO Assessment Results: \$2,851 A director (MGMT5) for 4 hours (\$190.52/hr × 4hrs = \$762) An external service provider (ESP) for 8 hours (\$260.28/hr × 8hrs = \$2,082) A staff IT specialist (IT4) for 0.08 hours (\$86.24/hr × 0.08hrs = \$7)
- Affirmation -initial affirmation post assessment: \$1,459
- C3PAO Costs: C3PAO engagement inclusive of Phases 1, 2, and 3 (3-person team) for 120 hours (\$260.28/hr × 120hrs = \$31,234)
- Reaffirmations: It is estimated that the costs to reaffirm a CMMC Level 2 C3PAO Assessment annually is \$1,459 (three-year cost is \$4,377, or \$1,459 × 3)
- A director (MGMT5) for 4 hours (\$190.52/hr × 4hrs = \$762)
- A staff IT specialist (IT4) for 8.08 hours (\$86.24/hr × 8.08hrs = \$697)

Summary: The following is the annual small entities total cost summary for CMMC Level 2 Certifications and Affirmations over a ten-year period: (Example calculation, Year 2: (*\$101,752 assessment per entity × 1,926 entities) + (\$1,459 annual affirmation per entity × 382 entities) = \$196,531,451) (printed page 83208) CMMC Level 3 Certification and Affirmation Costs for Small Business Entities

Purpose The purpose of the Select step is to select, tailor, and document the controls necessary to protect the information system and organization commensurate with risk to organizational operations and assets, individuals, other organizations, and the Nation. NIST SP 800-37, REVISION 2 RISK MANAGEMENT FRAMEWORK FOR INFORMATION SYSTEMS AND ORGANIZATIONS A System Life Cycle Approach for Security and Privacy

CHAPTER THREE PAGE 51 This publication is available free of charge from:

<https://doi.org/10.6028/NIST.SP.800-37r2> Expected Outputs: Controls selected for the system and the environment of operation. Primary Responsibility: System Owner; Common Control Provider. Supporting Roles: Authorizing Official or Authorizing Official Designated Representative; Information Owner or Steward; Systems Security Engineer; Privacy Engineer; System Security Officer; System Privacy Officer. System Development Life Cycle Phase: New · Development/Acquisition. Existing · Operations/Maintenance. Discussion: There are two approaches that can be used for the initial selection of controls: a baseline control selection approach, or an organization-generated control selection approach. The baseline control selection approach uses control baselines, which are pre-defined sets of controls specifically assembled to address the protection needs of a group, organization, or community of interest. Control baselines serve as a starting point for the protection of individuals' privacy, information, and information systems. Federal control baselines are provided in [SP 800-53B]. The system security categorization (see Task C-2) and the security requirements derived from stakeholder protection needs, laws, executive orders, regulations, policies, directives, instructions, and standards (see Task P-15) can help inform the selection of security control baselines. A privacy risk assessment (see Task P-14) and privacy requirements derived from stakeholder protection needs, laws, executive orders, regulations, policies, directives, instructions, and standards (see Task P-15) can help inform the selection of privacy control baselines. Privacy programs use security and privacy control baselines to manage the privacy risks arising from both unauthorized system activity or behavior, as well as from authorized activities. After the pre-defined control baseline is selected, organizations tailor the baseline in accordance with the guidance provided (see Task S-2). The baseline control selection approach can provide consistency across a broad community of interest. The organization-generated control selection approach differs from the baseline selection approach because the organization does not start with a pre-defined set of controls. Rather, the organization uses its own selection process to select controls. This may be necessary when the system is highly specialized (e.g., a weapons system or a medical device) or has limited purpose or scope (e.g., a smart meter). In these situations, it may be more efficient and cost-effective for an organization to select a specific set of controls for the system (i.e., a bottom-up approach) instead of starting with a pre-defined set of controls from a broad-based control baseline and subsequently eliminating controls through the tailoring process (i.e., top-down approach). In both the baseline control selection approach and organization-generated control selection approach, organizations develop a well-defined set of

security and privacy requirements using a life cycle-based systems engineering process (e.g., [ISO 15288] and [SP 800-160 v1] as described in the RMF Prepare- System Level step, Task P-15. This process generates a set of requirements that can be used to guide and inform the selection of a set of controls to satisfy the requirements (whether the organization starts with a control baseline or generates the set of controls from its own selection process). Similarly, organizations can use the [NIST CSF] to develop Cybersecurity Framework Profiles representing a set of organization-specific security and privacy requirements and thus, guiding and informing control selection from [SP 800-53]. Tailoring may also be required in the organization-generated control selection approach (see Task S-2). Organizations do not need to choose one approach for the selection of controls for each of their systems, but instead, may use different approaches as circumstances dictate. References: [FIPS 199]; [FIPS 200]; [SP 800-30]; [SP 800-53]; [SP 800-53B]; [SP 800-160 v1] (System Requirements Definition, Architecture Definition, and Design Definition Processes); [SP 800-161] (Respond and Chapter 3); [IR 8062]; [IR 8179]; [CNSSI 1253]; [NIST CSF] (Core [Identify, Protect, Detect, Respond, Recover Functions]; Profiles). CONTROL TAILORING TASK S-2 Tailor the controls selected for the system and the environment of operation.

Basic Safeguarding of Covered Contractor Information Systems. As prescribed in 4.404-3, insert the following clause: Basic Safeguarding of Covered Contractor Information Systems (DATE) (a) * * * Covered contractor information system means an information system owned or operated by a contractor on which the contractor processes, stores, or transmits covered Federal information. Covered Federal information means information provided by or created for the Government when that information is other than (1) Simple transactional information (such as that necessary to process payments); (2) Information already publicly released (such as on public websites), or marked for public release, by the Government; (3) Federally-funded basic and applied research in science, technology, and engineering at colleges, universities, and laboratories in accordance with National Security Decision Directive 189; (4) Controlled unclassified information (CUI); or (5) Classified information. Information means any communication or representation of knowledge such as facts, data, or opinions, in any medium or form, including textual, numerical, graphic, cartographic, narrative, electronic, or audiovisual forms (OMB Circular A-130, Managing Information as a Strategic Resource). * * * * * (b) * * * (3) Identification of covered Federal information. While covered Federal information is not required to be marked or identified by the Government, some administrative markings (e.g., draft, deliberative process, predecisional, not for public release) can indicate that the information is covered Federal information. If the Contractor is not sure whether specific information is covered Federal information, the Contractor can request clarification from the Contracting Officer. * * * * * 41. Add sections 52.204-WW, 52.204-XX, and 52.204-YY to read as follows: 52.204-WW Notice of Controlled Unclassified Information Requirements. As prescribed in 4.403-7(a), insert the following provision: Notice of Controlled Unclassified Information Requirements (DATE) (a) Definitions. As used in this provision, contractor-attributional information, contractor bid or proposal information, controlled unclassified information (CUI), CUI incident, and handling have the meaning provided in the clause 52.204-XX, Controlled Unclassified Information. (b) Government-provided information. (1) The Offeror shall not use Government-provided information for its own purposes, whether or not the information is marked as CUI, unless the information is in the public domain, or unless the information was lawfully made available to the Offeror by someone other than the Government. (printed page 4297) (2) If Offerors require access to CUI, the Government will provide agency procedures on handling the CUI to ensure compliance with the requirements in 32 CFR part 2002. Offerors shall comply with these agency procedures when handling CUI. (c) Offeror-provided information.

From the NIST SP 800-172 Rev 3 Final Public Draft: The impact value for CUI is no less than moderate. 12 In accordance with 32 CFR 2002 [5], CUI is categorized at no less than the FIPS 199 [6] moderate confidentiality impact value. However, when federal law, regulation, or government-wide policy establishing the control of CUI specifies controls that differ from those of the moderate control baseline, then the applicable law, regulation, or government-wide policy is followed. The security requirements in SP 800-171 [12] have been satisfied to provide the foundational level of protection for CUI. Additional safeguards are necessary to protect CUI that is associated with critical programs or high value assets.13 13 Additional protections are required to protect CUI that is associated with critical programs and high value asset

Accordingly, in paragraph (2), we propose to revise the description of transmission media to

recognize that data is transmitted almost exclusively in electronic form today. The limited exception to this would be data that is handwritten on paper and hand-delivered or mailed, such that the data is never on electronic storage material. Additionally, the Department proposes to include public networks in the examples of transmission media and to remove the sentence that describes transmissions that are not considered transmissions via electronic media. By making these changes, we would reflect technology's evolution since 2013. We also propose to make a technical correction to paragraph (2) of the definition, consistent with a revision made in the 2013 Omnibus Rule to paragraph (1). [345] Specifically, the Department proposes to replace the term "electronic storage media" with "electronic storage material" in paragraph (2) to clarify the connection between definitions of electronic storage material and transmission media. We neglected to make this change in 2013 when we replaced "electronic storage media" with "electronic storage material" in paragraph (1), which means that paragraph (2) relies on a term that is no longer defined. This technical correction we propose is consistent with how the Department has interpreted the definition of transmission media and the connection between it and electronic storage material since the change was made in 2013.

4. Request for Comment The Department requests comment on the foregoing proposals, including any benefits, drawbacks, or unintended consequences. We also request comment on the following considerations in particular:

- a. Whether the proposed modifications accurately capture current use of electronic media.
- b. Whether the proposed modifications allow for future technological innovation.
- c. Whether there are other types of electronic storage material that the Department should include in the non-exhaustive list of examples.
- d. Whether there are other types of transmission media that the Department should include in the non-exhaustive list of examples.

B. Section 164.304-Definitions

means an information system that performs or controls a function, either in whole or in part, as an integral element of a larger system or subsystem, such as, ground support equipment, flight simulators, engine test stands, or fire control systems. Empowered official is defined in 22 CFR part 120 . Entity is a generic and comprehensive term which may include sole proprietorships, partnerships, corporations, limited liability companies, societies, associations, institutions, contractors, licensees, grantees, certificate holders, and other organizations usually established and operating to carry out a commercial, industrial, educational, or other legitimate business, enterprise, or undertaking, or parts of these organizations. It may reference an entire organization, a prime contractor, parent organization, a branch or division, another type of sub-element, a sub-contractor, subsidiary, or other subordinate or connected entity (referred to as "sub-entities" when necessary to distinguish such entities from prime or parent entities). It may also reference a specific location or facility, or the headquarters or official business location of the organization, depending upon the organization's business structure, the access needs involved, and the responsible CSA's procedures. The term "entity" as used in this rule refers to the particular entity to which an agency might release, or is releasing, classified information, whether that entity is a parent or (printed page 83316) subordinate organization. The term "entity" in this rule includes contractors. Entity eligibility determination means an assessment by the CSA as to whether an entity is eligible for access to classified information of a certain level (and all lower levels). Entity eligibility determinations may be broad or limited to specific contracts, sponsoring agencies, or circumstances. A favorable entity eligibility determination results in eligibility to access classified information under the cognizance of the responsible CSA to the level approved. When the entity would be accessing categories of information such as RD or SCI for which the CSA for that information has set additional requirements, CSAs must also assess whether the entity is eligible for access to that category of information. Some CSAs refer to their favorable entity eligibility determinations as FCLs. However, a favorable entity eligibility determination for the DHS CCIPP is not equivalent to an FCL and does not meet the requirements for FCL reciprocity. A favorable entity eligibility determination does not convey authority to store classified information. Escort means a cleared person, designated by the contractor, who accompanies a shipment of classified material to its destination. The classified material does not remain in the personal possession of the escort but the conveyance in which the material is transported remains under the constant observation and control of the escort. Extent of protection

- Compromised workload (application) container (e.g., via a supply chain attack) - Compromised node L4 proxy or container network interface (CNI) - Compromised node L7 proxy - Compromised node with limited privileged access (e.g., a container breakout) - Root compromise of node (e.g., a container breakout chained with the exploitation of a privilege escalation vulnerability) - Network access to the Kubernetes API server Threat Description : A compromised application container (e.g., via a

supply chain attack during the development phase) leads to a takeover of the identity associated with that application. Threat Description : A compromised application container (e.g., via a supply chain attack during the development phase) leads to a takeover of the identity associated with that application.

In addition to specific routine uses which are listed in the applicable Army system of record notices, certain 'Blanket Routine Uses' apply to all DOD maintained systems of records. These are listed on the Defense Privacy Office's Web site <http://www.defenselink.mil/privacy/>. These 'Blanket Routine Uses' are not specifically listed in each system of records notice as the specific routine uses are. The current DOD 'Blanket Routine Uses' are as follows: (1) Law Enforcement Routine Use. If a system of records maintained by a DOD component to carry out its functions indicates a violation or potential violation of law, whether civil, criminal or regulatory in nature, and whether arising by general statute or by regulation, rule, or order issued pursuant thereto, the relevant records in the system of records may be referred, as a routine use, to the agency concerned, whether federal, state, local, or foreign, charged with the responsibility of investigating or prosecuting such violation or charged with enforcing or implementing the statute, rule, regulation or order issued pursuant thereto. (2) Disclosure When Requesting Information Routine Use. A record from a system of records maintained by a DOD component may be disclosed as a routine use to a Federal, State, or local agency maintaining civil, criminal, or other relevant enforcement information or other pertinent information, such as current licenses, if necessary to obtain information relevant to a DOD Component decision concerning the hiring or retention of an employee, the issuance of a security clearance, the letting of a contract, or the issuance of a license, grant or other benefit. (3) Disclosure of Requested Information Routine Use. A record from a system of records maintained by a DOD component may be disclosed to a Federal agency, in response to its request, in connection with the hiring or retention of an employee, the issuance of a security clearance, the reporting of an investigation of an employee, the letting of a contract, or the issuance of a license, grant, or other benefit by the requesting agency, to the extent that the information is relevant and necessary to the requesting agency's decision on the matter. (4) Congressional Inquiries Disclosure Routine Use. Disclosure from a system of records maintained by a DOD component may be made to a congressional office from the record of an individual in response to an inquiry from the congressional office made at the request of that individual. (5) Private Relief Legislation Routine Use. Relevant information contained in all systems of records of DOD published on or before August 22, 1975, may be disclosed to Office of Management and Budget in connection with the review of private relief legislation, as set forth in OMB Circular A-19, at any stage of the legislative coordination and clearance process as set forth in that Circular. (6) Disclosures Required by International Agreements Routine Use.

In this manual security information is provided about your PBX and adjunct systems. Adjunct systems are processors, access devices, or any related piece of equipment that supports PBX or voice mail system operation, maintenance, or administration. The schematics included in this manual provide some background information on the interconnection of these pieces of equipment. Remote Maintenance, Administration and Traffic System. Social engineering refers to a person's ability to use personality, knowledge of human nature, and social skills to steal toll calls. In one scheme, a hacker calls a long distance subscriber and claims to represent his/her long distance carrier. The hacker might claim to be doing maintenance or validating long distance access codes (PINs). He reads the first ten digits of the access code (which is the phone number of the person he is talking to) and makes up the last four digits. Human nature being what it is, the victim automatically corrects the hacker, giving him the correct PIN. The hacker thanks the subscriber and hangs up in full possession of a valid authorization code for placing long distance calls.

These standards and guidelines. - Performed research and conducted outreach on standards, practices, and technologies to enable prompt and effective computer security incident handling and coordination. - Continued the successful collaboration with the Office of the Director of National Intelligence (ODNI), the Committee on National Security Systems (CNSS). These trends have caused federal departments and agencies to have a lack of visibility and understanding throughout the supply chain of how the technology being acquired is developed, integrated and deployed, as well as the processes, procedures, and practices used to assure the integrity, security, resilience, and quality of the products and services. This lack of visibility and understanding, in turn, has decreased the control that federal departments and agencies have with regard to the decisions impacting the inherited risks traversing the supply chain and the ability to effectively manage

those risks. Figure 4 (below) shows how ICT supply-chain risk may be derived from adversarial or non-adversarial threats, as well as external or internal vulnerabilities. The likelihood of an event and the potential impact of an event are also key factors.

(1) The records in all systems of records maintained in accordance with the OPM Government-wide system notices are technically only in the temporary custody of the Department of Defense. (2) All requests for access to these records must be processed in accordance with 5 CFR part 297 as well as applicable Component procedures. (printed page 18769) (3) When a DoD Component refuses to grant access to a record in an OPM system, the Component shall advise the individual that his or her appeal must be directed to the Assistant Director for Workforce Information, Personnel Systems and Oversight Group, U.S. Office of Personnel Management, 1900 E Street, NW., Washington, DC, in accordance with the procedures of 5 CFR part 297 . §-310.19 Amendment of records. (a) Individual review and correction. Individuals are encouraged to review the personal information being maintained about them by the DoD Components periodically and to avail themselves of the procedures established by this part and other Regulations to update their records. (b) Amending records. (1) An individual may request the amendment of any record contained in a system of records pertaining to him or her unless the system of records has been exempted specifically from the amendment procedures of this part under paragraph (b) of §-310.26. Normally, amendments under this part are limited to correcting factual matters and not matters of official judgment, such as performance ratings, promotion potential, and job performance appraisals. (2) While a Component may require that the request for amendment be in writing, this requirement shall not be used to discourage individuals from requesting valid amendments or to burden needlessly the amendment process. (3) A request for amendment must include: (i) A description of the item or items to be amended; (ii) The specific reason for the amendment; (iii) The type of amendment action sought (deletion, correction, or addition); and (iv) Copies of available documentary evidence supporting the request. (c) Burden of proof. The applicant must support adequately his or her claim. (d) Identification of requesters. (1) Individuals may be required to provide identification to ensure that they are indeed seeking to amend a record pertaining to themselves and not, inadvertently or intentionally, the record of others. (2) The identification procedures shall not be used to discourage legitimate requests or to burden needlessly or delay the amendment process. (See paragraph (c) of §-310.17.) (e) Limits on attacking evidence previously submitted. (1) The amendment process is not intended to permit the alteration of records presented in the course of judicial or quasi-judicial proceedings. Any amendments or changes to these records normally are made through the specific procedures established for the amendment of such records.

The DoD is implementing a phased implementation for the revised CMMC Program and intends to introduce CMMC Status requirements in solicitations over a three-year period to provide appropriate ramp-up time. This phased implementation is intended to minimize the financial impacts to defense contractors, especially small businesses, and disruption to the existing DoD supply chain. After CMMC is implemented in acquisition regulation, DoD will include CMMC self-assessment requirements in solicitations and resulting contracts when warranted by the type of information that will be handled by the contractor of subcontractor(s). CMMC Status requirements for Levels 1, 2, and 3 will be included in solicitations and resulting contracts issued after the phase-in period when warranted by any FCI and/or CUI information protection requirements for the contract effort. In the intervening period, Government Program Managers will have discretion to include CMMC Status requirements or exclude them and rely upon existing DFARS clause 252.204-7012 requirements, in accordance with DoD policy. As stated in §-170.20(a), there is qualified standards acceptance between DCMA DIBCAC High Assessment and the CMMC Status of Level 2(C3PAO), which will result in staggering of the dates for new Level 2 certification assessments. The implementation period will consist of four (4) phases as set forth in §-170.3(e), during which time the Government will include CMMC requirements in certain solicitations and contracts. During the CMMC phase-in period, program managers and requiring activities will be required to include CMMC Status requirements in certain solicitations and contracts and will have discretion to include in others. A purpose of the phased implementation is to ensure adequate availability of authorized or accredited C3PAOs and assessors to meet the demand. Revised CMMC Program Flow Down CMMC Level requirements will be flowed down to subcontractors at all tiers as set forth in §-170.23; however, the specific CMMC Status required for a subcontractor will be based on the type of unclassified information and the priority of the acquisition program and/or technology being developed. Key Changes Incorporated in the Revised CMMC Program In November 2021, the Department announced the revised CMMC Program, which is an updated program structure with revised requirements. In the revised CMMC Program, the Department has introduced several key changes

that build on and refine the original program requirements. These include: Streamlining the model from five levels to three levels. Exclusively implementing National Institute of Standards and Technology (NIST) cybersecurity standards and guidelines. Allowing all companies subject to Level 1, and a subset of companies subject to Level 2 to demonstrate compliance through self-assessments. Increased oversight of professional and ethical standards of CMMC third-party assessors.

CMMC Level 2 self-assessment, Level 2 certification assessment, and Level 3 certification assessment are valid for a defined CMMC Assessment Scope as outlined in § 170.19 CMMC Scoping. A new CMMC assessment may be required if significant architectural or boundary changes are made to the previous Assessment Scope. Examples include, but are not limited to, expansions of networks or mergers and acquisitions. Operational changes within an Assessment Scope, such as adding or subtracting resources within the existing assessment boundary that follow the existing SSP do not require a new assessment, but rather are covered by the annual affirmations to the continuing compliance with requirements. The DoD did not accept the recommendation to change the criteria for POA&Ms or the timeline allowed to remediate open POA&M items. The 180-day timeline and the determination of the weighted practices that may be included in a POA&M were risk-based decisions. The determination factored the relative risk DoD is willing to accept when a particular practice is Not Met and the amount of risk the DoD is willing to accept for those security practices that remain ·NOT MET· for an extended period. Unlike the original CMMC Program, the revised CMMC Program accepts some risk with the use of limited POA&Ms. There is value to the DoD in having the pre-assessment information in CMMC eMASS for overall program management and oversight. The information indicates that an assessment is either scheduled or in-process. The CMMC PMO seeks to track CMMC Program adoption, and the pre-assessment information allows reporting on upcoming assessments. Based on the DoD's cost analysis, the cost to upload pre-assessment material is minimal. The rule and Hashing Guide have been updated to add clarity that only reporting a single hash is required, and the name of the hash algorithm used needs to be stored in CMMC eMASS. Each Assessment Objective in NIST SP 800-171A Jun2018 must yield a finding of MET or NOT APPLICABLE for the overall security requirement to be scored as MET. Assessors exercise judgment in determining when sufficient and adequate evidence has been presented to make an assessment finding. This is consistent with current DIBCAC High Assessments and assessments conducted under the Joint Surveillance Voluntary Assessment (JSVA) program. A security requirement can be applicable, even with assessment objectives that are N/A. The security requirement is NOT MET when one or more applicable assessment objectives is NOT MET. The requirements of each Level of the CMMC Model are defined in sections §§ 170.15 through 170.18 and the scoring of assessments is described in § 170.24. The assessment frequency required is every year for a CMMC Status of Final Level 1 (Self), (printed page 83199) and every 3 years for a CMMC Statuses of Final Level 2 (Self), Final Level 2 (C3PAO), and Final Level 3 (DIBCAC), or when changes within the CMMC Assessment Scope invalidate the assessment.

HIPAA Security Rule section 164.308 (Administrative Safeguards) addresses business associate contracts. Covered entities and business associates must implement appropriate safeguards to protect electronic protected health information (ePHI). For business associate contracts, organizations should: 1. Establish and document policies specific to business associate contracts 2. Implement technical and procedural controls 3. Train workforce members on their responsibilities 4. Conduct periodic risk assessments addressing business associate contracts 5. Maintain documentation of compliance efforts Under 45 CFR 164.308, this is a administrative safeguards requirement that applies to all covered entities and business associates that create, receive, maintain, or transmit ePHI.

means information that the Government creates or possesses, or that an entity creates or possesses for or on behalf of the Government, that a law, regulation, or Governmentwide policy requires or

ot recommended metrics. They are included to assist in explaining the concept of metrics as they are applied across tiers. Organizations define their own metrics and associated monitoring frequencies. In order to calculate metrics, associated controls and/or their objects are assessed and monitored with frequencies consistent with the timing requirements expressed in the metric.

The contribution to baseline traceback speeds by each sector is adjusted to reflect the probability that the food was contaminated further up the supply chain. Based on conversations with traceback personnel, we estimated that 10 percent of outbreaks requiring traceback records are from contamination at manufacturing facilities, and 90 percent are from contamination at the farm facilities (which may include mixed-type facilities subject to the recordkeeping requirements of this final rule).

a. Adjustments to traceback performance for the grocery sector . The baseline contribution from the retail sector to traceback performance is composed of contributions from both the restaurant and grocery sectors. The contribution to traceback performance from grocery outlets represents only a fraction of the total contribution of the retail sector. We adjust the probability of requiring traceback records from grocery outlets downward to account for the possibility that initial traceback from retail could begin at a restaurant as well as at a grocery outlet. For the adjustment we use the estimated number of restaurant locations of approximately 900,000 reported in

a recent survey conducted for the National Restaurant Association (Ref. 16). b. Adjustments to traceback performance for transportation and warehouse facilities . We adjusted estimates of the contributions to traceback performance by warehouse and transportation facilities to reflect the nature of traceback records from these facilities for many investigations. Manufacturers and third party warehouses are both important links in the supply chain and are required to keep records under the provisions of this regulation. This requirement allows FDA to determine whether what was sent at each stage is what was received, and if not, to be able to locate the unaccounted-for food. It is critical that FDA be able to locate and remove from commerce any adulterated food that presents a credible threat of serious adverse health consequences or death to humans or animals. We assume that there is a uniform likelihood between zero and one that there are more than two transportation or warehouse facilities used in the provision of a transportation or storage service. For these cases there is no adjustment to the value of records from such facilities during a traceback investigation. When two or fewer facilities provide transportation and warehouse services (estimated to be approximately half of the total number of such services) we adjust downward the value of records to acknowledge their role of verifying, rather than identifying, the buyer or seller of the food. For these cases we adjust the value of records to traceback performance by a factor of 0.5. c. Adjustments to traceback performance for large and very small facilities

SPRS is an existing DoD database that is compliant with DoD regulations, which includes meeting Privacy requirements. DoD suppliers are already required to use SPRS to record NIST SP 800-171 self-assessment scores, as referenced in DFARS clause 252.204-7020. The CMMC rule expands the use of SPRS to include CMMC Status, certification assessment scores, and affirmations. SPRS is the tool that the DoD acquisition workforce will use to verify companies meet CMMC requirements to be eligible for contract award. SPRS data entry does not make available to Contracting Officers scoring of individual security requirements. The DoD does not concur with granting prime contractors access to view the CMMC scores or Certificates of CMMC Status for potential subcontractors in SPRS. Subcontractors may voluntarily share their CMMC Status, assessment scores, or certificates to facilitate business teaming arrangements. Changing access to PIEE and SPRS is outside the scope of this rule. CMMC eMASS is a tailored, stand-alone instantiation of eMASS for use by authorized representatives from C3PAOs, the DCMA DIBCAC, and the CMMC PMO. Individuals from each C3PAO will have access to CMMC eMASS to upload Level 2 assessment data. DCMA DIBCAC personnel will have access to CMMC eMASS to upload Level 3 assessment data. OSAs will not have access to CMMC eMASS. Authorized personnel from OSAs may access SPRS, which will host assessment certification and self-assessment data, and will be able to upload and view scores only for their OSA. The DOD declines to add requirements for submitting self-assessments in eMASS. The requirement is for the OSA to enter scores into SPRS. There is value to the DoD in having the pre-assessment information in CMMC eMASS for overall program management and oversight. The information indicates that an assessment is either scheduled or in-process. The CMMC PMO seeks to track CMMC program adoption, and pre-assessment information allows reporting on upcoming assessments. Based on the DoD cost analysis, the effort to upload pre-assessment material is minimal. DoD Program Managers are not responsible for uploading data into eMASS, nor do they have any responsibility regarding the data uploaded to eMASS by DCMA. An ESP, OSA, or OSC seeking CMMC assessment will need a CAGE code and an account in SPRS to complete the annual attestation required of all CMMC certified or CMMC compliant organizations. An OSA/OSC must obtain a CAGE code via <https://sam.gov> before registering in PEE. Step by Step instructions for how to obtain an account can be found on the PEE Vendor Account website: <https://piee.eb.mil/·xhtml/·unauth/·web/·homepage/·vendorGettingStartedHelp.xhtml> . CAGE codes (or NCAGE codes for non-US-based companies) are also required. US-based contractors obtain a Commercial and Government Entity (CAGE) code from <https://cage.dla.mil/·Home/·UsageAgree> . Businesses outside of the US must obtain a NATO Commercial and Government Entity (NCAGE) code from

From the NIST SP 800-172 Rev 3 Final Public Draft: values can be guided and informed by laws, Executive Orders, directives, regulations, policies, standards, guidance, or mission and business needs. Once specified, the values for the OD Ps become part of the requirement. A discussion section is included with each requirement. It is derived from the control discussion section in SP 800-53 [8] and provides additional information to facilitate the implementation and assessment of the requirement. The discussion section is informative, not normative. It is not intended to extend the scope of a requirement or influence the solutions that organizations may implement to satisfy a requirement. The use of examples is notional, not exhaustive, and does not reflect the potential options available to organizations. If applicable, the sec

The responsibility of federal agencies to protect CUI does not change when such information is shared with nonfederal organizations. 4 A nonfederal organization is any entity that owns, operates, or maintains a nonfederal system. Therefore, a similar level of protection is needed when CUI is processed, stored, or transmitted by nonfederal organizations using nonfederal systems. The requirements for protecting CUI in nonfederal systems and organizations must comply with Federal Information Processing Standards (FIPS) 199 [6] and FIPS 200 [7] to maintain a consistent level of protection. The requirements are derived from the controls in NIST Special Publication (SP) 800-53 [8]. In certain situations, CUI may be associated with a critical program

Although CMMC compliance may add to an organization's cost, no member of the DIB can assume the status-quo in today's ever-changing cybersecurity environment. Increasing costs to protect the nation's data and industries from emerging threats is simply a component of doing business anywhere in the world. Processing, storing, or transmitting sensitive Government information comes with a handling cost that needs to be built into each organization's business model. All contractors or sub-contractors with access to CUI need to be capable of protecting that information to the standards specified in 32 CFR part 2002. If a small business cannot comply with the requirements of DFARS clause 252.204-7012 and NIST SP 800-171 R2, then that business should not receive CUI or process, store, or transmit CUI. If the DoD information flowed by the prime to a subcontractor is only FCI, then only a CMMC Level 1 self-assessment is required for the subcontractor prior to the flow of information under contract. DoD's programs, technological superiority, and best interests are not served if FCI and CUI are not consistently and adequately safeguarded by all who process, store, or transmit it. 2. Cost Benefit. Some commenters suggested it would be more cost effective for DoD to provide an environment or a DoD managed portal for the handling of CUI. A significant concern expressed was that companies have delayed complying with DoD cybersecurity standards until the CMMC rule was released and they could understand what level of compliance they will require. Several commenters felt DoD underestimated the costs and should have include the implementation cost of the requirements in this rule as well. One commenter was confused about how the discount rates were applied. Another commenter suggested that DoD provide flexibility to allow small businesses to not meet all the requirements and still be allowed to handle CUI and another expressed concerns regarding the cost of compliance and the degradation of the DIB that will be unable to afford compliance. DoD Response: The DoD declined to adopt the alternatives suggested in the comments, such as policy-based solutions that lack a rigorous assessment component or sharing CUI only through DoD-hosted secure platforms. The current DFARS clause 252.204-7012 requires protection of Security Protection Assets (SPA) and Security Protection Data (SPD). Section 1.1 of NIST SP 800-171 R2 states: "The requirements apply only to components of nonfederal systems that process, store, or transmit CUI, or that provide security protection for such components." There is therefore no increase in the scope because of the CMMC Program as described in the rule. SPD requires protection commensurate with the CUI it protects and is based on how and where the SPD is stored. The FedRAMP requirements for handling SPD are therefore the same as that for handling CUI.

(a) OSAs conduct a self-assessment based on NIST guidelines as addressed in § 170.16. This is an assessment to validate implementation of the 110 security requirements from NIST SP 800-171 Rev 2. (b) OSAs upload assessment results and affirmations in SPRS in accordance with § 170.16 and § 170.22. (c) OSAs may have a POA&M at CMMC Level 2 as addressed in § 170.21(a)(2). OSAs must perform a POA&M closeout self-assessment and post compliance results in SPRS in accordance with § 170.16. CMMC Level 2 Certification Assessment Collection The Level 2 Certification Assessment information collection reporting and recordkeeping requirements are included in this part with the exception of the requirement for the OSC to upload the affirmation in SPRS that will be included in the Title 48 acquisition rule and an update to the DFARS collection approved under OMB Control Number 0750-0004, Assessing Contractor Implementation of Cybersecurity Requirements. Additionally, the information collection reporting requirements for the CMMC instantiation of eMASS are included in a separate information collection request (ICR) for this part and cover only those requirements pertaining to the CMMC process. The information collection reporting requirements for eMASS include: The Accreditation Body provides the CMMC PMO with current data on C3PAOs, including authorization and accreditation records and status using the CMMC instantiation of eMASS as addressed in § 170.8(b)(9). C3PAOs submit pre-assessment and planning material, final assessment reports, and appropriate CMMC certificates of assessment into the CMMC instantiation of eMASS as addressed in § 170.9(b)(8). C3PAOs upload assessment data compliant with the CMMC assessment data standard into the CMMC instantiation of eMASS as addressed in § 170.9(b)(18). C3PAOs post POA&M closeout assessment compliance results into the CMMC instantiation of eMASS in accordance with

§ 170.17(a)(1)(ii)(B) of this part. C3PAOs upload artifacts (list of artifacts, hash of artifacts, and hashing algorithm used) into the CMMC instantiation of eMASS as addressed in § 170.9(b)(18) of this part. C3PAOs submit assessment appeals, review records, and decision results of assessment appeals using the CMMC instantiation of eMASS as addressed in § 170.9(b)(21) of this part. Additional information collection reporting and recordkeeping requirements for this part include: OSCs prepare for assessments based on NIST guidelines as addressed in § 170.17. C3PAOs conduct assessments based on NIST guidelines as addressed in § 170.17. This is an assessment to validate implementation of the 110 security requirements from NIST SP 800-171 Rev 2. Prospective C3PAOs must complete and submit the Standard Form (SF) 328 Certificate Pertaining to Foreign Interests upon request from Defense Counterintelligence and Security Agency (DCSA) (OMB Control Number 0704-0579). OSCs may have a POA&M at CMMC Level 2 as addressed in § 170.21(a)(2). C3PAOs must perform a POA&M closeout assessment.

§ 164.308 Administrative safeguards. (a) A covered entity or business associate must, in accordance with § 164.306 : (1) (i) Standard: Security management process. Implement policies and procedures to prevent, detect, contain, and correct security violations. (ii) Implementation specifications: (A) Risk analysis (Required). Conduct an accurate and thorough assessment of the potential risks and vulnerabilities to the confidentiality, integrity, and availability of electronic protected health information held by the covered entity or business associate. (B) Risk management (Required). Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with § 164.306(a) . (C) Sanction policy (Required). Apply appropriate sanctions against workforce members who fail to comply with the security policies and procedures of the covered entity or business associate. (D) Information system activity review (Required). Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports. (2) Standard: Assigned security responsibility. Identify the security official who is responsible for the development and implementation of the policies and procedures required by this subpart for the covered entity or business associate. (3) (i) Standard: Workforce security. Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a)(4) of this section from obtaining access to electronic protected health information. (ii) Implementation specifications: (A) Authorization and/or supervision (Addressable). Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed. (B) Workforce clearance procedure (Addressable). Implement procedures to determine that the access of a workforce member to electronic protected health information is appropriate. (C) Termination procedures (Addressable). Implement procedures for terminating access to electronic protected health information when the employment of, or other arrangement with, a workforce member ends or as required by determinations made as specified in paragraph (a)(3)(ii)(B) of this section. (4) (i) Standard: Information access management. Implement policies and procedures for authorizing access to electronic protected health information that are consistent with the applicable requirements of subpart E of this part . (ii) Implementation specifications: (A) Isolating health care clearinghouse functions (Required). If a health care clearinghouse is part of a larger organization, the clearinghouse must implement policies and procedures that protect the electronic protected health information of the clearinghouse from unauthorized access by the larger organization. (B) Access authorization (Addressable). Implement policies and procedures for granting access to electronic protected health information, for example, through access to a workstation, transaction, program, process, or other mechanism. (C) Access establishment and

modification (Addressable). Implement policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, transaction, program, or process. (5) (i) Standard: Security awareness and training. Implement a security awareness and training program for all members of its workforce (including management). (ii) Implementation specifications. Implement: (A) Security reminders (Addressable). Periodic security updates. (B) Protection from malicious software (Addressable). Procedures for guarding against, detecting, and reporting malicious software. (C) Log-in monitoring (Addressable). Procedures for monitoring log-in attempts and reporting discrepancies. (D) Password management (Addressable). Procedures for creating, changing, and safeguarding passwords. (6) (i) Standard: Security incident procedures. Implement policies and procedures to address security incidents. (ii) Implementation specification: Response and reporting (Required). Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes. (7) (i) Standard: Contingency plan. Establish (and implement as needed) policies and procedures for responding to an emergency or other occurrence (for example, fire, vandalism, system failure, and natural disaster) that damages systems that contain electronic protected health information. (ii) Implementation specifications: (A) Data backup plan (Required). Establish and implement procedures to create and maintain retrievable exact copies of electronic protected health information. (B) Disaster recovery plan (Required). Establish (and implement as needed) procedures to restore any loss of data. (C) Emergency mode operation plan (Required). Establish (and implement as needed) procedures to enable continuation of critical business processes for protection of the security of electronic protected health information while operating in emergency mode. (D) Testing and revision procedures (Addressable). Implement procedures for periodic testing and revision of contingency plans. (E) Applications and data criticality analysis (Addressable). Assess the relative criticality of specific applications and data in support of other contingency plan components. (8) Standard: Evaluation. Perform a periodic technical and nontechnical evaluation, based initially upon the standards implemented under this rule and, subsequently, in response to environmental or operational changes affecting the security of electronic protected health information, that establishes the extent to which a covered entity's or business associate's security policies and procedures meet the requirements of this subpart. (b) (1) Business associate contracts and other arrangements. A covered entity may permit a business associate to create, receive, maintain, or transmit electronic protected health information on the covered entity's behalf only if the covered entity obtains satisfactory assurances, in accordance with § 164.314(a) , that the business associate will appropriately safeguard the information. A covered entity is not required to obtain such satisfactory assurances from a business associate that is a subcontractor. (2) A business associate may permit a business associate that is a subcontractor to create, receive, maintain, or transmit electronic protected health information on its behalf only if the business associate obtains satisfactory assurances, in accordance with § 164.314(a) , that the subcontractor will appropriately safeguard the information. (3) Implementation specifications: Written contract or other arrangement (Required). Document the satisfactory assurances required by paragraph (b)(1) or (b)(2) of this section through a written contract or other arrangement with the business associate that meets the applicable requirements of § 164.314(a) . [68 FR 8376 , Feb. 20, 2003, as amended at 78 FR 5694 , Jan. 25, 2013]

- (3) When the Court orders the release of denied records, it may also issue a written finding that the circumstances surrounding the withholding raise questions as to whether DoD Component personnel acted arbitrarily and capriciously. In these cases, the special counsel of the Merit System Protection Board shall conduct an investigation to determine whether or not disciplinary action is warranted. The DoD Component is obligated to take the action recommended by the special counsel.
- (4) The Court may punish the responsible official for contempt when the DoD Component fails to comply with the court order to produce records that it determines have been withheld improperly, or to otherwise comply with a court order. (e) Non-United States Government source information (business information) . A requester may bring suit in a U.S. District Court to compel the release of records obtained from a submitter or records based on information obtained from a submitter. The submitter shall be notified promptly of the court action pursuant to E.O. 12600 . When the submitter advises that it is seeking court action to prevent release, the DoD Component shall defer answering or otherwise pleading to the (printed page 71862) complainant as long as permitted by the court, or until a decision is rendered in the court action of the source, whichever is sooner.
- (f) FOIA litigation . Personnel responsible for processing FOIA requests at the DoD Component

level shall be aware of litigation under the FOIA. Whenever a complaint is filed in a U.S. District Court under the FOIA, the DoD Component named in the complaint shall forward a copy of the complaint to DFOIPO with an information copy to the DoD Office of the General Counsel, ATTN: Office of Legal Counsel. Subpart E-Fee Schedule § 286.24 General provisions. (a) Application . (1) The fees described in this subpart apply to requests submitted pursuant to 5 U.S.C. 551 , 552 , and 552(a) and conform to the OMB Uniform Freedom of Information Act Fee Schedule and Guidelines S. They reflect direct costs for search, review (in the case of commercial requesters), and duplication of documents. (2) The fees are neither intended to imply they must be charged in connection with providing information to the public pursuant to the FOIA request nor are they meant to substitute for any other charges established by the Department of Defense, such as DoD 7000.14-R, to recoup direct costs of authorized services provided by DoD Components that are not FOIA related. (3) Nothing in this subpart shall supersede fees chargeable under a statute specifically providing for setting the level of fees for particular types of records, such as the GPO or the National Technical Information Service. The Components should ensure documents responsive to a request are maintained for distribution by agencies operating statutory-based fee schedule programs and inform requesters of the steps necessary to obtain records from those sources. (b) Fee restrictions

(n) ISO/IEC 17011:2017, titled ·Conformity assessment·Requirements for accreditation bodies accrediting conformity assessment bodies· specifies requirements for the competence, consistent operation and impartiality of accreditation bodies assessing and accrediting conformity assessment bodies. This document is incorporated by reference as a source for requirements on the CMMC Ecosystem. (o) ISO/IEC 17020:2012, titled ·Conformity assessment·Requirements for the operation of various types of bodies performing inspection· specifies requirements for the competence of bodies performing inspection and for the impartiality and consistency of their inspection activities. It applies to inspection bodies of type A, B or C, as defined in ISO/IEC 17020:2012, and it applies to any stage of inspection.· This document is incorporated by reference as a source for requirements on the CMMC Ecosystem. (p) ISO/IEC 17024:2012, titled ·Conformity assessment·Requirements for the operation of various types of bodies performing inspection· contains principles and requirements for a body certifying persons against specific requirements, and includes the development and maintenance of a certification scheme for persons.· This document is incorporated by reference as a source for requirements on the CMMC Ecosystem. Section 170.3·Applicability Section 170.3 identifies entities to which the rule applies and how the Department intends to implement the rule. The rule applies to defense contractors and subcontractors that will process, store, or transmit FCI or CUI, and private-sector businesses or other entities that are specified in Subpart C. Government information systems that are operated by contractors and subcontractors in support of the Government do not apply to this rule. CMMC Program requirements apply to DoD solicitations and contracts requiring defense contractors and subcontractors to process, store, or transmit FCI or CUI. Exceptions to the applicability of this rule are addressed in § 170.3(c)(1) and (2). Department Program Managers or requiring activities will determine which CMMC Level will apply to a contract or procurement. Applicability of the CMMC Level to subcontractors is addressed in § 170.23. Section 170.3 addresses the four-phased implementation plan of the CMMC Program requirements in solicitations and contracts. Phase 1 begins on the effective date of the CMMC revision to DFARS 252.204-7021. More information regarding Phase 1 can be found in § 170.3(e)(1). Phase 2 begins six months after the start date of Phase 1. More information regarding Phase 2 can be found in § 170.3(e)(2). Phase 3 begins one calendar year after the start date of Phase 2. More information regarding Phase 3 can be found in § 170.3(e)(3). Phase 4, or full implementation, begins one calendar year after the start date of Phase 3. More information regarding Phase 4 can be found in § 170.3(e)(4). Section 170.4·Acronyms and Definitions

From the NIST SP 800-172 Rev 3 Final Public Draft: In certain situations, CUI may be associated with a critical program 5 The definition of a critical program may vary from organization to organization. For example, the Department of Defense defines a critical program as one that significantly increases capabilities and mission effectiveness or extends the expected effective life of an essential system or capability [9]. or a high value asset.6 6 See OMB Memorandum M-19-03 [10]. These programs and assets are potential targets for the advanced persistent threat (APT). An APT is an adversary or adversarial group that possesses the expertise and resources that allow it to create opportunities to achieve its objectives by using multiple attack vectors, including cyber, physical, and deception. These objectives include establishing a

From the NIST SP 800-172 Rev 3 Final Public Draft: 03.04.05E Dual Authorization for System Changes

993 Enforce dual authorization for implementing changes to [Assignment: organization-defined system components and system-level information]. **DISCUSSION** Dual authorization is also known as two-person control. Organizations employ dual authorization to help ensure that any changes to selected system components and system-level information cannot occur unless two qualified individuals approve and implement such changes. Requiring two individuals to implement system changes provides an increased level of assurance that the proposed changes are correct implementations of approved changes. The individuals are also accountable for the changes that have been implemented. To reduce the risk of collusion, organizations consider rotating du

From the NIST SP 800-172 Rev 3 Final Public Draft: Rather, detonation chambers are intended to quickly identify malicious code and either reduce the likelihood that the code is propagated to user environments of operation or prevent NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 such propagation completely. This requirement does not enhance a specific 2032

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 **INTENDED EFFECT IMPACT ON RISK EXPECTED RESULTS** Reduce Decrease the degree of damage from a threat event. The degree of damage can have two dimensions: breadth (i.e., number of affected resources) and depth (i.e., level of harm to a given resource). Reduce the level of impact. · The level of damage to mission or business operations due to adversary activities is reduced with partial restoration or the reconstitution of all affected resources. Example: Resources determined to be corrupted or suspect (integrity checks, behavior validation) are restored from older, uncorrupted resources (protected backup and restore) with reduced functionality. · The level of damage

Meeting the CMMC Level 2 self-assessment (§170.16) or CMMC Level 2 certification assessment (§170.17) requirements also satisfies the CMMC Level 1 self-assessment requirements detailed in §170.15 for the same CMMC Assessment Scope. b. Level 2 Comment: Commenters provided a number of very specific Level 2 assessment scenarios and asked for rule interpretation for each scenario.

Scenarios included differing scores for self-assessment and third-party assessment; assessment timing; conditional assessment expiration; and CUI enclaves. One commenter stated the language describing certificates of assessment lacked clarity and seems to allow an OSC to be issued a certificate of assessment but not be certified. Two comments stated that wording describing the expiration of a Conditional Level 2 self-assessment or certification could be interpreted to mean that the OSA/OSC would be permanently barred from seeking further contracts using information systems within that CMMC Assessment Scope. One comment said it was not clearly stated that a Level 2 third party assessment would satisfy contractual requirements for a Level 2 self-assessment. One comment stated that the rule does not clearly indicate whether a Level 2 assessment checks for more than just proper implementation of the 110 requirements in NIST SP 800-171 R2 and includes paragraphs (c) through (g) of DFARS clause 252.204-7012. This commenter advocated that those requirements be assessed only during DIBCAC assessments. Response: The rule has been updated to clarify that meeting the requirements for a CMMC Level 2 certification assessment satisfies a CMMC Level 2 self-assessment requirement for the same CMMC Assessment Scope. The term ‘certificate of assessment’ has been replaced with the term ‘Certificate of CMMC Status’ in the final rule. When an OSC has met all the requirements for a Level 2 certification assessment, a Certificate of CMMC Status is obtained from the C3PAO conducting the assessment. See § 170.9. Under CMMC, OSCs are not certified; rather, the assessed network receives a (printed page 83129) Certificate of CMMC Status for the CMMC Assessment Scope if the network meets all applicable certification requirements. No rule edit is necessary because § 170.19 is clear on this point. The phrase ‘until such time as a valid CMMC Level 2 self-assessment is achieved’ is added to the rule in the event a Conditional Level 2 self-assessment or Conditional Level 3 expires [see sections §§ 170.16(a)(1)(ii)(B)) and 170.17(a)(1)(ii)(B)]. The CMMC program does not assess paragraph (c) through (g) of DFARS clause 252.204-7012. The CMMC Program assesses the security requirements set forth in the FAR clause 52.204-21; National Institute of Standards and Technology (NIST) Special Publication (SP) 800-171 R2; and selected requirements from the NIST SP 800-172 Feb2021, as applicable (see table 1 to § 170.14(c)(4) CMMC Level 3 Requirements). If the contract requires a Level 2 self-assessment (i.e.,

The structure and content of a typical security requirement includes: ODPs support consistent security assessments in determining whether security requirements have been satisfied. If a federal agency or a consortium of agencies do not specify a particular value or range of values for an ODP, nonfederal organizations must assign the value or values to complete the security requirement.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. The national and economic security of the United States (U.S.) is dependent upon the reliable functioning of the nation's critical infrastructure. Positioning, Navigation, and Timing (PNT) services are widely deployed throughout this infrastructure. In a government-wide effort to mitigate the potential impacts of a PNT disruption or manipulation, Executive Order (EO) 13905, Strengthening National Resilience Through Responsible Use of Positioning, Navigation and Timing Services , was issued on February 12, 2020. The National Institute of Standards and Technology (NIST), as part of the Department of Commerce (DoC), produced this voluntary PNT Profile in response to Sec.4 Implementation (a), as detailed in the EO. The PNT Profile was created by using the NIST Cybersecurity Framework and can be used as part of a risk management program to help organizations manage risks to systems, networks, and assets that use PNT services. The PNT Profile is intended to be broadly applicable and can serve as a foundation for the development of sector-specific guidance. This PNT Profile provides a flexible framework for users of PNT to manage risks

when forming and using PNT signals and data, which are susceptible to disruptions and manipulations that can be natural, manufactured, intentional, or unintentional.

The Defense Industrial Base (DIB) is the worldwide industrial complex that enables research and development, design, production, delivery, and maintenance of military weapons systems, subsystems, and components or parts to meet U.S. military requirements. The DIB includes over 300,000 companies and their subcontractors that perform work on DoD contracts. These organizations must comply with cybersecurity requirements (DFARS, CMMC) to protect Controlled Unclassified Information and Federal Contract Information.

(2) The term "information technology" includes computers, ancillary equipment (including imaging peripherals, input, output, and storage devices necessary for security and surveillance), peripheral equipment designed to be controlled by the central processing unit of a computer, software, firmware and similar procedures, services (including support services), and related resources. (3) The term "information technology" does not include any equipment acquired by a contractor incidental to a contract. * * * * PART 208-REQUIRED SOURCES OF SUPPLIES AND SERVICES 3. Revise section 208.405 to read as follows: 208.405 Ordering procedures for Federal Supply Schedules. Include an evaluation factor regarding supply chain risk (see subpart 239.73) when acquiring information technology, whether as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system, as defined in 239.7301. 4. In section 208.7402, revise paragraph (2) to read as follows: 208.7402 General. * * * * (2) Include an evaluation factor regarding supply chain risk (see subpart 239.73) when acquiring information technology, whether as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system, as defined in 239.7301. PART 212-ACQUISITION OF COMMERCIAL ITEMS 5. Amend section 212.301 by: a. Adding paragraph (c); and b. Revising paragraphs (f)(xv)(C) and (D). The addition and revisions read as follows: 212.301 Solicitation provisions and contract clauses for acquisition of commercial items. (c) Include an evaluation factor regarding supply chain risk (see subpart 239.73) when acquiring information technology, whether as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system, as defined in 239.7301. (f) * * * (xv) * * * (C) Use the provision at 252.239-7017, Notice of Supply Chain Risk, as prescribed in 239.7306(a), to comply with section 806 of Public Law 111-383 . (D) Use the clause at 252.239-7018, Supply Chain Risk, as prescribed in 239.7306(b), to comply with section 806 of Public Law 111-383 . * * * * PART 213-SIMPLIFIED ACQUISITION PROCEDURES 6. Add section 213.106-1 to read as follows: 213.106-1 Soliciting competition. (a)(2) Include an evaluation factor regarding supply chain risk (see subpart 239.73) when acquiring information technology, whether as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system, as defined in 239.7301. PART 214-SEALED BIDDING 7. Add section 214.201-5 to read as follows: 214.201-5 Part IV-Representations and instructions. (c) Include an evaluation factor regarding supply chain risk (see subpart 239.73) when acquiring information technology, whether as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system, as defined in 239.7301. 8. Add subpart 214.5 to read as follows: Subpart 214.5 Two-Step Sealed Bidding

(E) For compatibility with the exemption claimed from subsection (f), the civil remedies provisions of subsection (g) must be suspended for this record system. Because of the nature of criminal investigations, standards of accuracy, relevance, timeliness and completeness cannot apply to this record system. Information gathered in criminal investigations is often fragmentary and leads relating to an individual in the context of one investigation may instead pertain to a second investigation. (F) From subsection (e)(1) because the nature of the criminal investigative function creates unique problems in prescribing a specific parameter in a particular case with respect to what information is relevant or necessary. Also, due to USSOUTHCOM's close liaison and working relationships with the other Federal, as well as state, local and foreign country law enforcement agencies, information may be received which may relate to a case under the investigative jurisdiction of another agency. The maintenance of this information may be necessary to provide leads for appropriate law enforcement purposes and to establish patterns of activity which may relate to the jurisdiction of other cooperating agencies. (G) From subsection (e)(2) because collecting information to the greatest extent possible directly from the subject individual may or may not be practicable in a criminal investigation. The individual may choose not to provide information and the law enforcement process will rely upon significant information about the subject

from witnesses and informants. (H) From subsection (e)(3) because supplying an individual with a form containing a Privacy Act Statement would tend to inhibit cooperation by many individuals involved in a criminal investigation. The effect would be somewhat inimical to established investigative methods and techniques. (I) From subsection (e)(5) because the requirement that records be maintained with attention to accuracy, relevance, timeliness, and completeness would unfairly hamper the criminal investigative process. It is the nature of criminal law enforcement for investigations to uncover the commission of illegal acts at diverse stages. It is frequently impossible to determine initially what information is accurate, relevant, timely, and least of all complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light. (J) From subsection (e)(8) because the notice requirements of this provision could present a serious impediment to criminal law enforcement by revealing investigative techniques, procedures, and existence of confidential investigations. (3)-(15) [Reserved] (16) System identifier and name. DWHS E06, Enterprise Correspondence Control System (ECCS). (i) Exemption.

Numerous commenters asked whether CMMC could leverage the results of other assessments, such as ISO/IEC 27001/27002, NIST SP 800-53, NIST SP 800-172, HITRUST, DoE Cybersecurity Capability Maturity Model, NIAP Common Criteria Testing Laboratory Services (CCEVS), Committee on National Security Systems (CNSS) Instruction No. 12533 (CNSSI 12533), ISA/IEC-62443, DoD's Security Technical Implementation Guides (STIG), NIST Cyber Security Framework (CSF), NIST Risk Management Framework (RMF), the American Institute of CPAs Service and Organizational Controls, Service and Organization Controls (SOC) Trust Services Criteria (SOC 2), ISA/IEC-62443, ITAR, Criminal Justice Information Services (CJIS) security standards, and non-ISO/IEC standards used by foreign partners such as the Australian Cybersecurity Centre Essential Eight Maturity Model. Response: The CMMC Program standards acceptance is defined in § 170.20 of this rule. 11. CMMC Assessment Scope Comment: Multiple commenters requested details on assessment boundaries and what systems are in-scope for a CMMC assessment. Questions included how assessment boundaries are defined, how networks composed of federal components (including systems operated on behalf of the government) and non-federal components are addressed, how centralized security services are treated, and how enduring exceptions are handled. Response: § 170.19 states that prior to a CMMC assessment, the OSA must define the CMMC Assessment Scope for the assessment, representing the boundary with which the CMMC assessment will be associated. This section includes detailed guidance on how to define the CMMC Assessment Scope, how different categories of equipment are defined to be in- or out-of-scope for an assessment, how the security of specialized equipment is expected to be managed, External Service Providers considerations, and the incorporation of people, technology, and facilities into the boundary. GFE, IoT, OT, and, as defined, Restricted Information Systems and Test Equipment are categorized as Specialized Assets in § 170.19. NIST SP 800-171 Rev 2 uses the term enduring exceptions to describe how to handle exceptions for Specialized Assets. 12. Applicability of Multiple CMMC Levels Comment: Two commenters sought confirmation that it is acceptable for contractors with multiple business segments to have one or more CMMC assessments (e.g., one segment at Level 1, another at Level 2). Commenters also wanted to know if systems within the scope of an assessment require multiple assessments if the systems are used to support tasks under multiple contracts. Another asked, if a company has multiple Commercial and Government Entity (CAGE) codes, whether a single assessment can cover all CAGE codes. Response:

performance metrics, availability, status monitoring, usability, and cost effectiveness)? How effective would a federal government-sponsored grand challenge program be at drawing attention to

and promoting work on specific technical problems? 8. An Incentives Framework for Evolving Cyber-Risk Options and Cybersecurity Best Practices Outside the CIKR sectors, U.S. businesses and consumers generally have resorted to their own devices and evolved their own practices for dealing (or not dealing) with cyber risks. In other words, across large segments of the economy, the level of cybersecurity relies upon the private sector's development, dissemination and adoption of best practices. As Internet usage has grown domestically and abroad, U.S. companies have been faced with a range of Internet-related issues. Based on feedback the Task Force received, the adoption of industry best practices is uneven. According to some stakeholders, smaller and medium sized businesses may lack the specialized knowledge and resources necessary to meet cybersecurity challenges. Some stakeholders also suggested that the fundamental challenge may be a misalignment of incentives. Still others argued for greater leadership from industry and/or government in developing improved standards for securing cyberspace in a manner that will promote greater economic benefits from an expanding Internet economy. These assertions suggest several questions: Are existing incentives adequate to address the current risk environment? Do particular business segments lack sufficient incentives to make cybersecurity investments? If so, why? What would be the best way to encourage businesses to make appropriate investments in cybersecurity? Are there public policies or private sector initiatives in the United States or other countries that have successfully increased incentives to make such security investments? Are there disincentives that inhibit cybersecurity investments by firms? If so, what should be done to eliminate them? Are there examples of cybersecurity best practices that have been (or can be) sufficiently tailored to meet the diverse needs of commercial actors outside the CIKR sectors? Are those best practices well known and understood? Should a set, or sets, of best practices be developed to guide commercial organizations' investment decisions? What role, if any, should the U.S. Government play in their development?

o. Whether the proposed requirement in the standard for evaluation, to perform a written technical and nontechnical evaluation within a reasonable period of time before making a change in the regulated entity's environment or operations pursuant to the requirements, is sufficiently clear. If not, how should the Department clarify it? For example, should the Department require a specific amount of time, and if so, what length of time? p. Whether at least once every 12 months is the appropriate frequency for reviewing and updating written policies and procedures for patch management, sanctions policies and procedures information system activity review, workforce security, and information access management. q. Whether as reasonable and appropriate in response to changes in the risk analysis, but at least once every 12 months, is the appropriate frequency for reviews of a regulated entity's written risk management plan. r. Whether the proposed frequency for security awareness training is appropriate. s. Whether the proposed substance of the security awareness training is appropriate, and any recommendations for additional required content. t. Whether the proposed timelines for applying patches, updates, and upgrades are appropriate. u. Whether the Department should set a time limit for applying patches, updates, and upgrades to configurations of relevant electronic information systems to address moderate and low risks. If so, please explain and provide a recommendation. v. Whether the amount of time regulated entities currently retain records of information system activity varies by the type of record, and for how long such records are retained. w. Whether the Department should specify the length of time for which records of information system activity should be retained. If so, please explain. x. Whether the Department should require that a regulated entity notify other regulated entities of the termination of a workforce member's access to ePHI in less than 24 hours after the workforce member's termination. If so, please explain what would be an appropriate period of time (e.g., three business hours, 12 hours). y. Whether at least once every 12 months is the appropriate frequency for testing security incident response plans, documenting the results, and revising such plans. z. Whether it is reasonable and appropriate to require that regulated entities restore loss of critical relevant electronic information systems and data in 72 hours or less. aa. Whether the Department should require a regulated entity to restore all of its relevant electronic information systems and data within 72 hours? bb. Whether the Department should require some regulated entities to restore their relevant electronic information systems and data in less than 72 hours? If so, please explain. cc. Whether at least once every 12 months is the appropriate frequency for the testing of contingency plans?

Approaches and Challenges of Federal Cybersecurity Awareness Programs ## Approaches and Challenges of Federal Cybersecurity Awareness Programs Organizational security awareness programs experience a number of challenges, including lack of resources, difficulty measuring the impact of the program, and perceptions among the workforce that training is a boring, 'check-the-box'

activity. While prior surveys and research have examined programs in the private sector, there is little understanding of whether these findings also apply within the U.S. government. To address this gap and better understand the needs, challenges, practices, and necessary competencies of federal security awareness teams and programs, NIST conducted a research study that leveraged both qualitative and quantitative methodologies. This companion document to NISTIR 8420 'Federal Cybersecurity Awareness Programs: A Mixed Methods Research Study' reports on a subset of study results focused on identifying the current approaches and challenges of security awareness programs within the federal government. Insights gained from these results are informing guidance and other initiatives to aid federal organizations in building effective security awareness programs. While focused on the U.S. government, findings may also have implications for organizational security awareness programs in other sectors.

Control EC-1: nt for Reference Application Infrastructure Connectivity (between network elements) and access policies (between service instances) are network-tier policies and identity-tier policies, respectively. Consider the following example set of policies that contain a combination of network-tier and identity-tier policies. Network-tier policies can be further categorized into coarse-grained and fine-grained policies.

- Coarse-grained network-tier policies - These perimeter control policies are informally called firewall rules and are mostly static as they specify:
 - o The network location of the egress gateway from which the network edge element at the exit point of a cloud network (e.g., outbound firewall, such as the one at the edge of a cloud) can receive traffic
 - o The network location of the ingress gateway to which the incoming traffic that lands at the entry point of the on-premises network edge (e.g., inbound firewall at the entry point to an on-premises network) should be routed:
- Fine-grained network-tier policies - This category of policies is also called microsegmentation policies, and they specify the pathways for traffic flowing into and out of the services located within the network subnets at the cloud location or onpremises location.
 - o Specify the path on which the outbound traffic from a service or an application (e.g., App 1 in Fig. 2) can flow. The elements in the path that are specified include the egress gateway at the edge of the cluster and, subsequently, the outbound firewall for the network (cloud network in this example).
 - o Specify the path for the inbound traffic into the on-premises network to reach the target application. The elements in the path start from the inbound firewall at the edge of the on-premises network to the ingress gateway in an on-premises cluster to the network subnet where the target service is located.
 - o Notably, they specify how traffic can flow 'east-west' (i.e., inside of the perimeter).

DFARS 252.204-7012 (Safeguarding Covered Defense Information and Cyber Incident Reporting) Core CUI protection clause requiring NIST SP 800-171 implementation, cyber incident reporting within 72 hours, and preservation of evidence. Under DFARS 252.204-7012, contractors must report cyber incidents to the DoD Cyber Crime Center (DC3) within 72 hours of discovery. The report must include the nature of the incident, affected systems, compromised CUI, and preservation of forensic evidence for at least 90 days. Contractors must also submit malicious software to DC3 and provide access to affected systems if requested.

Section 164.304 includes definitions for key regulatory terms in the Security Rule. The Department proposes to add ten new defined terms and to modify the definitions of fifteen existing terms. The proposed new regulatory terms would be: Deploy, Implement, Electronic information system, Multi-factor authentication, Relevant electronic information system, Risk, Technical controls, Technology asset, Threat, and Vulnerability. The definitions we propose to modify are for the following terms: Access, Administrative safeguards, Authentication, Availability, Confidentiality, Information system, Malicious software, Password, Physical safeguards, Security or Security measures, Security incident, Technical safeguards, User, and Workstation. Generally, the Department is proposing to add or modify regulatory terms that would either clarify how regulated entities should apply the standards and implementation specifications or modernize the rule to better account for changes in the environment in which health care is provided.

1. Clarifying the Definition of 'Access' a.

Current Provision and Issues To Address The Security Rule defines the term 'access' as the ability or means necessary to perform a set of activities describing how a user may interact with a system resource. [346] These activities are reading, writing, modifying, communicating data/information, or otherwise using any component of an information system. The definition applies only to the Security Rule, not to the Breach Notification Rule or the Privacy Rule. The term 'access' defines the scope of some key regulatory provisions in the Security Rule. For example, whether a person meets the definition of a 'user' is determined based on whether their access to

information or a component of the regulated entity's information system is authorized. [347] The definition (printed page 923) of the term "security incident" requires consideration of whether a person attempted to access or accessed information without authorization. [348] To determine whether a regulated entity complied with the administrative safeguard standard for workforce security, the Department must consider to what extent a regulated entity established policies and procedures for ensuring that workforce members have appropriate access to ePHI. [349] The current definition is expansive but not fully representative of how users could interact with information today. As discussed above, users create, receive, maintain, and transmit information in more ways now than they did ten years ago. Thus, the Department believes that it is critical for the Department to consider modifying the definition of this term to adequately reflect the current electronic environment. b. Proposal

The revisions and additions read as follows: § 159.6 Procedures. (a) Standing Combatant Command (CCMD) guidance and procedures. Each CDR with a geographic AOR shall develop and publish guidance and procedures for PSCs and PSC personnel operating during contingency operations, humanitarian or peace operations, or other military operations or exercises within their AOR, consistent with applicable law; this part; applicable Military Department publications; and other applicable DoD issuances including DoD Directive 3020.49, DoD Instruction 1100.22, "Policy and Procedures for Determining Workforce Mix," FAR, DFARS, DoD Instruction 3020.41, DoD Directive 2311.01E, "DoD Law of War Program" (available at <https://www.esd.whs.mil/Portals/54/Documents/DD/issuances/dodd/231101p.pdf?ver=2020-07-02-143157-007>); DoD 5200.08-R, "Physical Security Program" (available at <https://www.esd.whs.mil/Portals/54/Documents/DD/issuances/dodm/520008rm.pdf>); CJCS Instruction 3121.01B,, and DoD Directive 5210.56. The guidance and procedures shall: * * * * * (2) * * * (ii) Assessing compliance with DoD approved business and operational standards for private security functions. * * * * * (v) Requirements for the PSC to cooperate with any investigation conducted by the DoD, including by providing access to its employees and relevant information in its possession regarding the matter(s) under investigation. * * * * * (b) Subordinate guidance and procedures. * * * (c) Consultation and coordination. * * * Dated: August 29, 2022. Aaron T. Siegel, Alternate OSD Federal Register Liaison Officer, Department of Defense. Footnotes 1. "CJCS Instruction 3121.01B provides guidance on the standing rules of engagement (SROE) and establishes standing rules for the use of force for DoD operations worldwide. Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 202, 204, 212, 232, and 252 [Docket DARS-2019-0019] RIN 0750-AK37 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Final rule. SUMMARY: DoD is issuing a final rule amending the Defense Federal Acquisition Regulation Supplement (printed page 19682) (DFARS) to implement a section of the National Defense Authorization Act for Fiscal Year 2017 that amends 10 U.S.C. 2307 to address the use of performance-based payments. DATES: Effective April 8, 2020. FOR FURTHER INFORMATION CONTACT: Ms. Amy Williams, DPC/DARS, at 571-372-6106. SUPPLEMENTARY INFORMATION: I. Background DoD published a proposed rule in the Federal Register at 84 FR 18221 on April 30, 2019, to implement section 831 of the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2017, which amends 10 U.S.C. 2307 to address the use of performance-based payments (PBPs). Eleven respondents submitted public comments in response to the proposed rule. II. Discussion and Analysis DoD reviewed the public comments in the development of the final rule. There was widespread support for the proposed implementation of 10 U.S.C. 2307(b)(2) requirement that PBPs shall not be conditioned upon costs incurred in contract performance, but on achievement of performance outcomes (232.1001(a)). A number of changes are made in the final rule, which are expected to increase support for the rule, such as permitting alternate forms of security for performance-based payments and clarifying that an acceptable accounting system is not required for incurred costs under the performance-based payments clause. A discussion of the comments and the changes made to the rule as a result of the comments received is provided, as follows: A. Summary of Significant Changes From the Proposed Rule 1. The requirement for

compliance with Generally Accepted Accounting Principles (GAAP) in order to receive performance-based payments at DFARS 232.1003-70 and in the representation at 252.232-7015 has been modified to apply to the contractor's financial statements, rather than the ·output· of the contractor's accounting system, and the requirement that compliance with GAAP must be evidenced by audited financial statements has been removed.

While some cyber intrusions are highly sophisticated, some require relatively little skill or effort. For instance, criminals can use widely available, low cost ·crimeware kits· to exploit computer systems and software vulnerabilities in order to launch malware against targeted computer systems. [15] The financial cost of cyber threats to firms and their customers appears to be significant. Though current fraud losses attributed to cybersecurity data breaches are small in comparison to total annual business fraud losses, they are increasing, rising from 7 percent of total fraud losses in 2007 to 11 percent in 2008. In 2009, the dollar loss from all cases of online crime referred to law enforcement in the United States reached \$550 million, more than twice the 2008 level. [16] Small businesses have just as much reason to focus on cybersecurity as do larger enterprises yet they are less likely to have adequately protected themselves from their risks. According to a National Cybersecurity Alliance poll, 65 percent of small businesses store customer data online, 43 percent store financial records online, 33 percent store credit card information online, and 22 percent have intellectual property and other sensitive corporate content online. [17] The same poll shows that only 14 percent of these firms have anyone solely focused on information technology security; only 53 percent check their computers to ensure that anti-virus, anti-spyware, firewalls, and operating systems are up to date; 20 percent say that they use the minimum threshold of security to protect customer and employee data, but 42 percent believe that their customers are (printed page 44219) concerned about the IT security of their business. Though many businesses are increasing their cybersecurity budgets, anecdotally, the Task Force has been told that there is a continuous requirement for IT managers to justify their expenditure of company resources on cybersecurity. Given this state of affairs, the Task Force believes that public policies affecting cybersecurity on the Internet, as well as private sector norms (both good and bad), require a fresh look. The Task Force recognizes the valuable roles, responsibilities, and capabilities of the private sector in creating tools and strategies to mitigate cyber risks associated with the Internet. More broadly, over the past two decades, the nation has benefitted greatly from industry-led, Internet-driven innovation and growth, with those benefits reflected throughout the entire economy. That said, the persistence of the cybersecurity challenges compels the Department to seek a better understanding of both how those challenges are affecting U.S. businesses and citizens, as well as useful steps that can enhance the security of e-commerce. Small, medium, and large businesses, and consumers, will continue to increase their reliance on the Internet. As that reliance grows, the level of cybersecurity must increase as well.

CIS Safeguard 13.2 · Deploy a Host-Based Intrusion Detection Solution Deploy a host-based intrusion detection solution on enterprise assets, where appropriate and/or supported. Implementation Groups: 2,3 Asset Type: devices Security Function: detect Parent Control: Network Monitoring and Defense

(b) No system of records within the NRO shall be considered exempt under subsection (j) or (k) of the Privacy Act until the exemption and the exemption rule for the system of records has been published as a final rule in the Federal Register . (c) An individual is not entitled to have access to any information compiled in reasonable anticipation of a civil action or proceeding (5 U.S.C. 552a(d)(5)). (d) Proposals to exempt a system of records will be forwarded to the Defense Privacy Office, consistent with the requirements of this part, for review and action. (1) System identifier and name. QNRO-23, Counterintelligence Issue Files. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (B) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (C) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(2) and/or (k)(5) from the following

subsections of 5 U.S.C. 552a(c)(3), (d), (e)(1), (e)(4)(G), (H) and (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5). (iii) Reasons. (A) From subsection (c)(3) because to grant access to the accounting for each disclosure as required by the Privacy Act, including the date, nature, and purpose of each disclosure and the identity of the recipient, could alert the subject to the identity of the recipient, could alert the subject to the existence of the investigation or prosecutable interest by NRO or other agencies. This could seriously compromise case preparation by prematurely revealing its existence and nature; compromise or interfere with witnesses or make witnesses reluctant to cooperate; and lead to suppression, alteration, or destruction of evidence. (B) From subsections (d)(1) through (d)(4), and (f) because providing access to records of a civil or administrative investigation and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant (printed page 14787)

3.1.4 Cyber Resiliency Conflicts and Synergies ... 3.1.4 Cyber Resiliency Conflicts and Synergies
Cyber resiliency techniques can interact in several ways. 3.1.4 and identified in Appendix D, Table D-3).

- Facilitating communication across the organizational risk management levels; - Encouraging the organization-wide identification of common controls and the development of organizationally tailored control baselines; - Reducing the complexity of the IT infrastructure; and - Providing additional methods to identify, prioritize, and focus resources on highvalue assets commensurate with risk. - Publication of Draft NISTIR 8259, Core Cybersecurity Feature Baseline for Securable IoT Devices: A Starting Point for IoT Device Manufacturers [29]. This NISTIR defines a baseline of cybersecurity features that manufacturers may voluntarily adopt for the IoT devices that they produce. It also provides information on how manufacturers can identify and implement features beyond the baseline that are most appropriate for their customers. - Publication of Draft NISTIR 8267, Security Review of Consumer Home Internet of Things (IoT) Products, which presents the results of technical assessments on the security features of various 'smart' products (e.g., smart light bulbs, security cameras, and doorbells) [30]. The report provides recommendations, information on the observations of the devices' security features, current practices, and the means by which these current practices could be improved. These technical assessments will help the NCCoE better address consumer home IoT security in a holistic manner in future projects. How does a system administrator know if some of the hardware or software in their systems contain vulnerabilities? Chances are that they utilize information that is freely available from the NVD. The NVD is a comprehensive cybersecurity vulnerability database that tracks vulnerability discovery trends over time, enabling users to assess changes in vulnerability discovery rates within specific products or types of vulnerabilities.

The DoD declines to comment on the reposting of information being reported in the media. This rule identifies requirements for the CAICO role in the ecosystem. The DoD has a variety of options available to address issues with reliance on a single CAICO. These include but are not limited to working with the CMMC AB to identify a new/replacement CAICO. The final rule includes a requirement for the Accreditation Body, CAICO, and C3PAOs to adhere to appropriate ISO/IEC standards, which include the current version of the standard for conformity assessment (ISO/IEC 17024:2012(E) located at ISO website: www.iso.org/standard/52993.html). All CMMC ecosystem members are required inter alia to abide by the appropriate ethics and conflicts of interest policies established by the CMMC AB and CAICO. Rule content pertaining to ethics, quality assurance functions, record keeping, data encryption, security, etc. functions across the ecosystem are tailored to reflect the role each entity fills in the ecosystem. Repeating this content in the section of each ecosystem role serves to emphasize the importance of adherence to these requirements. DoD disagrees with the commenter's suggestion that certain CAICO requirements are not needed or are redundant. The DoD requirement for documentation in English refers to official information provided to the Accreditation Body or the DoD. The commenter's preferred rewording of § 170.10(b)(3) is unnecessary because there is a

separate requirement for the CAICO to meet ISO/IEC standards, and this rule does not codify non-DoD requirements. The DoD declines to remove the requirement in § 170.10(b)(10) to provide status information to the CMMC AB because it is necessary for program management. The rule retains the separation of duties requirement at § 170.10(b)(11), which is more specific than the management of impartiality required under ISO/IEC 17024:2012(E). The DoD declines to delete certification requirements for CCI. Having the technical background as a CCP or CCA does not ensure all the instructor-unique qualifications necessary to be a CCI are met. The DoD also declines to remove the reference to § 170.10 from § 170.12(b)(1) since it is accurate that the CAICO certifies CCIs. Section § 170.10(b)(13) ensures that personal information is encrypted and protected in all CAICO information systems and databases and those of any CAICO training support service providers. DoD disagrees with the commentor's statement that training support service providers of the CAICO be allowed to disclose information about CCAs and/or CCPs. § 170.10 references the CAICO requirements. Entities providing training support services to the CAICO are not a part of the assessment process in the ecosystem. It is not up to them to release data on certified persons in the ecosystem. Any metrics regarding certifications will come from the CAICO.

Two comments asserted that the description of affirmations requirement could be mis-interpreted as suggesting that primes and subcontractors all submit a single affirmation or that one contractor must affirm another's continuing compliance. One comment requested clarification about FedRAMP requirements for Cloud Service Providers. Some comments asked whether POA&Ms must be documented in the System Security Plan. One comment recommended punctuation and grammatical edits and asked for clarification of rule text that discusses the impact of not logically or physically separating contractor-owned information systems that process, store, or transmit FCI (or CUI) from those that do not. Response: This rule follows the format and includes all sections required in OMB guidelines for formal rulemaking. The DoD lacks authority to modify the template or omit required sections, as requested by some commenters. In addition, one commenter recommended that the supplemental Assessment Guides be consolidated with and cross referenced to requirements for the CMMC Levels in the same document. The DoD interpreted this recommendation as a request to integrate all information in the supplemental guidance into the rule text, which does not align with rulemaking guidelines (1 CFR part 51). No changes were made to consolidate or integrate the supplemental guidance documents, which are not codified and are provided as optional resources to assist OSAs. The regulatory content in the 32 CFR part 170 CMMC Program rule takes precedence. Some commenters criticized the preamble summary paragraph, and one submitted a preferred rewrite that oversimplified the content so far as to alter the intended meaning. For that reason, the specific revisions were not incorporated. However, the DoD has revised the final rule to begin with a simplified statement of its purpose, as follows: 'With this final rule, DoD establishes a scalable way to verify, through assessment, that contractors have implemented required security measures necessary to safeguard DoD's Federal Contract Information (FCI) and Controlled Unclassified Information (CUI)'. The DoD strove to streamline the writing style. Note that the preamble is not part of the regulatory text, however, it is a required part of the rulemaking template. The DoD made the following changes to the preamble based on requests for text modifications. The preamble is updated to change the verb 'will' to 'should', where appropriate. The preamble and regulatory text have been updated to clarify that a Plan of Action need not be part of the System Security Plan. The sentence in the preamble overview about FAR clause 52.204-21 requirements has been rewritten to describe them as 'the minimum necessary' to receive FCI, rather than describing them as 'elementary' for 'basic' cybersecurity. Note that the title of the FAR clause 52.204-21 clause is Basic Safeguarding Requirements.

The contractor will limit disclosure of classified information to that specific information authorized in connection with an approved visit request and an export authorization, as required.

(D) Temporary exports. Classified articles, including articles that require the use of classified information for operation, exported for demonstration purposes must remain under U.S. control. The contractor must obtain an export authorization from the relevant authority (i.e., from the Department of State in accordance with 22 CFR parts 120-130 , also known as and referred to in this rule as the 'International Traffic in Arms Regulations,' or from the Department of Commerce in accordance with 15 CFR parts 730-774 , also known as the 'Export Administration Regulations').

(4) Direct commercial arrangements. (i) The disclosure of classified information may be authorized pursuant to a direct commercial sale with the appropriate export authorization. A direct commercial arrangement includes sales, loans, leases, or grants of classified items, including sales under a government agency sales financing program. (ii) If a proposed disclosure is in support of a foreign

government requirement, the contractor should consult with U.S. in-country officials, normally the U.S. Security Assistance/Armaments Cooperation Office or Commercial Counselor. (A) Before a contractor makes a proposal to a foreign interest that involves the eventual disclosure of U.S. classified information, the contractor must obtain appropriate government disclosure authorization. (B) Such disclosure authorization does not equate with authorization for export. Export authorization must be obtained from the appropriate regulatory body. (iii) The contractor will request a FCL assurance for a foreign entity through the CSA from the security authority of the foreign entity's sponsoring government prior to entering into a contractual arrangement with the foreign entity. (5) Subcontract security provisions. (i) A U.S. contractor may be authorized to enter into an agreement involving classified information with a foreign contractor. The U.S. contractor's empowered official will verify the contractor can release the information to a foreign person. Such agreements may include: (A) Award of a subcontract. (B) Department of State authorized manufacturing license agreement, technical assistance agreement, or other direct commercial arrangement. (ii) The contractor will incorporate security provisions into the subcontract document or agreement, and provide security classification guidance by means of a Contract Security Classification Specification, or equivalent. (iii) The contractor will provide a copy of the signed contract with the provisions and the classification guidance to the CSA.

Twenty-three comments expressed concern with or requested clarification regarding CUI marking. Twelve comments specifically noted concern with CUI markings being applied to too many documents, in part because CUI was an ambiguous concept. They requested the DoD encourage personnel to mark documents as CUI only when appropriate and provide better guidance for managing flow-down clauses. Another comment noted that many small businesses are currently subject to NIST SP 800-171 requirements through DFARS contract clause flow-down and cannot say with certainty that they have CUI in their possession. The comment further noted that small businesses regularly receive mismarked data. One comment stated there is an increased use of automatic CUI marking on DoD communications, seemingly without regard to content. One comment stated that the rule fails to outline a mechanism for reporting government mishandling, and that contractors should use a reporting system to minimize their own risk and liability. One comment requested the rule be edited to prevent Program Managers or requesting activities from assigning a CMMC Level 3 requirement unless they have high confidence that 80+ percent of CUI and/or FCI under the relevant contract has complete CUI markings. Another comment stated that the Federal government should develop a marking schema to communicate information safeguarding requirements, while yet another stated that DoD must publish a training module for contracting officers so that they are properly classifying documents prior to finalization of this rule. One comment stated CUI across the DoD is diverse and what may be CUI for one system may not be for another. The comment then questioned how this proposed rule and SPRS would accommodate these facts without assuming and mandating that all defense contractor information systems meet the same architecture, security, and cybersecurity standards. Response: The CMMC Program will not provide CUI guidance materials to industry as it is outside the scope of this CMMC rule. Relevant information regarding what to do when there are questions regarding appropriate marking of CUI may be found at 32 CFR 2002.50 - Challenges to designation of information as CUI. The DoD declined to incorporate suggested edits to the CMMC Level 3 requirements regarding confidence in proper CUI and/or FCI markings. The DoD's role as data owner is documented in the CUI Program implementing policies and the requirements of 32 CFR part 2002. DoDI 5200.48, states: The authorized holder of a document or material is responsible for determining, at the time of creation, whether information in a document or material falls into a CUI category. If so, the authorized holder is responsible for applying CUI markings and dissemination instructions accordingly. DoD Manual 5200.01 outlines DoD's Information Security Program and includes Volume 2, Marking of Information. The DoD declines to incorporate by reference those (printed page 83105)

The statute also directed the Secretary to adopt initial security standards within 18 months of its (printed page 903) enactment. [43] In adopting security standards for health information, HIPAA requires the Secretary to consider all of the following: [44] The technical capabilities of record systems used to maintain health information. The costs of security measures. Training for persons who have access to health information. The value of audit trails in computerized record systems. The needs and capabilities of small health care providers and rural health care providers. [45] Congress contemplated that the Department's rulemaking authorities under HIPAA would not be static. In fact, Congress specifically built in a mechanism to adapt such regulations as technology and health care evolve, directing the Secretary to review and adopt modifications to the Administrative Simplification standards, including the security standards, as determined

appropriate, but not more frequently than once every 12 months. [46] That statutory directive complements the Secretary's general rulemaking authority to make and publish such rules and regulations as may be necessary to the efficient administration of the functions with which the Secretary is charged. [47] The Secretary may adopt either a standard developed, adopted, or modified by a standard setting organization that relates to a standard that the Secretary is authorized or required to adopt under the Administrative Simplification provisions, or a standard that is different if the different standard will substantially reduce administrative costs to health care providers and health plans. [48] If no standard has been adopted by any standard setting organization, the Secretary shall rely on the recommendations of the National Committee on Vital and Health Statistics (NCVHS) and consult with Federal and State agencies and private organizations. [49] 2. Health Information Technology for Economic and Clinical Health (HITECH) Act On February 17, 2009, Congress enacted the Health Information Technology for Economic and Clinical Health Act of 2009 (HITECH Act), part of the American Recovery and Reinvestment Act of 2009 (ARRA), [50] promoting the nationwide adoption and standardization of health information technology (health IT) to support the electronic sharing of clinical data. The HITECH Act created financial incentives for health IT use among health care practitioners by providing funding for investing in health IT infrastructure, purchasing certified electronic health records (EHRs), and training on and the dissemination of best practices to integrate health IT. [51] The Purpose statement of an accompanying House of Representatives report [52] on the Energy and Commerce Recovery and Reinvestment Act [53]

CMMC Program rule has been updated to add -in performance of the DoD contract- to §.170.3, and the 48 CFR part 204 CMMC Acquisition rule will provide the contractual direction. A common carrier's information system is not within the contractor's CMMC Assessment Scope if CUI is properly encrypted during transport across the common carrier's information system. A common carrier who is a DoD contractor or subcontractor is responsible for complying with the CMMC requirements in their contracts. CUI encryption requirements already apply to the OSA, not the telecommunications network provider. The lack of adequate encryption on the part of the OSA would not trigger application of CMMC requirements to the common carrier's network. The term -common carrier- appears in the comment section to a previous rule making process. Its definition and use are taken from CNSSI 4009. Efforts to define it or related terms by other agencies are outside the scope of the CMMC Program. Commenter scenarios where a common carrier would be privy to an OSA's encryption keys are unrealistic. DoD declines to provide additional guidance. CMMC Program requirements make no change to existing policies for information security requirements implemented by DoD. Policies for CUI and creation of program documentation, to include Security Classification Guides, are separate from this rule. Relevant policies include DoDI 5200.48 -Controlled Unclassified Information- and DoD Manual 5200.45 -Instructions for Developing Security Classification Guides-. CMMC Program requirements will be identified as solicitation requirements. Contractors will be required to meet the stated CMMC requirements, when applicable, at or above the level identified. For this reason, it is up to each DIB organization to determine which CMMC level they should attain. Questions regarding specific contractual matters are outside of the scope of this rule and may be addressed by the 48 CFR part 204 CMMC Acquisition rule. The CMMC program will be implemented as a pre-award requirement. c. Joint Ventures Comment: Two commenters requested clarification as to whether CMMC requirements will apply to companies engaged in Joint Ventures. Response: CMMC program requirements are applicable when DoD requires processing, storing, or transmitting of either FCI or CUI in the performance of a contract between DoD and the respective contractor. CMMC Program requirements will apply to information systems associated with contract efforts that process, store, or transmit FCI or CUI, and to any information system that provides security protections for such systems, or information systems not logically or physically isolated from all such systems. The identity of an offeror or contractor as a joint venture does not in and of itself define the scope of the network to be assessed. d. Fundamental Research Efforts Comment:

1. Contractual terms and conditions include insurance, access requirements, and background checks.
2. Suppliers are contractually obligated to disclose component vulnerabilities, data loss, and security incidents.
3. The quality and interruption of supply are specifically mentioned in service agreements, though security is not called out.
4. Contractual terms and conditions include a specific section on information security requirements as well as consequences if there is a failure to comply with the requirements for security, quality, and integrity.
5. Contractual requirements include regular site visits, informal touchpoints, and supplier meetings. Most organizations communicate with suppliers on a regular basis via traditional enterprise communication methods,

including email, phone, communications platforms (e.g., Skype, Zoom, etc.), and supplier portals (e.g., iSupplier). Organizations also survey their critical suppliers annually to ensure people, data, and policies are maintained and up to date relative to supporting the contracts. These surveys include a variety of cybersecurity practices, such as supplier personnel receiving security training, physical security measures, use of security cameras and adequacy of camera recording storage, IT and network security measures, security organizational data on external networks, and assessment of applicable compliance levels. 1. Organizational realignment to mitigate supplier risks, such as dedicating personnel to assess supplier risks and effectively communicating them to executive leadership. 2. Operational technology (OT) risk reduction with most instances of prevention and monitoring (e.g., network segmentation, security information, and event management [SIEM] implementation) occurring on the OT portion of the acquirer networks. 3.

Three comments requested a narrow interpretation of the Freedom of Information Act (FOIA) exemptions, and one asked that the records not be exempted under Privacy Act provisions. Response: As recognized in the Background section of the Interim Rule (77 FR 27615 , at 27616), a foundational element of this program is the recognition that the information being shared includes extremely sensitive nonpublic information. This includes the GFI shared by the Government, as well as the information regarding cyber incidents that is shared by the DIB participants, which they typically treat as extremely sensitive proprietary, commercial, or operational information for which release and dissemination is tightly controlled. Accordingly, as stated in § 236.6 of the rule, confidentiality of such sensitive information exchanged under this program will be protected to the maximum extent authorized by law, regulation, and policy. This includes taking appropriate measures, including the use of any applicable exemptions under FOIA or the Privacy Act, to safeguard against unauthorized public disclosure and in full compliance with applicable laws, regulations, policies, and procedures (see § 236.2(c)(2)(vii) and § 236.5(h)). No change is made to the rule. Comment: Four comments addressed DoD working with private contractors without appropriate safeguards for privacy rights, maintaining a database on law abiding Americans and subverting due process and gathering information about an unsuspecting populace. Response:

- Data use denied because facility is inaccessible due to power failure. - Data is destroyed by fire. - Data base integrity damaged by effects of lightning. - Sensitive data disclosed because tornado scatters storage media and hardcopy outputs throughout uncontrolled access area. - Data validation and integrity checks' COMPUTER ABUSE Willful or negligent unauthorized activity that affects the availability, confidentiality, or integrity of computer resources. Computer abuse includes fraud, embezzlement, theft, malicious damage, unauthorized use, denial of service, and misappropriation. Levels of computer abuse are:

(A) From subsection (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (c)(4) because an exemption is being claimed for subsection (d) making this subsection not applicable. (C) From subsection (d) because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement. (D) From subsection (e)(1) because in the course of criminal investigations, information is often obtained concerning the violation of laws or civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this valuable information be retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought. (E) From subsection (e)(2) because in a criminal investigation, the requirement that information be collected to the greatest extent possible from the subject individual would present a serious impediment to law enforcement in that the subject of the investigation would be placed on notice of the existence of the investigation and would therefore be able to avoid detection. (F) From subsection (e)(3) because the requirement that individuals supplying information be provided with a form stating the requirements of subsection (e)(3) would constitute a serious impediment to law enforcement in that it could compromise the existence of a confidential investigation, reveal the identity of confidential sources of information and endanger the life and physical safety of confidential informants. (G) From subsections (e)(4)(G) and (e)(4)(H) because portions of this system of records have been exempted from access provisions of subsection (d) making these subsections not applicable. (H) From

subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (I) From subsection (e)(5) because in the collection of information for law (printed page 14749)

As discussed above, the Security Rule, as amended by the HITECH Act, specifically requires regulated entities to maintain reasonable and appropriate administrative, physical, and technical safeguards to ensure the confidentiality, integrity, and availability of ePHI; to protect against any reasonably anticipated threats or hazards to the security or integrity of ePHI and unauthorized uses or disclosures of ePHI; and ensure compliance with the Administrative Simplification provisions by officers and workforce members of regulated entities. [129] It is reasonable to anticipate that regulated entities will need to protect ePHI against cyberattacks and unauthorized uses and disclosures of ePHI by their workforce members. Experts estimate the costs to the U.S. from cyberattacks on health care facilities to be significant. [130] According to one study, health care data breach costs to affected organizations have increased by more than 50 percent since 2020, making health care data breaches more expensive than data breaches in any other sector, at an average cost of almost \$10.1 million per breach. [131] Yet these costs, though sizeable, do not fully take into account the practical implications of poor or ineffective cybersecurity protocols. A failure to implement adequate security measures may lead to: financial loss; reputational harm for affected individuals and affected regulated entities; privacy loss; and safety concerns. [132] Additionally, breaches of unsecured PHI may lead to identity theft, fraud, stock manipulation, and competitive disadvantage. [133] According to a study funded by the Institute for Critical Infrastructure Technology, victims of medical identity theft incur on average costs of \$13,500 to recover from that theft. [134] Unlike financial information, much of an individual's PHI is (printed page 908) immutable. For example, an individual's date and location of birth and their health history will not change, even if their address might. In contrast, an individual's passwords, bank account numbers, and other financial information can all be changed. Thus, PHI can continue to be exploited throughout an individual's lifetime, making PHI likely to be far more valuable than an individual's credit card information. [135] On the surface, the harms that result from a breach of ePHI or a cyberattack on a regulated entity's electronic information systems, as discussed above, are not significantly different than those that would result from a breach of information in another sector. However, the reality is, as discussed above, that the implications of such harms are far greater in the health care sector because of their potential to adversely affect an individual's health or quality of life, or even to cost an individual their life. [136]

(5) U.S. Army Criminal Investigation Command (USACIDC) reports of investigations (PA system of records notice A0195-2a USACIDC, Source Register; A0195-2b USACIDC, Criminal Investigation and Crime Laboratory Files) have been exempted from the amendment provisions of the Privacy Act. Requests to amend these reports will be considered under AR 195-2. Actions taken by the Commander of U.S. Army Criminal Investigation Command will constitute final action on behalf of the Secretary of the Army under that regulation. (6) Records placed in the National Archives are exempt from the Privacy Act provision allowing individuals to request amendment of records. Most provisions of the Privacy Act apply only to those systems of records that are under the legal control of the originating agency; for example, an agency's current operating files or records stored at a Federal Records Center. (7) Inspector General investigative files and action request/complaint files (records in system notice A0021-1 SAIG, Inspector General Records) have been exempted from the amendment provisions of the Privacy Act. Requests to amend these reports will be considered under AR 20-1 by the Inspector General. Action by the Inspector General will constitute final action on behalf of the Secretary of the Army under that regulation. (8) Other records that are exempt from the amendment provisions of the Privacy Act are listed in the applicable PA system of records notices. (c) Amendment procedures. (1) Requests to amend records should be addressed to the custodian or system manager of the records. The request must reasonably describe the records to be amended and the changes sought (e.g., deletion, addition, or amendment). The burden of proof is on the requester. The system manager or records custodian will provide the individual with a written acknowledgment of the request within 10 working days and will make a final response within 30 working days of the date the request was received. The acknowledgment must clearly identify the request and inform the individual that final action will be forthcoming within 30 working days. (2) Records for which amendment is sought must be reviewed by the proper system manager or custodian for accuracy, relevance, timeliness, and completeness. (3) If the amendment is appropriate, the system manager or custodian

will physically amend the records accordingly. The requester will be notified of such action. (4) If the amendment is not warranted, the request and all relevant documents, including reasons for not amending, will be forwarded to the proper Denial Authority within 10 working days to ensure that the 30 day time limit for the final response is met. In addition, the requester will be notified of the referral.

(i) NIST SP 800-171, titled "Protecting Controlled Unclassified Information in Nonfederal Systems and Organizations," Revision 2, February 2020 (includes updates as of January 28, 2021) (NIST SP 800-171 R2), provides agencies with recommended security requirements for protecting the confidentiality of CUI when the information is resident in nonfederal systems and organizations; when the nonfederal organization is not collecting or maintaining information on behalf of a Federal agency or using or operating a system on behalf of an agency; and where there are no specific safeguarding requirements for protecting the confidentiality of CUI prescribed by the authorizing law, regulation, or governmentwide policy for the CUI category listed in the CUI Registry. The requirements apply to all components of nonfederal systems and organizations that process, store, and/or transmit CUI, or that provide protection for such components. The security requirements are intended for use by Federal agencies in contractual vehicles or other agreements established between those agencies and nonfederal organizations. This document is incorporated by reference as a foundational source for definitions and security requirements. (j) NIST SP 800-171A, titled "Assessing Security Requirements for Controlled Unclassified Information," June 2018 (NIST SP 800-171A Jun2018), provides Federal and non-Federal organizations with assessment procedures and a methodology that can be employed to conduct assessments of the CUI security requirements in NIST SP 800-171 R2. The assessment procedures are flexible and can be customized to the needs of the organizations and the assessors conducting the assessments. Security assessments can be conducted as self-assessments; independent, third-party assessments; or government-sponsored assessments and can be applied with various degrees of rigor, based on customer-defined depth and coverage attributes. The findings and evidence produced during the security assessments can facilitate risk-based decisions by organizations related to the CUI requirements. This document is incorporated by reference as a foundational source for definitions and assessment.

CM.L2-3.4.7 · Nonessential Functionality CMMC Assessment Guide · Level 2 | Version 2.13 107
principle of least functionality but does not specifically address which elements of a system should be limited. Example You are responsible for purchasing new endpoint hardware, installing organizationally required software to the hardware, and configuring the endpoint in accordance with the organization's policy. The organization has a system imaging capability that loads all necessary software, but it does not remove unnecessary services, eliminate the use of certain protocols, or close unused ports. After imaging the systems, you close all ports and block the use of all protocols except the following: · TCP for SSH on port 22; · SMTP on port 25; · TCP and UDP on port 53; and · HTTP and HTTPS on port 443. The use of any other ports or protocols are allowed by exception only [i,l,o]. Potential Assessment Considerations · Are only applications and services that are needed for the function of the system configured and enabled [a,b,c,d,e,f]? · Are only those ports and protocols necessary to provide the service of the information system configured for that system [g,h,i,j,k,l]? · Are systems services reviewed to determine what is essential for the function of that system [m]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.4.7

(Response) The final rule applies to persons who manufacture, process, pack, transport, distribute, receive, hold, or import food in the United States, unless the person qualifies for an exclusion in § 1.327 of the final rule. An importer of record or an initial U.S. recipient that is involved in one or more of the identified activities must establish and maintain the required records. (Comment 18) Several comments express concern because the proposed regulation applies only to domestic, for-hire transporters, and foreign transporters that enter the United States, as well as domestic private transporters, are not covered. Comments state that the regulation should apply uniformly to all transporters, foreign and domestic, for-hire and private, to ensure that no group has an unfair competitive advantage. (Response) All persons transporting food in the United States must meet the requirements of subpart J of this final rule, regardless of whether they are ·for hire· or ·private·. FDA notes, however, that if a manufacturer located in the United States transports the food in its own company trucks, then it must comply with the recordkeeping requirements for nontransporters as opposed to those applicable to transporters because FDA does not need the facility to keep duplicative records of the food while it is in that facility's control. However, if a foreign person, such as a person who manufactures food, transports food in the United States, it

must comply with the requirements for transporters, even if it transports the food in the United States itself. This ensures that FDA will have the ability to traceback the food that is transported in the United States, even if the facility from which the food originates is an exempt foreign facility under subpart J. (Comment 19) One comment notes that CBP's current requirements apply to trucking companies that transport imported food into the United States. The comment suggests that FDA coordinate with CBP to get data from them in the event of a threat to the nation's food supply, rather than develop its own distinct recordkeeping regulations.

The Cyber AB marketplace (cyberab.org) is the official directory where organizations can find: - **C3PAOs**: Authorized third-party assessment organizations for CMMC Level 2 assessments - **RPOs**: Registered Provider Organizations that offer consulting and preparation services - **Registered Practitioners (RPs)**: Individual consultants certified to help with CMMC preparation - **Certified CMMC Assessors (CCAs)**: Individuals qualified to conduct assessments - **Certified CMMC Professionals (CCPs)**: Individuals with foundational CMMC knowledge All organizations and individuals listed in the marketplace have been vetted and authorized by the Cyber AB. Organizations seeking CMMC assessment or consulting should verify their provider is listed in the marketplace.

(E) Only a person trained in accordance with § 1045.120 10 CFR may classify matter containing TFNI. (F) Matter containing RD, FRD, and TFNI is not automatically declassified and only DOE-authorized persons may downgrade the category or declassify matter marked as containing RD. Only DOE or DoD authorized persons may downgrade the category or declassify matter marked as containing FRD. (G) How to submit a challenge if they believe RD, FRD, or TFNI information (e.g., a guide topic) or matter containing RD, FRD, or TFNI is not properly classified. (H) Access requirements for matter marked as containing RD or FRD. (ii) All persons with access to TFNI must receive initial and periodic refresher training as required under § 1045.120 10 CFR. This training may be combined with the training for access to RD and FRD. The training must include the following information: (A) What information is potentially TFNI. (B) Only a person with appropriate training may determine if matter contains TFNI. (C) Marking requirements for matter containing TFNI. (D) Matter containing TFNI is not automatically declassified and only DOE authorized persons may downgrade the category or declassify matter marked as containing TFNI. (E) How to submit a challenge if they believe TFNI information (e.g., a guide topic) or matter containing TFNI is not properly classified. (iii) Persons with access to RD, FRD, or TFNI must submit matter that potentially contains RD or FRD to an RD derivative classifier for review. If matter potentially contains TFNI, it must be submitted to a person trained to make TFNI determinations. Matter potentially containing RD, FRD, or TFNI must be reviewed, even if the potential RD, FRD, or TFNI is derived from the open literature. Prior to review, the matter must be marked as a working paper under 10 CFR 1045.140(c) . If the matter is intended for public release and potentially contains RD or TFNI, it must be submitted to the DOE for review. If the matter is intended for public release and contains FRD, it must be submitted to the DOE or the DoD. (iv) Only RD derivative classifiers may classify matter containing RD or FRD. RD derivative classifiers must receive initial training and refresher training every two years as required under 10 CFR 1045.120 . The training must include the content for persons with access to RD and FRD, along with the following: (A) The use of classification guides, classification bulletins, and portion-marked source documents to classify matter containing RD and FRD. (B) What to do if applicable classification guidance is not available. (C) Limitations on an RD derivative classifier's authority to remove RD or FRD portions from matter. (D) Marking requirements for matter containing RD and FRD.

(vi) Review proposed new, altered, and amended systems of records, to include submission of required notices for publication in the Federal Register and, when required, providing advance notification to the OMB and the Congress, consistent with 5 U.S.C. 552a , OMB Circular A-130, and DoD 5400.11-R. (vii) Review proposed DoD Component privacy rulemaking, to include submission of the rule to the Office of the Federal Register for publication and providing to the OMB and the Congress reports, consistent with 5 U.S.C. 552a , OMB Circular A-130, and DoD 5400.11-R. (viii) Develop, coordinate, and maintain all DoD computer matching agreements, to include the submission of required match notices for publication in the Federal Register and the provision of advance notification to the OMB and the Congress, consistent with 5 U.S.C. 552a , OMB Circular A-130, and DoD 5400.11-R. (ix) Provide advice and support to the DoD Components to ensure: (A) All information requirements developed to collect or maintain personal data conform to DoD Privacy Program standards; (printed page 18763) (B) Appropriate procedures and safeguards shall be developed, implemented, and maintained to protect personal information when it is stored in either a manual and/or automated

system of records or transferred by electronic or non-electronic means; and (C) Specific procedures and safeguards shall be developed and implemented when personal data is collected and maintained for research purposes. (x) Serve as the principal POC for coordination of privacy and related matters with the OMB and other Federal, State, and local governmental agencies. (xi) Compile and submit the Biennial Matching Activity Report to the OMB as required by OMB Circular A-130 and DoD 5400.11-R, and the Quarterly and Annual Federal Information Security Management Agency (FISMA) Privacy Reports, as required by 44 U.S.C. 3544(c), such other reports as may be required. (xii) Update and maintain this part and DoD 5400.11-R.

Subpart B-Systems of Records §.310.10 General. (a) **System of Records.** To be subject to the provisions of this part, a system of records must: (1) Consist of records (as defined in 310.4(r)) that are retrieved by the name of an individual or some other personal identifier; and (2) Be under the control of a DoD Component. (b) **Retrieval practices.** (1) Records in a group of records that MAY be retrieved by a name or personal identifier are not covered by this part even if the records contain personal data and are under control of a DoD Component. The records MUST be retrieved by name or other personal identifier to become a system of records for the purpose of this part. (i) When records are contained in an automated (Information Technology) system that is capable of being manipulated to retrieve information about an individual, this does not automatically transform the system into a system of records as defined in this part.

Making the user name the password makes the password easy to remember- and exceptionally easy to guess. Brand says he has never found a system that didn't have at least one Joe. Last summer, he says, 'While I was testing a series of sensitive systems where hundreds of thousands of dollars were spent to remove security | 7. | Need for data classification program (in conjunction with Legal Department) | X | |-----|-----
-----|-----|----| | 8 | Devising a
data classification program (in conjunction with Legal Department) | | X | | 9 | Evaluation of data
to detect errors and intentional misconduct | X | | 10 | Controlling security- related misconduct
by user-area employees | X | | 11 | Controlling security- related misconduct by DP staff | | X | |

12 | Preventing damage from technical intrusions by outsiders, such as through in-dial ports, wiretapping, etc. as may be cost-justified by users | | X | | 13 | Installing, maintaining, and administering access control programs, such as RACE. ACF2. TOP SECRET.

(E) From subsection (e)(4)(I) because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. (23) System identifier and name. F033 USSC A, Information Technology and Control Records. (i) Exemption. Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law, as a result of the maintenance of the information, the individual will be provided access to the information except to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (f)(23)(i). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. Any portion of this system of records which falls within the provisions of 5 U.S.C. 552a(k)(2) may be exempt from the following subsections of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (H), and (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) . (iii) Reasons. (A) From subsection (c)(3) because to grant access to the accounting for each disclosure as required by the Privacy Act, including the date, nature, and purpose of each disclosure and the identity of the recipient, could alert the subject to the existence of the investigation. This could seriously compromise case preparation by prematurely revealing its existence and nature; compromise or interfere with witnesses or make witnesses reluctant to cooperate; and lead to suppression, alteration, or destruction of evidence. (B) From subsections (d) and (f) because providing access to investigative records and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal their wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that would make them difficult or impossible to reach in order to satisfy any Government claim growing out of the investigation or proceeding.

(4) Requests for personal information from Congress. These are processed in accordance with DoD Directive 5400.4 except those specific provisions in Subpart E-Disclosure of Personal Information to Other Agencies and Third Parties. §-310.4. Definitions. (a) Access . The review of a record or a copy of a record or parts thereof in a system of records by any individual. (b) Agency . For the purposes of disclosing records subject to the Privacy Act among the DoD Components, the Department of Defense is a considered a single agency. For all other purposes to include requests for access and amendment, denial of access or amendment, appeals from denials, and record keeping as relating to release of records to non-DoD Agencies, each DoD Component is considered an agency within the meaning of the Privacy Act. (c) Computer Matching Program . The computerized comparison of two or more automated systems of records or a system of records with non-Federal records. Manual comparison of systems of records or a system of records with non-Federal records are not covered. (d) Confidential source . A person or organization who has furnished information to the Federal Government under an express promise, if made on or after September 27, 1975, that the person's or the organization's identity shall be held in confidence or under an implied promise of such confidentiality if this implied promise was made on or before September 26, 1975. (e) Disclosure . The transfer of any personal information from a system of records by any means of communication (such as oral, written, electronic, mechanical, or actual review) to any person, private entity, or Government Agency, other than the subject of the record, the subject's designated agent or the subject's legal guardian. (f) Federal benefit program . A program administered or funded by the Federal Government, or by any agent or State on behalf of the Federal Government, providing cash or in-kind assistance in the form of payments, grants, loans, or loan guarantees to individuals. (g) Federal personnel . Officers and employees of the Government of the United States, members of the uniformed services (including members of the Reserve Components), individuals entitled to receive immediate or deferred retirement benefits under any retirement program of the United States (including survivor benefits). (h) Individual . A living person who is a citizen of

the United States or an alien lawfully admitted for permanent residence. The parent of a minor or the legal guardian of any individual also may act on behalf of an individual. Members of the United States Armed Forces are individuals. Corporations, partnerships, sole proprietorships, professional groups, businesses, whether incorporated or unincorporated, and other commercial entities are not individuals when acting in an entrepreneurial capacity with the Department of Defense but are individuals otherwise (e.g., security clearances, entitlement to DoD privileges or benefits, etc.). (i)

IA.L2-3.5.11 · Obscure Feedback CMMC Assessment Guide · Level 2 | Version 2.13 134 IA.L2-3.5.11 · OBSCURE FEEDBACK Obscure feedback of authentication information. ASSESSMENT OBJECTIVES [NIST SP 800-171A]118 Determine if: [a] authentication information is obscured during the authentication process. POTENTIAL ASSESSMENT METHODS AND OBJECTS [NIST SP 800-171A]118 Examine [SELECT FROM: Identification and authentication policy; procedures addressing authenticator feedback; system security plan; system design documentation; system configuration settings and associated documentation; system audit logs and records; other relevant documents or records]. Interview [SELECT FROM: Personnel with information security responsibilities; system or network administrators; system developers]. Test [SELECT FROM: Mechanisms supporting or implementing the obscuring of feedback of authentication information during authentication]. DISCUSSION [NIST SP 800-171 REV. 2]

Assistant Secretary for Communications and Information, National Telecommunications and Information Administration. Footnotes 1. See, e.g., Cyberspace Policy Review: Assuring a Trusted and Resilient Information and Communications Infrastructure, May 29, 2009, at 1, http://www.whitehouse.gov/assets/documents/Cyberspace_Policy_Review_final.pdf (Cyberspace Policy Review), citing Director of National Intelligence, Annual Threat Assessment of the Intelligence Community for the Armed Services Committee, Statement for the Record, March 10, 2009, at 39. Wall, Cybercrime, Media and Insecurity: The Shaping of Public Perceptions of Cybercrime, 22 International Review of Law, Computers and Technology 45 (2008). A botnet, short for robot network, is an aggregation of compromised computers that are taken over via network connections without the knowledge or consent of their owners. Michigan Information Sharing and Analysis Center, Monthly Cyber Security Tips Newsletter (September 2007), http://www.michigan.gov/documents/cybersecurity/CSNewsletter_September2007_207450_7.pdf. Back to Citation 3. DHS oversees critical infrastructure protection, operates the United States Computer Emergency Readiness Team (US-CERT), oversees implementation of the Trusted Internet Connection initiative, and takes other actions to help secure both the federal civilian government systems and the private sector. DHS exercises primary responsibility within the executive branch for the operational aspects of Federal agency cybersecurity with respect to the Federal information systems that fall within the Federal Information Security Management Act of 2002 (FISMA). These responsibilities include overseeing the government-wide and agency-specific implementation of and reporting on cybersecurity policies and guidance; overseeing and assisting government-wide and agency-specific efforts to provide adequate, risk-based and cost-effective cybersecurity. Under FISMA, the Director of the Office of Management and Budget (OMB) oversees federal agency information security policies and practices, and OMB has directed all departments and agencies to coordinate and cooperate with DHS as necessary to carry out its FISMA responsibilities. OMB Memorandum M-10-28 Clarifying Cybersecurity Responsibilities and Activities of the Executive Office of the President and the Department of Homeland Security (DHS), http://www.whitehouse.gov/omb/assets/memoranda_2010/m10-28.pdf. Back to Citation 4. In addition, the Federal Communications Commission, an independent regulatory agency, is considering launching a voluntary certification program to encourage communications service providers to implement cybersecurity best practices. CIS Safeguard 7.3 · Perform Automated Operating System Patch Management Perform operating system updates on enterprise assets through automated patch management on a monthly, or more frequent, basis. Implementation Groups: 1,2,3 Asset Type: applications Security Function: protect Parent Control: Continuous Vulnerability Management

The Department proposes to modify the existing implementation specifications under the standard for access control and to add five new implementation specifications. Additionally, we propose to

redesignate the implementation specification for encryption and decryption as a standard. We propose to modify the implementation specification for unique user identification at 45 CFR 164.312(a)(2)(i) by renaming the implementation specification as 'Unique identification' and adding a requirement to assign a unique identifier for tracking each technology asset. These proposed modifications would clarify for regulated entities that the purpose of this requirement is to enable a regulated entity to identify and track unauthorized activity in its relevant electronic information systems. Such unauthorized activity may include activity by unauthorized persons or technology assets. It may also include activity by persons who are authorized to access the regulated entity's relevant information systems but who access ePHI that they do not need to access for their job or function. The Department also proposes to expand the types of identifiers a regulated entity may assign to users and technology assets beyond names to include numbers and/or other identifiers and to clarify that a unique identifier must be assigned to each user and technology asset in the regulated entity's relevant electronic information systems. This proposed modification would better meet the goals of this implementation specification by requiring a regulated entity to be able to discern and track activities among all users and technology assets, regardless of whether that user or technology asset is a person, hardware, software program, or device. The proposed implementation specification for unique identification aligns with the Department's essential CPG for Unique Credentials, which calls for regulated entities to use unique credentials to (printed page 966) help detect and track anomalous activities. [698] Additionally, we propose to add an implementation specification at proposed 45 CFR 164.312(a)(2)(ii) for administrative and increased access privileges. Access controls should enable an authorized user to access the minimum necessary information needed to perform their job functions. [699] Rights and/or privileges should be granted to authorized users based on the policies and procedures required under the administrative safeguard for information access management. [700] For example, a workforce member who has certain role-based administrative access privileges should have separate user identities for non-administrative access privileges and administrative access privileges. Separating a single workforce member's user identities based on access privilege substantially limits the risk that an intruder will be able to access ePHI through a workforce member's user identity when they are using the administrative access privileges. [701]

E.O. 13132 and published as part of the preambles to the final rules on February 20, 2003 [1024] and January (printed page 1009) 25, 2013. [1025] Regarding preemption, HIPAA dictates the relationship between State law and HIPAA regulatory requirements. [1026] The Health Information Technology for Economic and Clinical Health Act of 2009 (HITECH Act) provides that the HIPAA preemption provisions shall apply to the HITECH Act provisions and requirements. [1027] As explained by the House report that accompanied the American Recovery and Reinvestment Act of 2009, the HITECH Act would not only apply HIPAA's preemption provisions to the HITECH Act requirements, but it would also 'preserve the HIPAA privacy and security standards to the extent that they are consistent with' the HITECH Act. [1028] A requirement, standard, or implementation specification adopted in accordance with HIPAA and the HIPAA Rules supersedes any contrary provision of State law, subject to certain exceptions. [1029] Specifically, State law would be preempted under the Security Rule only when (1) a regulated entity finds it impossible to comply with both State and Federal requirements; or (2) the provision of State law stands as an obstacle to accomplishing and executing the purposes and objectives of the Administrative Simplification provisions or the HITECH Act. [1030] Although a few States (e.g., California and New York) have promulgated or are in the process of promulgating regulations pertaining to cybersecurity in health care that may be more stringent than the Security Rule, the Department believes that a regulated entity could comply with both sets of requirements by adhering to the more stringent standard. Thus, in such cases, the State law would not be an obstacle to the accomplishment and execution of HIPAA or the HITECH Act. The proposed modifications to the Security Rule would further the Congressional intent to improve the Medicare and Medicaid programs by the development of health information systems that are private and secure. The Department's proposals promote the safety, efficiency, and effectiveness of the health care system by refining the security standards established by Congress and implemented in the 2003 and 2013 Final Rules. The statute contemplated that the security measures adopted by all regulated entities, including State and local governments, would evolve over time in accordance with the security risks they face, and the NPRM proposals are in the nature of enhancing these existing requirements. Thus, the Department does not believe that the rule would impose substantial direct compliance costs on State and local governments that are not required by statute.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense 48 CFR Parts 204, 212, and 252 RIN 0750-AH58 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Proposed rule. SUMMARY: DoD is proposing to amend the Defense Federal Acquisition Regulation Supplement (DFARS) to provide a provision for offerors, if owned or controlled by another business entity, to identify the Commercial and Government Entity (CAGE) code and legal name of that business entity. DATES: Comments on the proposed rule should be submitted in writing to the address shown below on or before September 24, 2012, to be considered in the formation of the final rule. ADDRESSES: Submit comments identified by DFARS Case 2011-D044, using any of the following methods: · Regulations.gov: <http://www.regulations.gov> · Submit comments via the Federal eRulemaking portal by inputting ·DFARS Case 2011-D044· under the heading ·Enter keyword or ID· and selecting ·Search·. Select the link ·Submit a Comment· that corresponds with ·DFARS Case 2011-D044·. Follow the instructions provided at the ·Submit a Comment· screen. Please include your name, company name (if any), and ·DFARS Case 2011-D044· on your attached document. · Email: dfars@osd.mil · Include DFARS Case 2011-D044 in the subject line of the message. · Fax: 571-372-6094. · Mail: Defense Acquisition Regulations System, Attn: Ms. Veronica Fallon, OUSD(AT&L)DPAP/DARS, Room 3B855, 3060 Defense Pentagon, Washington, DC 20301-3060. Comments received generally will be posted without change to <http://www.regulations.gov>, including any personal information provided. To confirm receipt of your comment(s), please check www.regulations.gov, approximately two to three days after submission to verify posting (except allow 30 days for posting of comments submitted by mail). FOR FURTHER INFORMATION CONTACT: Ms. Veronica Fallon, telephone 571-372-6087. SUPPLEMENTARY INFORMATION: I. Background DoD proposes to collect the CAGE code and name from offerors, if owned or controlled by another business entity, in a new provision with an offeror's representations and certifications. The CAGE code is a five-character identification number used extensively within the Federal Government, and is administered by the Defense Logistics Information Service. A search feature for CAGE codes is available at http://www.logisticsinformationservice.dla.mil/cage_welcome.asp. CAGE codes for vendors located in the United States may be obtained via registration in the Central Contractor Registration (CCR) application, available at

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology (IT). ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. The keynote presentation was made by Eric Hudson and Steve Rabinowitz of the GAO, based on a GAO report titled Internet of Things: Information on Use by Federal Agencies [GAO20-577]. Mr. Hudson is a senior analyst with GAO's physical infrastructure team. Mr. Rabinowitz is also a senior analyst at GAO and has participated in a number of infrastructure-related studies. Their presentation had three components: - 56 of 90 agencies were using IoT, especially to control or monitor systems, control access to facilities, and track physical assets (vehicles, property). - 25 agencies were currently using IoT and planned to expand their use. - 13 agencies were neither using nor planning to use IoT, based on lack of return on investment, internal administrative hurdles, or the lack of a business case.

DFARS 252.204-7021 (Cybersecurity Maturity Model Certification Requirements) Requires CMMC certification at the level specified in the contract, effective Phase 1 November 10, 2025. Flow-down requirements: DFARS 252.204-7021 includes flow-down provisions requiring prime contractors to include the clause in subcontracts where CUI will be processed, stored, or transmitted. Subcontractors must meet the same security requirements as the prime.

). The Government is currently assessing where the organizationally-defined parameters within Revision 3 should be standardized and implemented on a governmentwide basis. As stated in the

benefits section of this rule, it is important for the Government to immediately implement requirements to protect CUI on non-Federal information systems; therefore, this proposed rule does not seek to implement NIST's most recent revision. The FAR Council anticipates that future rulemaking will be initiated to update NIST SP 800-171 and NIST SP 800-171A to the current version.

V. Specific Questions for Public Comment To understand the exact scope of this impact and how this impact could be affected in the final rule, DoD, GSA, and NASA welcome input on the following questions regarding anticipated impact on affected parties. DoD, GSA, and NASA recognize that some agencies may need to tailor the approach to the information collected based on the unique mission and risks for their agency.

1. Is there additional information or guidance you view as necessary to effectively comply with this rule?
2. Are there specific situations you anticipate where your organization will be required to report on different timelines in order to comply with the CUI incident reporting requirements outlined in this proposed rule, other Federal contract requirements, or other regulations promulgated under Federal law? How would your organization handle disparate incident reporting timelines in other Federal Government contracting requirements or from other regulatory agencies?
3. Incident response and associated reporting are often iterative processes, with system owners updating reports as a situation evolves and more data becomes available. What implications are there for your organization, including with respect to incident response, to meet disparate timelines for incident reporting?
4. How much, if at all, would you estimate that the initial reporting requirement described in this proposed rule could increase the price of the products or services your organization provides to the Federal Government?
5. Understanding evolving data capabilities may change the nature or sensitivity of information over time, are there specific concerns not adequately addressed in this proposed rule? If possible, please provide any relevant use cases.
6. The FAR Council notes there is also what is referred to as "CUI specified", which is information that is considered CUI, but is also required to be handled in a certain way due to other laws, regulations, and policies (e.g., restrictions on disseminating information to foreign nationals or dual citizens under International Traffic in Arms Regulations (ITAR)). For CUI specified information, not only does it have to be treated and handled as CUI, (printed page 4287)

) that is subject to controls on the access, use, reproduction, modification, performance, display, release, disclosure, or dissemination. Controlled technical information is to be marked with one of the distribution statements B through F, in accordance with Department of Defense Instruction 5230.24, "Distribution Statements of Technical Documents." The term does not include information that is lawfully publicly available without restrictions. "Technical Information" means technical data or computer software, as those terms are defined in Defense Federal Acquisition Regulation Supplement clause 252.227-7013, "Rights in Technical Data-Noncommercial Items" (48 CFR 252.227-7013). Examples of technical information include research and engineering data, engineering drawings, and associated lists, specifications, standards, process sheets, manuals, technical reports, technical orders, catalog-item identifications, data sets, studies and analyses and related information, and computer software executable code and source code; (ii) Information subject to export control under the International Traffic in Arms Regulations (ITAR) (http://pmddtc.state.gov/-regulations_-laws/-itar_-official.html), or the Export Administration Regulations (EAR). (15 CFR part 730); (iii) Information designated as Critical Program Information (CPI) in accordance with DoD Instruction 5200.39, "Critical Program Information (CPI) Protection within the Department of Defense"; (iv) Critical Information (Operations Security) includes specific facts identified through the Operations Security process about friendly intentions, capabilities, and activities vitally needed by adversaries for them to plan and act effectively so as to guarantee failure or unacceptable consequences for friendly mission accomplishment (part of Operations Security process as described in 5205.02-M, "DoD Operations Security (OPSEC Program Manual)"; (v) Personally Identifiable Information (PII) that can be used to distinguish or trace an individual's identity in accordance with DoD Directive 5400.11, "DoD Privacy Program"; (vi) Information bearing current and prior designations indicating controlled unclassified information (e.g., For Official Use Only, Sensitive But Unclassified, and Limited Official Use, DoD Unclassified Controlled Nuclear Information, Sensitive Information) that has not been cleared for public release in accordance with DoD Directive 5230.29, "Clearance of DoD Information for Public Release" (see also DoD 5200.01 M Volume 4, "DoD Information Security Program: Controlled Unclassified Information (CUI)"); or (vii) Any other information that is exempt from mandatory public disclosure under DoD Directive 5400.07, "DoD Freedom of Information Act (FOIA) Program", and DoD Regulation 5400.7-R, "DoD Freedom of Information Program".

(d) Covered DIB systems means an information system that is owned or operated by or for a DIB participant and that

processes, stores, or transmits covered defense information. (e)

FAR Subpart 4.19 and DFARS Subpart 204.73 address safeguarding of FCI and CUI in contractor information systems and prescribe contract clauses requiring protection of FCI and CUI within the supply chain. The FAR and DFARS requirements for safeguarding FCI and CUI predate the CMMC Program by many years, and baseline costs for their implementation are assumed to vary widely based on factors including, but not limited to, company size and complexity of the information systems to be secured. FAR 52.204-21, Basic Safeguarding of Covered Contractor Information Systems, is prescribed at FAR section 4.1903 for use in solicitations and contracts when the contractor or subcontractor at any tier may have FCI residing in or transiting through its information system. This clause requires contractors and subcontractors to apply basic safeguarding requirements and procedures to protect applicable contractor information systems that process, store, or transmit FCI. In addition, DFARS clause 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting, is prescribed at DFARS section 204.7304(c) for use in DoD in all solicitations and contracts, including solicitations and contracts using FAR part 12 procedures for the acquisition of commercial items, except for solicitations and contracts solely for the acquisition of commercially available off-the-shelf items. This clause applies when a contractor information system processes, stores, or transmits covered defense information and requires contractors and subcontractors to provide adequate security to safeguard that information when it resides on or transits through a contractor information system, and to report cyber incidents that affect that system or network. The clause states that to provide adequate security, the contractor shall implement, at a minimum, the security requirements in National Institute of Standards and Technology (NIST) Special Publication (SP) 800-171 Rev 2, Protecting CUI in Nonfederal Systems and Organizations. Contractors are also required to flow down DFARS clause 252.204-7012 to all subcontracts for operationally critical support or for which subcontractor performance will involve covered defense information. However, neither FAR clause 52.204-21 nor DFARS clause 252.204-7012 provide for DoD assessment of a contractor's implementation of the information protection requirements required by those clauses. The Department developed the CMMC Program to verify implementation of cybersecurity requirements in DoD contracts and subcontracts, by assessing (printed page 89080) adequacy of contractor information system security compliance prior to award and during performance of the contract. With limited exceptions, the Department intends to require compliance with CMMC as a condition of contract award. Once CMMC is implemented, the required CMMC Level for contractors and subcontractors will be specified in the solicitation and Requests for Information (RFIs), if utilized.

. Army policy concerning the privacy rights of individuals and the Army's responsibilities for compliance with the Privacy Act are as follows: (1) Protect the privacy of United States living citizens and aliens lawfully admitted for permanent residence from unwarranted intrusion. (2) Deceased individuals do not have Privacy Act rights, nor do executors or next-of-kin in general. However, immediate family members may have limited privacy rights in the manner of death details and funeral arrangements of the deceased individual. Family members often use the deceased individual's Social Security Number (SSN) for federal entitlements; appropriate safeguards must be implemented to protect the deceased individual's SSN from release. Also, the Health Insurance Portability and Accountability Act extends protection to certain medical information contained in a deceased individual's medical records. (3) Personally identifiable health information of individuals, both living and deceased, shall not be used or disclosed except for specifically permitted purposes. (4) Maintain only such information about an individual that is necessary to accomplish the Army's mission. (5) Maintain only personal information that is timely, accurate, complete, and relevant to the collection purpose. (6) Safeguard personal information to prevent unauthorized use, access, disclosure, alteration, or destruction. (7) Maintain records for the minimum time required in accordance with an approved National Archives and Records Administration record disposition. (8) Let individuals know what Privacy Act records the Army maintains by publishing Privacy Act system of records notices in the Federal Register . This will enable individuals to review and make copies of these records, subject to the exemptions authorized by law and approved by the Secretary of the Army. Department of the Army Privacy Act systems of records notices are available at <http://www.defenselink.mil/-/privacy> . (9) Permit individuals to correct and amend records about themselves which they can prove are factually in error, not timely, not complete, not accurate, or not relevant. (10) Allow individuals to request an administrative review of decisions that deny them access to or the right to amend their records. (11) Act on all requests promptly, accurately, and fairly. (12) Keep paper and electronic records that are retrieved by name or personal identifier only in approved Privacy Act systems of records. (13) Maintain no records describing how

an individual exercises his or her rights guaranteed by the First Amendment (freedom of religion, freedom of political beliefs, freedom of speech and press, freedom of peaceful assemblage, and petition) unless expressly authorized by statute, pertinent to and within the scope of an authorized law enforcement activity, or otherwise authorized by law or regulation.

and compromise protective services provided to the President and other individuals. Amendment of such records could also impose a highly impracticable administrative burden by requiring investigations to be continuously reinvestigated. (4) Exemption (k)(5). Personnel investigations and vetting records may contain investigatory material compiled solely for determining suitability, eligibility, and qualifications for Federal civilian employment, military service, Federal contracts, or access to classified information. In some cases, such records may contain information pertaining to the identity of a source who furnished information to the Government under an express promise that the source's identity would be held in confidence (or prior to the effective date of the Privacy Act, under an implied promise). Application of exemption (k)(5) for such records may be necessary because access to, amendment of, or release of the accounting of disclosures of such records could identify these confidential sources who might not have otherwise come forward to assist the Government, could hinder the Government's ability to obtain information from future confidential sources, and result in an unwarranted invasion of the privacy of others. Amendment of such records could also impose a highly impracticable administrative burden by requiring investigations to be continuously reinvestigated. (5) Exemption (k)(6). Personnel investigations and vetting records may contain information relating to testing or examination material used solely to determine individual qualifications for appointment or promotion in the Federal service. Application of exemption (k)(6) for such records may be necessary because access to, amendment of, or release of the accounting of disclosures of such records could compromise the objectivity and fairness of the testing or examination process. Amendment of such records could also impose a highly impracticable administrative burden by requiring investigations to be continuously reinvestigated. (6) Exemption (k)(7).

(B) Portions of this system of records are exempt from the following subsections of the Privacy Act: (c)(4), (d), (e)(4)(G), and (f). (ii) Authority. 5 U.S.C. 552a(j)(2) . (iii) Reasons. (A) Granting individuals access to records maintained by this Board could interfere with internal processes by which Board personnel are able to formulate decisions and policies with regard to clemency and parole in cases involving naval prisoners and other persons under the jurisdiction of the Board. Material will be screened to permit access to all material except such records or documents as reflecting items of opinion, conclusion, or recommendation expressed by individual board members or by the board as a whole. (B) The exemption of the individual's right to access to portions of these records, and the reasons therefore, necessitate the partial exemption of this system of records from the requirements of the other cited provisions. (19) System identifier and name. N01752-1, Family Advocacy Program System. (i) Exemptions. (A) Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (B) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, military service, Federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (C) Portions of this system of records are exempt from the following subsections of the Privacy Act: (c)(3) and (d). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5) . (iii) Reasons. (A) Exemption is needed in order to encourage persons having knowledge of abusive or neglectful acts toward children to report such information, and to protect such sources from embarrassment or recriminations, as well as to protect their right to privacy. It is essential that the identities of all individuals who furnish information under an express promise of confidentiality be protected. Additionally, granting individuals access to information relating to criminal and civil law enforcement, as well as the release of certain disclosure accounting, could interfere with ongoing investigations and the orderly administration of justice, in that it could result in the concealment, alteration, destruction, or fabrication of information; could hamper the identification of offenders or alleged offenders and the disposition of charges; and could jeopardize the safety and well-being of parents and their children. (printed page 14769)

20. Usability, expense, and support issues are significant considerations in selection of authentication and authorization controls. Most of these systems identify the user. Where the identity of the user is important to a system's access policy, issuance and maintenance of credentials depends on an underlying identity management system. Effective identity management systems establish one party's identity to another party's satisfaction, increasing consumer trust in the use of the Internet, while balancing the security and privacy concerns of all users involved. It is worthwhile to remember that users are not a homogeneous group. They consist of individuals, and small, medium, and large enterprises, both public and private. The diversity of the characteristics among these various categories of users means that each group will make selections among various security solutions based on different criteria that address their unique needs and economic drivers. Privacy considerations also significantly complicate identification based on personally identifiable information. For many purposes, identification needs to simply associate the user's request for access or service with an institutional authorization by the entity that is providing the access or service. By contrast, more sensitive transactions (e.g., online banking or exchange of electronic health records) may require authentication of more of an individual's identifying characteristics. Various audit and enforcement functions benefit from identification of the access with a specific person, but this is not necessary for all use cases. Back to Citation

(3) The contractor will maintain a record of all COMSEC briefings as specified by the appropriate COR. (f) U.S. classified cryptographic information access briefing and debriefing requirements. (1) U.S. classified cryptographic information does not include seed key or controlled cryptographic items. (2) A contractor's employee may be granted access to U.S. classified cryptographic information only if the employee: (i) Is a U.S. citizen. (ii) Has a final USG-issued eligibility determination appropriate to the classification of the U.S. cryptographic information to be accessed. (iii) Has a valid need-to-know to perform duties for, or on behalf of, the USG. (iv) Receives a security briefing appropriate to the U.S. Classified Cryptographic Information to be accessed. (v) Acknowledges the granting of access to classified information by executing Section I of Secretary of Defense (SD) Form 572, Cryptographic Access Certification and Termination (available at: <https://www.esd.whs.mil/Portals/54/Documents/DD/forms/sd/sd0572.pdf>). (vi) Where so directed by a USG department or agency head, acknowledges the possibility of being subject to a CI scope polygraph examination that will be administered in accordance with department or agency directives and applicable law. (3) An employee granted access to cryptographic information will be debriefed and execute Section II of the SD 572 not later than 90 days from the date access is no longer required. (4) The contractor will maintain the SD 572 for a minimum of five years following the debriefing. (5) Cryptographic access briefings must fully meet the requirements of paragraph (e) of this section. (printed page 83360) (g) Destruction and disposition of COMSEC material. The appropriate GCA representative, e.g., the contracting officer representative, will provide directions to the contractor when accountable COMSEC material is to be destroyed. These directions may be provided in superseding editions of publications or by specific instructions. (h) Subcontracting COMSEC work. Subcontracts requiring the disclosure of classified COMSEC information will be awarded only upon the written approval of the GCA. (i) Unsolicited proposals. Any unsolicited proposal for a COMSEC system, equipment, development, or study that may be submitted by a contractor to a USG agency will be forwarded to the Deputy National Manager for National Security Systems for review and follow up action at: Deputy National Manager for National Security Systems, NSA, Fort George G. Meade, MD 20755-6000. § 117.22 DHS CCIPP. (a) General. DHS will coordinate with other USG agencies that have an equity with a private sector entity and the CCIPP in accordance with § 117.6(f). (b) Authority.

The CFR is the codification of the Federal Government's rules and regulations published in the Federal Register . The CFR was created with the passage of the Federal Register Act and amended in 1937 to provide a codification of all regulations at least once a year. The CFR reflects the tenet

that the Federal Government must follow an open public process when rulemaking. Due to the broad application of CMMC requirements for DoD acquisition support by the defense industrial base, the Department determined that codifying the CMMC Program and its associated requirements in 32 CFR part 170 CMMC Program rule (for national defense and security) was needed in conjunction with the corresponding DFARS contractual requirements codified in 48 CFR part 204 CMMC Acquisition rule. The DoD has no authority to make CMMC a Federal-wide program. The notice of the required CMMC level is provided at time of solicitation. This does not prohibit contractors from pursuing CMMC assessments prior to receipt of a solicitation. DoD declines to comment on the reposting of information being reported in the media.

32. Administrative Changes to Terms, References and Notations Comment: Over 160 comments asked for clarification of terminology or the addition, removal, or modification of a definition. Most requests focused on Security Protection Data and Assets, Senior Officials, Information System, External Service Providers, Cloud Service Providers, Managed Support Providers, Internet of Things, CMMC Security Requirements, Organization Seeking Assessment, and Organization Seeking Certification. Numerous comments recommended the following terms could be clarified, expanded, or defined: ·Defense Industrial Base·, ·personal information·, ·contractor·, ·sub-contractor·, ·Prime Contractor·, ·equipment·, ·contractor information system·, ·Information System·, ·system·, ·Information Resource·, ·CMMC Approved Training Materials (CATM)·, ·CMMC Certified Instructor (CCI)·, ·Provisional Instructor (PI)·, ·cyber incident·, ·Accreditation Body·, ·Assessment Findings Report·, ·Organizationally-Defined·, ·Organizationally-Defined Parameter (ODP)·, ·Periodically·, ·Risk Assessment·, ·Risk Analysis·, Supervisory Control·, Data Acquisition·, ·Operationally Critical Support·, ·System Security Plan (SSP)·, ·TTP·, ·CMMC·, ·COTS·, ·NARA·, ·C3PAO·, ·IS·, ·NSS·, ·Technology Asset·, ·Personnel Assets·, ·Asset Categories·, ·DIBCAC High·, and ·Enterprise·. Response: All requests for changes to terminology definitions, references, and usage have been reviewed. In response, many terms were updated in §170.4 Acronyms and definitions. The DoD determined those terms that were not changed to be sufficiently defined and appropriately referenced, and the requested administrative changes would not have resulted in a substantive change.

a. SPA/SPD/Asset Comment:

systems, but such standards and guidelines shall not apply to national security systems without the express approval of the appropriate federal officials exercising policy authority over such systems. This guideline is consistent with requirements of the Office of Management and Budget (OMB) Circular A-130. Nothing in this publication should be taken to contradict the standards and guidelines made mandatory and binding on federal agencies by the Secretary of Commerce under statutory authority. Nor should these guidelines be interpreted as altering or superseding the existing authorities of the Secretary of Commerce, OMB Director, or any other federal official. (Response) FDA acknowledges the difficulties in addressing regulatory flexibility considerations with staggered compliance dates. Nevertheless, FDA has decided that staggering the compliance dates is a viable mechanism to address regulatory flexibility considerations without compromising the effectiveness of the regulation as intended by Congress when it enacted section 306 of the

Bioterrorism Act. However, to address the concerns expressed by these comments without compromising the effectiveness of the regulation, in the final rule compliance dates for all size businesses have been extended by 6 months to 12 months for large, 18 months for small, and 24 months for very small businesses. FDA further notes that small and very small businesses are not required by FDA to comply earlier than these timeframes even if they are doing business with larger businesses that have earlier compliance dates. (Comment 218) At least one comment suggests that requiring the same compliance date for all firms and excluding small businesses from complying with the regulation compromises the effectiveness of the regulation due to breaks in the recordkeeping chain during traceback investigations. Such a compromise is contrary to the intent of the Regulatory Flexibility Act. (Response) In the PRIA, FDA considered three regulatory flexibility options: (1) Exempting small business from all regulatory requirements, (2) offering small business exemptions from parts of the regulation, and (3) specifying longer effective compliance dates for small businesses. We found that specifying longer compliance dates for small businesses was one option that would not appreciably compromise the purpose of the regulation. (Comment 219) Several comments state that the 4 and 8 hour provision for records access is more onerous for small businesses and suggest either flexibility in the extent of the records to be made available in that time period for small businesses, or extending the records access time requirements for small businesses. One comment suggests that the rule requires firms to keep more records than is necessary and that FDA should consider relaxing the level of detail in the small business records required to be made available in the 4 and 8-hour records access times. One comment states that the burden on a small firm from devoting a single employee, who generally performs multiple tasks, to accessing requested records is greater than that on a large firm devoting an employee who may generally perform only one task.

; (d); (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I); and (f). Exemptions from these particular subsections are justified, on a case-by-case basis to be determined at the time a request is made, for the following reasons: (A) From subsection (c)(3) and (c)(4) (Accounting for Disclosures) because release of the accounting of disclosures could alert the subject of an investigation of an actual or potential criminal, civil, or regulatory violation to the existence of that investigation and reveal investigative interest on the part of NGA as well as the recipient agency. Disclosure of the accounting would therefore present a serious impediment to law enforcement efforts and/or efforts to preserve national security. Disclosure of the accounting would also permit the individual who is the subject of a record to impede the investigation, to tamper with witnesses or evidence, and to avoid detection or apprehension, which would undermine the entire investigative process. (B) From subsection (d) (Access to Records) because access to the records contained in this system of records could inform the subject of an investigation of an actual or potential criminal, civil, or regulatory violation to the existence of that investigation and reveal investigative interest on the part of NGA or another agency. Access to the records could permit the individual who is the subject of a record to impede the investigation, to tamper with witnesses or evidence, and to avoid detection or apprehension. Amendment of the records could interfere with ongoing investigations and law enforcement activities and would impose an unreasonable administrative burden by requiring investigations to be continually reinvestigated. In addition, permitting access and amendment to such information could disclose security-sensitive information that could be detrimental to homeland security. (C) From subsection (e)(1) (Relevancy and Necessity of Information) because in the course of investigations into potential violations of Federal law, the accuracy of information obtained or introduced occasionally may be unclear, or the information may not be strictly relevant or necessary to a specific investigation. In the interests of effective law enforcement, it is appropriate to retain all information that may aid in establishing patterns of unlawful activity. (D) From subsection (e)(2) (Collection of Information from Individuals) because requiring that information be collected from the subject of an investigation would alert the subject to the nature or existence of the investigation, thereby interfering with that investigation and related law enforcement activities. (E) From subsection (e)(3) (Notice to Subjects) because providing such detailed information could impede law enforcement by compromising the existence of a confidential investigation or reveal the identity of witnesses or confidential informants.

From the NIST SP 800-172 Rev 3 Final Public Draft: The Requirements 423 This section describes enhanced security requirements that are designed to protect the confidentiality, integrity, and availability of CUI in nonfederal systems and organizations. The enhanced security requirements are not required for any particular category or article of CUI. However, if a federal agency determines that CUI is associated with a critical program or a high value asset, the CUI and the system that processes, stores, or transmits such information are potential targets for the APT and, therefore,

may require increased protection. Such protection is expressed through the enhanced security requirements and is mandated by a federal agency in a contract, grant, or other agreement. The enhanced security requirements are selected either comprehensive

(Response) FDA's record access authority under sections 414(a) and 704(a) of the FD&C Act became effective upon enactment of the Bioterrorism Act on June 12, 2002. The record access provisions of the Bioterrorism Act do not require FDA to issue implementing regulations. FDA intends to issue guidance to FDA personnel regarding FDA's exercise of this provision in accordance with FDA's GGP's regulations (§10.115). The previously stated comments will be considered as FDA develops the agency's guidance. FDA does not agree that these procedures need to be codified. (Comment 151) One comment observes that, depending on the length of the distribution chain involved in a contamination event, FDA may need to examine records of numerous food handling facilities. As a result, it could still take FDA several days to obtain needed records. The comment suggests that source labeling could help FDA determine the ultimate source faster. (Response) The comment's suggestion is outside the scope of the proposed rule. The authority granted in section 306 of the Bioterrorism Act relates to establishing requirements for records to identify immediate previous sources and recipients of food, not establishing labeling requirements. (Comment 152) One comment requests specific guidelines and an opportunity to object to providing the records for a period before access of the records. (Response) FDA disagrees. FDA does not currently provide a period of time in which a person subject to an inspection may object prior to that inspection. As discussed in response to comment 171 of this document, FDA plans to issue a guidance document regarding the record access provisions. M. Comments on What Records Are Excluded From This Subpart? (Proposed §1.362) (Comment 153) Several comments express concern that information that FDA would view, copy, or otherwise access could contain confidential information, such as confidential commercial or trade secret information. Two comments ask FDA to permit a person subject to the requirements of section 414 of the FD&C Act to redact what they consider to be nonpublic information from records properly sought by FDA. One comment asks FDA to permit a person to create a separate document containing only that information FDA is entitled to inspect. Examples of confidential information that comments have described include formulas, recipes, information about their businesses, where the product was purchased or sold, product development information, and location and business operations of farms. One comment requests that FDA allow the affected person to either redact confidential information from the source records (purchase orders, bills of lading, etc.), or create separate records containing the information required by section 414 of the FD&C Act, but not including the information excluded by §1.362 of this final rule or any other confidential information.

3.5.2 Installation 1. 3.5.2 Setup Instructions 1. 3.5.2 Disabling of Unsecure services on Network Devices Use the following guidelines to disable unsecure services on all Allen Bradley devices of the Plant: 1.

Computer matching publication and review requirements. 310.53 Computer matching agreements (CMAs). Appendix A to Part 310-Safeguarding Personally Identifiable Information Appendix B to Part 310-Sample Notification Letter (printed page 18759) Appendix C to Part 310-DoD Blanket Routine Uses Appendix D to Part 310-Provisions of the Privacy Act From Which a General or Specific Exemption May Be Claimed Appendix E to Part 310-Sample of New or Altered System of Records Notice in Federal Register Format Appendix F to Part 310-Format for New or Altered System Report Appendix G to Part 310-Sample Amendments or Deletions to System Notices in Federal Register Format Appendix H to Part 310-Litigation Status Sheet Authority: Pub. L. 93-579, 88 Stat. 1896 (5 U.S.C. 552a). Subpart A-DoD Policy §310.1 Reissuance. This part consolidates into a single location (32 CFR part 310) Department of Defense (DoD) policies and procedures for implementing the Privacy Act of 1974, as amended (5 U.S.C. 552a) by authorizing the development, publication and maintenance of the DoD Privacy Program set forth by DoD Directive 5400.11 [1] and 5400.11-R, [2] both entitled: 'DoD Privacy Program.' §310.2 Purpose. This part: (a) Updates policies and responsibilities of the DoD Privacy Program under 5 U.S.C. 552a and OMB Circular A-130. (b) Authorizes the Defense Privacy Board, the Defense Privacy Board Legal Committee, and the Defense Data Integrity Board. (c) Continues to authorize the publication of DoD 5400.11-R. (d) Continues to delegate authorities and responsibilities for the effective administration of the DoD Privacy Program. §310.3 Applicability and scope. This part: (a) Applies to the Office of the Secretary of Defense (OSD), the Military Departments, the Chairman of the Joint Chiefs of Staff, the Combatant Commands, the Office of the Inspector General of the Department of Defense (IG, DoD), the Defense Agencies, the DoD Field Activities, and all other

organizational entities in the Department of Defense (hereinafter referred to collectively as the DoD Components). (b) Shall be made applicable to DoD contractors who are operating a system of records on behalf of a DoD Component, to include any of the activities, such as collecting and disseminating records, associated with maintaining a system of records. (c) This part does not apply to: (1) Requests for information made under the Freedom of Information Act. They are processed in accordance with DoD 5400.7-R. [3] (2) Requests for information from systems of records controlled by the Office of Personnel Management (OPM), although maintained by a DoD Component. These are processed in accordance with policies established by OPM Privacy Procedures for Personnel Records (5 CFR 297). (3) Requests for personal information from the General Accounting Office. These are processed in accordance with DoD Directive 7650.1. [4]

Disposition procedures . Clearly state that the records used in the match will be retained only for the time required for conducting the match. Once the matching purpose has been achieved, the records will be destroyed unless the records must be retained as directed by other legal authority. Unless the source agency requests that the records be returned, identify the means by which destruction will occur, i.e., shredding, burning, electronic erasure, etc. (12) Comptroller General access . Include a statement that the Comptroller General may have access to all records of the recipient agency to monitor or verify compliance with the terms of the CMA. (13) Cost-benefit analysis . (printed page 18783) (i) A cost-benefit analysis shall be conducted for the proposed computer matching program unless: (A) The Data Integrity Board waives the requirement, or (B) The matching program is required by a specific statute. (ii) The analysis must demonstrate that the program is likely to be cost-effective. This analysis is to ensure agencies are following sound management practices. The analysis provides an opportunity to examine the programs and to reject those that will only produce marginal results. Appendix A to Part 310 Safeguarding Personally Identifiable Information (PII) (See § 310.13 of Subpart B) A. General 1. The IT environment subjects personal information to special hazards as to unauthorized compromise, alteration, dissemination, and use. Therefore, special considerations must be given to safeguarding personal information in IT systems consistent with the requirements of DoD Directive 8500.1 and DoD Instruction 8500.2. 2. Personally identifiable information must also be protected while it is being processed or accessed in computer environments outside the data processing installation (such as, remote job entry stations, terminal stations, minicomputers, microprocessors, and similar activities). 3. IT facilities authorized to process classified material have adequate procedures and security for the purposes of this Regulation. However, all unclassified information subject to this Regulation must be processed following the procedures used to process and access information designated For Official Use Only. (See DoD 5200.1-R.) B. Risk Management and Safeguarding Standards 1. Establish administrative, technical, and physical safeguards that are adequate to protect the information against unauthorized disclosure, access, or misuse. (See OMB Circular A-130 and DoD Instruction 8500.2.) 2. Tailor safeguards to the type of system, the nature of the information involved, and the specific threat to be countered. C. Minimum Administrative Safeguards The minimum safeguarding standards as set forth in § 310.13(b) apply to all personal data within any IT system. In addition: 1. Consider the following when establishing IT safeguards: a. The sensitivity of the data being processed, stored and accessed. b. The installation environment. c. The risk of exposure.

facility security, network security). When making this decision, regulated entities should consider basic questions, such as: Has the organization agreed upon, and clearly identified and documented, the responsibilities of the Security Official? How are the roles and responsibilities of the Security Official crafted to reflect the size, complexity, and technical capabilities of the organization? NIST guidance urges the regulated entity to select a workforce member who is able to assess the effectiveness of security to serve as the point of contact for security policy, implementation, and monitoring. [543] It further recommends that a regulated entity should document the responsibilities in a job description and communicate this assigned role to the entire organization. NIST provides additional sample items for consideration by a regulated entity organizing its security practices, including identifying the workforce members in the organization who oversee the development and communication of security policies and procedures, direct IT security purchasing and investment, and ensure that security concerns have been addressed in system implementation. NIST also offers that a regulated entity should ask whether the security official has adequate access and communications with senior officials in the organization and whether there is a (printed page 948) complete job description that accurately reflects assigned security duties and responsibilities. k. Section 164.308(a)(9)(i) Standard: Workforce Security The purpose of the workforce security standard is to ensure that workforce members only have access to ePHI that

they need to perform their assigned functions and are prevented from accessing ePHI that they are not authorized to access to perform such functions. The proposed changes to the standard and implementation specifications would clarify the actions required of a regulated entity to assure such limits. Individuals have been harmed in the past by the failure of regulated entities to comply with the Security Rule requirements for workforce security. For example, a former employee of a large covered entity was able to access their former worksite and workstation using still-active credentials for more than a week after their employment was terminated. [544] OCR's investigation found evidence of a potential failure to terminate the former employee's access to PHI, which enabled the former employee to download the ePHI of nearly 500 individuals, including their names, addresses, dates of birth, race/ethnicity, gender, and sexually transmitted infection test results onto a USB drive. This type of real-world experience and OCR's observations more broadly inform the changes proposed in this NPRM.

The Department proposes to require that the regulated entity obtain this written verification documenting the business associate's deployment of the required technical safeguards at least once every 12 months. [623] Additionally, we propose that the verification include a written analysis of the business associate's relevant electronic information systems. [624] The written analysis would be required to be performed by a person with appropriate knowledge of and experience with generally accepted cybersecurity principles and methods for ensuring the confidentiality, integrity, and availability of ePHI to verify the business associate's compliance with each standard and implementation specification in 45 CFR 164.312 . [625] We also propose to require that the written verification be accompanied by a written certification by a person who has the authority to act on behalf of the business associate that the analysis has been performed and is accurate. [626] The proposal would permit the parties to determine the appropriate person to perform the analysis and how that person is engaged or compensated. This person may be a member of the covered entity's or business associate's workforce or an external party. This proposed new requirement that a regulated entity obtain written verification from its business associates that they have deployed technical safeguards combined with the existing requirement to obtain written satisfactory assurances that they safeguard ePHI, aligns with the Department's essential CPG for Vendor/Supplier Cybersecurity Requirements. [627] This CPG calls for regulated entities to identify, assess, and mitigate risks to ePHI used by or disclosed to business associates. [628] r. Section 164.308(b)(3)-Standard: Delegation To Business Associate Based on the OCR's investigations and enforcement experience, we believe that some regulated entities are not aware that they retain compliance responsibility for implementing requirements of the Security Rule, even when they have delegated the functions of designated security official to a business associate. Therefore, the Department proposes a new standard for delegation to a business associate at proposed 45 CFR 164.308(b)(3) . The proposed standard would clarify that a regulated entity may permit a business associate to serve as its designated security official. [629] However, a regulated entity that delegates actions, activities, or assessments required by the Security Rule to a business associate remains liable for compliance with all the applicable provisions of the Security Rule. [630] 4. Request for Comment The Department requests comment on the foregoing proposals, including any benefits, drawbacks, or unintended consequences. We also request comment on the following considerations in particular. For any proposed timeframe that a commenter believes is not appropriate, we request comment and explanation on a more appropriate timeframe. (printed page 957)

- 2) A statement based on detailed technical analysis that specifies the extent to which the security measures in the system or facility meet the security requirements. Certification is based on the results of the risk analysis performed. It does not necessarily imply a guarantee that the described system is impenetrable. It is an input to the security accreditation process. (AFR 700-10)
- 3) The technical evaluation of a system's security features, made as part of and in support of the approval/accreditation process, that establishes the extent to which a particular computer system's design and implementation meet a set of specified security requirements. (DOD 5200.28-STD)
- 4) The technical evaluation of an AIS's security features and other safeguards, made in support of the accreditation process, which establishes the extent to which a particular AIS design and implementation meet a set of specified security requirements. (DODD 5200.28)
- 5) Formal written assurance that, based on evaluation of security tests, the classified ADP system and its environment meet the security specifications outlined by the approved ADP security plan. (DOE 5637.1)
- 6) The technical evaluation, made as part of and in support of the accreditation process, that establishes the extent to which the design and implementation of a computer system or network meet prespecified

security requirements. (FIPS PUB 39; AR 380-380) - 7) The technical process evaluation, made as part of and in support of the accreditation process, whereby a procedure, program, system, component, or system is shown to be secure; i.e., that the security design specifications are correct and have been properly Implemented. Certification is performed by independent technical personnel according to an acceptable standard of proof such that the level of security protection is identified with regard to a procedure, program, system component, or system.

and insert the docket number, found in brackets in the heading of this document, into the Search box and follow the prompts and/or go to the Division of Dockets Management, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852. FOR FURTHER INFORMATION CONTACT: Ryan Cates, Office of Partnerships, Food and Drug Administration, Element Building, 12420 Parklawn Dr., Rockville, MD 20857, 301-796-5390, FAX: 301-827-3588, OP-ORA@fda.hhs.gov . SUPPLEMENTARY INFORMATION: I. Background on the New System and the Deleted System The FDA is establishing a new system of records referred to as the Commissioning of State and Local Officials (COSLO) system, to maintain records regarding State and local officials who apply to be commissioned by FDA. Under section 702(a)(1)(A) of the Federal Food, Drug, and Cosmetic Act (FD&C Act) (21 U.S.C. 372(a)(1)(A)), FDA can commission a health, food, or drug officer or employee of any State, territory, or political subdivision thereof (hereafter State and local officials) to conduct examinations and investigations for the purposes of the FD&C Act. In addition, FDA is deleting the SORN entitled FDA Credential Holder File, HHS/FDA/OC (System No. 09-10-0003). The records covered by that SORN (credential records for FDA employees and commissioned officials) will now be covered by this SORN for the COSLO system which contains records pertaining to commissioned officials, and by other existing personnel SORNs for records pertaining to FDA employees. Issued in Homeland Security Presidential Directive 12, Policy for a Common Identification Standard for Federal Employees and Contractors, FDA has completed the process of issuing Personal Identity Verification (PIV) badges to current employees and contractors, and will do the same for all new employees and contractors hired in the future. Records pertaining to those badges and background investigations are covered under HHS department-wide SORN No. 09-90-0777 entitled Facility and Resource Access Control Records System. Any additional records maintained to identify or manage FDA personnel designated to conduct examinations and inspections under the FD&C Act would be covered by HHS department-wide SORN No. 09-90-0018 entitled Personnel Records in Operating Offices or another personnel SORN.

According to Smart Cards and Mobile Device Authentication_ an Overview and Implementation, Summary: While mobile handheld devices provide productivity benefits, they also pose new risks associated with the information and network access capabilities they accumulate over time. User authentication safeguards against the risk of unauthorized use and access to a device's contents. This paper demonstrates how novel forms of smart cards can be implemented as a primary authentication method suitable for mobile devices. The methods used take advantage of interfaces built into most handheld devices, affording organizations the opportunity to extend smart card functionality easily to a segment of the computational infrastructure heretofore neglected.

Authentication processes resist replay attacks if it is impractical to successfully authenticate by recording or replaying previous authentication messages . Replay-resistant techniques include protocols that use nonces or challenges such as time synchronous or challenge- response one-time authenticators. NIST SP 800-63-3 provides guidance on digital identities. FURTHER DISCUSSION When insecure protocols are used for access to computing resources , an adversary may be able to capture login information and immediately reuse (replay) it for other purposes. It is important to use mechanisms that resist this technique. 104 NIST SP 800-171A, p. 32. 105 NIST SP 800-171 Rev. 2, p. 25. IA.L2-3.5.4 Replay-Resistant Authentication CMMC Assessment Guide Level 2 | Version 2.13 121 Example To protect your IT infrastructure, you understand that the methods for authentication must not be easily copied and re-sent to your systems by an adversary. You select Kerberos for authentication because of its built-in resistance to replay attacks. As a next step you upgrade all of your web applications to require Transport Layer Security (TLS), which also is replay-resistant. Your use of MFA to protect remote access also confers some replay resistance. Potential Assessment Considerations Are only anti-replay authentication mechanisms used [a]? KEY REFERENCES NIST SP 800-171 Rev. 2 3.5.4

From the NIST SP 800-172 Rev 3 Final Public Draft: 19 System components include mainframes, workstations, servers, input and output devices, network components, operating systems, virtual machines, applications, cyber-physical components (e.g., programmable logic controllers [PLC] or

medical devices), and mobile devices (e.g., smartphones and tablets). The security requirements for a nonfederal system processing, storing, or transmitting CUI that is associated with a critical program or a high value asset are conveyed to the nonfederal organization by the federal entity in a contract, grant, or other agreement. The implementation guidance associated with the security requirements is beyond the scope of this publication. Organizations have flexibility in the methods, techniques, technologies, and approaches used to satisfy the req

Agencies will also specify in the requirement the security and privacy controls necessary for contract performance. In accordance with paragraph (e) of the clause 52.239-YY, the controls specified by the agency will be based on the current version of the following documents at the time of contract award: NIST SP 800-53, ·Security and Privacy Controls for Information Systems and Organizations;· NIST SP 800-213 ·IOT Device Cybersecurity Guidance for the Federal Government: Establishing IoT Device Cybersecurity Requirements;· NIST SP 800-161, ·Cybersecurity (printed page 68404) Supply Chain Risk Management Practices for Systems and Organizations;· and NIST SP 800-82, ·Guide to Industrial Control Systems Security.· Paragraph (e) also requires contractors to: (1) develop, review, and update, if appropriate, an SSP to support authorization of all applicable FIS, and (2) have contingency plans for all information technology systems, aligned to NIST SP 800-34, ·Contingency Planning Guide for Federal Information Systems.· The rule does not require a specific format for the SSP, but NIST SP 800-34 provides information on a template that contractors may choose to use. Contractors will be expected to provide a copy of the SSP, as well as make contingency plans available, to an agency upon request. In some situations, an information system may be designated as a high value asset by the agency. In accordance with paragraph (e) of the clause 52.239-YY, contractors will be subject to, as specified in the requirement, additional security and privacy controls for a high value asset, that could include the implementation of a high value asset overlay, immediate failover and/or recover plans, and complying with requisite cybersecurity assessments (e.g., contractor cooperation and allowing access). Additional considerations.

Several comments also question why records should be maintained for an additional 22 months after a product has been consumed. The comments state that 6 months is sufficient time to maintain records necessary for any traceback investigation related to food safety or security risks in the produce industry. One comment estimates that few, if any foods, would qualify as perishable as defined by FDA. The comment has identified only a few foods sold at retail that are ·not heat-treated, not frozen and not otherwise preserved in a manner so as to prevent the quality of the food from being adversely affected if held longer than 7 days under normal shipping and storage conditions,· namely bread, fish, and store prepared food. One comment supports the following revised definition of the term ·perishable food.· Perishable food means food that may have been thermally processed or otherwise preserved in a manner so as to prevent the quality of the foods from being adversely affected if held for 90 days or less under normal shipping and storage conditions. The comment agrees with FDA's decision to divide the food products subject to the record maintenance requirement into perishable and nonperishable groupings, but disagrees with the 7-day aspect of the proposed rule's definition of perishable. In addition, the comment does not believe that whether a food has been subjected to heat treatment or thermal processing should be a factor in differentiating between perishable and nonperishable food. The comment's members consider as ·perishable· those juice

products that have a shelflife of 90 days or less. If 90 days was substituted for 7 days in the definition of ‘perishable,’ this would result in retention of records for perishable products for at least 4 times their shelflife.

Analogous to the periodic table, the BF weakness taxonomies allow for the identification of as yet unencountered security weakness types, which would allow for the prediction of new kinds of vulnerabilities. The BF taxonomies and models also form the basis for defining secure coding principles, such as input/output check safety (e.g., injection safety), memory safety (e.g., buffer over/underflow safety or use-after-free safety), and data type safety (e.g., null pointer safety or subtype confusion safety). While the BF formal language is descriptive of weaknesses and vulnerabilities, the BF secure coding principles are prescriptive against them - they prevent bugs and faults that compromise code safety. The BF formalism supports a deeper understanding of vulnerabilities as chains of weaknesses that adhere to strict causal, propagational, and compositional rules and allows for backward bug identification from a failure. It enables a new range of research and development efforts for the creation of comprehensively labeled weakness and vulnerability datasets and the generation of formal vulnerability specifications and multidimensional vulnerability classifications. The BF also supports the development of new static or dynamic analysis and simulation or emulation algorithms [2], as well as AI models and capabilities to identify bugs and detect vulnerabilities. Given the formal specification of code and the BF definitions of weakness and vulnerability, formal methods could also be applied to detect vulnerabilities.

, as it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From 5 U.S.C. 552a(e)(4)(G) and (H) , as there is no necessity for such publication since the system of records

would be exempt from the underlying duties to provide notification about and access to information in the system and to make amendments and corrections to the information in the system. (E) From 5 U.S.C. 552a(e)(4)(I) , as to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. DLA, nevertheless, will continue to publish such a notice in broad generic terms as is its current practice. (2) System identifier and name. S500.10 (Specific exemption), Personnel Security Files. (i) Exemption. (A) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (B) Therefore, portions of this system may be exempt pursuant to 5 U.S.C. 552a(k) (5) from the following subsections of 5 U.S.C. 552a(c)(3) , (d), and (e)(1). (ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons. (A) From 5 U.S.C. 552a(c)(3) and (d) , when access to accounting disclosures and access to or amendment of records would cause the identity of a confidential source to be revealed. Disclosure of the source's identity not only will result in the Department breaching the promise of confidentiality made to the source but it would impair the Department's future ability to compile investigatory material (printed page 14776) for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, Federal contracts, or access to classified information. Unless sources may be assured that a promise of confidentiality will be honored, they will be less likely to provide information considered essential to the Department in making the required determinations. (B) From 5 U.S.C. 552a(e)(1) , as in the collection of information for investigatory purposes, it is not always possible to determine the relevance and necessity of particular information in the early stages of the investigation. In some cases, it is only after the information is evaluated in light of other information that its relevance and necessity becomes clear. Such information permits more informed decision making by the Department when making required suitability, eligibility, and qualification determinations.

(z) The Commander, U.S. Army Combat Readiness Center (formerly U.S. Army Safety Center), is authorized to act on requests for Army safety records. (aa) The Commander, U.S. Army Test and Evaluation Command (ATEC), is authorized to act on requests for the records of ATEC headquarters, its subordinate commands, units, and activities that relate to test and evaluation operations. (bb) The General Counsel, Army and Air Force Exchange Service, is authorized to act on requests for Army and Air Force Exchange Service records, under AR 60-20/AFR 147-14. (cc) The Commandant, United States Disciplinary Barracks (USDB) is authorized to act on records pertaining to USDB functional area responsibilities relating to the administration and confinement of individual military prisoners at the USDB. This includes, but is not limited to, all records pertaining to the treatment of military prisoners; investigation of prisoner misconduct; management, operation, and administration of the USDB confinement facility; and related programs which fall directly within the scope of the Commandant's functional area of command and control. (dd) The Commander, U.S. Army Community and Family Support Center (USACFSC) is authorized to act on requests for records pertaining to morale, welfare, recreation, and entertainment programs; community and family action programs; child development centers; non-appropriated funds issues, and private organizations on Army installations. (ee) The Commander, Military Surface Deployment and Distribution Command (formerly Military Traffic Management Command) is authorized to act on requests for records pertaining to military and commercial transportation and traffic management records. (ff) The Director, Installation Management Agency (IMA) is authorized to act on requests for all IMA records. (gg) Special Denial Authority's authority for time-event related records may be designated on a case-by-case basis. These will be published in the Federal Register . You may contact the Department of the Army, Freedom of Information and Privacy Office to obtain current information on special delegations. Appendix C to Part 505-Privacy Act Statement Format (a) Authority: The specific federal statute or Executive Order that authorizes collection of the requested information. (b) Principal Purpose(s): The principal purpose or purposes for which the information is to be used. (c) Routine Uses(s): Disclosure of the information outside DOD. (d) Disclosure: Whether providing the information is voluntary or mandatory and the effects on the individual if he or she chooses not to provide the requested information. (1) Example of a Privacy Act Statement: (i) Authority: Emergency Supplement Act of 2000; Public Law 106-246 ; 5 U.S.C. 3013 , Secretary of the Army; 10 U.S.C. 5013 , Secretary of the Navy; 10 U.S.C. 8013 , Secretary of the Air Force; Department of Defense Directive 8500.aa, Information Assurance (IA); and E.O. 9397 (SSN). (ii)

Principal Purpose(s):

It has been determined that Privacy Act rules for the Department of Defense are not significant rules. The rules do not (1) have an annual effect on the economy of \$100 million or more or adversely affect in a material way the economy; a sector of the economy; productivity; competition; jobs; the environment; public health or safety; or State, local, or tribal governments or communities; (2) create a serious inconsistency or otherwise interfere with an action taken or planned by another Agency; (3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients thereof; or (4) raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in this Executive order. C. Regulatory Flexibility It has been certified that Privacy Act rules for the Department of Defense do not have significant economic impact on a substantial number of small entities because they are concerned only with the administration of Privacy Act systems of records within the Department of Defense. D. Paperwork Reduction Act It has been certified that Privacy Act rules for the Department of Defense impose no information requirements beyond the Department of Defense and that the information collected within the Department of Defense is necessary and consistent with 5 U.S.C. 552a, known as the Privacy Act of 1974. E. Unfunded Mandates Reform Act It has been certified that the Privacy Act rulemaking for the Department of Defense does not involve a Federal mandate that may result in the expenditure by State, local and tribal governments, in the aggregate, or by the private sector, of \$100 million or more and that such rulemaking will not significantly or uniquely affect small governments. F. Executive Order 13132 (Federalism) It has been certified that the Privacy Act rules for the Department of Defense do not have federalism implications. The rules do not have substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. Robert Dickerson, Chief, U.S. Army Freedom of Information Act and Privacy Office. List of Subjects in 32 CFR Part 505 Privacy For reasons stated in the preamble the Department of the Army revises 32 CFR part 505 to read as follows: PART 505-ARMY PRIVACY ACT PROGRAM 505.1 General information. 505.2 General provisions. 505.3 Privacy Act systems of records. 505.4 Collecting personal information. 505.5 Individual access to personal information. 505.6 Amendment of records. 505.7 Disclosure of personal information to other agencies and third parties. 505.8 Training requirements. 505.9 Reporting requirements. 505.10 Use and establishment of exemptions. 505.11 Federal Register publishing requirements. 505.12 Privacy Act enforcement actions. 505.13 Computer Matching Agreement Program. 505.14 Recordkeeping requirements under the Privacy Act.

42 U.S.C. 1320d note); Sec. 4101 of ARRA, Public Law 111-5, 123 Stat. 467 (Feb. 17, 2009), amending sec. 1848 of the SSA (codified at 42 U.S.C. 1395w-4). In the context of surplus sales, it is the buyer's responsibility to adhere to export control laws and regulations. Therefore, the referenced paragraph has been deleted and a new paragraph (g) has been inserted to specify that disposition shall be in accordance with foreign and U.S. laws and regulations, including regulations involving export controls, host nation requirements, Final Governing Standards, and Government-to-Government agreements, and that the contractor's responsibility to comply with all applicable laws and regulations regarding export-controlled items exists independent of the information provided by the clause. The new language is consistent with the respondent's recommendation and current DFARS language at 252.204-7008. B. Inventory Schedules Comment: A respondent stated that the requirement at DFARS 245.602-1 for ·obtaining bills of material and reviewing recent purchases, and stock record entries· is not a part of the disposal process. The respondent commented that these duties require the plant clearance officer to have a working knowledge of every contract and that the process will drive up costs. DoD Response: The proposed language at 245.602-1 exists today in the current DFARS at 245.7201. The proposed rule moved 245.7201 to subpart 245.6, and renamed the subpart Reporting, Reutilization, and Disposal, to conform with the FAR; however, the language at DFARS 245.602-1 has been (printed page 52140) clarified to specify applicability only to termination inventory. Comment: In reference to DFARS 245.602-1, Inventory disposal schedules, a respondent asked for guidance on when a physical count was required and suggested ways of addressing efficiency. DoD response: Generally, the Government relies on quantity data provided by the contractor, and physical counts are usually required only if the plant clearance officer suspects data integrity issues; however, 245.602-1(2) has been clarified to specify potential methods of verifying quantities. Comment: A respondent was concerned about the requirement at 252.245-70XX(b)(1)(i)(A) and (B) to provide Federal Supply Codes (FSCs) and manufacturer name, because this information is not always available or known. DoD Response: The language at 252.245-7004(b)(1)(i)(A) and (B) has been modified in the final rule to require the FSC and manufacturer name only if the information is assigned and/or available. Comment: A respondent recommended that new definitions for the terms ·manufacturer name· and ·manufacturer part number· be added at the clause at 252.245-70XX. DoD response: These terms are used commonly; therefore, they have not been added to the definitions section of the clause. Comment: In reference to 252.245-70XX(b), Inventory disposal schedules, a respondent recommended that the supplier name and part number be required for all items in Federal condition code A1 being reported as excess on inventory schedules. DoD Response:

3. Explanation : This Standard specifies secure hash algorithms - SHA-1, SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224 and SHA-512/256 - for computing a condensed representation of electronic data (message). When a message of any length less than 2⁶⁴ bits (for SHA-1, SHA-224 and SHA-256) or less than 2¹²⁸ bits (for SHA-384, SHA-512, SHA-512/224 and SHA-512/256) is input to a hash algorithm, the result is an output called a message digest. The message digests range in length from 160 to 512 bits, depending on the algorithm. Secure hash algorithms are typically used with other cryptographic algorithms, such as digital signature algorithms and keyed-hash message authentication codes, or in the generation of random numbers (bits). The hash algorithms specified in this Standard are called secure because, for a given algorithm, it is computationally infeasible 1) to find a message that corresponds to a given message digest, or 2) to find two different messages that produce the same message digest. Any change to a message will, with a very high probability, result in a different message digest. This will result in a verification failure when the secure hash algorithm is used with a digital signature algorithm or a keyed-hash message authentication algorithm. This Standard specifies secure hash algorithms, SHA-1, SHA-224, SHA-256, SHA-384, SHA512, SHA-512/224 and SHA-512/256. All of the algorithms are iterative, one-way hash functions that can process a message to produce a condensed representation called a message digest . These algorithms enable the determination of a message's integrity: any change to the message will, with a very high probability, result in a different message digest. This property is useful in the generation and verification of digital signatures and message authentication codes, and in the generation of random numbers or bits.

. However, if an individual is denied any right, privilege, or benefit for which he would otherwise

be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (c)(7)(i)(A). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. (B) All portions of this system of records which fall within the scope of 5 U.S.C. 552a(k)(2) may be exempt from the provisions of 5 U.S.C. 552a(c)(3), (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I) and (f). (ii) Authority. 5 U.S.C. 552a(k)(2). (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would place the subject of an investigation on notice that they are under investigation and provide them with significant information concerning the nature of the investigation, thus resulting in a serious impediment to law enforcement investigations. (B) From subsections (d) and (f) because providing access to records of a civil or administrative investigation and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal their wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that would make them difficult or (printed page 14794) impossible to reach in order to satisfy any Government claim growing out of the investigation or proceeding. (C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsections (e)(4)(G) and (H) because there is no necessity for such publication since the system of records will be exempt from the underlying duties to provide notification about and access to information in the system and to make amendments to and corrections of the information in the system.

ications and environments in which cryptographic modules may be employed. The security requirements cover areas related to the secure design and implementation of a cryptographic module. These areas include cryptographic module specification; cryptographic module interfaces; roles, services, and authentication; software/firmware security; operating environment; physical security; non-invasive security; sensitive security parameter management; self-tests; life-cycle assurance; and mitigation of other attacks. This standard supersedes FIPS 140-2, Security Requirements for Cryptographic Modules, in its entirety.

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is a significant regulatory action and, therefore, was subject to review under section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804. V. Regulatory Flexibility Act A final regulatory flexibility analysis has been prepared consistent with the Regulatory Flexibility Act, 5 U.S.C. 601, et seq., and is summarized as follows: The objective of this final rule is to implement in the Defense Federal Acquisition Regulation Supplement protection against risks to the supply chain affecting National Security Systems (NSS). The legal basis for this final rule is section 806 of the National Defense Authorization Act (NDAA) for Fiscal Year (FY) of 2011 (Pub. L. 111-383), as amended by section 806 of the NDAA for FY 2013 (Pub. L. 112-239). Congress has recognized a growing concern for risks to the supply chain for technology contracts supporting the Department of Defense (DoD). Congress has defined supply chain risk as the risk that an adversary may sabotage, maliciously introduce unwanted function, or otherwise subvert the design, integrity, manufacturing, production, distribution, installation, operation, or maintenance of a covered system so as to surveil, deny, disrupt, or otherwise degrade the function, use, or operation of such system (see 806(e)(4) of Pub. L. 111-383). This final rule calls for contractors providing information technology to DoD, whether as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system, to mitigate supply chain risk to the supplies and services being provided to the Government. It also enables agencies to exclude sources identified as having a

supply chain risk from consideration for award of a covered contract, in order to minimize the potential risk for supplies and services purchased by DoD to maliciously degrade the integrity and operation of sensitive information technology systems. Ultimately, DoD anticipates significant savings to taxpayers by reducing the risk of unsafe products entering our supply chain, which pose serious threats or risks to sensitive government information technology systems. No comments were received in response to the initial regulatory flexibility analysis.

Between the late 1980s and early 2000s, the internet hosted very basic websites that were mostly comprised of text (often just plain text but sometimes with simple formatting), images, and hyperlinks to other webpages. As a result, this era has since been dubbed the 'static' or 'read-only' web. Most websites were hosted by large organizations, government agencies, internet service providers, or tech-savvy users who were allotted a small portion of web storage from their internet service provider or other web-hosting provider to develop their own 'home page.' Websites eventually began to create more designs and styles via Hypertext Markup Language (HTML) tables, which allowed developers to change the format of their page. During this period, there were also some 'dynamic' pages on the web that used the Common Gateway Interface (CGI) to execute code on the server and generate a static webpage to be delivered to the end user. There were little to no client-side manipulatable websites. Online communications were done through email, bulletin boards, and forums, and there was almost no online shopping. Since there was not a lot of user interaction, organizations did not host massive amounts of user data. Web3 utilizes existing internet technologies that make up much of the current web architecture, such as Transmission Control Protocol/Internet Protocol (TCP/IP), remote procedure call (RPC), and Transport Layer Security (TLS). It can also use existing web services, servers, databases, and webpages to act as an interface. Web3 applications can be designed to interact with (as both input to and utilize output from) existing systems. Like blockchain systems and cryptocurrency systems, Web3 leverages well-known technologies, such as publickey cryptography, digital signatures, and cryptographic hashing algorithms. - [20] Department of Financial Protection & Innovation (2023) Crypto Scam Tracker.

(c) The USD(P) will, in accordance with DoD Directive 5111.1, 'Under Secretary of Defense for Policy (USD(P))' (available at <http://www.dtic.mil/whs/directives/corres/pdf/511101p.pdf>), advise the USD(I) and DSS on the foreign relations and international security aspects of FOCI, including FGI, foreign disclosures of U.S. classified information, exports of defense articles and technical data, security arrangements for DoD international programs, North Atlantic Treaty Organization security, and international agreements. (d) The USD(AT&L) will, in accordance with DoD Directive 5134.01, 'Under Secretary of Defense for Acquisition, Technology and Logistics (USD(AT&L))' (available at <http://www.dtic.mil/whs/directives/corres/pdf/513401p.pdf>): (1) Advise the USD(I) on the development and implementation of NISP policies, in accordance with DoD Instruction 5220.22. (2) Ensure that DoD Components establish and maintain a record capturing the current and legitimate need for access to classified information by contractors in the Defense Industrial Base. (3) Ensure that acquisition elements of DoD Components comply with the applicable provisions of DoD 5220.22-M. (e) The Director, DoD SAP Central Office (SAPCO) will, in accordance with DoD Directive 5205.07, 'Special Access Program (SAP) Policy' (available at <http://www.dtic.mil/whs/directives/corres/pdf/520507p.pdf>), notify DSS of the existence of SAP equities when DSS considers the acceptability of a contractor's FOCI action plan. In addition, the Director, DoD SAPCO, will develop procedures for the consideration of a NID when a contractor cleared under a Special Security Agreement (SSA) requires access to an unacknowledged Special Access Program (SAP). (f) The Heads of the Components will: (1) Oversee compliance by GCA personnel with applicable procedures identified in this subpart. (2) Designate in writing an individual who is authorized to make decisions and provide a coordinated GCA position on FOCI matters to DSS within timelines established in this part. (3) Submit proposed changes to DoD 5220.22-M, as deemed appropriate, to the OUSD(I) Security Directorate. § 117.56 Foreign ownership, control or influence (FOCI). (a) General. This section provides guidance for and establishes procedures concerning the initial or continued FCL eligibility of U.S. companies and U.S. contractors with foreign involvement; provides criteria for determining whether U.S. companies are under FOCI; prescribes responsibilities in FOCI matters; and outlines security measures that DSS may consider to mitigate or negate the effects of FOCI to an acceptable level. As stated in DoD 5220.22-M, and in accordance with E.O. 12829 : (1) The Secretary of Defense serves as the Executive Agent for inspecting and monitoring contractors who require or will require access to, or who store or will store classified information.

FAR 4.403 is replaced with new content that provides instructions on the implementation of the CUI Program. The added language identifies the contracting officer's role in receiving and incorporating the SF XXX in solicitations and contracts and the contracting officer's responsibilities during contract administration. A new provision at FAR 52.204-WW, Notice of Controlled Unclassified Information Requirements, and new clauses at FAR 52.204-XX, Controlled Unclassified Information, and 52.204-YY, Identifying and Reporting Information That Is Potentially Controlled Unclassified Information, are also prescribed. The changes for FAR 4.403 include the following: Existing FAR 4.403 has been renumbered as FAR 4.402-2. The clause at FAR 4.404 was moved to a new FAR 4.402-3. FAR 4.403-1 adds definitions for ·CUI Basic,· ·CUI categories,· ·CUI Specified,· ·handling,· ·lawful Government purpose,· ·limited dissemination control,· and ·on behalf of an agency.· FAR 4.403-2 provides information on E.O. 13556 including that the E.O. establishes NARA as the executive agent for the CUI Program. FAR 4.403-3 gives the applicability of the SF XXX and the new FAR clauses 52.204-XX and 52.204-YY. FAR 4.403-4 outlines the CUI policy and requires that CUI involved in performance of a contract shall be identified on a SF XXX and incorporated into the contract. Unmarked or mismarked CUI is not considered a CUI incident unless the mismarking or lack of marking has resulted in the mishandling or improper dissemination of the information. Offerors are requested and contractors are required to notify the Government within an 8 hour timeframe if they discover or suspect information is CUI, but that CUI is not listed on an SF XXX or is not marked or properly marked. FAR 4.403-5 adds the usage of the SF XXX. The SF XXX itself has detailed instructions. FAR 4.403-6 provides that the agency point of contact to whom the contractor reports an incident is found in the SF XXX at Part C, Section IV. When the SF XXX is not used in a contract, the point of contact is identified in FAR 52.204-YY(b). FAR 4.403-6 explains that the SF XXX should list any special incident reporting requirements for CUI Specified. FAR 4.403-6 also adds that the contracting officer shall provide instructions to the contractor for submitting the system images, in accordance with agency procedures. FAR 4.403-6 also explains that the contractor is required to hold the system images for 90 days unless the Government declines interest.

Professional Backgrounds, Knowledge, Skills, and Development Activities Professional Backgrounds, Knowledge, Skills, and Development Activities There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST.

Two types of requirements are delineated for secure processing: (1) specific security feature requirements and; (2) assurance requirements. The latter enable evaluation personnel to determine if the required features are present and functioning as intended. The Orange Book forms the basis upon which the National Computer Security Center (NCSC) conducts its commercial computer security evaluation process. This process is focused on commercially produced and supported general-purpose operating system products that meet the needs of government departments and agencies. The evaluation is aimed at off-the-shelf products and is completely separate from any considerations of overall system performance, potential applications, or processing environments. The evaluation can provide a key input to a computer system security approval /accreditation . However, it does not constitute a complete computer system security study. A complete study must consider additional factors dealing with the system in its unique environment, such as its proposed security mode of operation, specific users, applications, data sensitivity, physical and personnel security, administrative security and communications security The Orange Book and Red Book criteria do not address all of the security concerns that arise when one actually deploys a system, whether it consists of a single computer or is composed of multiple computer and network products from different vendors. Procedural, physical and personnel safeguards enter into overall system security, and these are only partially addressed by these two documents. System security requires a thorough analysis of the system in question, taking into account not only the ratings of products that might be used to build the system, but also the threats directed against the system. Based on this analysis a security architecture can then be proposed and developed.

The Department of the Army will submit reports, consistent with the requirements of DOD 5400.11-R, OMB Circular A-130, and as otherwise directed by the Defense Privacy Office. Contact the DA FOIA/P Office for further guidance regarding reporting requirements. §505.10 Use and establishment of

exemptions. (a) Three types of exemptions. (1) There are three types of exemptions applicable to an individual's right to access permitted by the Privacy Act. They are the Special, General, and Specific exemptions. (2) Special exemption (d)(5)-Relieves systems of records from the access provision of the Privacy Act only. This exemption applies to information compiled in reasonable anticipation of a civil action or proceeding. (3) General exemption (j)(2)-Relieves systems of records from most requirements of the Act. Only Army activities actually engaged in the enforcement of criminal laws as their primary function may claim this exemption. (4) Specific exemptions (k)(1)-(k)(7)-Relieves systems of records from only a few provisions of the Act. (5) To find out if an exemption is available for a particular record, refer to the applicable system of records notices. System of records notices will state which exemptions apply to a particular type of record. System of records notices that are applicable to the Army are contained in DA Pam 25-51 (available at the Army Publishing Directorate Web site <http://www.usapa.army.mil/>), the Defense Privacy Office's Web site <http://www.defenselink.mil/privacy/>), or in this section). Some of the system of records notices apply only to the Army and the DOD and some notices are applicable government-wide. (6) Descriptions of current exemptions are listed in detail at appendix C of this part. (b) Exemption procedures. (1) For the General and Specific exemptions to be applicable to the (printed page 24507) Army, the Secretary of the Army must promulgate exemption rules to implement them. This requirement is not applicable to the one Special exemption which is self-executing. Once an exemption is made applicable to the Army through the exemption rules, it will be listed in the applicable system of records notices to give notice of which specific types of records the exemption applies to. When a system manager seeks to have an exemption applied to a certain Privacy Act system of records that is not currently provided for by an existing system of records notice, the following information will be furnished to the DA FOIA/P Office: (i) Applicable system of records notice; (ii) Exemption sought; and (iii) Justification. (2) After appropriate staffing and approval by the Secretary of the Army and the Defense Privacy Office, it will be published in the Federal Register as a proposed rule, followed by a final rule 60 days later. No exemption may be invoked until these steps have been completed. § 505.11 Federal Register publishing requirements. (a) The Federal Register.

(1) When a member of the public complies with the procedures in this part and DoD Component supplementing regulations for obtaining DoD records, and the request is received by the official designated to respond, the DoD Component shall endeavor to provide a final response determination within the statutory 20 working days (5 U.S.C. 552(a)(6)(A)(i)). If unusual circumstances prevent a final response determination within the statutory time period, the Component shall advise the requester of this in writing, and provide a new completion date, which shall be not later than an additional 10 working days. If the Component needs more than this 10-day extension, it will provide the requester an opportunity to narrow the scope of the request, or arrange for an alternative timeframe. (i) Unusual circumstances are: (A) The responsive documents are located at a facility geographically separated from the office processing the FOIA request. (B) The responsive documents are voluminous. (printed page 71850) (C) One or more other outside agencies have a substantial interest in either the determination or the subject matter of the request, requiring the DoD Component processing the request to consult with the other agencies. This would include the submitter notice process (§ 286.18(d)(1)(i)(A)). (ii) A final response determination is notification to the requester that the records are released, or that the records cannot be provided for one or more of the reasons in § 286.13. Interim responses acknowledging receipt of the request are encouraged, as are negotiations with the requester concerning the scope of the request, the response timeframe, and the fee agreement. Such communications do not, however, constitute a final response determination. (2) If a request fails to meet the minimum requirements of this part, the DoD Component shall inform the requester how to perfect or correct the request. The statutory 20-working day time limit applies upon receipt of a perfected or correct FOIA. (d) Use of exemptions. It is DoD policy (32 CFR part 285) to make records publicly available, unless the record or portions thereof qualify for withholding under one or more of the 9 exemptions. (e) Waiver of exemptions. Records released under the authority of this part are considered to be in the public domain. The disclosure of exempt records without authorization by the appropriate DoD official is not considered a FOIA release. Such a release does not waive the Department of Defense's authority to assert FOIA exemptions to withhold the same records in response to a FOIA request. Also, while authority may exist to disclose records to individuals in their official capacity, the provisions of this part apply if the same individual seeks the records in a private or personal capacity. (f) Creating a record.

Historically, regulated entities relied on combinations of usernames and passwords to identify users and authenticate users to the system. We recognize that such combinations are insufficient to secure sensitive information and that more sophisticated mechanisms for doing so have been developed. As a best practice for managing cyber threats, most cybersecurity frameworks, including those discussed above, recommend that organizations adopt solutions that rely on multiple factors to identify and authenticate users. For example, the HHS 405(d) Program's 'Health Industry Cybersecurity Practices: Managing Threats and Protecting Patients' [363] recommends a layered approach to cyber defense (i.e., if a first layer is breached, a second exists to prevent a complete breach). [364] It further provides that MFA as a source of identity and access security control is an important means to control access to infrastructure and conduct proper change management control. [365] The Department's CPGs [366] identify MFA as an essential goal and a critical, additional layer of security for the protection of assets and accounts that are directly accessible from the internet. [367] The Department has also explained in guidance that weak authentication processes leave organizations vulnerable to intrusion, while effective authentication ensures that only authorized entities may access information systems and data. [368] Additionally, CISA has issued recommendations for implementing MFA, specifically MFA solutions that are phishing resistant to protect against disclosures of authentication data to a bad actor. [369]

b. Proposal The Department proposes to define the term 'Multi-factor authentication' to provide regulated entities with a specific level of authentication for accessing relevant electronic information systems. [370] Regulated entities would be required to apply this proposed definition when implementing the proposed rule's specific requirements for authenticating users' identities through verification of at least two of three categories of factors of information about the user. The proposed categories would be: Information known by the user, including but not limited to a password or personal identification number (PIN). Item possessed by the user, including but not limited to a token or a smart identification card. Personal characteristic of the user, including but not limited to fingerprint, facial recognition, gait, typing cadence, or other biometric or behavioral characteristics. MFA relies on the user presenting at least two factors. Authentication that relies on multiple instances of the same factor, such as requiring a password and PIN, is not MFA because both factors are 'something you know.' [371] For example, where MFA is deployed, users could seek access by entering a password. However, without the entry of at least a second factor such as a token [372]

. However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (e)(6)(i)(B). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k) (2) from the following subsections of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (H) and (I), and (f). (ii) Authority. 5 U.S.C. 552a(j)(2) and (k)(2) . (iii) Reasons. (A) From subsection (c)(3) because the release of accounting of disclosure would inform a subject that he or she is under investigation. This information would provide considerable advantage to the subject in providing him or her with knowledge concerning the nature of the investigation and the coordinated investigative efforts and techniques employed by the cooperating agencies. This would greatly impede the Air Force IG's criminal law enforcement. (B) From subsection (c)(4) and (d), because notification would alert a subject to the fact that an open investigation on that individual is taking place, and might weaken the ongoing investigation, reveal investigative techniques, and place confidential informants in jeopardy. (C) From subsection (e)(1) because the nature of the criminal and/or civil investigative function creates unique problems in prescribing a specific parameter in a particular case with respect to what information is relevant or necessary. Also, information may be received which may relate to a case under the investigative jurisdiction of another agency. The maintenance of this information may be necessary to provide leads for appropriate law enforcement purposes and to establish patterns of activity that may relate to the jurisdiction of other cooperating agencies. (D) From subsection (e)(2) because collecting information to the fullest extent possible directly from the subject individual may or may not be practical in a criminal and/or civil investigation. (E) From subsection (e)(3) because supplying an individual with a form containing a Privacy Act Statement would tend to inhibit cooperation by many individuals involved in a criminal and/or civil investigation. The effect would be somewhat adverse to established investigative methods and techniques. (F) From subsections (e)(4)(G), (H), and (I) because this system of records is exempt

from the access provisions of subsection (d) and (f).

(A) Granting individuals access to portions of these records pertaining to or consisting of, but not limited to, disciplinary reports, criminal investigations, and related statements of witnesses, and such other related matter in conjunction with the enforcement of criminal laws, could interfere with the orderly investigations, with the orderly administration of justice, and possibly enable suspects to avoid detection or apprehension. Disclosure of this information could result in the concealment, destruction, or fabrication of evidence, and jeopardize the safety and well-being of informants, witnesses and their families, and law enforcement personnel and their families. Disclosure of this information could also reveal and render ineffectual investigative techniques, sources, and methods used by these components and could result in the invasion of the privacy of individuals only incidentally related to an investigation. The exemption of the individual's right of access to portions of these records, and the reasons therefore, necessitate the exemption of this system of records from the requirement of the other cited provisions. (B) [Reserved] (5) System identifier and name. N01754-3, Navy Child Development Services Program. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (B) Portions of this system of records are exempt from the following subsections of the Privacy Act: (c)(3) and (d). (ii) Authority. 5 U.S.C. 552a(k)(2) . (iii) Reasons. (A) Exemption is needed in order to encourage persons having knowledge of abusive or neglectful acts toward children to report such information, and to protect such sources from embarrassment or recrimination, as well as to protect their right to privacy. It is essential that the identities of all individuals who furnish information under an express promise of confidentiality be protected. Additionally, granting individuals access to information relating to criminal and civil law enforcement, as well as the release of certain disclosure accountings, could interfere with ongoing investigations and the orderly administration of justice, in that it could result in the concealment, alteration, destruction, or fabrication of information; could hamper the identification of offenders and the disposition of charges; and could jeopardize the safety and well being of parents and their children. (B) [Reserved] (6) System identifier and name. N03834-1, Special Intelligence Personnel Access File. (i) Exemption. (A) Information specifically authorized to be classified under E.O. 12958

The CMMC Program is intended to: (1) align cybersecurity requirements to the sensitivity of unclassified information to be protected, and (2) add a certification element, where appropriate, to verify implementation of cybersecurity requirements. As part of the program, DoD also intends to provide supporting resources and training to defense contractors to help support companies who are working to achieve the required CMMC Status. The CMMC Program provides for assessment at three levels: basic safeguarding of FCI at CMMC Level 1, broad protection of CUI at CMMC Level 2, and enhanced protection of CUI against risk from Advanced Persistent Threats (APTs) at CMMC Level 3. The CMMC Program is designed to provide increased assurance to the Department that a defense contractor can adequately protect FCI and CUI in accordance with prescribed security requirements, accounting for information flow down to its subcontractors in a multi-tier supply chain. The CMMC Program addresses DoD's need to protect FCI and CUI during the acquisition and sustainment of products (printed page 83173) and services from the DIB. This effort is instrumental in establishing cybersecurity as a foundation for future DoD acquisition. Although DoD contract requirements to provide adequate security for covered defense information (reflected in DFARS clause 252.204-7012) predate CMMC by many years, a certification requirement for the handling of CUI to assess a contractor or subcontractor's compliance of those required information security controls is new with the CMMC Program. Findings from DoD Inspector General report [36] indicate that DoD contractors did not consistently implement mandated system security requirements for safeguarding CUI and recommended that DoD take steps to assess a contractor's ability to protect this information. The report emphasizes that malicious actors can exploit the vulnerabilities of contractors' networks and systems and exfiltrate information related to some of the Nation's most valuable advanced defense technologies. Currently, the FAR and DFARS prescribe contract clauses intended to protect FCI and CUI. Specifically, the clause at FAR 52.204-21, Basic Safeguarding of Covered Contractor Information Systems , is prescribed at FAR 4.1903 for use in Government solicitations and contracts when the contractor or a subcontractor at any tier may have FCI residing in or transiting through its information system(s). This clause requires contractors and

subcontractors to implement basic safeguarding requirements and procedures to protect FCI being processed, stored, or transmitted on contractor information systems. In addition, DFARS clause 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting

This rule applies to contractors providing the Government with information technology that qualifies as a covered system or covered item of supply. This includes purchases of commercial items, including commercial off-the-shelf items, and contracts not greater than the simplified acquisition threshold. While it is not possible to estimate the number of small businesses impacted, DoD does not expect this final rule to have a significant economic impact on a substantial number of contractors, since (1) the rule applies only when acquiring information technology that is part of a covered system or in support of a covered system and (2) the authority provided by the rule is expected to be invoked very infrequently. This rule does not require any specific reporting, recordkeeping or compliance requirements. No significant economic impact on small businesses is anticipated; however, the final rule does have a modified applicability for the provision and clause created by the rule. Instead of being prescribed for all information technology acquisitions the provision and clause will only apply to acquisitions for information technology that is a covered system or covered item of supply. This will significantly reduce the number of acquisitions to which the provision and clause will apply.

VI. Paperwork Reduction Act The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). List of Subjects in 48 CFR Parts 202 , 208 , 212 , 213 , 214 , 215 , 233 , 239 , 244 , and 252 Government procurement

Jennifer L. Hawes, Editor, Defense Acquisition Regulations System. Accordingly, DoD adopts as final the interim rule published at 78 FR 69268 on November 18, 2013, with the following changes:

1. The authority citation for 48 CFR parts 202 , 208 , 212 , 213 , 214 , 215 , 239 , 244 , and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1 .

PART 202-DEFINITIONS OF WORDS AND TERMS

2. Amend section 202.101 by adding, in alphabetical order, a definition for ·Information technology· to read as follows: 202.101 Definitions. * * * * *

Information technology (see 40 U.S.C. 11101(6)) means, in lieu of the definition at FAR 2.1, any equipment, or interconnected system(s) or subsystem(s) of equipment, that is used in the automatic acquisition, storage, analysis, evaluation, manipulation, management, movement, control, display, switching, interchange, transmission, or reception of data or information by the agency. (1) For purposes of this definition, equipment is used by an agency if the equipment is used by the agency directly or is used by a contractor under (printed page 67251) a contract with the agency that requires· (i) Its use; or (ii) To a significant extent, its use in the performance of a service or the furnishing of a product.

Section 170.1 addresses the purpose of this rule. It describes the CMMC Program and establishes policy for requiring the protection of FCI and CUI that is processed, stored, or transmitted on defense contractor and subcontractor information systems. The security standards utilized in the CMMC Program are from the FAR clause 52.204-21; DFARS clause 252.204-7012 that implements NIST SP 800-171 R2; and selected requirements from the NIST SP 800-172 Feb2021, as applicable. The purpose of the CMMC Program is for contractors and subcontractors to demonstrate that FCI and CUI being processed, stored, or transmitted is adequately safeguarded through the methodology provided in the rule.

Section 170.2-Incorporation by Reference Section 170.2 addresses the standards and guidelines that are incorporated by reference. The Director of the Federal Register under 5 U.S.C. 552(a) and 1 CFR part 51 approves any materials that are incorporated by reference. Materials that are incorporated by reference in this rule are reasonably available. Information on how to access the documents is detailed in §170.2. Materials that are incorporated by reference in this rule are from the NIST (see §170.2(a)), the Committee on National Security Systems (see §170.2(b)), and the International Organization for Standardization/International Electrotechnical Commission (ISO/IEC) (see §170.2(c)) which may require payment of a fee. Note: While the ISO/IEC standards are issued jointly, they are available from the ISO Secretariat (see §170.2(c)). The American National Standards Institute (ANSI) IBR Portal provides access to standards that have been incorporated by reference in the U.S. Code of Federal Regulations at <https://ibr.ansi.org> . These standards incorporated by the U.S. government in rulemakings are offered at no cost in ·read only· format and are presented for online reading. There are no print or download options. All users will be required to install the FileOpen plug-in and accept an online end user license agreement prior to accessing any standards. The materials that are incorporated by reference are summarized below.

(ii) The foreign government is currently exercising, or could prospectively exercise, that power,

whether directly or indirectly, such as: (A) Through ownership of the U.S. entity's securities, by contractual arrangements, or other means, or; (B) By the ability to control or influence the election or appointment of one or more members to the entity's governing board. (2) When the CSA has determined that an entity is under FOCI, the primary consideration will be the protection of classified information. The CSA will take whatever action is necessary to protect classified information, in coordination with other affected agencies as appropriate. (3) A U.S. entity that is in process for an entity eligibility determination for access to classified information and subsequently determined to be under FOCI is ineligible for access to classified information unless and until effective security measures have been put in place to negate or mitigate FOCI to the satisfaction of the CSA. (4) When a contractor determined to be under FOCI is negotiating an acceptable FOCI mitigation or negation measure in good faith, an existing entity eligibility determination may continue in effect so long as there is no indication that classified information is at risk of compromise in consultation with the applicable GCA. The applicable CSA may decide that circumstances involving the FOCI are such that the entity eligibility determination will be invalidated until implementation of an acceptable FOCI mitigation plan. (5) An existing entity eligibility determination will be invalidated if the contractor is unable or unwilling to negotiate and implement an acceptable FOCI mitigation or negation measure. An existing entity eligibility determination will be revoked if security measures cannot be taken to remove the possibility of unauthorized access to classified information or adverse effect on performance of classified contracts. (6) Changed conditions, such as a change in ownership, indebtedness, or a foreign intelligence threat, may justify certain adjustments to the security terms under which an entity is operating or, alternatively, that a different FOCI mitigation or negation method be employed. If a changed condition is of sufficient significance, it might also result in a determination that a contractor is no longer considered to be under FOCI, or, conversely, that a contractor is no longer eligible for access to classified information. (7) The USG reserves the right, and has the obligation, to impose any security method, safeguard, or restriction (including denial, termination or revocation of an entity eligibility determination) it believes necessary to ensure that unauthorized access to classified information is effectively precluded and performance of classified contracts is not adversely affected.

DISCUSSION Integrated analysis of audit records requires that the analysis of information NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 generated by scanning, monitoring, or other data collection activities is integrated 894

The National Institute of Standards and Technology (NIST) and the National Security Agency (NSA) initiated a joint project in Computer Network Security in 1984. The project was based on the recognition that a comprehensive set of security mechanisms is needed to provide cost effective access control to data in geographically distributed computer networks. While the detailed security mechanisms can differ between the classified and unclassified communities requiring security, both communities benefit when commercial computer networks are developed with a common security architecture. The NSA initiated the Secure Data Network System (SDNS) program in 1986 as a result, at least partially, of this joint project. - (1) Data Integrity, - (2) Data Confidentiality, - (3) Data Origination Authentication, and - (4) Access Control. | Index | Service Element | Status | Support | Support |

The identification of information processed on an information system is essential to the proper selection of security controls and ensuring the confidentiality, integrity, and availability of the system and its information. The National Institute of Standards and Technology (NIST) Special Publication (SP) 800-60 has been developed to assist Federal government agencies to categorize information and information systems. Security categorization provides a vital step in integrating security into the government agency's business and information technology management functions and establishes the foundation for security standardization amongst their information systems. Security categorization starts with the identification of what information supports which government lines of business, as defined by the Federal Enterprise Architecture (FEA). Subsequent steps focus on the

evaluation of the need for security in terms of confidentiality, integrity, and availability. The result is strong linkage between missions, information, and information systems with cost effective information security. Federal agencies are heavily dependent upon information and information systems to successfully conduct critical missions. With an increasing reliability on and growing complexity of information systems as well as a constantly changing risk environment, information security has become a mission-essential function. This function must be conducted in a manner that reduces the risks to the information entrusted to the agency, its overall mission, and its ability to do business and to serve the American public. In the end, information security, as a function, becomes a business enabler through diligent and effective management of risk to information confidentiality, integrity, and availability.

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft)
Enhanced Security Requirements for Protecting CUI September 2025 Organizations can create rules based on specified attributes and the authorizations 579

, 531 U.S. 159 (2001).) The agency has considered the relevant provisions of the Bioterrorism Act, the comments submitted on this issue, FDA's responsibilities in implementing the Bioterrorism Act, and the law interpreting the Commerce Clause of the Constitution (Article I, section 8). Based on these considerations, FDA is retaining § 1.326(b) as proposed, with the result that all persons that manufacture, process, pack, transport, distribute, receive, hold, or import food in the United States (unless otherwise exempt) must establish and maintain records, even if food from the facility does not enter interstate commerce. The plain language of new section 414 of the FD&C Act does not exclude a facility from recordkeeping because food from such facility does not enter interstate commerce. Notably, sections 301 and 304 (21 U.S.C. 331 and 334) of the FD&C Act demonstrate that Congress has included a specific interstate commerce nexus (e.g., has explicitly required interstate commerce) in the provisions of the FD&C Act when that is its intent. Accordingly, it is reasonable to interpret the Bioterrorism Act as not limiting recordkeeping only to those persons with a direct connection to interstate commerce. Congress's power to legislate under the Commerce Clause is very broad. We acknowledge that such power is not without limits, see *United States v. Lopez*, 514 U.S. 549, 567 (1995); *U.S. v. Morrison*, 529 U.S. 598, 618 (2000), but these limits have to be construed in light of relevant and enduring precedents. In particular, in *Lopez*, supra, the Supreme Court acknowledged the continuing vitality of *Wickard v. Filburn*, 317 U.S. 111 (1942), noting that: *** although *Filburn's* own contribution to the demand for wheat may have been trivial by itself, that was not enough to remove him from the scope of federal regulation where, as here, his contribution, taken together with that of many others similarly situated, is far from trivial.*** (*Lopez*, 514 U.S. at 556.) This principle applies squarely to the recordkeeping provision of the Bioterrorism Act. Accordingly, given the collective impact on commerce of intrastate manufacturing, processing, packing, transporting, distributing, receiving, or holding of food in the United States, FDA has concluded that the requirement to establish and maintain records should apply regardless of whether the food enters interstate commerce. Thus, FDA is retaining § 1.326(b) as proposed. See also response to comment 82 below for an expanded discussion of the collective impact on commerce of intrastate transportation of food. This is consistent with section 709 of the FD&C Act (21 U.S.C. 379a

The CMMC rule made no change to the FAR cost allowability or cost accounting standards. The 7% discount rate is not a discount for organizations; it is a part of a formula used in the regulatory impact analysis (RIA) calculations. When calculating 20 years in the future, a discount rate is used to determine the net present value of money. The cost estimate represents derived estimates based on internal expertise and public feedback in accordance with OMB Circular A-4: Regulatory Impact Analysis: A Primer. Step 7 in the manual explains discount rates. As written, this rule amply provides for the flexibility sought by the (printed page 83198) commenter. Rule section § 170.21 specifically addresses the flexibility to have a Plan of Action and Milestones (POA&M) to delay meeting certain requirements subject to CMMC assessment for up to 180 days. In addition, DFARS clause 252.204-7012 already permits contractors to request DoD CIO permission to utilize alternative security measures to those prescribed by NIST SP 800-171. If an OSC previously received a favorable adjudication from the DoD CIO for an alternative security measure, the DoD CIO adjudication must be included in the system security plan to receive consideration during an assessment. Implemented security measures adjudicated by the DoD CIO as equally effective are assessed as MET if there have been no changes in the environment. 3. CMMC Model. Some commenters claimed that the requirement for all subcontractors of Level 3 prime contractors to be at least Level 2 certified, regardless of

what work they do, will generate more demand for Level 2 assessments than the Department is anticipating. Since much of DoD's contract dollars flow through a relatively small number of companies, it is likely those companies will have at least one CMMC Level 3 project. The result would be Level 2 certification requirements being flowed down to nearly the entirety of the DIB. Some commenters believed this to be an unintended consequence of implementing the enhanced protection of CMMC Level 3. DoD Response: It is possible the commenters misunderstood § 170.23 Application to subcontractors in the rule. § 170.23(a)(4) states: "If a subcontractor will process, store, or transmit CUI in performance of the subcontract and the associated prime contractor has a requirement for the CMMC Status of Level 3 (DIBCAC), then the CMMC Status of Level 2 (C3PAO) is the minimum requirement for the subcontractor." The commenter's phrase "regardless of what work they do" does not acknowledge the fact that the Level 2 certification assessment is required for subcontractors who process, store, or transmit CUI.

To request more information on this proposed information collection or to obtain a copy of the proposal and associated collection instruments, please write to the Defense Acquisition Regulations System, Attn: Ms. Amy G. Williams, OUSD(A&S)DPC/DARS, Room 3B941, 3060 Defense Pentagon, Washington, DC 20301-3060, or email osd.dfars@mail.mil. Include DFARS Case 2019-D002 in the subject line of the message. List of Subjects in 48 CFR Parts 204, 232, and 252 Government procurement Jennifer Lee Hawes, Regulatory Control Officer, Defense Acquisition Regulations System. Therefore, 48 CFR parts 204, 232, and 252 are proposed to be amended as follows: 1. The authority citation for 48 CFR parts 204, 232, and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1. PART 204-ADMINISTRATIVE MATTERS 2. Amend section 204.1202 by: a. Revising the section heading; b. Redesignating paragraph (2)(xiii) as (2)(xiv); and c. Adding a new paragraph (2)(xiii). The revision and addition read as follows: 204.1202 Solicitation provision and contract clause. * * * * * (2) * * * (xiii) 252.232-70XX, Performance-Based Payments-Representation. * * * * * PART 232-CONTRACT FINANCING 3. In section 232.1001, revise paragraph (a) to read as follows: 232.1001 Policy. (a) In accordance with 10 U.S.C. 2307(b)(2), performance-based payments shall not be conditioned upon costs incurred in contract performance, but on the achievement of performance outcomes. Private sector companies, including nontraditional defense contractors, are eligible for performance-based payments, consistent with best commercial practices. * * * * * 4. Revise section 232.1003-70 to read as follows: 232.1003-70 Criteria for use. In accordance with 10 U.S.C. 2307(b), the output of a contractor's accounting system shall be in compliance with Generally Accepted Accounting Principles, as evidenced by audited financial statements, in order to receive performance-based payments. 10 U.S.C. 2307 does not grant the Defense Contract Audit Agency the authority to audit compliance with Generally Accepted Accounting Principles. 5. Amend section 232.1005-70 by: a. Designating the introductory text as paragraph (a); (printed page 18224) b. Redesignating paragraphs (a) and (b) as paragraphs (a)(1) and (2), respectively; and c. Adding a new paragraph (b). The addition reads as follows: 232.1003-70 Criteria for use. * * * * * (b) Use the provision at 252.232-70XX, Performance-Based Payments-Representation, in solicitations where the resulting contract may include performance-based payments. PART 252-SOLICITATION PROVISIONS AND CONTRACT CLAUSES 6. Amend section 252.204-7007 by: a. Removing the provision date of (APR 2018) and adding (DATE) in its place; and b. Adding paragraph (d)(2)(vi) to read as follows: 252.204-7007 Alternate A, Annual Representations and Certifications. * * * * * (d) * * * (2) * * * (vi) 252.232-70XX, Performance-Based Payments-Representation. * * * * * 7. Amend section 252.232-7012 by: a. In the clause introductory text, removing 232.1005-70(a) and adding 232.1005-70(a)(1) in its place; b.

Note 1 to paragraph (c)(13)(i)(A). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. (B) All portions of this system of records which fall within the scope of 5 U.S.C. 552a(k)(2) may be exempt from the provisions of 5 U.S.C. 552a(c)(3), (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I) and (f). (ii) Authority. 5 U.S.C. 552a(k)(2). (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would place the subject of an investigation on notice that they are under investigation and provide them with significant information concerning the nature of the investigation, thus resulting in a serious impediment to law enforcement investigations. (B) From subsections (d) and (f) because providing access to records of a civil or administrative investigation and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access

rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal their wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that would make them difficult or impossible to reach in order to satisfy any Government claim growing out of the investigation or proceeding. (C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsections (e)(4)(G) and (H) because there is no necessity for such publication since the system of records will be exempt from the underlying duties to provide notification about and access to information in the system and to make amendments to and corrections of the information in the system. (E) From subsection (e)(4)(I) because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. NSA will, nevertheless, continue to publish such a notice in broad generic terms, as is its current practice. (14) System identifier and name. GNSA 17, Employee Assistance Service (EAS) Case Record System. (i) Exemption.

SWID tags support the identification of installed patches, extensible metadata attributes, and software integrity measurement data not supported by CPE. Through these additional capabilities, SWID tags can support more comprehensive software inventory (including patch details), tamper detection, and application whitelisting. Through the fine-grained identification of software products and patches using SWID tags, improved automation of vulnerability and configuration management is possible in SCAP v2. NIST Internal Report (NISTIR) 8060 [5], provides details on the SWID tag format and discussion of the SWID tag operational model, which is intended to be used as part of SCAP v2.

The CAICO is responsible to ensure the separation of duties for individuals volunteering to assist with testing, training, and certification activities. An example of separation of duties is shown in § 170.12(b)(6), which specifies that a CCI cannot be involved in examination activities. DoD modified § 170.8(b)(17)(ii)(G) to add that a consultant is only limited from participation in the assessment process for 36 months. CMMC Ecosystem members do not participate in an assessor capacity on DIBCAC assessments. The DoD declined to add explicit requirements prohibiting ecosystem members from participating in an assessment of an OSC by whom they were previously employed (directly or as a consultant), because the scenario is already covered under § 170.8(b)(17)(ii)(G). DoD disagreed with the comments that a CMMC Ecosystem member is unable to avoid perceived conflicts of interest. The Accreditation Body is required to provide a CoI policy in § 170.8(b)(17) for CMMC Ecosystem members. The Department expects that a reasonable person subject to the CoI policy should understand how to avoid the appearance of conflicts of interest and, if unsure, seek clarity from the Accreditation Body. Details of the disclosure requirements are in the Accreditation Body conflict of interest policy. A satisfactory record of integrity and business ethics is a record that does not indicate derogatory behavior in relation to professional conduct or conflict of interest. The DoD declined to remove the 10-day re-evaluation deadline in §§ 170.17(c)(2) and 170.18(c)(2) to ensure consistency in the assessment process. The OSC may utilize the appeals process, as necessary. The DoD is required to codify CMMC program requirements through a prescribed and formal rulemaking process. The timeline for CMMC implementation changed due in part to DoD's decision to pause and assess the program, seek opportunities to streamline and ease the burden of its implementation, and respond to public comments. The DoD declines to respond to speculative or editorial comments regarding the actions of private citizens, which are not within the scope of this rule. g. Ecosystem Eligibility 1. Foreign Ownership Comment: Two comments noted the rule does not include Foreign Ownership, Control, or Influence (FOCI) requirements for the CAICO. One comment recommended the rule incorporate the definition of the 'national technology and industrial base' and exclude those companies from FOCI requirements. The NTIB includes organizations from the United States, the United Kingdom of Great Britain and Northern Ireland, Australia, New Zealand, and Canada that are engaged in research, development, production, integration, services, or information technology activities. Response:

SECRET cleared contractor personnel under DoD security cognizance and the estimated trips at .89 per

traveler is $(905,818 \times .89 = 813,054)$ estimated trips). Assuming the ratio for those employees reporting foreign travel into APACS is the same as cleared employees would report, of the estimated 813,054 foreign trips by cleared employees, it can be estimated that approximately 181,262 (22.3% of 813,054) will be taken by contractors at small entities, and 631,792 (77.7% of 813,054) by contractors at non-small businesses. It is estimated that it will take a half an hour for a cleared employee to report foreign travel in 2021 and in each of the following years up to year 20 to report foreign travel and receive any pre-travel or post-travel briefings. The estimated average labor rate for a cleared employee to report foreign travel is the equivalent of a GS11 step 5. These assumptions imply costs increasing from \$16.81 to \$19.25 million in each year one through 20.

2. Projected Public Costs. Based on the re-evaluation of the cost of training cleared employees on foreign travel reporting and submissions, the estimated public costs are present value costs of \$267.4 million, which includes the additional foreign travel reporting cost.

3. Updated Baseline Cost. With this increase for the foreign travel reporting, DoD's updated enterprise industrial security baseline cost is estimated not to exceed \$1.753 billion (\$1.486 billion plus \$267.4 million).

Regulatory Analysis Executive Order 12866 , ·Regulatory Planning and Review· and Executive Order 13563 , ·Improving Regulation and Regulatory Review· Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distribute impacts, and equity). Executive Order 13563 emphasizes the importance of quantifying both costs and benefits, reducing costs, harmonizing rules, and promoting flexibility. It has been determined that this rule is a significant regulatory action. Accordingly, the rule has been reviewed by the Office of Management and Budget (OMB) under the requirements of these Executive Orders.

Congressional Review Act This rule is not a ·major rule· as defined by 5 U.S.C. 804(2) . Public Law 96-354, ·Regulatory Flexibility Act· (5 U.S.C. Chapter 6) The Under Secretary of Defense for Intelligence and Security, pursuant to a delegation of authority from the Secretary of Defense, certifies that this rule will not, if promulgated, have a significant economic impact on a substantial number of small business entities in accordance with the Regulatory Flexibility Act (5 U.S.C. 601) requirements since a contractor cleared legal entity may, in entering into contracts requiring access to classified information, negotiate for security costs determined to be properly chargeable by a Government Contracting Activity.

about cybersecurity work. It expresses that work as Task statements and describes Knowledge and Skill statements that provide a foundation for learners including students, job seekers, and employees. The use of these statements helps students to develop skills, job seekers to demonstrate competencies, and employees to accomplish tasks. As a common, consistent lexicon that categorizes and describes cybersecurity work, the NICE Framework improves communication about how to identify, recruit, develop, and retain cybersecurity talent. The NICE Framework is a reference source from which organizations or sectors can develop additional publications or tools that meet their needs to define or provide guidance on different aspects of cybersecurity education, training, and workforce development.

means types of assets considered Specialized Assets for CMMC: Government Furnished Equipment, Internet of Things (IoT) or Industrial Internet of Things (IIoT), Operational Technology (OT), Restricted Information Systems, and Test Equipment. (CMMC-custom term) Subcontractor is defined in 48 CFR 3.502-1 . Supervisory Control and Data Acquisition (SCADA) means a generic name for a computerized system that is capable of gathering and processing data and applying operational controls over long distances. Typical uses include power transmission and distribution and pipeline systems. SCADA was designed for the unique communication challenges (e.g., delays, data integrity) posed by the various media that must be used, such as phone lines, microwave, and satellite. Usually shared rather than dedicated, as defined in NIST SP 800-82 Rev 2 (incorporated by reference, see §170.2). System Security Plan (SSP) means the formal document prepared by the information system owner (or common security controls owner for inherited controls) that provides an overview of the security requirements for the system and describes the security controls in place or planned for meeting those requirements. The plan can also contain as supporting appendices or as references, other key security-related documents such as a risk assessment, privacy impact assessment, system interconnection agreements, contingency plan, security configurations, configuration management plan, and incident response plan, as defined in CNSSI 4009 (incorporated by reference, see §170.2). Test Equipment means hardware and/or associated IT components used in the testing of products, system components, and contract deliverables. (CMMC-custom term) User means an individual, or (system) process acting on behalf of an individual, authorized to access a system, as defined in NIST SP 800-53 Rev 5, (incorporated by reference, see §170.2). §170.5 Policy. (a) Protection of FCI and CUI on contractor information systems is of paramount importance to the DoD and can directly impact its ability to successfully conduct essential missions and functions. It is DoD policy that defense contractors and subcontractors shall be required to safeguard FCI and CUI that is processed, stored, or transmitted on contractor information systems by applying specified security requirements. In addition, Defense contractors and subcontractors may be required to implement additional safeguards defined in NIST SP 800-172 (printed page 89123)

DoD has considered previous comments from Small Business Administration (SBA) regarding the impact and cost to small businesses to implement CMMC. In July 2022, the CMMC PMO met with the Office of Advocacy for the U.S. SBA to address the revisions planned in CMMC that are responsive to prior SBA concerns, with which the SBA was satisfied. An Initial Regulatory Flexibility Analysis that includes a detailed discussion and explanation about the assumptions and methodology used to estimate the cost of this regulatory action on small entities follows and is available at www.regulations.gov (search for ·DoD-2023-OS-0063,· click ·Open Docket,· and view ·Supporting Documents·). This final regulatory flexibility analysis has been prepared consistent with 5 U.S.C. 603 . D. Final Regulatory Flexibility Analysis This final regulatory flexibility analysis has been prepared consistent with 5 U.S.C. 604(a) . Reasons for the Action This final rule is necessary to create a secure and resilient supply chain, by addressing threats to the U.S. economy and national security from ongoing malicious cyber activities and preventing theft of hundreds of billions (printed page 83194) of dollars of U.S. intellectual property. The President's Executive Order (E.O.) 14028, ·Improving the Nation's Cybersecurity,· [60] emphasized that industrial security needs strengthening to ensure investments are not lost through intellectual property theft or among other supply chain risks. Currently, the Federal Acquisition Regulation

(FAR) and Defense Federal Acquisition Regulation Supplement (DFARS) prescribe contract clauses intended to protect Federal Contract Information (FCI) and Controlled Unclassified Information (CUI) within the Department of Defense (DoD) supply chain. Specifically, the clause at FAR clause 52.204-21, Basic Safeguarding of Covered Contractor Information Systems, is prescribed at FAR 4.1903 for use in Government solicitations and contracts when the contractor or a subcontractor at any tier may have FCI residing in or transiting through its information system. The FAR clause focuses on ensuring a basic level of cybersecurity hygiene and is reflective of actions that a prudent businessperson would employ.

(c) System Name: Use a short, specific, plain language title that identifies the system's general purpose (limited to 55 characters). (d) System Location: Specify the address of the primary system and any decentralized elements, including automated data systems with a central computer facility and input or output terminals at separate locations. Use street address, 2-letter state abbreviations and 9-digit ZIP Codes. Spell out office names. Do not use office symbols. (e) Categories of Individuals: Describe the individuals covered by the system. Use non-technical, specific categories of individuals about whom the Department of Army keeps records. Do not use categories like "all Army personnel" unless that is truly accurate. (f) Categories of Records in the System: Describe in clear, plain language, all categories of records in the system. List only documents actually kept in the system. Do not identify source documents that are used to collect data and then destroyed. Do not list form numbers. (g) Authority for Maintenance of the System: Cite the specific law or Executive Order that authorizes the maintenance of the system. Cite the DOD directive/instruction or Department of the Army Regulation(s) that authorizes the Privacy Act system of records. Always include titles with the citations. Note: Executive Order 9397 authorizes using the SSN as a personal identifier. Include this authority whenever the SSN is used to retrieve records. (h) Purpose(s): List the specific purposes for maintaining the system of records by the activity. (i) Routine Use(s): The blanket routine uses that appear at the beginning of each Component compilation apply to all systems notice unless the individual system notice specifically states that one or more of them do not apply to the system. Blanket Routine Uses are located at the beginning of the Component listing of systems notices and are not contained in individual system of records notices. However, specific routine uses are listed in each applicable system of records notice. List the specific activity to which the record may be released, for example "To the Veterans Administration" or "To state and local health agencies". For each routine user identified, include a statement as to the purpose or purposes for which the record is to release to that activity. Do not use general statements, such as "To other federal agencies as required" or "To any other appropriate federal agency". (j) Policies and Practices for Storing, Retrieving, Accessing, Retaining, and Disposing of Records in the System: (k) Storage: State the medium in which DA maintains the records; for example, in file folders, card files, microfiche, computer, or a combination of those methods. Storage does not refer to the storage container. (l) Retrievability: State how the Army retrieves the records; for example, by name, fingerprints or voiceprints. (m) Safeguards:

3.1.1 Identifying Possible Sources of Data... 3.1.1 describes the variety of data sources available and discusses actions that organizations can take to support the ongoing collection of data for forensic purposes. 3.1.1 Identifying Possible Sources of Data The increasingly widespread use of digital technology for both professional and personal purposes has led to an abundance of data sources.

Thus, it is critical that regulated entities improve their cybersecurity posture to protect not only against external threats but also (printed page 914) internal ones, and both intentional and accidental breaches. Emergencies or other occurrences can affect the security of ePHI without an intentional act. For example, in 2024, CrowdStrike released a defective update for its software on computers running Microsoft Windows. [225] This update affected the ability of regulated entities to access the ePHI of millions of individuals for varying periods of time. During this time, ePHI was unavailable, meaning that one of the key prongs of the security triad of confidentiality, integrity, and availability was affected. [226] Because of the increased digitization of PHI, it is, for example, essential that covered health care providers engage in thoughtful contingency planning that considers how they will proceed in the event that they are unable to access ePHI in their EHRs. Additionally, threat actors will often seek to take advantage of such incidents. As reported by a large subcontractor of a business associate, less than a week after the outage, the company "observed threat actors leveraging the event to distribute ransomware. [227] The environment in which health care is delivered, the way in which it is

delivered, and the manner in which related information is collected all mean that regulated entities must consider a different approach to operational continuity and resiliency in the face of such challenges. Additionally, they must be wary of the potential for bad actors to attempt to take advantage of such events. C. Regulated Entities' Compliance With the Requirements of the Security Rule Is Inconsistent Despite the proliferation of cybersecurity standards, guidelines, best practices, methodologies, procedures, and processes and the documented increase in unauthorized uses and disclosures of ePHI, many regulated entities have been slow to strengthen their security measures to protect ePHI and their information systems that create, receive, maintain, or transmit it in this new environment. [228] Among the reasons for this are the rapid pace of EHR adoption and digitization of health care, increased connectivity and use of cloud-based infrastructures, limited competition and a stable customer base, limited operating margins, and a failure to invest in cybersecurity infrastructure. [229] For example, regulated entities continue to rely on legacy systems and software that are unsupported by manufacturers, which means that the manufacturers no longer provide security patches or other updates to address security threats and vulnerabilities. [230] In a 2021 survey of health care cybersecurity professionals, 73 percent reported having legacy operating systems. [231] This apparent lack of urgency in adopting new, supported operating systems has serious implications for the confidentiality, integrity, and availability of ePHI.

CIS Safeguard 11.4 · Establish and Maintain an Isolated Instance of Recovery Data Establish and maintain an isolated instance of recovery data. Example implementations include, version controlling backup destinations through offline, cloud, or off-site systems or services. Implementation Groups: 1,2,3 Asset Type: data Security Function: recovery Parent Control: Data Recovery

processes associated with the IoT product, including : - i. Steps taken during development to ensure the IoT product and its product components are free of any known, exploitable vulnerabilities. - ii. The process of working with component suppliers and third-party vendors to ensure the security of the IoT product and its product components is maintained for the duration of its supported lifecycle. - iii. Any post end-of-support considerations, such as the discovery of a vulnerability which would significantly impact the security, privacy, or safety of customers who continue to use the IoT product and its product components. - g. The vulnerability management policies and processes associated with the IoT product, including : - i. Methods of receiving reports of vulnerabilities (see Information and Query Reception below). - ii. Processes for recording reported vulnerabilities. - iii. Policy for responding to reported vulnerabilities, including the process of coordinating vulnerability response activities among component suppliers and third-party vendors. - iv. Policy for disclosing reported vulnerabilities. - v. Processes for receiving notification from component suppliers and thirdparty vendors about any change in the status of their supplied components, such as end of production, end of support, deprecated status (e.g., the product is no longer recommended for use), or known insecurities.

3.1.2 | 3. 3.1.2 Adapt Roles to the Organization The sub-steps for adapting roles to the organization are described in this section.

It has been determined that this rule, as proposed, does impose reporting or recordkeeping requirements under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 et seq.) (PRA). DoD has submitted an information collection request (ICR) proposal to OMB. See the Supporting Statements in docket number DoD-2023-OS-0097 for specific details and to provide comments on the information collection requirements for the CMMC Program. Comments are invited on: (a) whether the proposed collections of information are necessary for the proper performance of the functions of DoD, including whether the information will have practical utility; (b) the accuracy of the estimate of the burden of the proposed information collections; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the information collections on respondents, including the use of automated collection techniques or other forms of information technology. Part A: Estimation of Respondent Burden Hours and Labor Cost For purposes of the proposed rule, DoD is proposing several separate information collections that will be addressed in the CMMC Title 32 Program rule and Title 48 acquisition rule. CMMC Program Information Collections and Recordkeeping Requirements are discussed in four separate groupings: (1) CMMC Level 1 Self-Assessment Collection (2) CMMC Level 2 Self-Assessment Collection (3) CMMC Level 2 Certification Assessment Collection (4) CMMC Level 3 Certification Assessment Collection CMMC

Level 1 Self-Assessment Collection The Level 1 Self-Assessment information collection reporting and recordkeeping requirements will be included in a modification of an existing DFARS collection approved under OMB Control Number 0750-0004, Assessing Contractor Implementation of Cybersecurity Requirements. Modifications to this DFARS collection will be addressed as part of the Title 48 acquisition rule. The information collection reporting and recordkeeping requirements include: OSAs conduct a self-assessment based on NIST guidelines as addressed in § 170.15 of this part. (printed page 89112) This is an assessment to validate implementation of the 15 security requirements listed in FAR clause 52.204-21(b)(1). OSAs upload assessment results and affirmations in SPRS in accordance with § 170.15 and § 170.22 of this part. CMMC Level 2 Self-Assessment Collection The Level 2 Self-Assessment information collection reporting and recordkeeping requirements will be included in a modification of an existing DFARS collection approved under OMB Control Number 0750-0004, Assessing Contractor Implementation of Cybersecurity Requirements. Modifications to this DFARS collection will be addressed as part of the Title 48 acquisition rule. The information collection reporting and recordkeeping requirements include:

From the NIST SP 800-172 Rev 3 Final Public Draft: Finally, a references section lists the source controls 16 With few exceptions, the security controls in SP 800-53 [8] are policy-, technology-, and sector-neutral, meaning that the controls focus on the fundamental measures necessary to protect information across the information life cycle. from SP 800-53 [8] that are associated with the enhanced security requirement. The hyperlink associated with each control provides access to the NIST Cybersecurity and Privacy Reference Tool (CPRT),^{17 17} The final version of SP 800-172r3 and SP 800-172Ar3 will be also be available on CPRT. which includes references to a variety of supporting technical publications. The structure and content of an enhanced security requirement is provided in the example below. 03.13.08E Decoys Use component

, is used to enter into a relationship: (a) Of which the principal purpose is to transfer a thing of value to the recipient to carry out a public purpose of support or stimulation authorized by a law of the United States, rather than to acquire property or services for the USG's direct benefit or use; or, (b) In which substantial involvement is not expected between DoD and the recipient when carrying out the activity contemplated by the award. Throughout this rule, the term grant will include both the grant and cooperative agreement. Grantee means the entity that receives a grant or cooperative agreement. Hand carrier means a cleared employee, designated by the contractor, who occasionally hand carries classified material to its destination in connection with a classified visit or meeting. The classified material remains in the personal possession of the hand carrier except for authorized overnight storage. Home office means the headquarters of a multiple facility entity. Industrial security means that portion of information security concerned with the protection of classified information in the custody of U.S. industry. Information means any knowledge that can be communicated or documentary material, regardless of its physical form or characteristics. Information security means the system of policies, procedures, and requirements established pursuant to executive order, statute, or regulation to protect information that, if subjected to unauthorized disclosure, could reasonably be expected to cause damage to national security. The term also applies to policies, procedures, and requirements established to protect unclassified information that may be withheld from release to the public. Information system means an assembly of computer hardware, software, and firmware configured for the purpose of automating the functions of calculating, computing, sequencing, storing, retrieving, displaying, communicating, or otherwise manipulating data, information and textual material. Insider means cleared contractor personnel with authorized access to any USG or contractor resource, including personnel, facilities, information, equipment, networks, and systems. Insider threat means the likelihood, risk, or potential that an insider will use his or her authorized access, wittingly or unwittingly, to do harm to the national security of the United States. Insider threats may include harm to contractor or program information, to the extent that the information impacts the contractor or agency's obligations to protect classified NSI. Joint venture means an association of two or more persons or entities engaged in a single defined project with all parties contributing assets and efforts, and sharing in the management, profits and losses, in accordance with the terms of an agreement among the parties. KMP

The guidance also recommends establishing a process for measuring contract performance and terminating the contract if security requirements are not being met. Important considerations include: Is there a process for reporting security incidents related to the agreement? Are additional assurances of protections for ePHI from the business associate necessary? If so, where

would such additional assurances be documented (e.g., in the business associate agreement, service-level agreement, or other documentation) and how would they be met (e.g., providing documentation of implemented safeguards, audits, certifications)? The Security Rule requires a regulated entity to protect the confidentiality, integrity, and availability of all ePHI that it creates, receives, maintains, or transmits. [618] It also requires a regulated entity to obtain written satisfactory assurances that its business associate will appropriately safeguard ePHI before allowing the business associate to create, receive, maintain, or transmit ePHI on its behalf. [619] However, the Security Rule does not require a regulated entity to verify that entities that create, receive, maintain, or transmit ePHI on its behalf are in fact taking the necessary steps to protect such ePHI. The lack of such a requirement may leave a gap in protections from risks to ePHI related to regulated entities' vendors and supply chains. Accordingly, the Department proposes several modifications to the Security Rule to provide greater assurance that business associates and their subcontractors are protecting ePHI because a subcontractor to a business associate is also a business associate. The Department proposes to redesignate 45 CFR 164.308(b)(1) and (2) as proposed 45 CFR 164.308(b)(1)(i) and (ii) , respectively. Additionally, we propose to make a technical correction to the standard for business associate contracts and other arrangements for organizational clarity, separating proposed paragraph (b)(1)(i) into paragraphs (b)(1)(i)(A) and (B). We believe this is a non-substantive change that would have no effects on any regulatory, recordkeeping, or reporting requirement, nor would it change the Department's interpretation of any regulation. We also propose to modify both to require a regulated entity to verify that the business associate has deployed the technical safeguards required by 45 CFR 164.312 [620] in addition to obtaining satisfactory assurances that its business associate would comply with the Security Rule. [621] To assist regulated entities in complying with the new standard, we propose to redesignate the implementation specifications at 45 CFR 164.308(b)(3) as 45 CFR 164.308(b)(2) and propose to add an implementation specification for written verification at proposed 45 CFR 164.308(b)(2)(ii) that would require the regulated entity to obtain written verification from the business associate that the business associate has deployed the required technical safeguards. [622]

, (B), (C), and (D) be made available in an appropriate facility where the public may inspect or copy them. This facility is known as the "FOIA reading room". In addition to these records, the DoD Components may elect to place other records in their reading rooms. The DoD Components shall comply with this provision of the FOIA by providing a location accessible to the public for viewing these documents. In lieu of paper copies, the Component may digitize the documents and have them available on a personal computer in the reading room. The DoD Components may share reading room facilities if the public is not unduly inconvenienced, and also may establish decentralized reading rooms. (b) Electronic reading room. The FOIA requires records described in 5 U.S.C. 552(a)(2)(A) , (B), (C), and (D) and created on or after November 1, 1996, be made available electronically. The DoD Components will meet the electronically available requirement by posting the records in an electronic reading room on their FOIA Requester Service Center Web sites. (1) These electronic reading rooms will have four designated sections, each one corresponding to one of the four sections described in paragraph (b) of this section. If a Component does not have relevant documents to post in any of the four sections of the FOIA Requester Service Center electronic reading room, that section of the reading room will contain the annotation that no documents apply. (2) If a DoD Component has documents that meet the qualifications of 5 U.S.C. 552(a)(2)(A) , (B), (C), and (D) posted on a separate Web site, the Component's FOIA Requester Service Center is not required to post these same documents. Instead, the electronic reading room shall link to the other Web site. For example, if a Component maintains electronic copies of its issuances on a separate Web site, then the (a)(2)(C) section of the electronic reading room shall have a link to that site. (3) Exemptions. All information that qualifies for withholding under one or more of the FOIA exemptions described in § 286.14 of this part shall be deleted from all 5 U.S.C. 552(a)(2) records that are made available to the public. § 286.8 Record availability. 5 U.S.C. 552(a)(2)(A) , (B), (C), and (D) records are: (a) "(a)(2)(A)" records. Final opinions, including concurring and dissenting opinions, and orders made in the adjudication of cases, as defined in 5 U.S.C. 551 , that may be cited, used, or relied on as precedents in future adjudications. (b) "(a)(2)(B)" records. Statements of policy and interpretations that have been adopted by the agency and are not published in the Federal Register . (c) "(a)(2)(C)" records.

In model checking, safety refers to the assurance that something undesirable never occurs. This is a fundamental property of an ACP that ensures the absence of safety threats, including privilege

leakage, privilege conflicts, and privilege escalation to unauthorized or unintended principals. Safety can be specified using LTL or CTL languages, which can generally be proven for ACP transition models that describe the safety requirements of any configuration [IR7874]. Formally, a safety property p in LTL or CTL is said to satisfy an ACP transition automaton A if there is no violation of the rules defined by the logic in p . It is assumed that A will eventually

*.Roman numerals in parentheses before the Security Requirement are for numbering purposes only. The numerals are not part of the naming convention for the requirement. (printed page 83227) (d) Implementation. Assessment of security requirements is prescribed by NIST SP 800-171A Jun2018 (incorporated by reference, see §.170.2) and NIST SP 800-172A Mar2022 (incorporated by reference, see §.170.2). Descriptive text in these documents support OSA implementation of the security requirements and use the terms organization-defined and periodically. Except where referring to Organization-Defined Parameters (ODPs), organization-defined means as determined by the OSA. Periodically means occurring at regular intervals. As used in many requirements within CMMC, the interval length is organization-defined to provide contractor flexibility, with an interval length of no more than one year. §.170.15 CMMC Level 1 self-assessment and affirmation requirements. (a) Level 1 self-assessment. To comply with CMMC Level 1 self-assessment requirements, the OSA must meet the requirements detailed in paragraphs (a)(1) and (2) of this section. An OSA conducts a Level 1 self-assessment as detailed in paragraph (c) of this section to achieve a CMMC Status of Final Level 1 (Self). (1) Level 1 self-assessment requirements. The OSA must complete and achieve a MET result for all security requirements specified in §.170.14(c)(2) to achieve the CMMC Status of Final Level 1 (Self). No POA&Ms are permitted for CMMC Level 1. The OSA must conduct a self-assessment in accordance with the procedures set forth in §.170.15(c)(1) and submit assessment results in SPRS. To maintain compliance with the requirements for the CMMC Status of Final Level 1 (Self), the OSA must conduct a Level 1 self-assessment on an annual basis and submit the results in SPRS, or its successor capability. (i) Inputs to SPRS. The Level 1 self-assessment results in the Supplier Performance Risk System (SPRS) shall include, at minimum, the following items: (A) CMMC Level. (B) CMMC Status Date. (C) CMMC Assessment Scope. (D) All industry CAGE code(s) associated with the information system(s) addressed by the CMMC Assessment Scope. (E) Compliance result. (ii) [Reserved] (2) Affirmation. Affirmation of the Level 1 (Self) CMMC Status is required for all Level 1 self-assessments. Affirmation procedures are set forth in §.170.22. (b) Contract eligibility. Prior to award of any contract or subcontract with a requirement for the CMMC Status of Level 1 (Self), OSAs must both achieve a CMMC Status of Level 1 (Self) and have submitted an affirmation of compliance into SPRS for all information systems within the CMMC Assessment Scope. (c) Procedures ·(1) Level 1 self-assessment. The OSA must conduct a Level 1 self-assessment scored in accordance with the CMMC Scoring Methodology described in §.170.24. The Level 1 self-assessment must be performed in accordance with the CMMC Level 1 scope requirements set forth in §.170.19(a) and (b) and the following:

Documents relating to the proceedings before the Board, including the name of the individual initiating NSLRB action, statements of witnesses, reports of interviews and hearings, examiner's findings and recommendations, a copy of the original decision, and related correspondence and exhibits. Authority for maintenance of the system: The National Defense Authorization Act for FY 2004, Public Law 108-136 , Section 1101; 5 U.S.C. 9902(m) , Labor Management Relations in the Department of Defense; and 5 CFR 9901.907 , National Security Labor Relations Board. Purpose(s): To establish a system of records that will document adjudication of unfair labor practice charges, negotiability disputes, exceptions to arbitration awards, and impasses filed with the National Security Labor Relations Board. Routine uses of records maintained in the system, including categories of users and the purposes of such uses: In addition to those disclosures generally permitted under 5 U.S.C. 552a(b) of the Privacy Act, these records or information contained therein may specifically be disclosed outside the DoD as a routine use pursuant to 5 U.S.C. 552a(b)(3) as follows: To the Federal Labor Relations Authority (FLRA) or the Equal Employment Opportunity Commission, when requested, for performance of functions authorized by law. To disclose, in response to a request for discovery or for appearance of a witness, information that is relevant to the subject matter involved in a pending judicial or administrative proceeding. To provide information to officials of labor organizations recognized under 5 U.S.C. 71 when relevant and necessary to their duties of exclusive representation concerning personnel policies, practices, and matters affecting work conditions. The DoD ·Blanket Routine Uses· set forth at the beginning of OSD's compilation of systems of records notices apply to this system. Policies and practices for storing, retrieving, accessing, retaining, and disposing of records in the system: Storage:

Records are maintained on electronic storage media and paper. Retrieval: Records will be retrieved in the system by the following identifiers: assigned case number; individual's name; labor organizations filing the unfair labor practice charges; negotiability disputes; exceptions to arbitration awards; date, month, year or filing; complaint type; and the organizational component from which the complaint arises. Safeguards: Records are maintained in a controlled facility. Physical entry is restricted by the use of locks, guards, and is accessible only to authorized personnel. Access to records is limited to person(s) responsible for servicing the record in performance of their official duties and who are properly screened and cleared for need-to-know. Access to computerized data is restricted by passwords, which are changed periodically. Retention and disposal: Records are disposed of 5 years after final resolution of case. System manager(s) and address:

If CMMC Level 1 or Level 2 Self-Assessment is a contract requirement, the defense contractor will be required to self-assess its compliance with the CMMC Level 1 or Level 2 requirements and submit the assessment results and an affirmation of conformance in SPRS. CMMC Level 1 self-assessment and associated affirmation is required annually. CMMC Level 2 Self-Assessment is required triennially with an affirmation following self-assessment and annually thereafter. If CMMC Level 2 Certification Assessment is a contract requirement, CMMC assessments must be performed by an authorized or accredited CMMC Third Party Assessment Organization (C3PAO). When CMMC Level 3 Certification Assessment is a contract requirement, an assessment by DoD is required following a CMMC Level 2 Final Certification Assessment. Upon completion of a CMMC Level 2 or 3 Certification Assessment, the offeror may be granted a certification of assessment based on the results of the assessment at the appropriate CMMC Level (as described in the CMMC Model). The assessment results are documented in SPRS to enable contracting officers to verify the validity status of an offeror's certification level and currency (i.e., not more than three years old) prior to contract award. The offeror must also submit an affirmation of conformance in SPRS following the assessment and annually thereafter. CMMC allows the use of a Plan of Action and Milestones (POA&Ms) for specified CMMC Level 2 and 3 security requirements. Each POA&M must be closed, i.e., all requirements completed, within 180 days of the initial assessment. The details of the requirements for self-assessment, third-party assessment, and affirmation for each CMMC Level, are provided in §170.15 through §170.18. POA&M requirements, including which requirements are allowed to be on a POA&M and POA&M closeout requirements, in addition to requirements for provision of an affirmation at closeout, contract eligibility, and continuation are provided in §170.21 and §170.22.

Evaluation Assurance 21 Role of Evaluation Assurance Requirements 23 Evaluation Organizations and Processes 25

The reasons for asserting these exemptions is to ensure the integrity of the privacy and civil liberties process. The execution requires that information be provided in a free and open manner without fear of retribution or harassment in order to facilitate a just, thorough, and timely resolution of the complaint or inquiry. Disclosures from this system can enable individuals to conceal their wrongdoing or mislead the course of the investigation by concealing, destroying, or fabricating evidence or documents. In addition, disclosures can subject sources and witnesses to harassment or intimidation which may cause individuals not to seek redress for wrongs through privacy and civil liberties channels for fear of retribution or harassment. (10) System identifier and name. LDIA 0209, Litigation Case Files. (i) Exemption. Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or which he would otherwise be eligible, as a result of maintenance of the information, the individual will be provided access to the information except to the extent that disclosure would reveal the identity of a confidential source. This exemption provides limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. Any portion of this record system which falls within the provisions of 5 U.S.C. 552a(k)(2) and (k)(5) may be exempt from the following subsections of 5 U.S.C. 552a : (c)(3), (d)(1)(2)(3)(4)(5), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I). Exempt materials from other systems of records may in turn become part of the case

records in this system. To the extent that copies of exempt records from those 'other' systems of records are entered into this case record, the Defense Intelligence Agency hereby claims the same exemptions for the records from those 'other' systems that are entered into this system, as claimed for the original primary systems of records, which they are a part. (ii) Authority. 5 U.S.C. 552a(j)(2), (k)(2), (k)(3), (k)(4), (k)(5), (k)(6), and (k)(7). (iii) Reasons. The reason for asserting these exemptions (k)(2) and (k)(5) is to ensure the integrity of the litigation process. (11) System identifier and name. LDIA 10-0004 Occupational, Safety, Health, and Environmental Management Records. (i) Exemption. Any portion of this record system which falls within the provisions of 5 U.S.C. 552a(k)(2)

3.3.1 | Using Existing Competencies... 3.3.1 Using Existing Competencies The NICE Framework Competencies are a way for organizations to align with the NICE Framework at a high level without delving into the details of TKS statements.

Records accuracy assessment . Provide an assessment by the source and recipient agencies as to the quality of the information that will be used for the match. The poorer the quality, the more likely that the program will not be cost-effective. (6) Notice Procedures . Identify what direct and indirect means will be used to inform individuals that matching will take place. (i) Direct notice . Indicate whether the individual is advised that matching may be conducted when he or she applies for a Federal benefit program. Such an advisory should normally be part of the Privacy Act Statement that is contained in the application for benefits. Individual notice sometimes is provided by a separate notice that is furnished the individual upon receipt of the benefit. (ii) Indirect notice . Indicate whether the individual is advised that matching may be conducted by constructive notice. Indirect or constructive notice is achieved by publication of a routine use in the Federal Register when the matching is between agencies or is achieved by publication of the match notice in the Federal Register . (7) Verification procedures . Explain how information produced as a result of the match will be independently verified to ensure any adverse information obtained is that of the individual identified in the match. (8) Due process procedures . Describe what procedures will be used to notify individuals of any adverse information uncovered as a result of the match and to give such individuals an opportunity to either explain the information or how to contest the information. No adverse action shall be taken against the individual until the due process procedures have been satisfied. (i) Unless other statutory or regulatory authority provides for a longer period of time, the individual shall be given 30 calendar days from the date of the notice to respond to the notice. (ii) If an individual contacts the agency within the notice period and indicates his or her acceptance of the validity of the adverse information, the agency may take final action. If the period expires without a response, the agency may take final action. (iii) If the agency determines that there is a potentially significant effect on public health or safety, it may take appropriate action notwithstanding the due process provisions. (9) Security procedures . Describe the administrative, technical, and physical safeguards that will be established to preserve and protect the privacy and confidentiality of the records involved in the match. The level of security must be commensurate with the level of the sensitivity of the records. (10) Records usage, duplication, and redisclosure restrictions . Describe any restrictions imposed by the source agency or by statute or regulation on the collateral uses of the records. Recipient agencies may not use the records obtained for matching purposes for any other purpose absent a specific statutory requirement or where the disclosure is essential to the conduct of the matching program. (11)

(B) In addition to records under the control of NGA, the Threat Mitigation system of records may include records originating from systems of records of other law enforcement and intelligence agencies which may be exempt from certain provisions of the Privacy Act. However, NGA does not assert exemption to any provisions of the Privacy Act with respect to information submitted by or on behalf of individuals. (C) To the extent the Threat Mitigation system contains records originating from other systems of records, NGA will rely on the exemptions claimed for those records in the originating system of records. Exemptions for certain records within the Threat Mitigation system from particular subsections of the Privacy Act are justified for the following reasons: (1) From subsection (c)(3) (Accounting for Disclosures) because giving a record subject access to the accounting of disclosures from records concerning him or her could reveal investigative interest on the part of the recipient agency that obtained the record pursuant to a routine use. Disclosure of the accounting could therefore present a serious impediment to law enforcement efforts on the part of the recipient agency because the individual who is the subject of the record would learn of third agency investigative interests and could take steps to evade detection or apprehension. Disclosure

of the accounting also could reveal the details of watch list matching measures under the Threat Mitigation system, as well as capabilities and vulnerabilities of the watch list matching process, the release of which could permit an individual to evade future detection and thereby impede efforts to ensure security. (2) From subsection (c)(4) because portions of this system are exempt from the access and amendment provisions of subsection (d). (3) From subsection (d) (Access to Records) because access to the records contained in this system of records could inform the subject of an investigation of an actual or potential criminal, civil, or regulatory violation to the existence of that investigation and reveal investigative interest on the part of Department of Homeland Security or another agency. Access to the records could permit the individual who is the subject of a record to impede the investigation, to tamper with witnesses or evidence, and to avoid detection or apprehension. Amendment of the records could interfere with ongoing investigations and law enforcement activities and would impose an unreasonable administrative burden by requiring investigations to be continually reinvestigated. In addition, permitting access and amendment to such information could disclose security sensitive information that could be detrimental to national security. (4

(3) The entity must otherwise meet the entity eligibility determination requirements set out in this rule. (4) Access limitations are inherent with the limited entity eligibility determination and are imposed upon all of the entity's employees regardless of citizenship. (5) Contractors should be aware that the CSA will document the requirements of each limited entity eligibility determination it makes, including the scope of, and any limitations on, access to classified information. (6) Contractors should be aware that the CSA will verify limited entity eligibility determinations only to the requesting GCA. In the case of multiple limited entity eligibility determinations for a single entity, the CSA verifies each one separately only to its requestor. (7) The applicable CSA administratively terminates the limited entity eligibility determination when there is no longer a need for access to the classified information for which the CSA approved the limited entity eligibility determination. (printed page 83328) (n) Termination of the entity eligibility determination. Once granted, a favorable entity eligibility determination remains in effect until terminated or revoked. If the entity eligibility determination is terminated or revoked, the contractor will return all classified material in its possession to the appropriate GCA or dispose of the material as instructed by the CSA. The contractor should be aware that it may request an administrative termination or the CSA may: (1) After coordination with applicable GCAs, administratively terminate the entity eligibility determination because the contractor no longer has a need for access to classified information. (2) Revoke an entity eligibility determination if the contractor is unable or unwilling to protect classified information or is unable to comply with the security requirements of this rule. (o) Invalidation of the entity eligibility determination. The CSA may invalidate an existing entity eligibility determination. While the entity eligibility determination is in an invalidated status, the contractor may not bid on or be awarded new classified contracts or solicitations. The contractor may continue to work on existing classified contracts if the GCA agrees. (p) Records maintenance. Contractors will maintain the original CSA designated forms for the duration of the entity eligibility determination in accordance with CSA-provided guidance. §:117.10 Determination of eligibility for access to classified information for contractor employees. (a) General. (1) The CSA is responsible for determining an employee's eligibility for access to classified information. (i) The contractor must determine that access to classified information is essential in the performance of tasks or services related to the fulfillment of a classified contract. (ii) Access must be clearly consistent with U.S. national security interests as determined by the CSA.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 204 and 252 [Docket DARS-2019-0049] RIN 0750-AK14 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Proposed rule. SUMMARY: DoD is proposing to amend the Defense Federal Acquisition Regulation Supplement (DFARS) to modify the text of an existing DFARS clause to clarify its intent and conform its language to current DFARS terminology, pursuant to action taken by the Regulatory Reform Task Force. DATES: Comments on the proposed rule should be submitted in writing to the address shown below on or before December 30, 2019, to be considered in

the formation of a final rule. ADDRESSES: Submit comments identified by DFARS Case 2018-D050, using any of the following methods: · Regulations.gov: <http://www.regulations.gov> · Submit comments via the Federal eRulemaking portal by entering ·DFARS Case 2018-D050· under the heading ·Enter keyword or ID· and selecting ·Search·. Select the link ·Submit a Comment· that corresponds with ·DFARS Case 2018-D050·. Follow the instructions provided at the ·Submit a Comment· screen. Comments received generally will be posted without change to <http://www.regulations.gov> , including any personal information provided. To confirm receipt of your comment(s), please check www.regulations.gov , approximately two to three days after submission to verify posting, except allow 30 days for posting of comments submitted by mail. FOR FURTHER INFORMATION CONTACT: Ms. Carrie Moore, telephone 571-372-6093. SUPPLEMENTARY INFORMATION: I. Background This rule proposes to modify the clause at DFARS 252.204-7002, Payment for Subline Items Not Separately Priced, to simplify the clause text and conform terminology used in the text to current Government contract line item structure terminology. This update will clarify the intent of the clause, as it pertains to payment on contracts that contain not separately priced (NSP) items, when applicable. The rule also adds a prescription for DFARS 252.204-7002 in the applicable DFARS subpart 204.7109, Contract Clauses. II. Discussion and Analysis

From the NIST SP 800-172 Rev 3 Final Public Draft: PROTECTION STRATEGY DLO NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 ADVERSARY EFFECTS 862

Examples of /uniFB01nal errors include integer over/uniFB02ow , query injec/t\ _i.ligaon, bu/uniFB00er over/uniFB02ow , and side communica/t\ _i.ligaon channels. Legi/t\ _i.ligamate and side channels may also be direct exploit vectors without prior causa/t\ _i.ligaon. Examples of failures include informa/t\ _i.ligaon exposure (IEX) (i.e., con/uniFB01den/t\ _i.ligaality loss), data tampering (TPR) (i.e., integrity loss), denial of service (DOS) (i.e., availability loss), and arbitrary code execu/t\ _i.ligaon (ACE) (i.e., everything could be lost). - Data Tampering (TPR) -Unauthorized modi/uniFB01ca/t\ _i.ligaon or destruc/t\ _i.ligaon of informa/t\ _i.ligaon that leads to integrity loss.

3.1.1 | Notional Risk Management Roles ... 3.1.1 Notional Risk Management Roles An important element of the internal and external context is identifying the relevant work roles for each stage. 3.1.1.

IA.L2-3.5.11 · Obscure Feedback CMMC Assessment Guide · Level 2 | Version 2.13 135 the actual characters. Feedback is obscured based on a defined policy (e.g., smaller devices may briefly show characters before obscuring). Example As a system administrator, you configure your systems to display an asterisk when users enter their passwords into a computer system [a]. For mobile devices, the password characters are briefly displayed to the user before being obscured. This prevents people from figuring out passwords by looking over someone's shoulder. Potential Assessment Considerations · Is the feedback immediately obscured when the authentication is presented on a larger display (e.g., desktop or notebook computers with relatively large monitors) [a]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.5.11

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the

cost-effective security and privacy of other than national security-related information in federal information systems. CWE designators (i.e., CWE-XXXX) are given to weaknesses, views, and categories. A view provides a hierarchical organization of CWEs from a particular perspective (e.g., software development, research, or hardware design). A category is a simpler construct that groups a set of CWEs that have some similarity. Views may contain categories within their hierarchy.

1. Implement a standards-oriented approach to supplier risk to streamline C-SCRM processes : Start with available standards, such as NIST guidance, ISO/IEC 20243, ISO/IEC 27001 series, ISO/IEC 15408, and Federal Information Processing Standard (FIPS)-140. Leveraging an external authority gives the acquirer's supplier security requirements a defensible position and makes compliance attractive to suppliers and business partners concerned about their own security posture. This approach can scale to supply chain demands and be applied to virtually every supplier in every market. 2. Uplift cyber hygiene practices for vendors : Instead of focusing exclusively on manufacturing or logistics processes, work with suppliers to improve their security posture so that they appreciate and fully benefit from enterprise controls such as multi-factor authentication and logical segmentation. Similarly, organizations should evaluate cybersecurity alongside business considerations like financial stability. 3. Invest in unified secure platforms for exchanging information with suppliers : The added confidentiality and authentication provided by these platforms protect the inherently sensitive material in supplier communications, limiting the potential for fraud, theft, and cybersecurity breaches. These platforms also streamline supplier management, simplifying sourcing functions beyond risk management. 4. Develop a central risk management team responsible for the entire organization : The team would be comprised of roles such as Chief Risk Officer, Chief Security Officer, Chief Supply Chain Officer, or other similar roles. This group would work together to address cyber supply chain risks and be responsible for communication and engagement with executive leadership. This team should leverage existing organizational expertise, like information security and compliance functions, when holistically assessing risk. 5.

(E) From subsection (e)(4)(I) because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. NSA will, nevertheless, continue to publish such a notice in broad generic terms, as is its current practice. (8) System identifier and name. GNSA 09, Personnel File. (i) Exemption. (A) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (B) Testing or examination material used solely to determine individual qualifications for appointment or promotion in the Federal service may be exempt pursuant to 5 U.S.C. 552a(k)(6) , if the disclosure would compromise the objectivity or fairness of the test or examination process. (C) All portions of this system of records which fall within the scope of 5 U.S.C. 552a(k)(5) and (k)(6) may be exempt from the provisions of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I) and (f). (ii) Authority. 5 U.S.C. 552a(k)(5) and (k)(6) . (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would place the subject of an investigation on notice that they are under investigation and provide them with significant information concerning the nature of the investigation, thus resulting in a serious impediment to law enforcement investigations. (B) From subsections (d) and (f) because providing access to records of a civil or administrative investigation and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal their wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that would make them difficult or impossible to reach in order to satisfy any Government claim growing out of the investigation or proceeding.

. The disclosure of a record outside the Department of Defense for a use that is compatible with the purpose for which the information was collected and maintained by the Department of Defense. The routine use must be included in the published system notice for the system of records involved. (u)

Source agency . Any agency which discloses records contained in a system of records to be used in a computer matching program, or any state or local government, or agency thereof, which discloses records to be used in a computer matching program. (v) Statistical record . A record maintained only for statistical research or reporting purposes and not used in whole or in part in making determinations about specific individuals. (w) System of records . A group of records under the control of a DoD Component from which personal information about an individual is retrieved by the name of the individual or by some other identifying number, symbol, or other identifying particular assigned, that is unique to the individual. §310.5 Policy. It is DoD policy that: (a) The privacy of an individual is a personal and fundamental right that shall be respected and protected. (1) The Department's need to collect, maintain, use, or disseminate personal information about individuals for purposes of discharging its statutory responsibilities shall be balanced against the right of the individual to be protected against unwarranted invasions of their privacy. (2) The legal rights of individuals, as guaranteed by Federal law, regulation, and policy, shall be protected when collecting, maintaining, using, or disseminating personal information about individuals. (3) DoD personnel, to include contractors, have an affirmative responsibility to protect an individual's privacy when collecting, maintaining, using, or disseminating personal information about an individual. (4) Departmental legislative, regulatory, or other policy proposals shall be evaluated to ensure that privacy implications, including those relating to the collection, maintenance, use, or dissemination of personal information, are assessed, to include, when required and consistent with the Privacy Provision of the E-Government Act of 2002 (44 U.S.C. 3501 , Note), the preparation of a Privacy Impact Assessment. (b) Personal information shall be collected, maintained, used, or disclosed to ensure that: (1) It shall be relevant and necessary to accomplish a lawful DoD purpose required to be accomplished by statute or Executive order. (2) It shall be collected to the greatest extent practicable directly from the individual. (3) The individual shall be informed as to why the information is being collected, the authority for collection, what uses will be made of it, whether disclosure is mandatory or voluntary, and the consequences of not providing that information. (4) It shall be relevant, timely, complete, and accurate for its intended use; and

In June 2020, NIST ITL published resources for applying NIST SP 800-63. Based on requests from federal agencies and industry and on recommendations from the U.S. General Accountability Office (GAO), NIST developed and published materials to provide nonnormative guidance for the implementation of SP 800-63A, Enrollment and Identity Proofing ; SP 800-63B, Authentication and Lifecycle Management ; and SP 800-63C, Federation and Assertions . The guidance addresses key topics and aspects of each volume to facilitate the understanding and implementation of the requirements for all assurance levels. ITL presented information for federal agencies and industry to promote the use of the implementation resources and discuss key topics, requirements, and controls and how to properly implement them. Cybersecurity Metrics provide decision support , and they help to measure and improve performance and accountability for cybersecurity activities. A mature metrics program is content-rich, supports a broader range of stakeholders, and provides greater value to the organization. More precise measurement data helps to focus on an actionable approach to improving cybersecurity. To support this effort, NIST has embarked on various initiatives, some of which are highlighted here. Initiatives include research in new technology areas, risk management tools and guidance, and ways for organizations to mature the use of cybersecurity metrics.

that do not specify exactly the type of information to be released, may be honored if it is clear the individual in signing the consent statement intended to obtain a personal benefit (for example, a loan to buy a house) and was aware of the type of information that would be sought. Care should be exercised in these situations to release only the minimum amount of personal information essential to obtain the benefit sought. (5) Do not honor requests from commercial enterprises for official evaluation of personal characteristics, such as evaluation of personal financial habits. §310.24 Disclosures to the public from medical records. (a) Disclosures from medical records are not only governed by the requirement of this part but also by the disclosure provisions of DoD 6025.18-R. (b) Any medical records that are subject to both this part and DoD 6025.18-R may only be disclosed if disclosure is authorized under both. If disclosure is permitted under this part (e.g., pursuant to a routine use), but the disclosure is not authorized under DoD 6025.18-R, disclosure is not authorized. If a disclosure is authorized under DoD 6025.18-R (e.g., releases outside the Department of Defense), but the disclosure is not authorized under this part, disclosure is not authorized. §310.25 Disclosure accounting. (a) Disclosure accountings. (1) Keep an accurate record of all disclosures made from any system of records except disclosures: (i) To DoD personnel for use in the

performance of their official duties; or (ii) Under 5 U.S.C. 552, the FOIA. (2) In all other cases a disclosure accounting is required even if the individual has consented to the disclosure of the information. (3) Disclosure accountings: (i) Permit individuals to determine to whom information has been disclosed; (ii) Enable the activity to notify past recipients of disputed or corrected information (§ 310.19(i)); and (iii) Provide a method of determining compliance with paragraph (c) of § 310.21. (b) Contents of disclosure accountings. As a minimum, disclosure accounting shall contain: (1) The date of the disclosure. (2) A description of the information released. (3) The purpose of the disclosure. (4) The name and address of the person or Agency to whom the disclosure was made. (c) Methods of disclosure accounting. Use any system of disclosure accounting that shall provide readily the necessary disclosure information (see paragraph (a)(3) of this section). (d) Accounting for mass disclosures. When numerous similar records are released, identify the category of records disclosed and include the data required by paragraph (b) of this section in a form that can be used to construct an accounting disclosure record for individual records if required (see paragraph (a)(3) of this section). (e) Disposition of disclosure accounting records. Retain disclosure accounting records for 5 years after the disclosure or the life of the record, whichever is longer. (f) Furnishing disclosure accountings to the individual.

(4) Ensure all Component legislative proposals, policies, or programs having privacy implications, such as the DoD Privacy Impact Assessment Program, are evaluated to ensure consistency with the information privacy principles of this part and DoD 5400.11-R. (5) Assess the impact of technology on the privacy of personal information and, when feasible, adopt privacy-enhancing technology both to preserve and protect personal information contained in Component systems of records and to permit auditing of compliance with the requirements of this part and DoD 5400.11-R. (6) Ensure the DoD Privacy Program periodically shall be reviewed by the Inspectors General or other officials, who shall have specialized knowledge of the DoD Privacy Program. (7) Submit reports, consistent with the requirements of DoD 5400.11-R, as mandated by 5 U.S.C. 552a and OMB Circular A-130, and DoD Directive 5500.1, and as otherwise directed by the DPO. (e) The Secretaries of the Military Departments shall provide support to the Combatant Commands, as identified in DoD Directive 5100.3, [7] in the administration of the DoD Privacy Program. § 310.7 Information requirements. The reporting requirements in § 310.6(d)(7) are assigned Report Control Symbol DD-DA&M(A)1379. § 310.8 Rules of conduct. (a) DoD personnel shall: (1) Take such actions, as considered appropriate, to ensure that personal information contained in a system of records, to which they have access to or are using incident to the conduct of official business, shall be protected so that the security and confidentiality of the information shall be preserved. (2) Not disclose any personal information contained in any system of records except as authorized by DoD 5400.11-R or other applicable law or regulation. Personnel willfully making such a disclosure when knowing that disclosure is prohibited are subject to possible criminal penalties and/or administrative sanctions. (3) Report any unauthorized disclosures of personal information from a system of records or the maintenance of any system of records that are not authorized by this part to the applicable Privacy POC for his or her DoD Component. (b) DoD System Managers for each system of records shall: (1) Ensure that all personnel who either shall have access to the system of records or who shall develop or supervise procedures for handling records in the system of records shall be aware of their responsibilities and are properly trained to safeguard personal information being collected and maintained under the DoD Privacy Program. (2) Prepare promptly any required new, amended, or altered system notices for the system of records and submit them through their DoD Component Privacy POC to the DPO for publication in the Federal Register. (3) Not maintain any official files on individuals which are retrieved by name or other personal identifier without first (printed page 18762) ensuring that a notice for the system of records shall have been published in the Federal Register

(Response) FDA agrees in part with the comments, but has decided not to define ‘perishable food’ in this final rule. FDA defined perishable food in the proposal for the purpose of establishing a shorter record retention time for those foods as opposed to nonperishable foods. FDA has concluded that this objective can be achieved by inserting language directly in § 1.360(b) of this final rule using similar criteria as the NIST definitions for perishable, semi-perishable and long shelf-life food. FDA agrees that the proposed definition is too restrictive for purposes of these final regulations. Therefore, FDA has changed the record retention requirements in § 1.360(b) of this final rule to require record retention for: (1) 6 months for food for which a significant risk of spoilage, loss of value, or loss of palatability occurs within 60 days after the date you receive or release the food; (2) 1 year for food for which a significant risk of spoilage, loss of value, or loss of palatability occurs only after a minimum of 60 days, but within 6 months, after the date you

receive or release the food; and (3) 2 years for food for which a significant risk of spoilage, loss of value, or loss of palatability does not occur sooner than 6 months after the date you receive or release the food, including foods preserved by freezing, dehydrating, or being placed in a hermetically sealed container. However, transporters, or nontransporters retaining records on behalf of transporters, are required to retain for 6 months records for any food having a significant risk of spoilage, loss of value, (printed page 71590) or loss of palatability within 60 days after the date the food is received or released and 1 year for any food having a significant risk of spoilage, loss of value, or loss of palatability only after a minimum of 60 days after the date the food is received or released. FDA chose this approach because: (1) The food industry already is familiar with classification of foods into these three categories due to existing regulations and practices and (2) it will mitigate the problem raised by some comments of inadequate infrastructure for long term storage of records for the shorter shelf life foods. FDA believes that a tracing investigation involving ·perishable· food will not be compromised by providing for the reduced record retention of 6 months because most of these tracebacks are initiated within 6 months of the outbreak.

a. Whether the Department's proposal to provide regulated entities with additional time to revise business associate agreements or other written contracts is appropriate. If not, please explain. b. Whether the Department should also provide group health plans and plan sponsors additional time to revise plan documents by adding a transition provision to grandfather certain existing plan documents for a specified period of time. c. Whether the Department should consider additional constraints or specificity for a new paragraph (d) to allow group health plans more time to comply with the Security Rule requirements for plan documents. J. Section 164.320·Severability The Department intends that, if any provisions of this subpart, including the provisions of this NPRM, if finalized, were held to be invalid or unenforceable facially, or as applied to any person, plaintiff, or stayed pending further judicial or agency action, such provision shall be severable from other provisions of this subpart, and from other rules and regulations currently in effect, and not affect the remainder of this subpart. It is also our intent that, unless such provision shall be held to be utterly invalid or unenforceable, it shall be construed to give the provision maximum effect to the provision permitted by law, including in the application of the provision to other persons not similarly situated or to other dissimilar circumstances from those where the provision may be held to be invalid or unenforceable. The provisions of this subpart, including the proposals of this NPRM, are intended to operate independently of each other, even if multiple provisions serve the same or similar general purpose(s) or policy goal(s). Where a provision is necessarily dependent on another, the context generally makes that clear, such as by cross-reference to a particular standard, requirement, or implementation specification. Where a provision that is dependent on one that is stayed or held invalid or unenforceable, as described in the preceding paragraph, is included in paragraph or section within 45 CFR part 160 or 164 , we intend that other provisions of such paragraph(s) or section(s) that operate independently of said provision would remain in effect. The Department intends the individual standards in 45 CFR 164.308 , 164.310 , 164.312 , 164.314 , and 164.316 to apply separately to govern how a regulated entity must protect the security of all ePHI it creates, receives, (printed page 988) maintains, or transmits. Accordingly, if finalized, this provision would provide that if any one or several standards in 45 CFR 164.308 , 164.310 , 164.312 , 164.314 , and 164.316 are deemed invalid by a court, or non-applicable to a particular person or circumstance, all remaining standards shall be unaffected and shall remain in force, and any remaining component of the adjudicated provision, not invalid or found to be unenforceable or inapplicable, shall be considered by the Department to be still in effect.

, under which records may be disclosed to recipients outside HHS, without the individual record subject's prior written consent: Public disclosures may be made (for example, on FDA's Web site) of the names of commissioned officials, and other basic information, including the identification of their State or local agency, their job titles, the type of commission, any specific commissioned areas, and the date of their commission, to the extent disclosure is not an unwarranted invasion of personal privacy. Disclosure may be made to appropriate Federal Agencies and Department contractors that have a need to know the information for the purpose of assisting the Department's efforts to respond to a suspected or confirmed breach of the security or confidentiality of information maintained in this system of records, provided the information disclosed is relevant and necessary for that assistance. Disclosure may be made to a Federal, State, local, territorial, tribal, foreign, or other public authority, on request, in connection with the hiring or retention of an

employee, the issuance or retention of a security clearance, the letting of a contract, or the issuance or retention of a license, grant, or other benefit, to the extent that the information is relevant and necessary to the requesting Agency's decision. No disclosure will be made unless the information has been determined to be sufficiently reliable to support a referral to another office within the Agency or to another Federal Agency for criminal, civil, administrative, personnel, or regulatory action. Disclosure of system information may be made to a State, local, territorial, and tribal agencies or governments to provide copies of records that were originally provided to the Agency by that entity. Disclosure may be made to Federal Agencies, contractors, and other individuals or entities who perform services for the Agency related to this system of records and who need access to the records to perform those services. Recipients shall be required to comply with the requirements of the Privacy Act of 1974, as amended, 5 U.S.C. 552a . When a record on its face, or in conjunction with other records, indicates a violation or potential violation of law, whether civil, criminal, or regulatory in nature, disclosure may be made to the appropriate public authority, whether Federal, foreign, State, local, or tribal, or otherwise, responsible for enforcing, investigating, or prosecuting such violation, if the information disclosed is relevant to the responsibilities of the Agency or public authority. Disclosure may be made to a court or other tribunal or adjudicative body in a proceeding, when: · The Agency or any component thereof; or · any employee of the Agency in his or her official capacity; or · any employee of the Agency in his or her individual capacity where the Department of Justice (DOJ) has agreed to represent the employee; or

AC.L2-3.1.1 · Authorized Access Control [CUI Data] CMMC Assessment Guide · Level 2 | Version 2.13
 14 Access Control (AC) AC.L2-3.1.1 · AUTHORIZED ACCESS CONTROL [CUI DATA] Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems). ASSESSMENT OBJECTIVES [NIST SP 800-171A]11 Determine if: [a] authorized users are identified; [b] processes acting on behalf of authorized users are identified; [c] devices (and other systems) authorized to connect to the system are identified; [d] system access is limited to authorized users; [e] system access is limited to processes acting on behalf of authorized users; and [f] system access is limited to authorized devices (including other systems). POTENTIAL ASSESSMENT METHODS AND OBJECTS [NIST SP 800-171A] 11 Examine [SELECT FROM: Access control policy; procedures addressing account management; system security plan; system design documentation; system configuration settings and associated documentation; list of active system accounts and the name of the individual associated with each account; notifications or records of recently transferred, separated, or terminated employees; list of conditions for group and role membership; list of recently disabled system accounts along with the name of the individual associated with each account; access authorization records; account management compliance reviews; system monitoring records; system audit logs and records; list of devices and systems authorized to connect to organizational systems; other relevant documents or records]. Interview [SELECT FROM: Personnel with account management responsibilities; system or network administrators; personnel with information security responsibilities]. Test [SELECT FROM: Organizational processes for managing system accounts; mechanisms for implementing account management]. 11 NIST SP 800-171A, p. 9.

Establish and implement as needed a written contingency plan, consisting of written policies and procedures for responding to an emergency or other occurrence including but not limited to fire, vandalism, system failure, natural disaster, or security incident that adversely affects relevant electronic information systems. (ii) Implementation specifications ·(A) Criticality analysis. Perform and document an assessment of the relative criticality of the covered entity's or business associate's relevant electronic information systems and technology assets in its relevant electronic information systems. (B) Data backups. Establish and implement written procedures to create and maintain exact retrievable copies of electronic protected health information, including verification that the electronic protected health information has been copied accurately. (C) Information systems backups. Establish and implement written procedures to create and maintain backups of the covered entity's or business associate's relevant electronic information systems, including verification of success of backups. (D) Disaster recovery plan. (1) Establish (and implement as needed) written procedures to restore loss of the covered entity's or business associate's critical relevant electronic information systems and data within 72 hours of the loss. (2) Establish (and implement as needed) written procedures to restore loss of the covered entity's or business associate's other relevant electronic information systems and data in accordance with the criticality analysis required by paragraph (a)(13)(ii)(A) of this section. (E) Emergency mode operation plan. Establish (and implement as needed) written procedures to enable continuation of

critical business processes for protection of the security of electronic protected health information while operating in emergency mode. (F) Testing and revision procedures. (1) Establish written procedures for testing and revising contingency plans as required by this paragraph (a)(13) in accordance with paragraph (a)(13)(ii)(F)(2) of this section. (2) Review and test contingency plans required by this paragraph (a)(13) at least once every 12 months, document the results of such tests, and modify such contingency plans as reasonable and appropriate in accordance with the results of those tests. (printed page 1016) (14) Standard: Compliance audit. Perform and document an audit at least once every 12 months of the covered entity's or business associate's compliance with each standard and implementation specification in this subpart. (b)(1) Standard: Business associate contracts and other arrangements.

DoD uses this information to control unclassified contract data that is sensitive and inappropriate for release to the public; and to facilitate data exchange among automated systems for contract award, contract administration, and contract payment by assigning a unique code to each DoD contractor. Affected Public: Businesses or other for-profit and not-for-profit institutions: Annual Burden Hours: 13,758. Number of Respondents: 22,602. Responses Per Respondent: 1. Annual Responses: 22,602. Average Burden Per Response: .61 hours. Frequency: On occasion. Summary of Information Collection DFARS 204.404-70(a) prescribes use of the clause at DFARS 252.204-7000, Disclosure of Information, in contracts that require the contractor to access or generate unclassified information that may be sensitive and inappropriate for release to the public. The clause requires the contractor to obtain approval of the contracting officer before release of any unclassified contract-related information outside the contractor's organization, unless the information is already in the public domain. In requesting this approval, the contractor must identify the specific information to be released, the medium to be used, and the purpose for the release. DFARS 204.603(1) prescribes use of the provision at DFARS 252.204-7001, Commercial and Government Entity (CAGE) Code Reporting, in solicitations when CAGE codes for potential offerors are not available to the contracting officer. The provision requires an offeror to enter its CAGE code on its offer. If an offeror does not have a CAGE code, the offeror may request one from the contracting officer, who will ask the offeror to complete Section B of DD Form 2051, Request for Assignment of a Commercial and Government Entity (CAGE) Code. Michele P. Peterson, Executive Editor, Defense Acquisition Regulations Council. [FR Doc. 01-3743 Filed 2-13-01; 8:45 am] BILLING CODE 5000-04-M

CMVP; Cryptographic Module Validation Program; FIPS 140; FIPS 140 testing; ISO/IEC 19790; ISO/IEC 24759; security policy; testing requirement; vendor documentation; vendor evidence. This document is intended for vendors, testing labs, and CMVP to address issues in ISO/IEC 19790, Information technology - Security techniques - Security requirements for cryptographic modules , and ISO/IEC 24759, Information technology - Security techniques - Test requirements for cryptographic modules . This document specifies the Cryptographic Module Validation Program (CMVP) modifications of the methods to be used by a Cryptographic and Security Testing Laboratory (CSTL) to demonstrate conformance. This document also specifies the modification of documentation for providing evidence to demonstrate conformity. Unless otherwise specified in this document, the test requirements are specified in ISO/IEC 19790 Annex B and ISO/IEC 24759 Section 6.14.

Blockchain for Access Control Systems ## Blockchain for Access Control Systems The rapid development and wide application of distributed network systems have made network security - especially access control and data privacy - ever more important. Blockchain technology offers

features such as decentralization, high confidence, and tamper-resistance, which are advantages to solving auditability, resource consumption, scalability, central authority, and trust issues - all of which are challenges for network access control by traditional mechanisms. This document presents general information for blockchain access control systems from the views of blockchain system properties, components, functions, and supports for access control policy models. Considerations for implementing blockchain access control systems are also included.

(L) From subsection (g) because portions of this system of records are compiled for law enforcement purposes and have been exempted from the access provisions of subsections (d) and (f). (10) System identifier and name. A0190-14 OPMG, Registration and Permit Files. (i) Exemption. Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2), is exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(2) from subsections 5 U.S.C. 552a(c)(3), (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2). (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (d) because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement. (C) From subsection (e)(1) because in the course of criminal investigations, information is often obtained concerning the violations of laws or (printed page 14750) civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this valuable information is retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought. (D) From subsections (e)(4)(G) and (e)(4)(H) because portions of this system of records have been exempted from the access provisions of subsection (d), making these subsections not applicable. (E) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (F) From subsection (f) because portions of this system of records have been exempted from the access provisions of subsection (d). (11) System identifier and name. A0190-45 OPMG, Military Police Reporting Program Records (MPRP). (i) Exemption. Parts of this system may be exempt pursuant to 5 U.S.C. 552a(j)(2).

When a contractor is potentially collocated with or in close proximity to its foreign parent or an affiliate, the contractor will provide a facilities location plan that identifies the physical locations of the contractor and its foreign parent(s) or affiliate(s) respectively. The facilities location plan will assist the CSA in determining if the contractor is collocated or if the close proximity can be allowed under the FOCI mitigation plan. A U.S. entity generally cannot be collocated with the foreign parent or affiliate, i.e., at the same address or in the same location. * * * * § 117.12 [Amended] 8. Amend § 117.12 in paragraph (k) by removing the words "every 12 months" and adding in their place the words "at least annually". 9. Amend § 117.15 by: a. Revising paragraph (a) introductory text; b. Redesignating paragraphs (a)(2) and (a)(3) as paragraphs (a)(3) and (a)(4); c. Adding new paragraph (a)(2); d. In the newly redesignated paragraph (a)(3), revising the heading; e. In the newly redesignated paragraph (a)(4), redesignating paragraphs (ii), (iii), and (iv) as paragraphs (iii), (iv), and (v); f. In the newly redesignated paragraph (a)(4), adding a new paragraph (ii); (printed page 86294) g. In the newly redesignated paragraph (a)(4)(iv)(B), adding the word "effects" after the word "personal"; h. Revising paragraph (c) introductory text; i. Revising paragraph (d)(3)(i)(A); j. Revising paragraph (e)(1)(ii) and paragraph (e)(2) introductory text; k. Adding a new paragraph (e)(2)(viii); and l. Revising paragraph (e)(6). The revisions and additions read as follows: § 117.15 Safeguarding classified information. (a) General safeguarding. Contractors will be responsible for safeguarding classified information in their custody or under their control, with approval for such storage of classified information by the applicable CSA. Individuals are responsible for safeguarding classified information entrusted to them. Contractors will provide the

extent of protection to classified information in accordance with the provisions of this rule. * *

* * * (2) Restricted areas. When it is necessary to control access to classified material and an open storage area is not available, a restricted area may be established. A restricted area will normally become necessary when it is impractical or impossible to protect classified material because of its size, quantity, or other unusual characteristic. The restricted area shall have a clearly defined perimeter, but physical barriers are not required. Personnel within the area shall be responsible for challenging all persons who may lack appropriate need-to-know for the information within the restricted area. All classified material will be secured during non-working hours in approved repositories, in accordance with the provisions of this rule, or secured using other methods approved by the CSA. (3) Security checks. * * * (4) * * *

(7) This exemption also applies when the fact of the existence or nonexistence of a responsive record would itself reveal information in which a privacy interest exists, and the public interest in disclosure is not sufficient to outweigh the privacy interest. In this situation, the DoD Components shall neither confirm nor deny the existence or nonexistence of the record being requested. This is known as a 'Glomar response', and Exemption 6 must be cited in the response. Refusal to confirm or deny should not be used when: (i) The person whose personal privacy is in jeopardy has provided the requester with a privacy waiver. (ii) The person seeking access to an agency record initiated or directly participated in an investigation that leads to the creation of that record. (iii) The person whose personal privacy is in jeopardy is deceased, the agency is aware of that fact, and disclosure would not invade the privacy of the deceased's family. (g) Exemption 7 . Pursuant to 5 U.S.C. 552(b)(7) , records or information compiled for law enforcement purposes are exempt from disclosure upon the identification of one of the six harms delineated in the 6 subparts of Exemption 7. Law enforcement purposes include civil, criminal, military, regulatory, and administrative law, including the implementation of Executive Orders or regulations issued pursuant to law. This exemption may be invoked to prevent disclosure of documents not originally created for, but later gathered for, law enforcement purposes. (1) Conditions under which exception 7 applies. Exemption 7 applies only when production of such law enforcement records or information: (i) Exemption 7A. This applies when the disclosure of law enforcement records could reasonably be expected to interfere with enforcement proceedings (5 U.S.C. 552(b)(7)(A)). (ii) Exemption 7B. This applies when the disclosure of law enforcement records would deprive a person of the right to a fair trial or to an impartial adjudication (5 U.S.C. 552(b)(7)(B)). (iii) Exemption 7C . This applies when the disclosure of law enforcement records could reasonably be expected to constitute an unwarranted invasion of the personal privacy of a living person, including surviving family members of an individual identified in such a record (5 U.S.C. 552(b)(7)(C)). (iv) Exemption 7D . This applies when the disclosure of law enforcement records could reasonably be expected to disclose the identity of a confidential source, including a source within the Department of Defense; a state, local, or foreign agency or authority; or any private institution that furnishes the information on a confidential basis; and could disclose information furnished from a confidential source and obtained by a criminal law enforcement authority in a criminal investigation or by an agency conducting a lawful national security intelligence investigation (section 5 U.S.C. 552(b)(7)(D)). (v) Exemption 7E.

| access category | One of the classes to which a user, program or process in an ADP system may be assigned on the basis of the resources or groups of resources that each is authorized to use. (AR 380-380; FIPS PUB 39) | |-----|-----|

-----| | access control | 1) The process of limiting access to the resources of a system to authorized users, programs, processes or other systems (in networks). (AR 380-380) | | access control list | A list of subjects which are authorized to have access to some object. (IV1TR-8201) | |-----|-----|

-----| | access control measures | Hardware and software features, physical controls, operating procedures, management procedures, and various combinations of these designed to detect or prevent unauthorized access to an ADP system and to enforce access control. (DOE 5637.1) | | access control mechanism(s) | Hardware or software features, operating procedures, management procedures, and various combinations of these designed to detect and prevent unauthorized access and to permit authorized access to an automated system. (AR 380-380; FIPS PUB 39) | | access control roster | A list of human and computer users who communicate or interface with a system, that documents the

degree of access and control for each user.

The Department believes that determinations of risk level and criticality may vary based on the specific type of regulated entity and the regulated entity's specific circumstances. For example, a health care provider must consider the higher levels of risks to physical and technical security that are created by regular entry and exit of individuals seeking health care and other members of the public into its facilities, creating potentially numerous avenues for access to ePHI through technology assets; in contrast, a health plan that generally does not permit physical entry by individuals into its office building may determine that the risks to ePHI from physical entry by individuals or other members of the public is low because its workforce members do not generally physically interact with the public. As another example, a vulnerability permitting unauthenticated remote code execution on a device connected to a regulated entity's relevant electronic information systems would likely constitute either a high or critical risk. However, should such a device not have the ability to connect to the network, the risk might be low or moderate because the likelihood of triggering a network vulnerability on a non-networked device is low, even though the impact of such trigger might be high. Thus, it is essential that a regulated entity consider its specific circumstances when assessing the criticality of a risk and to address such risks in a manner that is appropriate to its specific facts and circumstances. [473] In yet another example, a regulated entity in possession of legacy devices or devices that are nearing the end of their lifespan should assess the risks associated with continued use of such devices as part of its risk analysis and ensure that replacement of such devices and/or the implementation of compensating controls are included in its risk management plan. Despite our having made available an abundance of free and widely-publicized guidance tools, OCR unfortunately has learned through its compliance and enforcement activities that regulated entities often do not perform compliant risk analyses. As discussed above, in 2016 and 2017, the Department conducted audits of 166 covered entities and 41 business associates for their compliance with selected provisions of the HIPAA Rules. [474] These audits confirmed that only small percentages of covered entities (14 percent) and business associates (17 percent) were substantially fulfilling their regulatory responsibilities to safeguard ePHI they hold through risk analysis activities. Entities generally failed to: Identify and assess the risks to all of the ePHI in their possession or even develop and implement policies and procedures for conducting a risk analysis. Identify threats and vulnerabilities to consider their potential likelihoods and effects, and to rate the risk to ePHI.

Together, the annual cost to a contractor to obtain an independent assessment of the security of a FIS is approximately \$132,000 (\$52,000 + 80,000). ii. Cyber Threat Hunting and Vulnerability Assessment. The (printed page 68409) Government estimates that four senior level employees will expend a total of 448 hours (4 individuals * 8 hours * 14 days) to complete cyber threat hunting and the vulnerability assessment of a FIS. Using an average loaded wage rate of \$250.00 for a cyber threat hunter/vulnerability assessor, the Government estimates the annual cost for a contractor to conduct a cyber threat hunting and vulnerability assessment of a FIS is approximately \$112,000 (448 hours * \$250). iii. Submission of Assessments. The Government estimates a contractor will spend one hour preparing and submitting each assessment to the Government. Using an average loaded wage rate of \$91.10 for FIS occupations, the total annual estimated cost for a contractor that operates or maintains a non-cloud FIS designated as a moderate or high FIPS 199 impact to submit both assessments to the Government is approximately \$182 (1 hour * 2 responses * \$91.10). 4. Submission of a Continuous Monitoring Strategy Paragraph (f)(7) of the new clause 52.239-YY requires a contractor that develops, implements, operates, or maintains a non-cloud FIS to provide the Government with a continuous monitoring strategy for the FIS (as developed under NIST SP 800-53) that demonstrates an ongoing awareness of information security, vulnerabilities, and threats in order to support risk management decisions, and applies the use of automation, wherever possible; protects vulnerability scan data, logs, and telemetry; and applies the guidance of NIST SP 800-137, Information Security Continuous Monitoring (ISCM) for Federal Information Systems and Organizations. All 28 contractors awarded a contract involving a non-cloud FIS will be required to develop or update their continuous monitoring strategy to meet the requirements of this rule. Many contractors will have developed a continuous monitoring strategy to comply with the guidance in NIST 800-53; however, those plans may need to be revised to demonstrate a continuous monitoring strategy. The Government estimates a contractor will spend, on average, 160 hours developing and/or documenting a continuous monitoring strategy, revising their existing strategy, as needed, and submitting the strategy to the Government. Using an average loaded wage rate of \$91.10 for FIS occupations, the total annual estimated cost for a contractor that operates or maintains a non-cloud

FIS to submit a continuous monitoring strategy to the Government is approximately \$14,600 (160 hours * \$91.10).

From the DoD SP 800-171 Rev 3 Organization-Defined Parameters: DEPARTMENT OF DEFENSE 6000 DEFENSE PENTAGON WASHINGTON, D.C. 20301-6000 "Protecting Controlled Unclassified Information in Organizations," NIST Special Publication (MEMORANDUM FOR SENIOR PENTAGON LEADERSHIP COMMANDERS OF THE COMBATANT COMMANDS DEFENSE AGENCY AND DOD FIELD ACTIVITY DIRECTORS SUBJECT: Department of Defense Organization-Defined Parameters for National Institute of Standards and Technology Special Publication 800-171 Revision 3 Reference: (a) National Institute of Standards and Technology (NIST) Special Publication, Nonfederal Systems and SP) 800-171 Revision 3, May 2024 A key aspect of reference (a) is the inclusion of organization-defined parameters (ODPs), which allow organizations to tailor select security controls to specific security requirements, as dete

4. Recommendations to minimize the information collection burden on the affected public, including automated collection techniques. The PRA requires consideration of the time, effort, and financial resources necessary to meet the information collection requirements referenced in this section. The Department solicits public comments on its assumptions and burden estimates in this NPRM as summarized below. In this RIA, the Department proposes to revise certain information collection requirements associated with this NPRM and, as such, would revise the information collection last prepared in 2024 and approved under OMB control #0945-0003. [1033] The proposed revisions to the information collection describe all new and adjusted information (printed page 1010) collection requirements for regulated entities pursuant to the implementing regulation for HIPAA at 45 CFR parts 160 and 164 , the HIPAA Privacy, Security, Breach Notification, and Enforcement Rules (-HIPAA Rules-). The estimated annual labor burden presented by the regulatory modifications is 77,067,552 burden hours at a first-year cost of \$9,314,106,174. These figures, respectively, represent the sum of 37,781,637 new burden hours at a cost of \$4,655,324,954 for compliance by regulated entities and 39,285,915 new burden hours at a cost of \$4,658,781,219 for compliance by health plan sponsors. The overall total burden for respondents to comply with the information collection requirements of all of the HIPAA Privacy, Security, and Breach Notification Rules, including new burdens presented by proposed program changes, is estimated to be 925,144,023 burden hours at a cost of \$109,085,104,674, plus \$163,499,411 in capital costs for a total estimated annual burden of \$109,248,604,085, after the effective date of the final rule. This estimate is based on a total of 1,202,562,864 responses for a total of 2,565,011 respondents. The total burden for the HIPAA Rules, including the changes proposed in this NPRM, would result in a decrease of 28,838,213 burden hours and a cost increase of \$1,911,898,144, in comparison to the baseline in the ICR associated with the 2024 Privacy Rule to Support Reproductive Health Care Privacy. [1034] This is the result of multiples changes, such as decreasing burden hours for some existing requirements, increasing the estimated number of covered entities, adding new Security Rule requirements, and expanding the pool of respondents for the Security Rule by adding requirements for health plan sponsors. Details describing the burden analysis for the proposals associated with this RIA are presented below and explained further in the ICR associated with the NPRM. 1. Explanation of Estimated Annualized Burden Hours

As defined in section 4.1901 of the FAR, FCI means information, not intended for public release, that is provided by or generated for the Government under a contract to develop or deliver a product or service to the Government, but not including information provided by the Government to the public, such as that on public websites, or simple transactional information, such as that necessary to process payments. Controlled Unclassified Information (CUI): 32 CFR 2002.4(h) defines CUI, in part, as information the Government creates or possesses, or that an entity creates or possesses for or on behalf of the Government, that a law, regulation, or Government-wide policy requires or permits an agency to handle using safeguarding or dissemination controls, including FCI. In September 2020, the DoD published DFARS interim rule (Case 2019-D041), which implemented DoD's initial vision for the Cybersecurity Maturity Model Certification (CMMC) Program (-CMMC 1.0-) and outlined basic program features, to include: 5-level tiered model, CMMC Certified Third Party Assessment Organization (C3PAO) assessments in support of contractor and subcontractor certification, with no allowance for a Plan of Action and Milestones, and implementation of all security requirements by the time of a contract award. A total of 750 comments were received on the CMMC Program during the public comment period that ended on November 30, 2020. These comments highlighted a variety of industry concerns including concerns relating to the costs for a C3PAO certification, and the costs and burden associated with implementing, prior to award, the required

process maturity and 20 additional cybersecurity practices that were included in CMMC 1.0. The Small Business Administration Office of Advocacy also raised similar concerns on the impact the rule would have on small businesses in the DIB. Pursuant to DFARS clause 252.204-7012, DoD has required certain defense contractors and subcontractors to implement the security protections set forth in the National Institute of Standards and Technology (NIST) Special Publication (SP) 800-171 Rev 2 to provide adequate security for sensitive unclassified DoD information that is processed, stored, or transmitted on contractor information systems and to document their implementation status, including any plans of action for any NIST SP 800-171 Rev 2 requirement not yet implemented, in a System Security Plan. The CMMC Program provides the Department the mechanism needed to verify that a defense contractor or subcontractor has implemented the security requirements at each CMMC Level and is maintaining that status across the contract period of performance, as required.

and a copy to the Defense Acquisition Regulations System, Attn: Ms. Veronica Fallon, OUSD(AT&L)DPAP/DARS, Room 3B855, 3060 Defense Pentagon, Washington, DC 20301-3060. Comments can be received from 30 to 60 days after the date of this notice, but comments to OMB will be most useful if received by OMB within 30 days after the date of this notice. Public comments are particularly invited on: Whether this collection of information is necessary for the proper performance of functions of the DFARS, and will have practical utility; whether our estimate of the public burden of this collection of information is accurate, and based on valid assumptions and methodology; ways to enhance the quality, utility, and clarity of the information to be collected; and ways in which we can minimize the burden of the collection of information on those who are to respond, through the use of appropriate technological collection techniques or other forms of information technology. To request more information on this proposed information collection or to obtain a copy of the proposal and associated collection instruments, please write to the Defense Acquisition Regulations System, Attn: Ms. Veronica Fallon, OUSD(AT&L)DPAP/DARS, Room 3B855, 3060 Defense Pentagon, Washington, DC 20301-3060, or email dfars@osd.mil. Include DFARS Case 2011-D044 in the subject line of the message. List of Subjects in 48 CFR Parts 204, 212, and 252 Government procurement Mary Overstreet, Editor, Defense Acquisition Regulations System. Therefore 48 CFR parts 204, 212, and 252 are proposed to be amended as follows: 1. The authority citation for 48 CFR parts 204, 212, and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1. PART 204-ADMINISTRATIVE MATTERS 2. Section 204.1202 is amended by- a. Redesignating paragraphs (2)(i) through (xiii) as paragraphs (2)(ii) through (xiv); and b. Adding new paragraph (2)(i) to read as follows: 204.1202 Solicitation provision and contract clause. * * * * * (2) * * * (i) 252.204-70XX, Ownership of Offeror. * * * * * 3. Section 204.7207 is revised to read as follows: (printed page 43479) 204.7207 Solicitation provisions. (a) Use the provision at 252.204-7001, Commercial and Government Entity (CAGE) Code Reporting, in solicitations when- (1) The solicitation does not include the clause at FAR 52.204-7, Central Contractor Registration; and (2) The CAGE codes for the potential offerors are not available to the contracting office. (b) Use the provision at 252.204-70XX, Ownership of Offeror, in all solicitations. PART 212-ACQUISITION OF COMMERCIAL ITEMS 4. Section 212.301 is amended by- a. Redesignating paragraphs (f)(iv)(C) through (Q) as paragraphs (f)(iv)(D) through (R); and b. Adding a new paragraph (f)(iv)(C) to read as follows: 212.301 Solicitation provisions and contract clauses for the acquisition of commercial items. * * * * * (iv) * * * (C) Use the provision at 252.204-70XX Ownership of Offeror, as prescribed in 204.7207. * * * * * PART 252-SOLICITATION PROVISIONS AND CONTRACT CLAUSES 252.204-7001

. If an individual disagrees with the denial decision, he or she may file an appeal within 60 calendar days of receipt of the denial notification. Appeals should be sent to: NGB Chief Counsel, 1636 Defense Pentagon, Room 1D164, Washington DC 20301-1636. (5) The Chief Counsel will use the following procedures for any appeals received: (i) The Chief Counsel will notify Chief of the OIP that an appeal has been received and request an exact copy of the administrative record be provided within 10 working days. (ii) The Chief Counsel will review the appeal and make a final determination on whether to grant or deny the appeal. (A) If the Chief Counsel denies the appeal, a written letter will be provided to the requestor using the procedures outlined in 32 CFR part 310, subpart D including notification to the requestor that they may file a statement of disagreement. A brief statement will be prepared by the NGB Chief Counsel summarizing the reasons for refusing to amend the records and a copy will be provided to the Chief of the OIP and the System Manager. (B) If the appellate authority grants the appeal, the procedures outlined in 32 CFR part 310, subpart D and this part will be followed. The System Manager will be responsible for informing all previous recipients of the amendment when a disclosure accounting has been maintained in accordance with 32

CFR part 310, subpart E . (iii) All appeals should be processed within 30 working days after receipt by the Chief Counsel. If the Chief Counsel determines that a fair and equitable review cannot be made within that time, the individual shall be informed in writing of the reasons for the delay and of the approximate date the review is expected to be completed. (g) Disclosure of Disputed Information. If the appellate authority determines the record should not be amended and the individual has filed a statement of disagreement, the following procedures will be used: (1) The System Manager that has control of the record shall annotate the disputed record so it is apparent to any person to whom the record is disclosed that a statement has been filed. Where feasible, the notation itself shall be integral to the record. (2) Where disclosure accounting has been made, the System Manager shall advise previous recipients that the record has been disputed and shall provide a copy of the individual's statement of disagreement, and the statement summarizing the reasons for the NGB refusing to amend the records in accordance with 32 CFR part 310, subpart D . (3) The statement of disagreement shall be maintained in a manner that permits ready retrieval whenever the disputed portion of the record is disclosed. (4) When information that is the subject of a statement of disagreement is subsequently requested for disclosure, the System Manager will follow these procedures: (i) The System Manager shall note which information is disputed and provide a copy of the individual's statement in the disclosure.

Under DFARS clause 252.204-7012, defense contractors and subcontractors must document implementation of the security requirements in NIST SP 800-171 Rev 2 in a system security plan and may use a Plan of Action Milestones to describe how and when any unimplemented security requirements will be met. For the CMMC Program, the solicitation, will specify the required CMMC level, which will be determined considering program criticality, information sensitivity, and severity of cyber threat. Although the security requirements in NIST SP 800-171 Rev 2 address a range of threats, additional requirements are needed to significantly reduce the risk posed by APTs. An APT is an adversary that possesses sophisticated levels of expertise and significant resources that allow it to create opportunities to achieve its objectives by using multiple attack vectors (e.g., cyber, physical, and (printed page 89083) deception). CMMC Level 3 requires implementation of selected security requirements from NIST SP 800-172 to reduce the risk of APT threats. The CMMC Program will require prime contractors to flow the appropriate CMMC requirement down throughout the entire supply chain relevant to a particular contract. Defense contractors or subcontractors that handle FCI, must meet the requirements for CMMC Level 1. Defense contractors that handle CUI must meet the requirements for CMMC Level 2 or higher, depending on the sensitivity of the information associated with a program or technology being developed. Scale and Depth Today, DoD prime contractors must include DFARS clause 252.204-7012 in subcontracts for which performance will involve covered defense information, but this does not provide the Department with sufficient insights with respect to the cybersecurity posture of all members of a multi-tier supply chain for any given program or technology development effort. CMMC 2.0 requires prime contractors to flow down appropriate CMMC Level requirements, as applicable, to subcontractors throughout their supply chain(s). Given the size and scale of the DIB, the Department cannot scale its existing cybersecurity assessment capability to conduct on-site assessments of approximately 220,000 DoD contractors and subcontractors every three years. The Department's existing assessment capability is best suited for conducting targeted assessments for the relatively small subset of DoD contractors and subcontractors that support designated high-priority programs involving CUI.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 204 and 252 [Docket DARS-2017-0015] RIN 0750-AJ54 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Final rule. SUMMARY: DoD is issuing a final rule amending the Defense Federal Acquisition Regulation Supplement (DFARS) to remove a provision that is duplicative of an existing Federal Acquisition Regulation (FAR) provision that requires a vendor to enter Commercial and Government Entity (CAGE) code information into a Governmentwide database prior to award of any contract or agreement. DATES: Effective May 30, 2018. FOR FURTHER INFORMATION CONTACT: Ms. Carrie Moore, telephone 571-372-6093. SUPPLEMENTARY INFORMATION: I. Background DoD is amending the DFARS to remove the DFARS provision 252.204-7004, Alternate A, System for Award Management (SAM), and the associated provision prescription at DFARS 204.1105. The DFARS provision

provided definitions that are to be substituted for the definitions in paragraph (a) of the FAR provision 52.204-7, System for Award Management. The FAR provision is prescribed for use in most solicitations. The purpose of the FAR provision is to inform offerors of the requirement to be registered in SAM in order to be eligible for an award. The DFARS provision was created for use in DoD solicitations, to ensure, in part, that offerors responding to DoD solicitations understood that they needed to enter a CAGE code in SAM in order to be considered registered in the system. However, the DFARS provision is no longer necessary, because the definition of "Registered in the System for Award Management (SAM) database" in paragraph (a) of the FAR provision has been updated to include a CAGE code as part of the information required from an offeror in order to be considered registered in SAM. As such, this DFARS alternate provision is redundant and can be removed. The removal of this DFARS text supports a recommendation from the DoD Regulatory Reform Task Force. On February 24, 2017, the President signed Executive Order (E.O.) 13777, "Enforcing the Regulatory Reform Agenda," which established a Federal policy "to alleviate unnecessary regulatory burdens" on the American people. In accordance with E.O. 13777

From the NIST SP 800-172 Rev 3 Final Public Draft: Integrity-checking mechanisms including parity checks, cyclical 2097 redundancy checks, cryptographic hashes, and associated tools can automatically monitor the integrity of systems and hosted applications. There are many ways to verify software integrity throughout the system development life cycle. Root of trust mechanisms (e.g., secure boot, trusted platform modules, UEFI) verify that only trusted code is executed during boot processes. The employment of cryptographic signatures ensures the integrity and authenticity of critical software that stores, processes, or transmits, CUI. This requirement is sourced to a control tailored out of the SP 800-53B [13] moderate baseline in SP 800-171. P

3.4.1 Current automated information systems capable of representing multiple levels of confidentiality sensitivity only support a monolithic model described in terms of ordered hierarchical levels and additional non-hierarchical categories.

- o Timeline analysis of log data, including synchronization of timestamps 4. Anti-forensics (e.g., obfuscation, data hiding, malware). Anti-forensics is a set of techniques used specifically to prevent or mislead forensic analysis. Anti-forensic challenges in cloud forensics include: - o The use of obfuscation, malware, data hiding, or other techniques to compromise the integrity of evidence - o Malware may circumvent virtual machine isolation methods 5. Incident first responders (e.g., trustworthiness of cloud providers, response time, reconstruction). Incident first responder challenges in cloud forensics include: - o Confidence, competence, and trustworthiness of the cloud providers to act as first responders and perform data collection - o Difficulty in performing initial triage - o Processing a large volume of collected forensic artifacts 6. Role management (e.g., data owners, identity management, users, access control). Role management challenges in cloud forensics include: - o Uniquely identifying the owner of an account - o Decoupling between cloud user credentials and physical users - o Ease of anonymity and creating fictitious identities online - o Determining exact ownership of data - o Authentication and access control 7. Legal (e.g., jurisdictions, laws, service-level agreements, contracts, subpoenas, international cooperation, privacy, ethics). Legal challenges in cloud forensics include: - o Identifying and addressing issues of jurisdictions for legal access to data - o Lack of effective channels for international communication and cooperation during an investigation - o Data acquisition that relies on the cooperation, competence, and trustworthiness of cloud providers - o Missing terms in contracts and service-level agreements - o Issuing subpoenas without knowledge of the physical location of data 8. Standards (e.g., standard operating procedures, interoperability, testing, validation).

Control OS-1100: or reviewing system security is also provided. We recommend that auditors attend the Information Systems Workshop or EDP Audit Workshop seminars, or their equivalents, prior to attending this session. ## DECNET COURSE TITLE: Auditing Decnet COURSE LENGTH: 2 DAY ## VENDOR: Canaudit Inc. P.O. Box 4150 Simi Valley, CA 93093 (805) 583-3723 Many Canaudit clients use the DEC VAX as an integral part of extensive network applications. It is essential that these applications be secure and that communications be safe and confidential, this seminar is specifically designed for Canaudit clients using DECnet, the primary communications architecture for Digital networks. Complete coverage of all aspects of DECnet security including network implementations. Network Control Program and network access control methodologies is included in this concentrated seminar. All participants will learn the critical control features of DECnet and how to evaluate the control

structure. In addition they will receive complete audit programs and utilities to automate much of the audit. NOTE: AUDITING VAX: A COMPREHENSIVE APPROACH is the prerequisite for this course. VAX COURSE TITLE: Auditing VAX: A Comprehensive Approach COURSE LENGTH: 3 DAY VENDOR: Canaudit Inc. P.O. Box 4150 Simi Valley, CA 93093 (805) 583-3723 This session is the most comprehensive VAX Audit course currently available. It is intended for auditors who will be auditing the VAX operating system and its components. The seminar provides participants with an understanding of the hardware, software and security requirements as well as depth, along with detailed descriptions of utilities and System Generation controls. Because of the popularity of this topic, we recommend early registration. NOTE: We recommend that participants attend the AUDITING ADVANCED INFORMATION TECHNOLOGY or EDP AUDIT WORKSHOP seminars or their equivalents prior to attending this course.

Based on the number of small businesses registered within the SBA Dynamic Small Business Search, the overall industrial base of federal government small businesses is 313,651. Approximately 1,000 facilities were randomly selected from the NISP to determine if the selected facilities were registered within the SBA Dynamic Small Business Search. With 95% confidence, it can be estimated that there are between 7,672 and 8,400 small entities impacted by this rule. The general methodology to determine a random sample and the estimated number of small business entities impacted by this rule is outlined in the following table. The random selection is dependent on the contractor facility having an active facility security clearance and permanent CAGE Code. NISP small entities estimate Total cleared contractor facilities enrolled in the DoD National Industrial Security System (NISS) as of May 14, 2020: 12,384 Randomly Selected facilities from the current cleared contractor population: 1,014 The proportion of cleared contractor facilities in the simple random sample enrolled in the SBA Database: $658/1,014 = 64.89\%$ Equates to 8,036 facilities as small business entities. Margin of Error for proportion enrolled in SBA database (95% confidence): $\pm 2.94\%$ Equates to ± 364 facilities cleared contractor facilities. The interval estimate for the number of small businesses in the NISP: $8,036 \pm 364 = 7,672$ to $8,400$ cleared contractor facilities. (printed page 83311) Based on the simple random sample, we can be 95% confident that the true proportion of active cleared contractor facilities enrolled in the SBA database is between 62.0% and 67.8%. Based on cleared contractor enrollment as of May 14, 2020, the percentages equate to an interval estimate between 7,672 and 8,400 small business entities which are cleared contractor facilities and impacted by this rule. Assumptions and Notes: · Facilities self-enrolled in the SBA database are, in fact, small businesses. The following link was used to determine if a facility was a small business by searching CAGE codes showing all NAICS for which a business is a small business: https://web.sba.gov/pro-net/search/dsp_dsbs.cfm . · The SBA database is generally a self-certifying database. The SBA does not make any representation as to the accuracy of any of the data included, other than certifications relating to 8(a) Business Development, HUBZone or Small Disadvantaged Business status. The SBA strongly recommends that contracting officers diligently review a bidder's small business self-certification before awarding a contract. · Facilities were selected from the active NISS population using a simple random sample (1,014 selected of 12,384 enrolled facilities). · Selection of each facility is independent of all other facilities selected ($N * .10 > n$). · The sample is large enough ($n = 1014$) that we can assume the sampling distribution of sample proportions is approximately normal ($n * p > 10$ and $n * (1-p) > 10$). Congressional Review Act

(8) No verification of identity shall be required of an individual seeking access to records that are otherwise available to the public. (9) Individuals shall not be denied access to a record in a SOR about themselves because those records are exempted from disclosure under 32 CFR part 285 . Individuals may only be denied access to a record in a SOR about themselves when those records are exempted from the access provisions of 32 CFR part 310, subpart F , and this part. (10) Individuals shall not be denied access to their records for refusing to disclose their Social Security Number (SSN), unless disclosure of the SSN is required by statute, by regulation adopted before January 1, 1975, or if the record's filing identifier and only means (printed page 24130) of retrieval is by the SSN (reference 5 U.S.C. 552a , note, Executive Order 9397). (c) Access to Records or Information Compiled for Law Enforcement Purposes. (1) All requests by individuals to access records about themselves are processed under 5 U.S.C. 552 , 5 U.S.C. 552a as well as 32 CFR part 286 , 32 CFR part 310, subpart D to give requesters a greater degree of access to records on themselves, regardless of which Act is cited by the requestor for processing. (2) Records (including those in the custody of law enforcement activities) that have been incorporated into a SOR exempted from the access conditions of 5 U.S.C. 552a and 32 CFR part 310, subpart D will be processed in accordance with 5 U.S.C. 552a , 32 CFR part 310, subpart D , and this part.

Individuals shall not be denied access to records solely because they are in an exempt system. They will have the same access that they would receive under 5 U.S.C. 552 and 32 CFR part 286 . (3) Records systems exempted from access conditions will be processed under 5 U.S.C. 552 and 32 CFR part 286 , or 5 U.S.C. 552a and 32 CFR part 310, subpart D , depending upon which gives the greater degree of access. (4) If a non-law enforcement element has temporary custody of a record otherwise exempted from access under 32 CFR part 310, subpart F for the purpose of adjudication or personnel actions, they shall refer any such access request, along with the records, to the originating agency and notify the requestor of the referral. (d) Access to Illegible, Incomplete, or Partially Exempt Records. (1) An individual shall not be denied access to his or her record or a copy of the record solely because the physical condition or the format of the record does not make it readily available (e.g. record is in a deteriorated state or on a magnetic tape). The document will be prepared as an extract, or it will be exactly recopied. (2) If a portion of the record contains information that is exempt from access, an extract or summary containing all of the information in the record that is releasable shall be prepared by the System Manager. (3) When the physical condition of the record makes it necessary to prepare an extract for release, the extract shall be prepared so that the requestor will understand it.

of the Privacy Act of 1974, as amended, was submitted on January 29, 2004, to the House Committee on Government Reform, the Senate Committee on Governmental Affairs, and the Office of Management and Budget (OMB) pursuant to paragraph 4c of Appendix I to OMB Circular No. A-130, 'Federal Agency Responsibilities for Maintaining Records About Individuals,' dated February 8, 1996 (February 20, 1996, 61 FR 6427). Dated: February 2, 2004. John Miller, Alternate OSD Federal Register Liaison Officer, Department of Defense. S253.10 DLA-G System name: Invention Disclosure (February 22, 1993, 58 FR 10854). Changes: * * * * * System identifier: Replace 'S253.10 DLA-G' with 'S100.70'. * * * * * Categories of individuals covered by the system: Delete 'to the DLA General Counsel' at the end of the sentence and replace with 'to DLA'. * * * * * Categories of records in the system: Delete entry and replace with 'Inventor's name, Social Security Number, address, and telephone numbers; descriptions of inventions; designs or drawings, as appropriate; evaluations of patentability; recommendations for employee awards; licensing documents; and similar records. Where patent protection is pursued by DLA, the file may also contain copies of applications, Letters Patent, and related materials.' * * * * * Authority for maintenance of the system: Delete entry and replace with ' 5 U.S.C. 301 , Departmental Regulations; 5 U.S.C. 4502 , General provisions; 10 U.S.C. 2320 , Rights in technical data; 15 U.S.C. 3710b , Rewards for scientific, engineering, and technical personnel of federal agencies; 15 U.S.C. 3711d , Employee activities; 35 U.S.C. 181-185 , Secrecy of Certain Inventions and Filing Applications in Foreign Countries; E.O. 9397 (SSN); and E.O. 10096 (Inventions Made by Government Employees) as amended by E.O. 10930 .' * * * * * Purpose(s): Delete entry and replace with 'Data is maintained for making determinations regarding and recording DLA interest in the acquisition of patents; for documenting the patent process; and for documenting any rights of the inventor. The records may also be used in conjunction with the employee award program, where appropriate.' * * * * * Routine uses of records maintained in the system, including categories of users and the purpose of such uses: Add two new paragraphs: 'To the U.S. Patent and Trademark Office for use in processing applications and performing related functions and responsibilities under Title 35 of the U.S. Code. To foreign government patent offices for the purpose of securing foreign patent rights.' * * * * * Safeguards: Delete entry and replace with 'Access is limited to those individuals who require the records for the performance of their official duties. Paper records are maintained in buildings with controlled or monitored access. During non-duty hours, records are secured in locked or guarded buildings, locked offices, or guarded cabinets. The electronic records systems employ user identification and password or smart card technology protocols.' * * * * *

Retention and disposal:

The Department is committed to overseeing the CMMC Program and will take appropriate measures to ensure its efficient execution. Presently, the Department has no intention of mandating that contracting offices adopt presumptive measures that would reduce the number of small contracts subject to Level 2 certification assessment, nor does it plan to impose affirmative requirements on prime contracts to utilize enclaves. Prior to conduct of an assessment, the OSC engages with the C3PAO assessor. It is during this time that classification of assets should be established, and the results of these discussions documented in pre-planning materials. This is an example of the pre-assessment and planning material submitted by the C3PAO as required in §170.9(b)(8) and the CMMC Assessment Scope submitted to eMASS as required in §170.17(a)(1)(i)(D). The DoD considered the NIST

definitions for System Information and Security Relevant Information in the development of the CMMC definition for SPD. This rule does not regulate an OSA's SPD, but instead implements existing regulatory requirements for the safeguarding of CUI, as defined in 32 CFR 2002.14(h)(2) and implemented by DFARS clause 252.204-7012. The DFARS clause 252.204-7012 requires protection of security protection assets and security protection data through its specification of NIST SP 800-171. Section 1.1 of NIST SP 800-171 R2 states: "The requirements apply only to components of nonfederal systems that process, store, or transmit CUI, or that provide security protection for such components." There is therefore no increase in the scope as described in the rule, and no revisions to cost estimates are required. The DoD received numerous comments about the requirements for CMMC when an ESP is used. In response to these comments, the DoD revised the rule to reduce the assessment burden on External Service Providers (ESPs) by updating the ESP assessment, certification, and authorization requirements in §§ 170.19(c)(2) and (d)(2). The use of an ESP, its relationship to the OSA, and the services provided need to be documented in the OSA's System Security Plan and described in the ESP's service description and customer responsibility matrix (CRM), which describes the responsibilities of the OSA and ESP with respect to the services provided. An ESP is considered a Cloud Service Provider (CSP) when it provides its own cloud services based on a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing that can be rapidly provisioned and released with minimal management effort or service provider interaction on the part of the OSA. ESPs that are CSPs, and process, store, or transmit CUI, must meet the FedRAMP requirements in DFARS clause 252.204-7012. ESPs that are CSPs and do not process, store, or transmit CUI, are not required to meet FedRAMP requirements in DFARS clause 252.204-7012.

addresses the implementation of procedures for terminating a workforce member's access to ePHI when their employment or similar arrangement ends or as required by the regulated entity's workforce clearance procedures. Under 45 CFR 164.308(a)(4)(i), the standard for information access management, a regulated entity is required to implement policies and procedures for authorizing access to ePHI in a manner that is consistent with the requirements of the Privacy Rule, that is, only when such access is appropriate based on the user or recipient's role (i.e., "role-based access"). This interpretation is consistent with the Privacy Rule's standard that limits most uses and disclosures of PHI to the "minimum necessary" to accomplish the purpose of the use or disclosure. [434] The standard for information access management has three implementation specifications: paragraph (a)(4)(ii)(A) requires a health care clearinghouse that is part of a larger organization to implement policies and procedures to protect ePHI from unauthorized access by that organization; paragraph (a)(4)(ii)(B) addresses implementation of policies and procedures for granting access to ePHI, for example, through a workstation, program, or other mechanism; and paragraph (a)(4)(ii)(C) addresses the implementation of policies and procedures that, based on the regulated entity's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, program, or other process. Section 164.308(a)(5)(i) contains the standard for security awareness and training. This standard requires a regulated entity to implement a security awareness and training program for all workforce members, including management. There are four associated implementation specifications that address the need for regulated entities to implement the following: Periodic security updates. [435] Procedures for guarding against, detecting, and reporting malicious software. [436] Procedures for monitoring log-in attempts and reporting discrepancies. [437] Procedures for creating, changing, and safeguarding passwords. [438] The standard for security incident procedures at 45 CFR 164.308(a)(6)(i) requires a regulated entity to implement policies and procedures to address security incidents. The one implementation specification associated with this standard, 45 CFR 164.308(a)(6)(ii), requires regulated entities to identify and respond to suspected or known security incidents; to mitigate, to the extent practicable, harmful effects of security incidents that are known to the regulated entity; and to document security incidents and their outcomes. Under the standard for contingency planning at 45 CFR 164.308(a)(7)(i), a regulated entity is required to establish, and

implement as needed, policies and procedures for responding to an emergency or other occurrence that damages systems that contain ePHI. The standard includes five implementation specifications at 45 CFR 164.308(a)(7)(ii)

To address this recurring problem, this rule establishes and standardizes a process to enable offerors to propose changes in their offer to the solicitation's line item structure. Establishing such a process is a first step towards managing variation in these transactions by eliminating or reducing manual intervention. II. Executive Orders 12866 and 13563 Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804. III. Regulatory Flexibility Act DoD certifies that this final rule will not have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601, et seq., because the rule does not impose any additional requirements on small businesses. Further, this change does not add to, or delete from existing requirements or authorities for entities to include alternative line item structures in their offers. This rule is formalizing a process to facilitate offerors' ability to request changes to the line item structure. IV. Paperwork Reduction Act The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). (printed page 58139) List of Subjects in 48 CFR Parts 204, 212, and 252 Government procurement Mary Overstreet, Editor, Defense Acquisition Regulations System. Therefore, 48 CFR parts 204, 212, and 252 are amended as follows: 1. The authority citation for 48 CFR parts 204, 212, and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1. PART 204-ADMINISTRATIVE MATTERS 2. Amend section 204.7103 by adding a new paragraph (g) to read as follows: 204.7103-1 Criteria for establishing. * * * * *

(2)(i) If the Contractor's accounting system is not capable of identifying and tracking through the build cycle the property that is allocable and properly chargeable to this contract, the Contracting Officer may consider acceptance of one or a combination of the following alternative forms of security sufficient to constitute adequate security for the performance-based payments and so specify in the contract, consistent with FAR 32.202-4: (A) A paramount lien on assets. (B) An irrevocable letter of credit from a federally insured financial institution. (C) A bond from a surety, acceptable in accordance with FAR part 28. (D) A guarantee of repayment from a person or corporation of demonstrated (printed page 19691) liquid net worth, connected by significant ownership interest to the Contractor. (E) Title to identified Contractor assets of adequate worth. (ii) Paragraph (f) of the clause at FAR 52.232-32 does not apply to the extent that the Contractor and the Contracting Officer agree on alternative forms of security. In the event the Contractor fails to provide adequate security, as required in this contract, no financing payment will be made under this contract. Upon receipt of adequate security, financing payments will be made, including all previous payments to which the Contractor is entitled, in accordance with the terms of the provisions for contract financing. If at any time the Contracting Officer determines that the security provided by the Contractor is insufficient, the Contractor shall promptly provide such additional security as the Contracting Officer determines necessary. In the event the Contractor fails to provide such additional security, the Contracting Officer may collect or liquidate such security that has been provided and suspend further payments to the Contractor; and the Contractor shall repay to the Government the amount of unliquidated financing payments as the Contracting Officer at his sole discretion deems repayable. 12. Add section 252.232-7015 to read as follows: 252.232-7015 Performance-Based Payments-Representation As prescribed in 232.1005-70(b), use the following provision: Performance-Based Payments-Representation (APR 2020) (a) In accordance with 10 U.S.C. 2307(b)(4)(A), the Contractor's financial statements shall be in compliance with Generally Accepted Accounting Principles in order to receive performance-based payments. (b) The Offeror represents that its financial statements are [.] are not [.] in compliance with Generally Accepted Accounting Principles. (End of provision) 13. Add section 252.232-7016 to read as follows: 252.232-7016 Notice of Progress Payments or Performance-Based Payments As prescribed in 232.1005-70(c), insert the following provision: Notice of Progress Payments or Performance-Based

(Comment 27) One comment seeks clarification regarding application of the recordkeeping requirements to certain ownership-partnership relationships involving a U.S. trucking company and a Canadian or Mexican trucking company. The comment asks, for example, whether a Canadian subsidiary of a U.S. trucking company is subject to the recordkeeping requirements. The comment states that a Canadian trucking company may be in partnership with a U.S. company, and the percentage of U.S. ownership is established in each partnership. Another example provided by the comment is that a Mexican motor carrier may have a contractual or interline relationship with a U.S. company. The comment asks whether the recordkeeping requirements apply to the foreign transporters with these U.S. relationships. (Response) The final rule applies to persons who manufacture, process, pack, transport, distribute, receive, hold, or import food in the United States. Thus, any person who transports food in the United States is subject to these recordkeeping requirements with respect to that food that enters the United States. The partnership or contractual status with a U.S. company does not affect the application of these requirements to a foreign person if they are transporting food in the United States, because such persons are already covered by this final rule by virtue of transporting food in the United States. (Comment 28) One comment seeks clarification on whether residency in a territory of the United States affects applicability of the regulation. One comment questions FDA's authority to apply the proposed regulation to the Caribbean jurisdictions of the U.S. Virgin Islands and the Commonwealth of Puerto Rico. The comment contends that the regulations would be burdensome to grocery operators or other retailers in the Caribbean jurisdictions who do not export to the Continental United States, but would not deter bioterrorism acts in the Continental United States or in the Caribbean jurisdictions. The comment asserts that the proposed regulation will jeopardize the island economies of the Caribbean jurisdictions by increasing unnecessary expenses to the food retailing activity, which is already more expensive than in the Continental United States, by adding, among other expenses, the maritime transportation cost to the goods.

In recognition of those potential harms and the health care sector's importance to the economy and security of the U.S., the President has designated 'Healthcare and Public Health' as a critical infrastructure sector [11] and the Department as the Sector Risk Management Agency (SRMA). [12] In addition, to address concerns about the increasing level of cybercrime, the President has charged Federal agencies with 'establishing and implementing minimum requirements for risk management' and robustly enforcing those requirements and Federal laws to help manage that risk. [13] We believe that a comprehensive and updated Security Rule is critical to accomplishing these directives and to the Department's effectiveness as the SRMA for the Healthcare and Public Health sector. In further recognition of these concerns, States have promulgated or are in the process of promulgating regulations that would require the adoption of certain standards or measures for the protection of sensitive information, such as PHI. [14] While these proposed regulations may contain helpful guidance for regulated entities, none specifically focus on ensuring the security of ePHI and the information systems that create, receive, maintain, or transmit ePHI. Additionally, a patchwork of State-specific laws may create difficulties for regulated entities that are located or operate in multiple States. Several entities, including Federal agencies, have published and maintained guidelines, best practices, methodologies, procedures, and processes for protecting the security of sensitive information, including PHI. Some examples of these resources include the National Institute of Standards and Technology's (NIST's) 'Cybersecurity Framework,' [15] the HHS 405(d) Program's 'Health Industry Cybersecurity Practices: Managing Threats and Protecting Patients,' [16] the Federal Trade Commission's (FTC's) 'Start with Security: A Guide for Business,' [17] and the Department's 'Cybersecurity Performance Goals' (CPGs). [18] We believe that the proliferation of such documents in recent years has been helpful, and we have considered them in the development of this NPRM. However, in light of the increasing number and sophistication of cybersecurity incidents, we do not believe that these documents are sufficiently instructive for regulated entities to help improve their compliance with the Security Rule. Under its statutory authority to administer and enforce the HIPAA Rules, the Department modifies the HIPAA Rules as needed, but does not modify a standard or implementation specification more than once every 12 months. [19]

. However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law, as a result of the maintenance of the information, the individual will be provided access to the information except to the extent that disclosure would reveal the identity

of a confidential source. Note 1 to paragraph (f)(22)(i). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. Any portion of this system of records which falls within the provisions of 5 U.S.C. 552a(k)(2) may be exempt from the following subsections of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (H), and (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) . (iii) Reasons. (A) From subsection (c)(3) because to grant access to the accounting for each disclosure as required by the Privacy Act, including the date, nature, and purpose of each disclosure and the identity of the recipient, could alert the subject to the existence of the investigation. This could seriously compromise case preparation by prematurely revealing its existence and nature; compromise or interfere with witnesses or make witnesses reluctant to cooperate; and lead to suppression, alteration, or destruction of evidence. (B) From subsections (d) and (f) because providing access to investigative records and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal their wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that would make them difficult or impossible to reach in order to satisfy any Government claim growing out of the investigation or proceeding. (C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsections (e)(4)(G) and (H) because this system of records is compiled for investigative purposes and is exempt from the access provisions of subsections (d) and (f).

The records redesign burden presented in table 25 of this document reflects the burden that some firms will incur by adding a limited amount of new information to their records. Some firms will not already be keeping the required information in a readily accessible form. The records redesign burden includes labor and capital costs associated with modifying existing forms so that they are better suited to meet the recordkeeping requirements. This is assumed to be a one-time burden incurred by each covered firm in the first and second years following implementation of the final rule. FDA expects that personnel at most facilities will incur a records maintenance burden due to collecting, recording, and checking for accuracy the limited amount of additional information required by the proposed rule. The burden from this activity is reported in table 25 of this document and is assumed to be incurred by all facilities in each subsequent year following enactment of the final rule. Finally, new firms are assumed to incur burdens from learning in each subsequent year following enactment of the final rule. These burdens for new (printed page 71650) firms are reported in table 26 of this document.

Table 25. Estimated Annual Recordkeeping Burden-First and Second Years			
21 CFR Section	No. of Record keepers	Annual Frequency per Record	Total Annual Records
1.337, 1.345, and 1.352 (learning)	707,672	4.790	3,390,000
1.337, 1.345, and 1.352 (redesign)	150,358	1	150,358
Total	7,763,000	1	7,763,000

There are no operating and maintenance costs associated with this collection of information.

Table 26. Estimated Annual Recordkeeping Burden-Subsequent Years			
21 CFR Section	No. of Record Keepers	Annual Frequency per Record	Total Annual Records
1.337, 1.345, and 1.352 (additional records maintenance)	379,493	13.228	5,020,000
1.337, 1.345, and 1.352 (learning for new firms)	70,767	4.790	339,000
Total	5,359,000	1	5,359,000

There are no capital costs or operating and maintenance costs associated with this collection of information. The information collection provisions of this final rule have been submitted to OMB for review. Before the effective date of this final rule, FDA will publish a notice in the Federal Register announcing OMB's decision to approve, modify, or disapprove the information collection provisions in this final rule. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number.

IX. Analysis of Environmental Impact The agency has carefully considered the potential environmental effects of this action. FDA has concluded under 21 CFR 25.30(h) that this action is of a type that does not individually or cumulatively have a significant effect on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement is required.

X. Federalism

Some of the public safety mobile application security requirements may be addressed using techniques

after the application is deployed. The following are a few examples of these techniques: mobile device profile management, mobile application whitelisting, scanning the mobile device for installed malware, and network security. Since these techniques are highly dependent on the mobile application's operating environment and outside the control of the mobile application developer, these techniques were considered outside the scope of this workshop. 1. Apps are just like any software and are vulnerable to commonly known risks of infection, malware, and other cyber threats.

From the NIST SP 800-172 Rev 3 Final Public Draft: This publication incorporates the following changes from the original edition (February 2, 2021):

- Streamlined introductory information in Sec. 1 and Sec. 2 to improve clarity and understanding
- Increased the specificity of the enhanced security requirements to remove ambiguity, improve the effectiveness of implementation, and clarify the scope of assessments
- Grouped enhanced security requirements, where possible, to improve understanding and the efficiency of implementations and assessments
- Removed outdated and redundant enhanced security requirements
- Added new enhanced security requirements based on (1) the latest threat intelligence, (2) empirical data from cyber-attacks, and (3) the expansion of security objectives to include integrity and availability
- Added titles to the

ations prevailed. An important characteristic of a forensic tool is its ability to maintain the integrity of the original data source being acquired and also that of the extracted data. The former is done by blocking or otherwise eliminating write requests to the device containing the data. The latter is done by computing a cryptographic hash over the contents of the evidence files created and recurrently verifying that this value remains unchanged throughout the lifetime of those files. Preserving integrity not only maintains credibility from a legal perspective, but it also allows any subsequent investigation to use the same baseline for replicating the analysis.

SP 800-53 Revision 4 has been updated to reflect the evolving technology and threat space. Example areas include issues particular to mobile and cloud computing; insider threats; applications security; supply chain risks; advanced persistent threat; and trustworthiness, assurance, and resilience of information systems. The revision also contains a new appendix of privacy controls, and related implementation guidance (Appendix J), based on the Fair Information Practice Principles (FIPPs), a widely accepted framework of defining principles to be used in the evaluation and consideration of systems, processes, or programs that affect individual privacy. Many organizations use well-known international information security standards as the basis or as a supplemental source of security controls for risk management. To aid in selection and comparison, SP 800-53 Rev. 4 provides mapping tables to provide organizations with a general indication of security control coverage with respect to ISO/IEC 27001, Information technology Security techniques-Information security management systems-Requirements and ISO/IEC 15408, Information technology -- Security techniques -- Evaluation criteria for IT security . ISO/IEC 27001 applies to all types of organizations and specifies requirements for establishing, implementing, operating, monitoring, reviewing, maintaining, and improving a documented information security management system (ISMS) within the context of business risks. ISO/IEC 15408 (also known as the Common Criteria) provides functionality and assurance requirements for developers of information systems and information system components (i.e., information technology products).

As NIST states in NIST SP 800-171A Jun2018,

- The assessment procedures are flexible and can be customized to the needs of the organizations and the assessors conducting the assessments. Security assessments can be conducted as self-assessments; independent, third-party assessments; or government-sponsored assessments and can be applied with various degrees of rigor, based on customer-defined depth and coverage attributes.
- CMMC Program requirements are designed to ensure compliance with existing standards for protection of FCI and CUI and align directly to NIST guidelines (i.e., NIST SP 800-171 R2 and NIST SP 800-172 Feb2021) and the basic safeguarding requirements (of FAR clause 52.204-21) that apply to all executive agencies. The rule accounts for costs associated with assessment via NIST SP 800-171A Jun2018. Within the limitations of section §170.21 Plan of Action and Milestones Requirements, offerors may bid on a contract while continuing to work towards full CMMC compliance. DoD rejects the notion that organizations must accelerate to meet a requirement in place since 2017. DoD did not intend nor expect that POA&Ms would remain open-ended and unimplemented for years. The DoD provided an analysis of costs to meet CMMC Level 1 and 2 requirements in the regulatory impact analysis for this rule. Certification is never required for CMMC Level 1, which is a self-assessment requirement. CMMC Level 2 may either be met via self-assessment, or via a C3PAO assessment, depending on the specific requirement cited in the

solicitation. It is not within in scope of this rule to address the way companies recover assessment costs. Verifying compliance with applicable security requirements may increase cost and is necessary for the protection of DoD FCI and CUI. The cost of lost technological advantage over potential adversaries is greater than the costs of such enforcement. 29. CMMC Benefits and Cost Estimates a. Cost Estimate Assumptions Comment: Some comments proposed the DoD directly assume the costs for industrial base compliance, increase contract award prices, offer grants and loans, or provide tax credits to offset the costs associated with compliance. One asked for clarification regarding allowable versus unallowable costs. One comment stated the cost estimate was a good guesstimate of the total cost to the USG, but the flow down costs and the price of doing business will be at the Program Office level. The commenter requested the DoD provide a table of Program Office funding requirements to aid Program Managers in reflecting CMMC costs in an Acquisition Strategy and Cost Analysis Requirements Document (CARD).

(3) Furnish copies of the statement of disagreement to all DoD Components and Federal agencies that have been provided copies of the disputed information and who may be maintaining the information.

(n) Maintaining statements of disagreement. (1) When possible, incorporate the statement of disagreement into the record. (2) If the statement cannot be made a part of the record, establish procedures to ensure that it is apparent from the records a statement of disagreement has been filed and maintain the statement so that it can be obtained readily when the disputed information is used or disclosed. (3) Automated record systems that are not programmed to accept statements of disagreement shall be annotated or coded so they clearly indicate that a statement of disagreement is on file, and clearly identify the statement with the disputed information in the system. (4)

Provide a copy of the statement of disagreement whenever the disputed information is disclosed for any purpose. (o) The DoD Component statement of reasons for refusing to amend. (1) A statement of reasons for refusing to amend may be included with any record for which a statement of disagreement is filed. (2) Include in this statement only the reasons furnished to the individual for not amending the record. Do not comment on or respond to comments contained in the statement of disagreement. Normally, both statements are filed together. (3) When disclosing information for which a statement of reasons has been filed, a copy of the statement may be released whenever the record and the statement of disagreement are disclosed. (p) Privacy case files. (1) Establish a separate Privacy case file to retain the documentation received and generated during the amendment or access process. (2) The Privacy case file shall contain as a minimum: (i) The request for amendment and access. (ii) Copies of the DoD Component's reply granting or denying the request; (iii) Any appeals from the individual; (iv) Copies of the action regarding the appeal with supporting documentation that is not in the basic file; and (v) Any other correspondence generated in processing the appeal, to include coordination documentation. (3) Only the items listed in paragraphs (p)(4) and (p)(5) of this section may be included in the system of records challenged for amendment or for which access is sought. Do not retain copies of the original record in the basic record system if the request for amendment is granted and the record has been amended. (4) The following items relating to an amendment request may be included in the disputed record system: (i) Copies of the amended record. (ii) Copies of the individual's statement of disagreement (see paragraph (m) of this section). (iii) Copies of the Component's statement of reasons for refusing to amend (see paragraph (o) of this section). (iv) Supporting documentation submitted by the individual. (5) The following items relating to an access request may be included in the basic records system:

(Comment 78) Some comments state that these proposed regulations would require a substantial and costly change in the way meals are delivered and processed. The comments urge FDA to consider whether the air and rail industries can bear the additional expense of these proposed regulations, as numerous ingredients are included in each meal that is prepared and boarded. The comments state that compliance with the traceability regulations depicted in the rule would require so many revamped processes and additional personnel that their organizations would likely not recover from the fiscal implications. The comments further state that they would have to completely change the way they produce and package meals for their customers, going to unprecedented lengths to ensure strict batch preparation. As an example, the comments note that with their current processes, they can determine shipment origin and location of the entire meal; however, it would be impossible to trace each individual ingredient going into the package. For example, meat from one lot number of ham could be put into sandwiches along with other ingredients from different sources and fruit or chips, and then loaded onto numerous flights. This level of batch control would make the production of these sandwiches and meals cost prohibitive. The comments further state that the impact on the

airline industry from September 11, 2001, has been tremendous. The airline industry is facing unprecedented challenges, and the way business is conducted has been altered forever. The comments note that reductions and bankruptcy filings by the various airlines have been extreme and have resulted in immense reductions in the airline catering business. The airlines' decisions to significantly cut back, eliminate food service, and reduce the load capacity on airplanes and number of flights continue to impact the interstate conveyance catering business. The comments urge FDA to consider these conditions because it will be difficult for the airline catering business to absorb the costs of proposed regulations into its current pricing structure. The comments conclude that they would be forced to pass these costs onto the already struggling airline industry.

The Defense Industrial Base Cybersecurity Assessment Center (DIBCAC) is the sole entity within the Department of Defense entrusted with conducting cybersecurity assessments of defense contractor information systems. DIBCAC operates under the Defense Contract Management Agency (DCMA) and is responsible for Medium and High assessments under DFARS 252.204-7020 and government-led CMMC Level 3 assessments. In FY2026, DCMA is establishing four functional teams with approximately 18 additional FTEs to perform 75 additional cybersecurity assessments.

156. On July 29, 2024, the Department announced that the Office of the National Coordinator for Health Information Technology was being renamed the Assistant Secretary for Technology Policy and Office of the National Coordinator for Health Information Technology. In this NPRM, we continue to use ONC for publications cited that predate the renaming of that office. 89 FR 60903 (July 29, 2024). Back to Citation 157. See, e.g., 45 CFR 170.315(d)(6), (7), (12), and (13).

167. See Public Law 104-191, 110 Stat. 2021 (Aug. 21, 1996) (codified at

- Organizing constructs in Revision 1 have been simplified by deprecating Categories (e.g., securely provision, oversee and govern, protect and defend, analyze, etc.) and Specialty Areas (e.g., incident response, threat analysis, cybersecurity management, etc.). In order to simplify an approach that offers agility, flexibility, interoperability, and modularity for organizations, Revision 1 presents a streamlined set of 'building blocks' comprised of Tasks, Knowledge, and Skills. Organizations that find value in the former Categories and Specialty Areas can continue to use them or create teams around those concepts and align them with this version of the NICE Framework (see Section 3.4). - Revision 1 describes several uses of Tasks, Knowledge, and Skills, including methods of applying those in the creation of Work Roles. Users of the Work Roles described

in the original NIST SP 800-181 may continue to use those; updates to those may be published by NICE in the future. [2] The relationships among Tasks, Knowledge, Skills, and Abilities have changed. Skill and Ability statements from the previous version have been refactored for simplicity into Skill statements, which focus on the action of the learner. This revision describes methods for associating Knowledge and Skill statements with Task statements for various outcomes. The lists of Tasks, Knowledge, Skills, and Work Roles that were previously available in Appendices A and B of the 2017 Framework have been removed from this version in order to simplify the maintenance of the NICE Framework and to ease updates to those lists. The Task, Knowledge, and Skills (TKS) statements and corresponding Competencies and Work Roles will be maintained as separate artifacts and will be subject to ongoing review and updates with a defined change process and indication of version control to manage and communicate changes.

- A built-in infrastructure for (a) providing service identities, (b) service discovery, and (c) external policy-based authorization engines in which policies incorporate contextual variables. Policies pertain to service-to-service and user-to-resource authentications and authorizations and ensure application integrity and confidentiality. These policies generally are expressed through a structure called access control. Some examples of access control models include: Next Generation Access Control (NGAC) model, and Attribute-based access control (ABAC) model. - Code for performing network-related functions (e.g., traffic routing) and for ensuring network resiliency through functions such as retries, timeouts, blue-green deployments, and circuit breaking. - More details on the container orchestration platform with an integrated service mesh can be found in [2], and an access control implementation in that platform is described extensively in [3]. - Measure the integrity and security posture of all resources by establishing a continuous diagnostics and mitigation (CDM) or similar system to monitor the state of devices and applications and apply patches or fixes as needed. - An enterprise should collect data about the resource security posture, network traffic, and access requests; process that data; and use any insight gained to improve policy creation and enforcement. This data can also be used to provide context for access requests from subjects.

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in Federal information systems. The usability considerations are further divided into memory, physical, and environmental considerations. Several themes emerged when looking across authentication methods: - Any authentication method requiring text entry, such as knowledge-based authentication (KBA) and passwords, will have critical usability issues. - Personal Identification Numbers (PINs) may be slightly better than complex passwords since they require fewer keystrokes. However, even PINs will not work for gloved first responders. - Any authentication method requiring that users recall information, such as KBA or memorized secret tokens (e.g., passwords, PINs, gestures) will have significant memory usability considerations. Memory issues may be exacerbated in stressful situations. - For authentication methods that require a separate physical device (e.g., smartcard, wearable proximity token), first responders must remember to bring the device and have it readily accessible for authentication. If the device is used in conjunction with another authentication method (e.g., smartcard with PIN) the usability issues are magnified. - Biometric authentication may be difficult for first responders in certain situations. Fingerprints will only work for users who are not wearing gloves.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Health and Human Services Office of the Secretary 45 CFR Parts 160 and 164 RIN 0945-AA22 AGENCY: Office for Civil Rights (OCR), Office of the Secretary, Department of Health and Human Services. ACTION: Notice of proposed rulemaking; notice of Tribal consultation. SUMMARY: The Department of Health and Human Services (HHS or Department) is

issuing this notice of proposed rulemaking (NPRM) to solicit comment on its proposal to modify the Security Standards for the Protection of Electronic Protected Health Information (Security Rule) under the Health Insurance Portability and Accountability Act of 1996 (HIPAA) and the Health Information Technology for Economic and Clinical Health Act of 2009 (HITECH Act). The proposed modifications would revise existing standards to better protect the confidentiality, integrity, and availability of electronic protected health information (ePHI). The proposals in this NPRM would increase the cybersecurity for ePHI by revising the Security Rule to address: changes in the environment in which health care is provided; significant increases in breaches and cyberattacks; common deficiencies the Office for Civil Rights has observed in investigations into Security Rule compliance by covered entities and their business associates (collectively, regulated entities); other cybersecurity guidelines, best practices, methodologies, procedures, and processes; and court decisions that affect enforcement of the Security Rule.

DATES: Comments: Submit comments on or before March 7, 2025. Meeting: Pursuant to Executive Order 13175, Consultation and Coordination with Indian Tribal Governments, the Department of Health and Human Services' Tribal Consultation Policy, and the Department's Plan for Implementing Executive Order 13175, the Office for Civil Rights solicits input from Tribal officials as the Department develops the modifications to the HIPAA Security Rule at 45 CFR part 160 and subparts A and C of 45 CFR part 164. The Tribal consultation meeting will be held on February 6, 2025, at 2 p.m. to 3:30 p.m. eastern time.

ADDRESSES: You may submit comments, identified by RIN Number 0945-AA22, by any of the following methods. Please do not submit duplicate comments. Federal eRulemaking Portal: You may submit electronic comments at <https://www.regulations.gov> by searching for the Docket ID number HHS-OCR-0945-AA22. Follow the instructions at <https://www.regulations.gov>

non-cloud FIS) to: (1) Develop and maintain a list of the physical location of all operational technology (OT) equipment included within the boundary of the non-cloud FIS; (2) When requested by the Government, submit a copy of the OT equipment list to the Government; (3) Submit a copy of their continuous monitoring strategy for the FIS; and (4) For FISs categorized as FIPS Publication 199 moderate or high security impact, submit the results of: an annual independent assessment of the security of the FIS, and an annual cyber threat hunting and vulnerability assessment.

A. Regulatory Familiarization and Standards Document Reviews It is estimated that approximately all six small business entities, and up to seven small business subcontractor entities, awarded a contract to design, implement, operate, or maintain a FIS on behalf of the Government will need to become familiar with the various compliance requirements of the new clauses 52.239-YY or 52.239-XX, as well as review any applicable standards documents, to be prepared to develop, implement, operate, or maintain a cloud and/or non-cloud FIS, as applicable.

B. Develop and Submit OT Equipment List It is estimated that approximately three small business entities, and up to seven small business subcontractor entities, will be awarded a contract or subcontract annually to develop, implement, operate, or maintain a non-cloud FIS. Each of these entities, will be required to develop, maintain, and submit a list of OT equipment for the duration of the contract. The list must include: (1) the identification and location of any controllers, relays, sensors, pumps, actuators, Open Platform Communications Unified Architecture devices, and other industrial control system devices, as well as all the IP (printed page 68412) addresses assigned to the different hardware components, used in performance of the contract; (2) An explanation of whether the device is password protected and, if so, whether it can be changed, (3) an explanation of whether the device is accessible remotely; and (4) whether multi-factor authentication is present and enabled. The location information in the list must include enough detail to affirmatively locate the OT equipment, when necessary, and track any movement of such equipment during performance of the contract. It is estimated that one of these three small business entities, and up to seven small business subcontractor entities, will be asked to submit the OT equipment list to the Government each year. To develop and maintain the list of OT equipment, a small business will need at least one employee within an information system occupation series (e.g., computer system analyst, information security analyst, system administrator, network architect) to identify the requisite devices used in performance of the contract, track the location of such devices as changes occur, and update and modify the OT equipment list as necessary.

C. Submit Continuous Monitoring Strategy

(viii) Proprietary information submitted strictly on a voluntary basis, absent any exercised authority prescribing criteria for submission. Examples of exercised authorities prescribing criteria for submission are statutes, Executive Orders, regulations, invitations for bids, requests for proposals, and contracts. Submission of information under these authorities is not voluntary.

(2) When the Components receive FOIA requests for information that could be protected by this

Exemption, submitter notice shall be provided. See § 286.2. (e) Exemption 5. Pursuant to 5 U.S.C. 552(b)(5), inter-agency or intra-agency memorandums or letters containing information considered privileged in litigation are exempt from disclosure. The courts have construed 'privileged in litigation' to mean information that is normally privileged in the civil discovery context (U.S. Department of Justice (DOJ) Guide). [3] Merely being an internal record is an insufficient basis for withholding under this exemption. Records that are not available routinely through the discovery process in the course of litigation with the agency because they are privileged should not be withheld under this exemption. The most common discovery privileges have been incorporated into Exemption 5. These privileges are the deliberative process, the attorney work product, and the attorney client privilege. (1) Threshold. (i) A document must meet the threshold requirement of being an inter- or intra-agency document before the proper privilege can be identified in any given case. Because in many instances the Government must seek expert advice from external entities (or consultants), the courts developed an 'outside consultant' test which helps in determining whether such an external entity qualifies as an 'agency' for the purposes of this exemption. If an entity meets the test, then documents it originates may be protected by Exemption 5. (ii) The Components should be careful to ensure that the outside consultant is not an interested party in the agency decision-making process. In 2001, the U.S. Supreme Court ruled that the threshold of Exemption 5 does not encompass communications between an outside consultant (in this case, several Indian tribes) and the Government (the U.S. Department of the Interior (DOI)). In this case, the outside consultants offered an expert opinion on an issue under consideration by DOI. The Supreme Court found that the tribes had an interest in the outcome of the DOI final decision; therefore, the DOI communications did not meet the threshold of Exemption 5. (DOJ FOIA Post Web site) (2) The privileges and types of information protected by Exemption 5 include: (i) Deliberative process privilege.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Office of the Secretary 32 CFR Part 236 [DOD-2009-OS-0183] RIN 0790-AI60 AGENCY: Office of the DoD Chief Information Officer, DoD. ACTION: Final rule. SUMMARY: This final rule responds to public comments regarding the establishment of the DIB CS/IA program, a voluntary cyber security information sharing program between DoD and eligible DIB companies. The program enhances and supplements DIB participants' capabilities to safeguard DoD information that resides on, or transits, DIB unclassified information systems. DATES: Effective Date: This rule is effective November 21, 2013. FOR FURTHER INFORMATION CONTACT: Mr. Dan Prieto at 703-571-5911, or the DIB Cyber Security and Information Assurance Program Office: (703) 604-3167, toll free (855) 363-4227, email osd.ncr.dod-cio.mbx.dib-cs-ia-program-registration@mail.mil . SUPPLEMENTARY INFORMATION: Executive Summary This final rule responds to public comments regarding the establishment of the DIB CS/IA program, a voluntary (printed page 62431) cyber security information sharing activity between DoD and eligible DIB companies to enhance and supplement DIB participants' capabilities to safeguard DoD information that resides on, or transits, DIB unclassified information systems. The program is codified at 32 CFR Part 236 and implements DoD statutory authorities to establish programs and activities to protect DoD information and DoD information systems, including information and information systems operated and maintained by contractors or others in support of DoD activities (see 10 U.S.C. 2224 and the Federal Information Security Management Act (FISMA), codified at 44 U.S.C. 3541

(Response) FDA notes that we computed the retention costs of the proposed rule on a per-facility basis and that we assumed that costs did not differ significantly from those of current business practices. The example documented in the comment illustrates the small amount of storage space that is required per facility. In the PRIA, FDA assumed that all firms keep most of the proposed records so that larger firms with a larger quantity of records may find it necessary to retain off-site records storage. In the final rule, FDA has revised the recordkeeping retention and other requirements for transporters to be consistent with current requirements for interstate transportation. Consequently, the retention requirements from this final rule should impose no extra burden on these facilities. (Comment 191) One comment from an association of wholesalers states that its members typically retain invoices and shipping records for approximately 6 months and will find it difficult to find the storage space to retain records under the proposed requirements. The

comment states that a 2-year retention requirement would constitute a dramatic change in distributors' operations and lead to a substantial increase in data storage costs. (Response) FDA does not agree that the retention requirements from this final rule will impose a large burden on food businesses. Only a small fraction of information is required to be added to existing records. Furthermore, based on preliminary research, a survey of dietary supplement manufacturers, and our interpretation of most of the comments to the proposed rule, the retention requirements in this final rule do not differ substantially from the industry norm. We believe that any change in practice from wholesalers that generates costs is mostly included in the estimated redesign and other set-up costs. 4. Records Access Costs (Comment 192) One comment states that a 4 and 8 hour records access cost is an additional cost, because it requires retrieval on the weekends, which may require companies to renegotiate storage contracts to allow for weekend access. (Response) FDA researched typical records storage contracts and found that at least one company's standard records retention contract explicitly provides that "unscheduled or emergency delivery of records" was to be charged on a "per event" basis (Ref. 26). FDA assumes this to be the norm in the industry. For both the proposed and final rules, FDA does not estimate the probability of a records access request, and weekend access is assumed to be charged on a per-event basis, which is considered a cost of performing a records access request. Because the records access costs are estimated to be the private costs of planning for a records access request, rather than for performing a records access request, the estimates for planning for a records access request in the analysis of the final rule do not change.

As shown in Table III-10 and Table III-II and Figures III-6 through III-38, the vast majority of the controls are reported either in place or in place and planned. The notable exception is certification/accreditation, which is reported less than 60 percent in place or in place and planned. Also, integrity and confidentiality controls for General ADP Support System (GADPS) are reported only approximately 80% in place or planned. OMB Bulletin 88-16 defined these controls narrowly as encryption, message authentication, and other technical mechanisms. On the other hand, integrity controls for Major Application Systems (MAS), which were 94% in place and planned, include a broad array of data validation mechanisms, such as edit checks and processing integrity checks.

Table 6 to Paragraph (d) DHS Cognizant Security Office Designation Mailing address Telephone No. CSO DHS Cognizant Security Office, ATTN: Chief Security Officer, 245 Murray Lane, M/S 0120-3, Washington, DC 20528 (202) 447-5424; (202) 447-5345 Dated: December 11, 2020. Patricia L. Toppings, OSD Federal Register Liaison Officer, Department of Defense. Footnotes 1. On June 20, 2020, the Secretary of Defense re-named the Defense Security Service (DSS) as the Defense Counterintelligence and Security Agency (DCSA), as required by Executive Order 13467, section 2.6(b)(i) (as amended by Executive Order 13968, Apr. 24, 2019, 84 FR 18125). Pursuant to Section 4 of E.O. 13968, references to DSS in DoD issuances should be deemed or construed to refer to DCSA. Back to Citation [FR Doc. 2020-27698 Filed 12-18-20; 8:45 am] BILLING CODE 5001-06-P

However, another comment states that FDA's intent to assert jurisdiction over food, whether or not it enters interstate commerce, may be unconstitutional. The comment notes that this assertion of power to regulate food in intrastate commerce is inconsistent with limitations imposed by the Commerce Clause of the U.S. Constitution, which generally authorizes Congress to regulate purely interstate commerce only. The comment further states that FDA should have assumed that Congress did not intend to violate the Constitution, and should revise the proposed rule accordingly. Another comment states that the FDA is proposing that domestic persons must maintain appropriate records as stipulated by the proposed regulations regardless of whether their food enters interstate commerce. The comment adds that appropriate State, local, and municipal regulatory bodies have authority to regulate domestic persons who manufacture, process, pack, transport, distribute, receive, or hold food intended for human or animal consumption, when intended solely for intrastate commerce in the United States. The comment argues that the proposed regulations regarding recordkeeping should not be expanded beyond what has been set forth in the Bioterrorism Act. Another comment states that the FMCSA has guidelines for determining whether carriers and drivers are engaged in interstate commerce

and provides the following definition in 49 CFR part 390.5 : Interstate commerce means trade, traffic, or transportation in the United States: (1) Between a place in a State and a place outside of such State (including a place outside of the United States); (2) Between two places in a State through another State or a place outside of the United States; or (3) Between two places in a State as part of trade, traffic, or transportation originating or terminating outside the State or the United States. (Response) In the preamble to the proposed rule, FDA sought comments on its tentative conclusion that it has authority to require recordkeeping by persons engaged only in intrastate commerce. FDA also sought comments on how many intrastate persons would not be covered by one of the exclusions (printed page 71572) from the recordkeeping requirements (e.g., the farm or restaurant exemption). Based on consideration of the received comments and further review of the provision of the Bioterrorism Act that provides FDA with the authority to require the establishment and maintenance of records by all persons who engage in specified activities involving food, FDA has concluded that the Bioterrorism Act gives FDA authority to require persons to establish and maintain records, whether or not they engage in interstate commerce, as long as they fall within Congress's power to legislate in this area. FDA is mindful that its interpretation of the Bioterrorism Act should not cast doubt on the constitutionality of the statute. (See *Solid Waste Agency of Northern Cook County v. U.S.*

FAR 32.1004(b)(2)(i) states that performance-based payments shall reflect prudent contract financing provided only to the extent needed for contract performance, and FAR 32.1004(b)(3)(ii) states that the contracting officer shall ensure that performance-based payment amounts are commensurate with the value of the performance event or performance criterion and are not expected to result in an unreasonably low or negative level of contractor investment in the contract. DoD is not trying to limit reasonable cash flow with this rule as it does not differ from FAR 32.1004 (b)(2)(ii) which limits contract financing to 90% of price. Any training provided will be done so in accordance with the rules in the FAR and DFARS. 10. Applicability to Acquisition of Commercial Items Comment: One respondent recommended that DoD should consider making PBPs available to commercial item contracts that are large in terms of scope and dollar value when the contractor needs early funding of the facilities, equipment, supplies and the like for performance. The respondent requested that DoD should provide guidance for such use of PBPs. Response: The law contemplates the use of financing similar to performance based payments on commercial item as well as other contracts. However, it also requires that payments for commercial items be made under such terms and conditions as the head of the agency determines are appropriate or customary in the commercial marketplace and are in the best interests of the United States. (10 U.S.C. 2307(f)(1)). It is impossible to specify in the DFARS what specific terms and conditions for PBPs are appropriate or customary in the commercial marketplace, since we assume they may vary widely depending on the marketplace for the kind of supply or service item being purchased. For this reason, the FAR and DFARS do not provide further detailed guidance other than what is already prescribed in FAR 32.2 and DFARS 232.2, Commercial Item Purchase Financing. III. Applicability to Contracts at or Below the Simplified Acquisition Threshold and for Commercial Items, Including Commercially Available Off-the-Shelf Items This rule amends the clauses at DFARS 252.232-7012 and 252.232-7013 and adds a new provision at DFARS 252.232-7015, Performance-Based Payments-Representation. These clauses and provision do not apply to contracts at or below the simplified acquisition threshold or for the acquisition of commercial items. In accordance with 10 U.S.C. 2307(f) and 41 U.S.C. 4505

One commenter interpreted CMMC Level 3 assessment requirements as meaning all parts of an OSCs infrastructure are within scope for CMMC assessment if the OSC uses a CSP, and recommended the rule specify that security requirements from the CRM must be documented in the SSP. Another asked whether OSCs must track all FedRAMP controls in their SSP or only those relevant to NIST SP 800-171 R2. Response: Requirements associated with the use of cloud service providers (CSPs) are covered under section (b)(2)(ii)(D) of DFARS clause 252.204-7012. When a CSP is used, it must meet the requirements of the FedRAMP moderate baseline or the equivalent. The rule was updated for consistency with those requirements, and now requires FedRAMP moderate or FedRAMP moderate equivalency as defined in DoD Policy. §§ 170.16(c)(2), 170.17(c)(5), 170.18(c)(5) address CMMC requirements for CSPs. The CMMC rule does not add new requirements on the use of CSPs, which are found in DFARS clause 252.204-7012. A CSP must be assessed against the FedRAMP moderate baseline when the CSP processes, stores, or transmits CUI. The CMMC rule does not oppose or contradict the requirements of DFARS clause 252.204-7012, nor does this rule relieve a CSP from any requirement defined in DFARS clause 252.204-7012. § 170.17(c)(5)(iii) and the corresponding requirement in § 170.18(c)(5)(iii) only apply to CSPs used to process, store, or transmit CUI in the execution of

the contract or subcontract requiring CMMC assessment. It does not expand to any cloud provider outside the scope of the assessment. Interactions between DoD contractors and their service providers are beyond the scope of the rule. CMMC Level 2 self-assessment and affirmation requirements described in § 170.16 make clear that an OSA using a FedRAMP Authorized CSP (at the FedRAMP Moderate or higher baseline) is not responsible for the CSP's compliance. The OSA needs to document in its SSP how the OSA meets its requirements assigned in the CSP's CRM. When using a CSP that is not FedRAMP Authorized, the OSA is responsible for determining if the CSP meets the requirements for FedRAMP Moderate equivalency as specified in DoD policy. In this case, the OSA also needs to document in its SSP how the OSA meets the requirements assigned to it in the CSP's CRM. The rule has been updated to include verbiage from the DFARS clause 252.204-7012 in the performance of a contract: for consistency. Use of the term CUI in this rule is deliberate because DoD intends to assess compliance with NIST SP 800-171 R2 for all CUI. The DoD declines to replace the word CUI with the word CDI, as the term CUI more clearly conveys that NIST SP 800-171 is the requirement for all CUI information, as described in 32 CFR 2002.14 .

(C) Require CMMC Ecosystem members to have and maintain a satisfactory record of integrity and business ethics. § 170.9 CMMC Third-Party Assessment Organizations (C3PAOs). (a) Roles and responsibilities. C3PAOs are organizations that are responsible for granting CMMC Level 2 Certification Assessments and issuing certificates of assessment for OSCs. C3PAOs must be accredited or authorized by the Accreditation Body in accordance with the requirements set forth. (b) Requirements. C3PAOs shall: (1) Obtain authorization or accreditation from the Accreditation Body in accordance with § 170.8(b)(3). (2) Comply with the Accreditation Body policies for Conflict of Interest, Code of Professional Conduct, and Ethics set forth in § 170.8(b)(17); and achieve and maintain compliance with ISO/IEC 17020:2012 (incorporated by reference, see § 170.2) within 27 months of authorization. If ISO/IEC 17020:2012 is revised or superseded, the C3PAO shall achieve full compliance with the updated standard within 12 months of the date of revision. (3) Require all C3PAO company personnel participating in the CMMC assessment process to complete a Tier 3 background investigation resulting in a determination of national security eligibility. This includes the CMMC Assessment Team and the quality assurance individual. This Tier 3 background investigation will not result in a security clearance, and is not being executed for the purpose of government employment. The Tier 3 background investigation is initiated using the Standard Form (SF) 86. These positions are designated as non-critical sensitive with a risk designation of 'Moderate Risk' in accordance with title 5 CFR 1400.201(b) and (d) and the investigative requirements of title 5 CFR 731.106(c)(2). (4) Require all C3PAO company personnel participating in the CMMC assessment process who are not eligible to obtain a Tier 3 background investigation to meet the equivalent of a favorably adjudicated Tier 3 background investigation. DoD will determine the Tier 3 background investigation equivalence for use with the CMMC Program only. (5) Comply with Foreign Ownership, Control or Influence (FOCI) by: (i) Completing and submitting Standard Form (SF) 328 Certificate

Pertaining to Foreign Interests upon request from DCSA and undergo a National Security Review with regards to the protection of controlled unclassified information based on the factors identified in 32 CFR 117.11(b) using the procedures outlined in 32 CFR 117.11(c) . (ii) Receiving a non-disqualifying eligibility determination from the CMMC PMO resulting from the FOCI risk assessment in order to proceed to a DCMA DIBCAC CMMC Level 2 assessment as part of the authorization and accreditation process set forth in paragraph (b)(6) of this section.

To select a CMMC Level for a procurement, Program Managers and requiring activities will identify the applicable CMMC Level using the factors included in § 170.5(b)(1) through (5). The DoD did agree with one comment to rephrase § 170.5(b)(4) to delete a reference to the potential for impact from exploitation of information security deficiencies, which likely cannot be effectively determined. The DoD does not agree that the wording equates to a sub-CONFIDENTIAL classification and declines to delete that criterion. § 170.5(b)(3) is appropriately worded in that it states Program Managers will consider the listed criteria in selecting a CMMC requirement level. It does not have the effect of transforming FCI into CUI. The DoD reserves the right to define the criteria for selection of the CMMC assessment requirement, just as it defines all other requirements for inclusion in a solicitation. The Department remains committed to implementing the CMMC program to require compliance assessment against applicable security requirements in all DoD contracts involving FCI or CUI. Some such contracts will require only a CMMC self-assessment, while others will require a certification assessment. The commenter misinterprets that some contracts that do require processing of FCI or CUI will not require CMMC assessment of either kind, without approval of a waiver. The DoD declines to remove self-assessments from the rule. Self-assessments allow the acquiring organization to balance the cost and complexity of assessment with the risk to the information being shared with the OSA. Supporting guidance for CMMC implementation will be updated, as necessary. DoD has options to mitigate implementation issues such as waivers and other contractual remedies. DoD's estimate for the number of contractor's requiring CMMC Level 1 and cost estimates represent derived estimates based on internal expertise and public feedback in accordance with OMB Circular A-4. 12. Flow-Down/Applicability to Sub Contractors a. Applicability and Compliance Comment: Several comments requested clarification about the applicability of CMMC requirements to subcontractors and how to correctly flow down requirements. Some asked whether prime contractors would have flexibility to flow down a lower CMMC level than required for the prime contract. Three comments expressed confusion about the type of Level 2 assessment required for subcontractors when supporting a prime that is required to meet CMMC Level 3 requirements. Two asked about the impact to flow-down when contractors hold multiple contracts. A couple comments requested clarity on how to determine the correct CMMC level to flow down. Some comments asked what factors would result in flow-down of a particular CMMC requirement level, or whether affirmations submitted by primes would require knowledge of subcontractor compliance status.

The Security Object enforces integrity of the CCC according to the issuer. All FIPS 201 mandatory information printed on the card is duplicated on the chip in that data object. The printed information data object SHALL NOT be modified post-issuance. The Security Object enforces integrity of this information according to the issuer. This provides specific protection that the card information must match the printed information, mitigating alteration risks on the printed media. The Security Object enforces integrity of the Discovery Object according to the issuer.

software) or technical controls. Under the proposal, a regulated entity would be required to collect sufficient information to understand what a specific activity in its relevant electronic information systems is, such that the regulated entity would be better able to address activity that presents a risk to the confidentiality, integrity, or availability of ePHI. For example, a regulated entity should understand that a given activity in a relevant electronic information system is an attempt to access a portable workstation without authorization. The proposal also would modify the limitation on the regulated entity's obligation to record and identify activity in its relevant electronic information systems. Thus, the proposal would require a regulated entity to record and identify any activity that could present a risk to ePHI, meaning activity in all of its relevant electronic information systems, not only in its electronic information systems that create, receive, maintain, or transmit ePHI. In so doing, the Department would also require a regulated entity to record and identify activity in its electronic information systems that may affect the confidentiality, integrity, or availability of ePHI. This redesignated standard, as proposed, aligns more closely with the Department's enhanced CPG for Centralized Log Collection by addressing the deployment of technical controls to record and identify activity in all electronic information systems. [763] Additionally, as an example, we note that adoption of health IT certified through the ONC Health IT Certification Program may contribute to a regulated entity's compliance with the proposed standard for audit trail and system log controls where such health IT meets the criteria for auditing actions on health information and recording actions related to electronic health information and audit log status. [764] (printed page 973) The Department proposes four implementation specifications under this proposed standard that are intended to improve the effectiveness of audit controls deployed by a regulated entity. The proposed implementation specification for monitoring and identifying activity at proposed 45 CFR 164.312(d)(2)(i) would require a regulated entity to deploy technology assets and/or technical controls that monitor in real-time (i.e., contemporaneously) all activity occurring in a regulated entity's relevant electronic information systems and identify indications of unauthorized persons and unauthorized activity, as determined by the regulated entity's risk analysis. As proposed, the technology assets and/or technical controls also would be required to alert workforce members of such indications in accordance with the regulated entity's policies and procedures for information system activity review at proposed 45 CFR 164.308(a)(7)

There is the possibility that direct marketers are included in the estimate of the number of direct marketers cited earlier and excluded in the NES if they are casual market participants, and have temporarily left the industry, or if they do not file as a sole proprietorship business with the IRS. Casual market participants might be included in the estimate of the total number of direct market facilities even if they are not active members. This would tend to inflate the total number of direct marketers to include both active and inactive members. Because of the ease of entry and exit by these firms, casual direct marketers that have temporarily left the industry are assumed to be approximately half of the number of direct marketers of food, or 1.75 percent of all direct marketers. This assumption leaves an estimated 1.75 percent (175,000) of direct marketers that are not counted in the NES statistics because they did not file as a sole proprietorship business with the IRS. We use this estimate of the number of direct food marketers that did not file as a sole proprietorship business with the IRS to revise our estimate of the total number of retail facilities. Direct marketers that did not file as a sole proprietorship business with the IRS are assumed to be part-time suppliers and to sell mostly at the retail level. Furthermore, because these are very small businesses that only sell food products on a part-time basis, the additional records maintenance costs for these facilities will be considerably less than that for larger, full-time businesses. We estimate the additional records maintenance costs for these part-time facilities to be one half that for other retailers. The learning costs, records redesign costs, and records access planning costs for these facilities are assumed to be the same as for other facilities. FDA does not agree that the burden of the rule would be higher for direct marketers than for other retailers. In the PRIA, FDA estimated that about 88 percent of retailers classified as very small firms have fewer than 10 employees. FDA believes it is reasonable to assume that compliance costs for direct

marketers would be about the same as for other very small firms. (Comment 184) One comment suggests that FDA underestimated the number of mixed-type facilities that engage in nut farming. The comment states that, in the almond industry, there are about 360 hullers and processors who are also growers, while FDA estimated that there were only 290 mixed-type facilities that engage in all categories of nut farming. Furthermore, because there are about 6,000 almond growers, the comment states that this implies that 6 percent of all almond growers would be classified as mixed-type facilities, compared to FDA's estimate of 2 percent of all nut farms.

1. Create a part of the cloud to meet the specific and varying security requirements of users. 2. Control access to that portion of the cloud so that the correct applications (workloads) get deployed there. 3. Enable audits of that portion of the cloud so that users can verify compliance.

1. Configure a cloud server platform as being trusted. The 'cloud server platform' includes the hardware configuration (e.g., BIOS integrity), operating system (OS) configuration (boot loader and OS kernel configuration and integrity), and the integrity of the container runtime. This also includes the varying hardware security technologies enabled on the server. These chain of trust (CoT) technologies provide platform integrity verification. Additional technologies and details can be found in the aforementioned NISTIR 8320 [1] and are discussed in Section 3.2. 2. Before each container worker node launch, verify (measure) the trustworthiness of the cloud server platform. The items configured in goal 1 (BIOS, OS, container runtime) need to have their configurations verified against previous measurements before launching the container runtime to ensure that the assumed level of trust is still in place. 3. During container runtime execution, periodically audit the trustworthiness of the cloud server platform. This periodic audit is essentially the same check as that performed as goal 2, except that it is performed frequently while the container runtime is executing. Ideally this checking would be part of continuous monitoring.

1. Deploy workloads only to cloud servers with trusted platforms. This basically means that you perform stage 0, goal 3 (auditing platform trustworthiness) and only deploy a workload to the cloud server if the audit demonstrates that the platform is trustworthy.

enables a regulated entity to determine if any ePHI has been used or disclosed in an inappropriate manner. [525] The procedures should be customized to meet the regulated entity's risk management strategy and consider the capabilities of all information systems with ePHI. [526] These activities should also promote continual awareness of any information system activity that could suggest a security incident. [527] Detecting and preventing data leakage initiated by malicious authorized users is a significant challenge. [528] Identifying potential malicious activity in relevant electronic information systems, including in workstations and other components, as soon as possible is key to preventing or mitigating the impact of such activity. [529] To identify potential suspicious activity, organizations should consider an insider's interactions with information systems and their components. A regulated entity can detect anomalous user behavior or indicators of misuse by either a trusted employee or third-party vendor who has access to critical systems, workstations and other system components, and data. [530] To minimize this risk, an organization may employ safeguards that detect suspicious user activities, such as traffic to an unauthorized website, downloading data to an external device (e.g., thumb drive), or access to a network server by an unauthorized mobile device. Maintaining audit controls (e.g., system event logs, application audit logs) and regularly reviewing audit logs, access reports, and security incident tracking reports are important security measures that can assist in detecting and identifying suspicious activity or unusual patterns of data access. [531] Regulated entities should regularly review activity in their relevant electronic information systems (including the components of such systems) for potential concerns and consider ways to automate such reviews. [532] Additionally, regulated entities are responsible for establishing and implementing appropriate standard operating procedures, including determining the types of audit trail data and monitoring procedures that would be needed to derive exception reports. [533] They also must activate the necessary review processes and maintain auditing and logging activity. [534] Department and NIST guidance advise regulated entities to consider many questions when establishing their policies and procedures for reviewing activity in their relevant electronic information systems review. [535] These include: What logs or reports are generated by the information systems? Is there a policy that establishes what reviews will be conducted? Are there corresponding procedures that describe the specifics of the reviews? Who is responsible for the overall process and results? How often will review results be analyzed? Where will audit information reside (e.g., separate server)? Will it be stored external to the organization (e.g., cloud service provider)?

2. Guidance on the use of an evaluation factor regarding supply chain risk is modified to require the inclusion of the evaluation factor when acquiring information technology, whether as a service or as a supply that is a covered system, is a part of a covered system, or is in support of a covered system. Additional text regarding an evaluation factor has been added at DFARS 212.301, 213.106-1, 214.201-5, and 214.503-1. 3. DFARS clause 252.239-7018, Supply Chain Risk, is changed as follows:

a. Paragraph (b), is modified to state that the contractor shall mitigate supply chain risk in the provision of supplies and services to the Government; and b. Paragraph (c) is removed as the clause will no longer contain a requirement to flow down the clause to subcontractors.

B. Analysis of Public Comments

1. Interim Rule Should Be Reissued as a Proposed Rule Comment: Numerous respondents urged DoD to rescind the interim rule and reissue the rule as a proposed rule. One respondent suggested that the new rule authorizes the exclusion of businesses from the defense industrial base and that such authority should not be exercised without first hearing the views of and gathering all relevant information from the parties that will be directly impacted by this rule. One respondent commented that the rule could prevent suppliers from addressing and mitigating supply chain security risks, and that a public comment period would have allowed industry to suggest alternative approaches that could allow for risk mitigation. Another respondent commented that the interim rule denies industry and other critical stakeholders ample time, opportunity to shape, and ultimately collaborate with the DoD to design a complex program that addresses multiple risks and complexities. One respondent added that without a standard notice-and-comment rulemaking process, industry has no opportunity to comment on areas of concern before the rule takes effect whereby industry must incur costs and move towards compliance without guidance through the rulemaking process. Response: DoD issued an interim rule because of the need to protect national security systems (NSS) and the integrity of its supply chains. The rule implements the specific authorities provided in the statute. The pilot authority provided for by the statute will expire September 30, 2018. It is in DoD's interest to initiate the pilot program and begin gathering feedback for its report to Congress. DoD considered all public comments received during the public comment period in the formation of this final rule.

2. Definitions

a. **·Covered Item·/·Covered System·** Comment: Several respondents objected to the broad definitions of **·covered system·** and **·covered item·**. One respondent questioned why the Council chose to use the term **·covered item·** versus **·covered item of supply·**, which is the term used in section 806. Response:

3.1. Compliance With NIST Standards and Validation 3.1. Compliance With NIST Standards and Validation

CMMC program requirements are applicable when DoD requires processing, storing, or transmitting of either FCI or CUI on a non-Federal contractor owned information system in the performance of a contract between DoD and the contractor. The DoD does not manage nor is it involved in data exchanges between contractors and subcontractors.

3. Other DoD Policies and Programs Many comments dealt with DoD policies and programs that, while relevant for understanding CMMC requirements, are still entirely separate programs or policies that are not within the scope of the CMMC program. However, several commenters recommended that the rule be revised to address them. Key topics among such comments include:

a. **Adaptive Acquisition Framework** Comment: One commenter misunderstood CMMC program purpose and thought the requirements applied to systems and capabilities acquired or developed for DoD's use, using formal policies of the Defense Acquisition System. Based on this misinterpretation, this commenter made dozens of recommendations related to integration of CMMC assessment and program requirements with other existing DoD acquisition frameworks and suggested relying on the assessors that complete TRAs, in place of implementing the CMMC program. One of their comments also proposed establishing a single responsible office for CUI and SCRM, hosting CUI material within a single, separate secure and existing cloud-based data warehouse and including

hardware and software approving authorities as part of the proposed rule for GFE. The commentor also stated the role of the Office of Small Business Programs (OSBP) needs to flow down to the Small Business Administration military service offices. The commentor also asked how to reconcile CMMC against the DoDI 8582.01 requirement stating a DoD Component should not specify the content and format of plans of action that address deficiencies or specifying the parameters of security controls. This commentor also recommended creation of a MIL-Standard in lieu of aligning cybersecurity requirements to existing NIST standards, and linkage of CMMC requirements to procedures related to Approval to Operate (which applies to DoD systems. This commentor suggested that the CMMC PMO be made responsible to provide system scans to check for Software Bills of Material as part of DoD's response to Executive Order 14028

External attackers may include foreign adversaries, criminal organizations, and cyber-activists who target an SSC for various reasons, such as espionage or sabotage. Internal attackers pose a significant risk, as they may have insider access to sensitive information - often using legitimate access rights - that allow them to launch attacks or steal confidential information. Additionally, both categories of threat actors may use a variety of techniques to compromise the SDLC environment and steal or manipulate software, such as phishing, malware, social engineering, and physical access. Therefore, companies should be aware of these risks and take appropriate measures (see Sec. 3.2) to secure their SSC. - Malware - Code reuse or the ingest of libraries and dependencies - Social engineering - Network-based attacks - Physical attacks Attack vectors can originate from various sources, including malware attacks on developer workstations, social engineering attacks on developers, network-based attacks on the development environment, and physical attacks on the hardware or networks used by developers. These different attack vectors require distinct countermeasures, including endpoint protection software, network security controls, access control policies, and physical security measures. Companies should identify potential risks and vulnerabilities, assess their security posture, and implement appropriate defensive measures to mitigate threats to their SDLC environment.

- Subverting, removing, or introducing a step within the SSC to maliciously modify or sabotage the resulting software product - Stealing credentials from the build system to mint and sign unauthorized malicious software - Causing naming collisions - Source code - Credentials - Sensitive data - Internal operations - Build systems A software developer's workstation typically contains various assets, including source code, credentials, and access to sensitive information, such as personally identifiable information (PII), protected health information (PHI), intellectual property (IP), cryptographic materials (e.g., software artifact signing keys), and proprietary information. Companies should identify critical assets and implement controls to protect them from unauthorized access, such as access controls, multi-factor authentication, encryption of data at rest and in transit, and data loss prevention (DLP) measures.

(Response) The costs estimated in the PRIA use cost estimates of the juice HACCP rule as a reference, not those of the seafood HACCP regulation. FDA has also received information that costs for compliance with the seafood HACCP rule were underestimated. FDA developed the estimates for the juice HACCP rule much later than those for the seafood HACCP rule. In addition, the burden for the additional records maintenance required in this final rule is considerably less than that required by the juice HACCP rule, particularly because FDA has relaxed the requirement for maintaining lot code information in the final rule and removed the requirement to record and maintain contact information for each transaction. (Comment 200) Some comments state that FDA failed to account for the effect of higher transaction costs (as a result of the regulation) on reducing arbitrage opportunities. Food arbitrage is a line item in most food distributors' and retailers' financial statements. The comments assert that this final rule will result in fewer arbitrage opportunities, because the cost of a transaction will rise, which will cause a substantial reduction in profits, encourage layoffs, and raise consumer prices. (Response) FDA agrees that the recordkeeping provisions in this regulation may increase the costs of transactions, thereby decreasing the total number of transactions. FDA believes, however, that transactions will be only slightly costlier and the effect on consumer prices and arbitrage opportunities will be small. (Comment 201) One comment urges FDA to clarify and confirm that it would not consider records identifying producers of coffee cherry for traceback purposes as information that would be considered to be information reasonably available. The comment states that it would be prohibitively costly to link the identities of individual coffee cherry growers to any processed food item, because the cherries from many growers are typically mixed upon delivery to a processing facility.

Proceedings of the Cybersecurity in CyberPhysical Systems Workshop, April 23 - 24, 2012 ##
Proceedings of the Cybersecurity in CyberPhysical Systems Workshop, April 23 - 24, 2012 The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in Federal information systems.

One respondent while expressing concern that the reporting requirement could be interpreted to require the submission of FAR part 31 compliant costs, stated that costs generated by a GAAP-compliant system should be sufficient to provide DoD with data necessary for negotiation of PBPs in future contracts. This respondent recommended clarification that a contractor may report costs from its GAAP-compliant system, adjusted by a decrement factor to reflect estimated unallowable costs as appropriate. Response: The clauses in the final rule have been revised to specify that if the Contractor's accounting system is not capable of tracking costs on a job order basis, the Contractor shall provide a realistic approximation of the allocation of incurred costs attributable to this contract in accordance with the Contractor's accounting system. DoD considers that it would constitute excessive risk to the Government and would be an impediment to issuing financing payments to a company if that company is unable to comply with this requirement, even when it is properly understood that this clause does not require a Government-unique accounting system. To the extent that a company is unable to report the costs of performance at all, relying on its own accounting books and records, this will make it impossible for the Government to have any confidence that complete performance of the contract is assured, or that the negotiated events reflect prudent contract financing. (FAR 32.1004(b)(2)(i)) and do not result in an unreasonably low or negative level of contractor investment in the contract. (FAR 32.1004(b)(3)(ii)). b. Disincentive to use of PBPs, rather than a preference. Comment: One respondent stated that nontraditional entities may be disinterested in expending time and resources to implement business systems to collect and report costs on a contract basis, which are beyond the system necessary to comply with GAAP. Similarly, another respondent stated that the requirement to report incurred costs undermines the stated preference for PBPs, could deter contractors from pursuing PBPs because contractors with only fixed-price contracts are unlikely to track costs on a contract-by-contract basis, and effectively would require many contractors to add business and compliance systems if they were to pursue PBPs. They suggest that this is therefore contrary to the statutory preference at 10 U.S.C. 2307 for PBPs as a means of financing. Response: If the contractor's financial statements are in compliance with GAAP, it is likely that the contractor, even a nontraditional defense contractor, will have some means of providing a realistic approximation of the allocation of incurred costs. While it is possible that some contractors will have no such system at all, rather than only no Government-unique system, DoD does not believe it is reasonable, necessary, or the intent of Congress, to issue Government financing when the recipient has no such visibility over its costs.

3.2.2 Technology : EPCR application, public safety mobile device, backend server ## Description
While assisting a patient, an EMS employee is recording patient information into an EPCR application.

CMMC Program requirements are designed to require completion of an assessment and an annual affirmation. The purpose of the annual affirmation addressed in § 170.22 is to validate to the DoD that the contractor is actively maintaining its CMMC level status, which is more than a checkbox exercise. One commenter misinterpreted the quoted definition of subcontractor, which makes clear that term includes only those entities providing supplies, materials, equipment, or services under a subcontract in connection with the prime contract. DFARS clause 252.204-7012 and FAR clause 52.204-21 also flow-down the requirement to safeguard information. CMMC program requirements will be flowed down similarly, therefore there is no anticipated expansion of scope. The cost estimates included in the published rule include costs for both existing DIB members and new entrants (or newly covered entities). The DoD modified the Overview summary of CMMC 2.0 to read The DFARS clause 252.204-7012 also requires defense contractors to include this clause in all subcontracts that will require the subcontractor to process, store, or transmit CUI. The DoD declined additional edits in this location that requested reframing the criteria Program Managers will use select CMMC

requirements to address Levels 2 and 3 only. The DoD may apply CMMC Level 2 or 3 requirements when there is anticipation of the need for the contractor or subcontractors to process, store, or transmit CUI during the performance of a contract. b. Prime and Subcontractor Relationships Comment: Many requested specific examples of when a prime contractor should flow down its CMMC requirements to a subcontractor or ESP, and how to determine the appropriate CMMC level to flow down. For example, (printed page 83118) one comment asked whether the subcontract document would require safeguarding, necessitating flow-down of the CMMC requirement. Some comments expressed concern that flow-down requirements are not sufficiently clear to prevent prime contractors from unnecessarily sharing CUI and applying CMMC requirements to lower tier suppliers. Another thought that the flow-down requirements will drastically expand the scope of the program and drive cost increases for the DIB. Several comments suggested strategies for minimizing the burden of security implementation on lower tier subcontractors, such as requiring prime contractors to provide access to CUI on prime contractor systems, or prohibiting prime contractors from unnecessarily sharing CUI information that would necessitate a CMMC requirement. One asked whether the prime contractor has a responsibility to check which CMMC level the subcontractor has flowed down to the next tier. One comment referenced industry activities aimed at gauging subcontractor preparedness for CMMC and expressed concern with anecdotal evidence that primes will not issue orders until the subcontractor has submitted CMMC scores into SPRS. Response:

3.3.2 Job Experience ## Focus Groups In the focus group demographic survey, we asked participants how many years they had worked as government employees, in their current organization, and in a cybersecurity role.

The CSA will meet at least annually, and otherwise as required by circumstances, with the GSCs of contractors operating under a VT, PA, SSA, or SCA to review the purpose and effectiveness of the clearance arrangement and to establish a common understanding of the operating requirements and their implementation. These reviews will include an examination of: (i) Acts of compliance or noncompliance with the approved security arrangement, standard rules, and applicable laws and regulations. (ii) Problems or impediments associated with the practical application or utility of the security arrangement. (iii) Whether security controls, practices, or procedures warrant adjustment. (2) Annual certification. For contractors operating under a VT, PA, SSA, or SCA, the chairman of the GSC will submit to the CSA one year from the effective date of the agreement and annually thereafter, an implementation and compliance report. Such reports will include: (i) A detailed description of the manner in which the contractor is carrying out its obligations under the agreement. (ii) Changes to security procedures, implemented or proposed, and the reasons for those changes. (iii) A detailed description of any acts of noncompliance, whether inadvertent or intentional, with a discussion of remedial measures, including steps taken to prevent such acts from recurring. (iv) Any changes, or impending changes, of KMP or key board members, including the reasons therefore. (v) Any changes or impending changes in the organizational structure or ownership, including any reorganizations, acquisitions, mergers, or divestitures. (vi) Any other issues that could have a bearing on the effectiveness of the applicable agreement. (j) Transactions involving foreign persons, and the Committee on Foreign Investment in the United States (CFIUS). (1) The CFIUS is a USG interagency committee chaired by the Treasury Department that conducts assessments, reviews and investigations of transactions that could result in foreign control of a U.S. business, and certain non-controlling investments and certain real estate transactions involving foreign persons under 50 U.S.C. 4565 . (2) In CFIUS cases where the acquired U.S. business requires access to classified information, the CFIUS assessment, review or investigation, as applicable, and the CSA industrial (printed page 83335) security FOCI review are carried out in parallel, but are separate processes with different time constraints and considerations.

(vi) If the proposed transaction involves access to proscribed information and the contractor is contemplating the use of an SSA to mitigate FOCI, the GCA will provide DSS with a preliminary determination regarding the acceptability of the proposed FOCI mitigation. The determination must be provided to DSS one day prior to the suspense date established by the MIBP CFIUS Team and must include whether a favorable NID will be provided. If the GCA does not notify DSS, DSS will not delay implementation of a FOCI action plan pending completion of a GCA's NID process as long as there is no indication that the NID will be denied. (vii) If DSS, under its FOCI authorities, is notified of a transaction with respect to which the parties thereto have not filed a notice with CFIUS, DSS will notify the MIBP CFIUS Team through the OUSD(I) Security Directorate. (viii) When a merger, sale, or

acquisition of a contractor is finalized prior to having an acceptable FOCI mitigation agreement in place, DSS will take actions consistent with paragraph (b)(2)(iv) of this section. Dated: April 2, 2014. Aaron Siegel, Alternate OSD Federal Register Liaison Officer, Department of Defense. [FR Doc. 2014-07826 Filed 4-8-14; 8:45 am] BILLING CODE 5001-06-P

DFARS 252.204-7021 (Cybersecurity Maturity Model Certification Requirements) Requires CMMC certification at the level specified in the contract, effective Phase 1 November 10, 2025. DFARS 252.204-7021 works in conjunction with the CMMC program. While 252.204-7021 establishes the contractual requirement, CMMC (under 32 CFR Part 170) provides the assessment framework. Phase 1 began November 10, 2025, with Phase 2 (C3PAO certification requirements) scheduled for November 10, 2026.

(iii) Append the servicing Judge Advocate's legal review, including a determination that the Privacy Act Review Board packet is complete. (d) DA Privacy Act Review Board. (1) The DA Privacy Act Review Board acts on behalf of the Secretary of the Army in deciding appeals of the appropriate Denial Authority's refusal to amend records. (2) The Board will process an appeal within 30 working days of its receipt. The General Counsel may authorize an additional 30 days when unusual circumstances and good cause so warrant. (3) The Board membership consists of the following principal members, comprised of three voting and two non-voting members, or their delegates. (4) Three voting members include- (i) Administrative Assistant to the Secretary of the Army (AASA) who acts as the Chairman of the Board; (ii) The Judge Advocate General; and (iii) The Chief, DA Freedom of Information and Privacy Division, U.S. Army Records Management and Declassification Agency. (5) In addition, two non-voting members include- (printed page 24504) (i) The Chief Attorney, OAASA (or designee) who serves as the legal advisor and will be present at all Board sessions to provide legal advice as required; and (ii) Recording Secretary provided by the Office of the Administrative Assistant to the Secretary of the Army. (e) DA Privacy Act Review Board meetings. (1) The meeting of the Board requires the presence of all five members or their designated representatives. Other non-voting members with subject matter expertise may participate in a meeting of the Board, at the discretion of the Chairman. (2) Majority vote of the voting members is required to make a final determination on a request before the Board. (3) Board members, who have denial authority, may not vote on a matter upon which they took Denial Authority action. However, an individual who took Denial Authority action, or his or her representative, may serve as a non-voting member when the Board considers matters in the Denial Authority's area of functional specialization. (4) The Board may seek additional information, including the requester's official personnel file, if relevant and necessary to decide the appeal. (5) If the Board determines that an amendment is warranted (the record is inaccurate as a matter of fact rather than judgment, irrelevant, untimely, or incomplete) it will amend the record and notify the requester, the Denial Authority, the custodian of the record, and any prior recipients of the record, of the amendment. (6) If the Board determines that amendment is unwarranted, they will- (i) Obtain the General Counsel's concurrence in writing; (ii) Respond to the requester with the reasons for denial; and

and subject to the agency's public release procedures. Contractors will request approval for public disclosure of declassified information in accordance with the procedures of this paragraph. (i) Disposition. Contractors will: (1) Establish procedures for review of their classified holdings on a recurring basis to ensure the classified holdings are in support of a current contract or authorization to retain beyond the end of the contract period. (2) Destroy duplicate copies as soon as practical. (3) For disposition of classified material not received under a specific contract: (i) Return or destroy classified material received with a bid, proposal, or quote if the bid, proposal, or quote is not: (A) Submitted or is withdrawn within 180 days after the opening date of bids, proposals, or quotes. (B) Accepted within 180 days after notification that a bid, proposal, or quote has not been accepted. (ii) If the classified material was not received under a specific contract, such as material obtained at classified meetings or from a secondary distribution center, return or destroy the classified material within one year after receipt. (j) Retention. The provisions of § 117.13(d)(5) apply for retention of classified material upon completion of a classified contract. (1) If contractors propose to retain copies of classified material beyond 2 years, the contractor will identify: (i) TOP SECRET material identified in a list of specific documents unless the GCA authorizes identification by subject and approximate number of documents. (ii) SECRET and CONFIDENTIAL material may be identified by general subject and the approximate number of documents. (iii) Contractors will include a statement of justification for retention beyond two years based on if the material: (A) Is necessary for the maintenance of the contractor's essential records. (B) Is patentable or proprietary data to which the contractor has the title. (C) Will assist the contractor in independent research and development efforts. (D) Will benefit the USG in the performance of other prospective or existing agency contracts. (E) Will benefit the USG in the performance of another active contract and will be transferred to that contract (specify contract). (2) If the GCA does not authorize retention beyond two years, the contractor will destroy all classified material received or generated in the performance of a classified contract unless it has been declassified or the GCA has requested that the material be returned. (k) Termination of security agreement. Notwithstanding the provisions for retention outlined in paragraph (i) in this section, in the event that the CSA terminates the contractor's eligibility for access to classified information, the contractor will return all classified material in its possession to the GCA concerned, or dispose of such material in accordance with instructions from the CSA. (l) Safeguarding CUI.

In summary, the estimated USG cost/cost savings are present value costs of \$10.82 million and annualized costs of \$0.76 million. Throughout, labor rates are adjusted upward by 100% to account for overhead and benefits. 2. Cost analysis. a. Regulatory Familiarization. There will be an initial step to become familiar with the clause requirements and what actions the USG executive branch agencies must take to comply with the changes in this rule. To become familiar with the new requirements, USG executive branch agencies may review the Federal Register notice with the new 32 CFR part 117 . It is estimated that 38 USG executive branch agencies will become familiar with the rule (i.e., the five Cognizant Security Agencies (DoD, DOE, NRC, ODNI, DHS) and the 33 USG agencies which currently have an industrial security services agreement (printed page 83308) with DoD pursuant to 32 CFR part 2004). The estimated labor rate used for the cost calculation is the equivalent of a GS12 step 5 for the designated NISP lead at each of those 38 agencies. It is estimated that it will take 8 hours in the first year as well as in each of the following through year 20 to become familiar and remain familiar with the rule, as this will be the first time that the NISPOM is in a rule format instead of as a DoD policy issuance, as well as familiarization with the changes. These assumptions imply costs of approximately \$25 thousand each year. b. Training the USG civilian employees of NISP CSAs who provide oversight of contractor compliance with this rule. It is estimated that the NISP CSAs (i.e., DoD, DOE, NRC, ODNI and DHS) must train a total of 800 personnel who provide oversight of contractor compliance with this rule in the first year with annual refresher training in subsequent years. The largest number of personnel would be trained by DoD. The initial training is estimated to take 24 hours in 2021 to ensure those government personnel conducting oversight are versed in the changed requirements to assess compliance by cleared entities. The second year refresher training will be 16 hours with 8 hours of refresher training in each of years 3 through 20. The average labor rate for these 800 government headquarters and field personnel is estimated to be a GS13 step 5. These assumptions imply costs of \$1.90 million in year one; \$1.27 million in year 2; and, \$0.63 million in each year 3 through 20. c. Accepting submissions of foreign travel reports by SECRET cleared entity personnel. DoD, with the largest population of cleared entity personnel, already has the data fields for foreign travel reporting in the Defense Information System for Security and will not have to make more changes to that automated

system to accept submission of these reports. There are no expected costs or costs savings. d.

ne or more information systems. If an information system inherits a common control, such as environmental controls within a data center, that system does not need to explicitly implement that control. - Applying scoping considerations - these, when applied in conjunction with risk management guidance, can eliminate unnecessary security controls from the initial security control baselines and help ensure that organizations select only those controls needed to provide the appropriate level of protection for information systems. When scoping considerations are applied, compensating controls may need to be selected to provide alternative means to achieve security requirements. - Supplementing baselines - additional security controls and control enhancements are selected if needed to address specific threats and vulnerabilities.

) It is impractical for the contractor to establish a GCMS or proprietary guard force at that location. In this case, installation of these systems must use NRTL-approved equipment and be accomplished by an NRTL-approved entity meeting the applicable testing standard for the category of service. (ii) An installation proposal, explaining how the system would operate, will be submitted to the CSA. The proposal must include: (A) Sufficient justification for the granting of an exception and the full name and address of the police department that will monitor the system and provide the required response. (B) The name and address of the NRTL-approved entity that will install the system, and inspect, maintain, and repair the equipment. (iii) The response times will be in accordance with the provisions in paragraphs (c)(1) through (c)(3) in this section as applicable. Arrangements will be made with the central monitoring station to immediately notify a contractor representative on receipt of the alarm. The contractor representative is required to go immediately to the facility to investigate the alarm and to take appropriate measures to secure the classified material. (iv) In exceptional cases where central station monitoring service is available, but no proprietary security force, central station, or subcontracted guard response is available, and where the police department does not agree to respond to alarms, and no other manner of investigative response is available, the CSA may approve cleared employees as the sole means of response. (e) Information controls. (1) Information management system. Contractors will establish: (i) A system to verify that classified information in their custody is used or retained only for a lawful and authorized USG purpose. (ii) An information management system to protect and control the classified information in their possession regardless of media, to include information processed and stored on authorized information systems. (2) Top secret information. Contractors will establish controls for TOP SECRET information and material to validate procedures are in place to address accountability, need to know, and retention, e.g., demonstrating that TOP SECRET material stored in an electronic format on an authorized classified information system does not need to be individually numbered in series. These controls are in addition to the information management system and must be applied, unless otherwise directed by the applicable CSA, regardless of the media of the TOP SECRET information, to include information processed and stored on authorized information systems. Unless otherwise directed by the applicable (printed page 83342) CSA, the contractor will establish the following additional controls: (i) Designate TOP SECRET control officials to receive, transmit, and maintain access and accountability records to TOP SECRET information. (ii) Conduct an annual inventory of TOP SECRET information and material.

(ii) Paragraph (f) of the clause at FAR 52.232-32 does not apply to the extent that the Contractor and the Contracting Officer agree on alternative forms of security. In the event the Contractor fails to provide adequate security, as required in this contract, no financing payment will be made under this contract. Upon receipt of adequate security, financing payments will be made, including all previous payments to which the Contractor is entitled, in accordance with the terms of the provisions for contract financing. If at any time the Contracting Officer determines that the security provided by the Contractor is insufficient, the Contractor shall promptly provide such additional security as the Contracting Officer determines necessary. In the event the Contractor fails to provide such additional security, the Contracting Officer may collect or liquidate such security that has been provided and suspend further payments to the Contractor; and the Contractor shall repay to the Government the amount of unliquidated financing payments as the Contracting Officer at his sole discretion deems repayable. 11. Amend section 252.232-7013 by: a. In the clause introductory text, removing ·232.1005-70(b)· and adding ·232.1005-70(a)(2)· in its place; (printed page 19690) b. Removing the clause date of ·(APR 2014)· and adding ·(APR 2020)· in its place; c. Redesignating paragraph (b) as (c); d. Adding a new paragraph (b); e. Revising the newly redesignated paragraph (c); and f. Adding paragraph (d). The additions and revision read as

follows: 252.232-7013 Performance-Based Payments-Deliverable-Item Basis. * * * * * (b) In accordance with 10 U.S.C. 2307(b)(4)(A), the Contractor's financial statements shall be in compliance with Generally Accepted Accounting Principles in order to receive performance-based payments. (c)(1) The Contractor shall, in addition to providing the information required by FAR 52.232-32, submit information for all payment requests using the following format: (2) Incurred cost is determined by the Contractor's accounting books and records, to which the Contractor shall provide access upon request of the Contracting Officer. An acceptable accounting system in accordance with DFARS 252.242-7006 is not required for reporting of incurred costs under this clause. If the Contractor's accounting system is not capable of tracking costs on a job order basis, the Contractor shall provide a realistic approximation of the allocation of incurred costs attributable to this contract in accordance with the Contractor's accounting system. FAR 52.232-32(m) does not require certification of incurred costs. (d) Security for financing. (1) Title to the property described in paragraph (f) of the clause at FAR 52.232-32, Performance-Based Payments, is the preferred security for receipt of performance-based payments.

(2) Instruct personnel who act in FOIA matters on the provisions of this part; advise them of the legal hazards involved and the strict prohibition against arbitrary and capricious withholding of information. (3) Provide procedural and legal guidance and instruction to initial denial and appellate authorities concerning the discharge of their responsibilities. (4) Emphasize that the processing of FOIA requests must be citizen-centered and results-oriented. (5) Advise personnel of the penalties for noncompliance with the FOIA. §-28.31 Implementation. To ensure uniformity of interpretation, the Components should coordinate their educational and training programs with DFOIPO. Appendix A to Part 286-DoD FOIA Program Components List of DoD FOIA Program Components Office of the Secretary of Defense Office of the Chairman of the Joint Chiefs of Staff Combatant Commands DoD Field Activities Department of the Army Department of the Navy Department of the Air Force Defense Commissary Agency Defense Contract Audit Agency Defense Contract Management Agency Defense Finance and Accounting Service Defense Information Systems Agency Defense Intelligence Agency Defense Logistics Agency Defense Security Service Defense Threat Reduction Agency National Geospatial Intelligence Agency National Reconnaissance Office National Security Agency Office of the Inspector General, Department of Defense Appendix B to Part 286-Addressing FOIA Requests AP2.1. From the NIST SP 800-172 Rev 3 Final Public Draft: Establish and maintain a cyber threat-hunting capability to: NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 1. Search for indicators of compromise in organizational systems and 1481 2. Detect, track, and disrupt threats that evade existing safeguards. 1482

The reports reflect rampant escalation of cyberattacks using hacking (260 percent increase) and ransomware (264 percent increase). [212] Based on reports made to OCR, in 2022, approximately three-fourths of the breaches of unsecured PHI affecting 500 or more individuals were the result of hacking of electronic equipment or a network server. [213] In 2023, over 160 million individuals were affected by breaches involving the PHI of 500 or more individuals-a new record. We anticipate that 2024 will surpass that record, particularly in light of the estimate provided by a

large covered entity regarding the number of individuals affected by a breach of its subsidiary. [214] In 2023, the Federal Bureau of Investigation's internet Crime Complaint Center received almost 250 reports of ransomware affecting the Healthcare and Public Health sector, the most of any of the 16 identified infrastructure sectors. [215] The Healthcare and Public Health sector has been the most targeted critical infrastructure sector since at least as far back as 2015. [216] Between 2015 and 2019, cyberattacks on health care organizations increased by 125 percent. [217] And between 2022 and 2023, ransomware attacks against the U.S. health care sector increased 128 percent. [218] Many people, including regulated entities, inaccurately believe that only large regulated entities that maintain electronic records about millions of individuals are likely to face a cyberattack, and thus that it is less important for smaller regulated entities to invest resources in cybersecurity. [219] In fact, smaller regulated entities may also be the target of, or adversely affected by, cybercrime, partly because of the interconnectedness of health care and partly because they are less likely to have invested in cybersecurity, making them easier targets. [220] As explained in a recent national security memorandum, cybercriminals are targeting critical infrastructure (i.e., the physical and virtual assets and systems so vital to the Nation that their incapacity or destruction would have a debilitating impact on national security, national economic security, or national public health or safety), and their activities may be tolerated or enabled by other countries. [221] Thus, it is essential that the Department and regulated entities take steps to safeguard health care infrastructure and ePHI. External actors are not the only, or even the greatest, threat to the security of ePHI. According to a recent study, insiders were the second leading cause of breaches in the health care sector in 2023, exceeded only by miscellaneous errors, such as misdelivery. [222] For example, a recent settlement resolved an OCR investigation involving the theft and sale of the ePHI of more than 12,000 patients by an employee of a large health care system. [223] In another example, security guards at a large health care provider were alleged to have used their login credentials to inappropriately access ePHI. [224]

document. The general policy for comments and other submissions from members of the public is to make these submissions available for public viewing at <https://www.regulations.gov> as they are received without change, including any personal identifiers or contact information. FOR FURTHER INFORMATION CONTACT: Ms. Diane Knight, Office of the DoD CIO, 202-770-9100. SUPPLEMENTARY INFORMATION: History of the Program The CMMC Program is designed to verify protection of sensitive unclassified information shared between the Department and its contractors and subcontractors or generated by the contractors and subcontractors. CMMC increases assurance that contractors and subcontractors are meeting cybersecurity requirements applying to acquisition programs and systems processing CUI. The beginnings of CMMC start with the November 2010, Executive Order (E.O.) 13556, [1] Controlled Unclassified Information. The intent of this Order was to establish an open and uniform program for managing [unclassified] information that requires safeguarding or dissemination controls. Prior to this E.O., more than 100 different markings for this information existed across the executive branch. This ad hoc, agency-specific approach created inefficiency and confusion, led to a patchwork system that failed to adequately safeguard information requiring protection, and unnecessarily restricted information-sharing. As a result, the E.O. established the CUI Program to standardize the way the executive branch handles information requiring safeguarding or dissemination controls (excluding information that is classified under E.O. 13526, Classified National Security Information [2] or any predecessor or successor order; or the Atomic Energy Act of 1954, [3] as amended). In 2019, DoD announced the development of CMMC in order to move away from a self-attestation model of security. It was first conceived by the Office of the Under Secretary of Defense for Acquisition and Sustainment (OUSD(A&S)) to secure the Defense Industrial Base (DIB) sector against evolving cybersecurity threats. In September 2020, DoD published an interim rule, Defense Federal Acquisition Regulation Supplement (DFARS): Assessing Contractor Implementation of Cybersecurity Requirements (DFARS Case 2019-D041), [4] which implemented the DoD's initial vision for the CMMC Program (CMMC 1.0) and outlined the basic features of the framework (tiered model of practices and processes, required assessments, and implementation through contracts) to protect FCI and CUI. The interim rule became effective on 30 November 2020, establishing a five-year phase-in period. In response to approximately 750 public comments on the CMMC 1.0 Program, in March 2021, the Department initiated an internal review of CMMC's implementation. In November 2021, the Department announced CMMC 2.0, an updated program structure and requirements designed to achieve the primary goals of the internal review:

Guidance documents are also available at <http://www.regulations.gov> . To receive Class II

Special Controls Guidance Document: In Vitro Diagnostic Devices for *Bacillus* spp. Detection, you may either send an e-mail request to dsmica@fda.hhs.gov to receive an electronic copy of the document or send a fax request to 301-847-8149 to receive a hard copy. Please use the document number 1667 to identify the guidance you are requesting. IV. Paperwork Reduction Act of 1995 This draft guidance refers to previously approved collections of information found in FDA regulations. These collections of information are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (the PRA) (44 U.S.C. 3501-3520). The collections of information in 21 CFR part 807, subpart E , have been approved under OMB control number 0910-0120, and the collections of information in 21 CFR part 801 , and 21 CFR 809.10 have been approved under OMB control number 0910-0485. The labeling requirement listed in Section 8A, Intended Use, is not subject to review under the PRA because it is a public disclosure of information originally supplied by the Federal Government to the recipient for the purpose of disclosure to the public (5 CFR 1320.3(c)(2) and 21 CFR 1040.10(g)). V. Comments Interested persons may submit to the Division of Dockets Management (see ADDRESSES), either electronic or written comments regarding this document. It is only necessary to send one set of comments. It is no longer necessary to send two copies of mailed comments. Identify comments with the docket number found in brackets in the heading of this document. Received comments may be seen in the Division of Dockets Management between 9 a.m. and 4 p.m., Monday through Friday. Dated: May 12, 2011. Nancy K. Stade, Deputy Director for Policy, Center for Devices and Radiological Health. [FR Doc. 2011-12081 Filed 5-17-11; 8:45 am] BILLING CODE 4160-01-P

. Another policy option excludes food contact substance suppliers, estimated to be 37,000 manufacturers and distributors of the finished container that contacts the food, from the requirement to establish and maintain records. Because of the small number of manufacturers and distributors of the finished container that contacts the food compared with the total number of foreign suppliers, their exclusion from recordkeeping requirements would have a relatively small impact on traceback performance (if we ignore the possibility that excluding packaging suppliers increases their profile as potential targets for terrorist activities). Moreover, because manufacturers and distributors of the finished container that contacts the food occupy up-stream positions along the supply chain relative to foreign entities, we estimate the reduction in benefits from excluding them to be less than that from excluding foreign entities. Finally, if the requirements of section 306(a) of the Bioterrorism Act were satisfied, FDA would have access to existing records at these facilities. c. Excluding transporters . One policy option would exclude all transporters from the requirement to establish and maintain records. FDA determined, however, that the qualitative and quantitative impact on benefits in the classified and unclassified scenarios would greatly eliminate the effectiveness of the rule and FDA's ability to timely and efficiently respond to a threat of serious adverse health consequences or death to humans or animals. As a practical matter, because the final rule's requirements for interstate shipments can be satisfied by compliance with existing requirements for interstate shipments, the final rule only establishes new requirements for the following: (1) Intrastate transporters; and (2) intrastate shipments conveyed by interstate transporters. FDA estimates that there are approximately 115,000 intrastate carriers, and based on DOT data, almost one million commercial drivers report intrastate travel. In reviewing the truck tonnage by commodity, approximately 12 percent of the intrastate shipments are of FDA-regulated food products. The average distance these products are shipped is 231 miles, which means many shipments are intrastate, especially in the larger western states.

3.3.1 Review Risk Assessment and Security Plan The Contractor shall review the appropriate <organization name>; risk assessment and <organization name>; security plan for the sensitive systems addressed by this SOW.

(B) The current version of National Institute of Standards and Technology (NIST) Special Publication (SP) 800-53B, Control Baselines for Information Systems and Organizations; and (C) Agency procedures (see paragraph (a)(2) of this section for mandatory controls to be addressed in all requirements); (iii) Includes the FIPS Publication 199 impact level (paragraph (a)(1)(i) of this section) and the identified controls (paragraph (a)(1)(ii) of this section) in the contract; (iv) Identifies any Cybersecurity and Infrastructure Security Agency (CISA) Binding Operational Directives and Emergency Directives (from the list at <https://www.cisa.gov/directives>) that will not apply to the requirement (see fill-in at paragraph (l)(2) of 52.239-YY); and (v) Addresses each of the elements identified at 52.239-YY(f), as applicable. (2) Mandatory controls. The controls identified in paragraph (a)(1)(ii) of this section must address the following requirements: (i)

Multifactor authentication. (A) All accounts other than service accounts must employ multifactor authentication that meets or exceeds Authenticator Assurance Level 2 (AAL2), as defined in the most recent version of NIST SP 800-63B, Digital Identity Guidelines: Authentication and Lifecycle Management. Agencies may mandate accounts for Government or contractor personnel requiring phishing resistant multifactor authentication (printed page 68416) exceeding AAL2, depending on the sensitivity of the system or non-public data accessed. (B) Any administrative access must be conducted using a hardware-based multifactor cryptographic device authenticator. (ii) Administrative accounts. (A) All systems and services provided shall have unique administrative accounts, with the exception of service accounts. (B) Any accounts that administer any part of the systems used in the performance of the contract, to include support systems and infrastructure, shall be considered part of the system authorization boundary and must have unique administrative accounts that are unique and exclusive to agency systems. Administrator accounts must be disclosed, upon request by the contracting officer. (iii) Consent banners. Login and consent banners must be deployed on all systems and networks. Such banners must be consistent with CISA guidance at <https://www.cisa.gov/publication/guidance-consent-banners> . The contract may include more specific requirements for consent banners; such requirements will be consistent with the CISA guidance linked above; (iv) Internet of Things devices. Apply any additional cybersecurity requirements necessary for IoT devices located within the boundary of the FIS in accordance with the current version of NIST SP 800-213, IoT Device Cybersecurity Guidance for the Federal Government: Establishing IoT Device Cybersecurity Requirements; and (v) Annual assessments. For a FIS designated as a moderate or high FIPS Publication 199 impact, specify the specific requirements for the annual assessments (see FAR 52.239-YY(d)). (b)

(Response) As described in response to comment 37, persons are not required to establish and maintain records to identify the nontransporter and transporter subsequent recipients of food distributed directly to consumers (§ 1.327(d) of this final rule). Further, as described in response to comment 50, these regulations do not distinguish between direct marketers and others selling food from a retail establishment. In addition, retail food establishments that employ 10 or fewer full-time equivalent employees are excluded from all of the requirements of subpart J of this final rule, except §§ 1.361 and 1.363. (See response to comment 38 of this document for a further discussion of FDA's rationale underlying this exclusion.) (Comment 50) One comment states that because direct sellers might also sell to other direct sellers either for consumption or for resale to other consumers, it is possible that the proposed recordkeeping requirements of the regulation might be construed to apply to them. The comment strongly suggests that were the requirements to apply to their businesses, many individuals would be discouraged from entering into direct sales. Individuals who are attracted to direct selling because of the ease of entry into the business would surely not welcome the additional paperwork and bureaucratic requirements necessitated by the proposal. Although perhaps appropriate for larger businesses, these requirements would provide a severe disincentive to their way of doing business. Additionally, given the sheer numbers of salespeople potentially involved, and the generally small size of the sales transactions consummated by direct sellers, the massive paperwork generated by direct sellers under the recordkeeping requirements could actually be counterproductive to efforts to enhance bioterrorism preparedness. The comment states that, given the unique, micro-entrepreneurial nature of operations of individual direct sellers and the questionable (at best) benefit to national security that might be achieved by applying this regulation to them, direct sellers should be exempt from the extensive recordkeeping requirements with respect to both immediate previous sources and immediate subsequent recipients. The comment also notes that other retailing operations are exempt (at least in part) from the proposed regulation, and believes that an exemption for direct sellers is consistent with the retailing exemption and the Bioterrorism Act.

(Response) The records required to be kept by these regulations are those FDA needs to help identify the immediate previous sources and immediate subsequent recipients of food. Section 1.361 of the final rule allows FDA access to transporters' existing records when FDA has a reasonable belief that an article of food is adulterated and presents a threat of serious adverse health consequences or death to humans or animals. When conducting a traceback, FDA needs access to the required records at each point in the distribution chain for the implicated food. Thus, FDA will expect to obtain applicable records from transportation companies in the distribution chain. Although FDA may contact, and coordinate tracebacks with, other Federal agencies, including CBP, the agency expects transportation companies to comply with the recordkeeping and access provisions of these regulations. FDA notes that entities keeping records to satisfy CBP's regulations may use those same

records to satisfy some or all of the requirements of this final rule if those records contain some or all of the information required by subpart J of this final rule. Entities also can supplement existing records with any new data required by this regulation, instead of creating an entirely new record containing both existing and new information. (Comment 20) A few comments ask FDA to clarify what constitutes ·holding· food, who FDA considers to be ·holders of food,· and under what circumstances food is being held in transport. The comment notes that the lack of clarity leaves a carrier's terminal operating facility, gas stations, truck stops, and even trucks themselves vulnerable to being considered as ·holders of food· and thereby subject to burdensome reporting requirements. Comments also ask FDA to exclude trucks, truck terminals, and facilities from the definition of ·holding,· stating that this would be consistent with the intent of the law and the realities of the trucking industry's business practices. One comment asks whether food held for short periods of time in a trucking terminal during cross-dock operations meets the definition of ·holding.· One comment states that there are certain areas in the supply chain that provide temporary space for food during transit and that these areas should not be considered to be ·holding· or ·storing· food and subject to the recordkeeping requirements. The comment notes that some sites serve as transitory staging areas where produce is momentarily held before transportation and that, because of the perishable nature of the product and the desire to transport the fresh commodity rapidly, produce moves from these staging areas as quickly as possible.

- Tests are routinely conducted to evaluate the adequacy and effectiveness of all implementations, - Tests ensure that all policies, procedures, and controls are acting as intended and that they ensure the appropriate information security level, - Effective corrective actions are taken to address identified weaknesses, including those identified as a result of potential or actual information security incidents or through information security alerts issued by US-CERT, vendors, and other trusted sources, - Self-assessments, a type of test that can be performed by agency staff, by contractors, or others engaged by agency management, are routinely conducted to evaluate the adequacy and effectiveness of all implementations, - Independent audits such as those arranged by the Government Accountability Office (GAO) or an agency Inspector General (IG), are an important check on agency performance, but are not to be viewed as a substitute for evaluations initiated by agency management, - Information gleaned from records of potential and actual Information security incidents and from security alerts, such as those issued by software vendors are considered as test results. Such information can identify specific vulnerabilities and provide insights into the latest threats and resulting risk, - Evaluation requirements, including requirements regarding the type and frequency of testing, are documented, approved, and effectively implemented, and - The frequency and rigor with which individual controls are tested depend on the risks that will be posed if the controls are not operating effectively.

3.2.3 | Detection Capabilities... 3.2.3 Detection Capabilities IDPS technologies typically offer extensive, broad detection capabilities. 3.2.3 focusing specifically on acquiring and applying updates.

It is estimated that the costs to reaffirm a CMMC Level 2 (printed page 89095) Certification Assessment annually is \$1,459 (three-year cost is \$4,377, or \$1,459 × 3) A director (MGMT5) for 4 hours (\$190.52/hr × 4hrs = \$762) A staff IT specialist (IT4-SB) for 8.08 hours (\$86.24/hr × 8.08hrs = \$697) The Level 2 Affirmations cost burden will be addressed as part of the 48 CFR acquisition rule. Summary: The following is the annual small entities total cost summary for CMMC Level 2 Certifications and Affirmations over a ten-year period: (E×ample calculation, Year 2: (*\$101,752 assessment per entity × 1,926 entities) + (\$1,459 annual affirmation per entity × 382 entities) = \$196,531,451). All Entities Summary The following is a summary of the cost to all entities regardless of size for CMMC Level 2 Certification and Affirmation costs over a ten-year period: (printed page 89096) CMMC Level 3 Certification Assessment and Affirmation Costs An OSC pursuing Level 3 Certification must have a CMMC Level 2 Final Certification Assessment, and also must demonstrate compliance with CMMC Level 3, which includes implementation of selected security requirements from NIST SP 800-172 not required in prior rules. Therefore, the Nonrecurring Engineering and Recurring Engineering cost estimates have been included for the initial implementation and maintenance of the required selected NIST SP 800-172 requirements. The cost estimates account for time for an OSC to implement these security requirements and prepare for, support, participate in, and closeout a CMMC Level 3 Certification Assessment conducted by DCMA DIBCAC. The OSC should keep in mind that the total cost of a CMMC Level 3 Certification Assessment includes the cost of a Level 2 Certification Assessment as well as the costs to implement and assess

the security requirements specific to Level 3. CMMC Level 3 is expected to affect a small subset of the DIB. Other Than Small Entities, Per Entity Nonrecurring Engineering Costs: \$21,100,000. [41] Recurring Engineering Costs: \$4,120,000. Assessment Costs and Initial Affirmation Costs: It is estimated that the cost to support a CMMC Level 3 Certification and affirmation for an other than small entity is \$39,021. The three-year cost is \$44,445 (as summarized in 4.1.2, Table 1), and includes the triennial assessment + affirmation, plus two additional annual affirmations (\$39,021 + \$2,712 + \$2,712). Phase 1: Planning and preparing for the assessment: \$7,066 A director (MGMT5) for 12 hours (\$190.52/hr × 12hrs = \$2,286) A manager (MGMT2) for 12 hours (\$95.96/hr × 12hrs = \$1,152) A staff IT specialist (IT4) for 16 hours (\$97.49/hr × 16hrs = \$1,560) A senior IT specialist (IT3) for 12 hours (\$81.96/hr × 12hrs = \$984) An IT specialist (IT2) for 20 hours (\$54.27/hr × 20hrs = \$1,085) Phase 2: Conducting the assessment: \$23,136 A director (MGMT5) for 24 hours (\$190.52/hr × 24hrs = \$4,572) A manager (MGMT2) for 24 hours (\$95.96/hr × 24hrs = \$2,303)

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 202, 208, 212, 213, 214, 215, 233, 239, 244, and 252 [Docket No. DARS 2013-0052] RIN 0750-AH96 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Final rule. SUMMARY: DoD has adopted as final, with changes, an interim rule amending the Defense Federal Acquisition Regulation Supplement (DFARS) to implement a section of the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2011, as amended by the NDAA for FY 2013. This final rule allows DoD to consider the impact of supply chain risk in specified types of procurements related to national security systems. DATES: Effective October 30, 2015. FOR FURTHER INFORMATION CONTACT: Mr. Dustin Pitsch, telephone 571-372-6090. SUPPLEMENTARY INFORMATION: I. Background DoD published an interim rule in the Federal Register at 78 FR 69268 on November 18, 2013, to implement section 806 of the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2011 (Pub. L. 111-383), entitled 'Requirements for Information Relating to Supply Chain Risk,' as amended by section 806 of the NDAA for FY 2013 (Pub. L. 112-239). This rule is part of DoD's retrospective plan, completed in August 2011, under Executive Order 13563 , Improving Regulation and Regulatory Review. DoD's full plan and updates can be accessed at: <http://www.regulations.gov/#!docketDetail;D=DOD-2011-OS-0036> . Eight respondents submitted public comments in response to the interim rule. II. Discussion and Analysis DoD reviewed the public comments in the development of the final rule. A discussion of the comments and the changes made to the rule as a result of those comments is provided, as follows: A. Significant Changes From the Interim Rule 1. Language is added to the rule to clarify that section 806 authority is only applicable when acquiring information technology, whether as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system, including clarification of the prescriptions for DFARS provision 252.239-7017, Notice of Supply Chain Risk, and DFARS clause 252.239-7018, Supply Chain Risk.

(1) If a potential employee requires access to classified information immediately upon commencement of employment, the contractor may submit a request for investigation prior to the date of employment, provided: (i) A written commitment for employment has been made by the contractor. (ii) The candidate has accepted the offer in writing. (2) The commitment for employment must indicate employment will commence within 45 days of the employee being granted eligibility for access to classified information at a level that allows them to perform the tasks or services associated with the contract or USG requirement for which they were hired. (3) Contractors will comply with the requirements pursuant to paragraph (a) (5) of this section. (g) Classified information NDA. The NDA designated by the CSA (e.g., SF 312), is an agreement between the USG and an individual who is determined eligible for access to classified information. (1) An employee determined eligible for access to classified information must execute an NDA prior to being granted access to classified information. (2) The employee must sign and date the NDA in the presence of a witness. The employee's and witness' signatures must bear the same date. (3) The contractor will

forward the executed NDA to the CSA for retention. The CSA may authorize the contractor to retain a copy of the form for administrative purposes, if appropriate. (4) If the employee refuses to execute the NDA, the contractor will deny the employee access to classified information and submit a report to the CSA in accordance with § 117.8(c)(6). (h) Reciprocity. The applicable CSA is responsible for determining whether contractor employees have been previously determined eligible for access to classified information or investigated by an authorized investigative activity in accordance with SEAD 7 (available at:

https://www.dni.gov/files/NCSC/documents/Regulations/SEAD-7_BI_ReciprocityU.pdf). (1) Any current eligibility determination for access to classified information that is based on an investigation of a scope that meets or exceeds that necessary for the required level of access will provide the basis for a new eligibility determination. (2) The prior investigation will be used without further investigation or adjudication unless the CSA becomes aware of significant derogatory information that was not previously adjudicated. (i) Break in access.

This rule provides a baseline for protection of classified information through analysis, evaluation and, if needed, protective measures to mitigate or FOCI information at U.S. companies performing on contracts requiring access to classified information. Government Contracting Activities (GCAs) don't know if there are risks, such as foreign ownership or control of a U.S. company before awarding a contract requiring access to classified information or when a U.S. company is acquired by a foreign interest while performing on any contracts requiring access to classified information without these procedures. The uniform procedures in this rule provide the GCAs with analysis of potential adverse impact and mitigation or negation of FOCI information to allow foreign-owned U.S. companies to compete to perform on classified contracts. DoD and non-DoD Components face an increased probability of the loss or compromise of classified information and subsequent harm to the national security, as a result of the award of classified contracts to foreign-owned U.S. companies without this rule in place for the proper mitigation of FOCI information. Definitions For the definitions without a cited source in this rule, upon approval of this rule, those terms and their definitions will be proposed for inclusion in the next edition of the Joint Publication 1-02, DoD Dictionary of Military and Associated Terms (available at http://www.dtic.mil/doctrine/new_pubs/jp1_02.pdf). Regulatory Procedures E.O. 12866 , Regulatory Planning and Review and E.O. 13563 , Improving Regulation and Regulatory Review. It has been certified that 32 CFR part 117 does not: (1) Have an annual effect on the economy of \$100 million or more or adversely affect in a material way the economy; a section of the economy; productivity; competition; jobs; the environment; public health or safety; or State, local, or tribal governments or communities; (2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency; (3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients thereof; or (4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in these Executive Orders. Section 202, Public Law 104-4 , Unfunded Mandates Reform Act. It has been certified that 32 CFR part 117 does not contain a Federal mandate that may result in expenditure by State, local and tribal governments, in aggregate, or by the private sector, of \$100 million or more in any one year. Public Law 96-354, Regulatory Flexibility Act (5 U.S.C. 601) It has been certified that 32 CFR part 117 is not subject to the Regulatory Flexibility Act (5 U.S.C. 601) because it would not, if promulgated, have a significant economic impact on a substantial number of small entities. Public Law 96-511, Paperwork Reduction Act (44 U.S.C. Chapter 35) It has been certified that
