

ndation for information security across the federal government, including a structure , yet flexible approach for managing information security risk across an organization. In 2012, this collaboration produced foundational guidelines for conducting risk assessments, and - updated guidelines for selecting and specifying security controls for federal information systems and organizations; - “ Provided assistance to agencies and the private sector: conducted ongoing, substantial reimbursable and non-reimbursable assistance to the government and private sector , including many outreach efforts through the Federal Information Systems Security Educators' Association (FISSEA), the Federal Computer Security Program Managers' Forum, and the Small Business Information Security Corner; - “ Reviewe security policies an technologies from the private sector and national security systems for potential federal agency use: hosted a repository of federal agency security practices, public/private security practices, an security configuration checklists for IT pro ucts. Continue to lea , in conjunction with the Government of Canada's Communications Security Establishment, the Cryptographic Module Validation Program (CMVP).

(Response) In the PRIA, we assumed that persons subject to this final rule may be required to add a limited amount of new information to existing transactions records, such as bills of lading, commercial invoices, and other shipping documents. We did not model the costs of compliance for each sector in the food economy, and assumed that the private incentives to maintain most, if not all, of the required information were sufficient. Examples of private incentives to maintain the required records are provided in our response to comment 189. Moreover, we do not require that the information be in any particular form or format, which further reduces the potential costs of compliance. c. Pet foods sector . (Comment 210) Some comments suggest that FDA eliminate requirements for pet food because the risk of exposure through that sector is small. Other comments acknowledge potential targets and impacts from terrorist attacks through the pet food sector and encourage FDA to require all in the pet food sector to be subject to the final rule. (Response) In the proposed rule, pet food not subject to the BSE rule was excluded from the requirement to establish and maintain records. In this final rule, all animal feed entities, including all pet food entities, are subject to all requirements of the rule, but have a records retention requirement of 1 year. There are approximately 19,600 facilities that were excluded in the proposed rule and that have been included in this final rule. In the PRIA, rather than estimate the cost savings from excluding these facilities from complying with the regulation, we noted that the costs were overestimated because pet food facilities were included in the estimates. In the final rule, pet food entities are subject to the regulation and are included in the cost estimates. d. Food contact substances and the packaging sector . (Comment 211) FDA received many comments that FDA underestimated the number of facilities covered by the definition of substances and components of substances that contact food. One comment states that FDA does not include the ‘upstream’ manufacturers that make ingredients and components that go into food packaging who would be required to comply with the recordkeeping provisions of this regulation. The comment further states that there is no logical conclusion to this chain. Some other comments assert that FDA did not account for warehouses that hold articles that can migrate to food from food packaging, or other articles that contact food. Another comment states that FDA's count of the number of domestic facilities is overly inclusive if FDA's intention is to include only finished packaging and that the Operational and Administrative System for Import Support (OASIS) database used for the count of foreign facilities does not include suppliers of food contact articles. Other comments indicate that FDA understated the number of (printed page 71640)

According to NIST_SP_800-37r2_Risk_Management_Framework, Executive Summary: by the Defense Science Board, the Executive Order, and the OMB policy memorandum to develop the nextgeneration Risk Management Framework (RMF) for information systems, organizations, and individuals. There are seven major objectives for this update: - To provide closer linkage and communication between the risk management processes and activities at the C-suite or governance level of the organization and the individuals, processes, and activities at the system and operational level of the organization; - To institutionalize critical risk management preparatory activities at all risk management levels to facilitate a more effective, efficient, and cost-effective execution of the RMF; - To demonstrate how the NIST Cybersecurity Framework [NIST CSF] can be aligned with the RMF and implemented using established NIST risk management processes; - To integrate privacy risk management processes into the RMF to better support the privacy protection needs for which privacy programs are responsible; - To promote the development of trustworthy secure software and systems by aligning life cycle-based systems engineering processes in NIST Special Publication 800-160, Volume 1 [SP 800-160 v1], with the relevant tasks in the RMF; - To integrate security-related, supply chain risk management (SCRM)

concepts into the RMF to address untrustworthy suppliers, insertion of counterfeits, tampering, unauthorized production, theft, insertion of malicious code, and poor manufacturing and development practices throughout the SDLC; and - To allow for an organization-generated control selection approach to complement the traditional baseline control selection approach and support the use of the consolidated control catalog in NIST Special Publication 800-53, Revision 5. The addition of the Prepare step is one of the key changes to the RMF-incorporated to achieve more effective, efficient, and cost-effective security and privacy risk management processes.

C3PAO engagement inclusive of Phases 1, 2, and 3 (3-person team) for 120 hours (\$260.28/hr × 120hrs = \$31,234) Reaffirmations: It is estimated that the costs to reaffirm a Level 2 certification assessment annually is \$1,459 (three-year cost is \$4,377, or \$1,459 × 3) A director (MGMT5) for 4 hours (\$190.52/hr × 4hrs = \$762) A staff IT specialist (IT4-SB) for 8.08 hours (\$86.24/hr × 8.08hrs = \$697) The Level 2 affirmations cost burden will be addressed as part of the 48 CFR part 204 CMMC Acquisition rule. Summary: The following is the annual small entities total cost summary for Level 2 certification assessments and affirmations over a ten-year period: (Example calculation, Year 2: (*\$101,752 assessment per entity × 1,926 entities) + (\$1,459 annual affirmation per entity × 382 entities) = \$196,531,451) All Entities Summary The following is a summary of the cost to all entities regardless of size for Level 2 certification assessment and affirmation costs over a ten-year period: (printed page 83187) CMMC Level 3 Certification Assessment and Affirmation Costs An OSC pursuing Level 3 certification assessment must have a CMMC Status of Final Level 2 (C3PAO), and also must demonstrate compliance with CMMC Level 3, which includes implementation of selected security requirements from NIST SP 800-172 Feb2021 not required in prior rules. Therefore, the Nonrecurring Engineering and Recurring Engineering cost estimates have been included for the initial implementation and maintenance of the required selected NIST SP 800-172 Feb2021 security requirements. The cost estimates account for time for an OSC to implement these security requirements and prepare for, support, participate in, and closeout a Level 3 certification assessment conducted by DCMA DIBCAC. The OSC should keep in mind that the total cost of a Level 3 certification assessment includes the cost of a Level 2 certification assessment as well as the costs to implement and assess the security requirements specific to Level 3. CMMC Level 3 is expected to affect a small subset of the DIB. Other Than Small Entities, per Entity Nonrecurring Engineering Costs: \$21,100,000. [49] Recurring Engineering Costs: \$4,120,000. Assessment Costs and Initial Affirmation Costs: It is estimated that the cost to support a Level 3 certification assessment and affirmation for an other than small entity is *\$39,021. The three-year cost is \$44,445 (as summarized in 4.1.2, table 23), and includes the triennial assessment + affirmation, plus two additional annual affirmations (\$39,021 + \$2,712 + \$2,712). Phase 1: Planning and preparing for the certification assessment: \$7,066 A director (MGMT5) for 12 hours (\$190.52/hr × 12hrs = \$2,286) A manager (MGMT2) for 12 hours (\$95.96/hr × 12hrs = \$1,152) A staff IT specialist (IT4) for 16 hours (\$97.49/hr × 16hrs = \$1,560) A senior IT specialist (IT3) for 12 hours (\$81.96/hr × 12hrs = \$984) An IT specialist (IT2) for 20 hours (\$54.27/hr × 20hrs = \$1,085) Phase 2: Conducting the certification assessment: \$23,136

- 4) map communications between the security zones - 5) determine security controls for the security zones - 6) create a logical security architecture diagram Security zone-based architecture provides a standardized way of designing a scalable and consistent security architecture. It offers increased network resiliency, meaning it helps keep communications working in the face of misconfiguration and faults. Security segmentation can help mitigate the vulnerabilities listed above and should be part of a comprehensive cybersecurity plan. The fundamental building blocks of security segmentation are security zones, security controls, and trusted communications. Each is explained in turn, below.

. (1) A DoD contract for performance of services and/or delivery of supplies in an area of contingency operations outside the United States or a contract of a non-DoD Federal agency for performance of services and/or delivery of supplies in an area of combat operations or other significant military operations, as designated by the Secretary of Defense; a subcontract at any tier under such a contract; or a task order or delivery order issued under such a contract or subcontract. (2) Also includes contracts or subcontracts funded under grants and sub-grants by a Federal agency for performance in an area of combat operations or other significant military operations as designated by the Secretary of Defense. (3) Excludes temporary arrangements entered into by non-DoD contractors or grantees for the performance of private security functions by individual indigenous personnel not affiliated with a local or expatriate security company. Such arrangements must still be in compliance with local law. Other significant military operations.

For purposes of this part, the term 'other significant military operations' means activities, other than combat operations, as part of an overseas contingency operation that are carried out by United States Armed Forces in an uncontrolled or unpredictable high-threat environment where personnel performing security functions may be called upon to use deadly force. [1] Private security functions . Activities engaged in by a contractor under a covered contract as follows: (1) Guarding of personnel, facilities, designated sites, or property of a Federal agency, the contractor or subcontractor, or a third party. [2] (2) Any other activity for which personnel are required to carry weapons in the performance of their duties in accordance with the terms of their contract. For the DoD, DoDI Instruction 3020.41, 'Contractor Personnel Authorized to Accompany the U.S. Armed Forces,' [3] prescribes policies related to personnel allowed to carry weapons for self defense. PSC . During contingency operations 'PSC' means a company employed by the DoD performing private security functions under a covered contract. In a designated area of combat operations or other significant military operations, the term 'PSC' expands to include all companies employed by U.S.G. agencies performing private security functions under a covered contract. PSC personnel . Any individual performing private security functions under a covered contract. § 159.4 Policy. (a) Consistent with the requirements of paragraph (a)(2) of section 862 of Public Law 110-181

3.8.1 | The Audit Organization | The Audit Organization | 65 | | 3. 3.8.1 The Audit Organization
The NBS/PCIE workshop attendees came up with a number of recommendations for further activity by ADP Audit/Computer Security Organizations.

3.3.4 Trade Literature/Publications/Electronic News In addition to monitoring the system, it is useful to monitor external sources for information.

Rural health care providers are more likely to have limited resources to update legacy information technology (IT) systems, implement new or changed regulatory requirements, and respond to large breaches. Additionally, the health IT workforce is more limited in rural areas, which may affect the ability of rural health care providers to access in-person technical assistance. Because most rural hospitals are 'located more than 35 miles from another hospital,' responding to cyberattacks may be more challenging. [1017] We request comment on the burdens these proposals would impose on rural health care providers, including rural hospitals. Rural health care providers and other regulated entities can avail themselves of grants and incentives to improve broadband access and adoption of health IT. [1018] For cybersecurity in particular, the White House, in partnership with private companies, announced the availability of direct assistance to rural health care providers on cybersecurity in the form of grants, discounts, and technical advice. [1019] Additionally, CISA has compiled a list of free services and tools available to regulated entities from private and public sector entities. CISA also has published, in partnership with the Joint Cyber Defense Collaborative, a list of cybersecurity resources especially focused on high-risk communities. [1020] And the Advanced Research Projects Agency for Health announced plans to invest \$50 million to develop an autonomous solution for addressing cyberthreats to assist hospitals in defending their information systems. [1021] Cybersecurity is as essential for small and rural health care providers and their business associates, as it is for large and urban regulated entities. The seamless flow of data and increased connectivity means that threats to one health care provider do not affect only that one health care provider, regardless of size or location. The effects on patient care may be greater in rural environments where fewer alternatives exist if care is delayed or denied as a result of a cyberattack or malfunction. [1022] As discussed in the preamble, the factors described at 45 CFR 164.306(b)(2) provide the flexibility for small and rural providers, in particular, to adopt security measures that are reasonable and appropriate for their circumstances. D. Executive Order 13132 'Federalism As required by E.O. 13132 on Federalism, [1023] the Department has examined the provisions in the proposed regulation for their effects on the relationship between the Federal Government and the States. E.O. 13132 establishes certain requirements that an agency must meet when it promulgates a proposed rule (and subsequent final rule) that imposes substantial direct requirement costs on State and local governments, preempts State law, or otherwise has federalism implications. In the Department's view, the proposed rule would not have any federalism implications. The federalism implications of the Security Rule were also assessed as required by

This proposed rule will impact small businesses awarded a contract to develop, implement, operate, or maintain a FIS on behalf of the Government. The Government acknowledges that large businesses

awarded a contract for such services may further subcontract some of the services that are subject to the requirements of the clauses. As such, the Government estimates that up to an additional seven small business entities may receive a subcontract to develop, implement, operate, or maintain a FIS under a prime contract for the same services. The responsibilities prescribed to contractors under this rule apply per FIS, not per contractor or subcontractor. Multiple entities will not be responsible for implementing or executing the same requirement for the same FIS; As such, the Government describes the impact of this rule on small business under the assumption that each of the responsibilities described below will be subcontracted to a small business at least once annually. According to subject matter experts, there are approximately 140 non-cloud FISs currently being operated or maintained by contractors on behalf of the Government. The Government estimates it awards 28 contracts ((20 percent * 140 non-cloud FISs) * 1 contract/FIS) to 28 unique contractors (28 contracts = 28 unique entities) annually for the development, implementation, operation, or maintenance of a non-cloud FIS on behalf of the Government. Of the 28 contractors to be awarded a contract each year to operate or maintain a non-cloud FIS, approximately three (28 contractors * 10 percent) are small businesses. According to FedRAMP data and subject matter experts, there are approximately 280 unique FedRAMP-authorized and ready cloud service offerings available to the Federal Government. Based on the number of FedRAMP-authorized offerings, the Government estimates that there are approximately 56 new or revised FIS offerings (20 percent * 280 cloud service offerings) each year for which the Government contracts. Therefore, the Government estimates that 56 unique entities to be awarded a contract annually for the development, implementation, operation, or maintenance of a cloud FIS on behalf of the Government, of which approximately three (56 contractors * five percent) are small businesses. The proposed rule requires contractors awarded a contract or subcontract to develop, implement, operate, or maintain a FIS to read and become familiar with the rule, as well as review the applicable standards documents identified in the rule. The proposed rule also requires contractors awarded a contract or subcontract to develop, implement, operate, or maintain a FIS using other than cloud computing services (i.e.,

, respectively), the Department proposes several changes that would recognize the increasingly mobile nature of ePHI and workstations that connect to the information systems of regulated entities. The purpose of these proposals is to ensure that regulated entities properly consider physical safeguards for all workstations, including those that are mobile, and not only those that are located in regulated entities' facilities. The Department also proposes to modify both standards to clarify the organization of the regulatory text. The Department proposes to modify the standard for workstation use to clarify that policies and procedures established by a regulated entity to govern the use of workstations be in writing and address all workstations that access ePHI or the regulated entity's relevant electronic information systems. These proposed changes are consistent with the Department's longstanding expectations and other proposals in this NPRM described above. In 45 CFR 164.310(b)(2)(i)(C) , the Department proposes to require a regulated entity to establish and implement written policies and procedures that, among other things, specify the physical attributes of workstation surroundings, including the removal of workstations from a facility and the movement of workstations within and outside of a facility. This proposal is consistent with (printed page 961) the proposed revision to the definition of ·workstation· discussed above. Additionally, we propose to add an implementation specification for maintenance at proposed 45 CFR 164.310(b)(2)(ii) to require that a regulated entity review and test its written policies and procedures at least once every 12 months, and to modify those policies and procedures as reasonable and appropriate based on that review. Relatedly, the Department proposes to modify the standard for workstation security at 45 CFR 164.310(c) to require a regulated entity to implement physical safeguards for workstations that access ePHI or relevant electronic information systems to comply with its written policies and procedures for workstation use. This proposal would also make clear that such physical safeguards must be modified in response to any modifications to the written policies and procedures for workstation use. As part of their policies and procedures for workstation security, the Department encourages regulated entities to consider, among other things, whether there are workstations located in public areas or other areas that are more vulnerable to theft, unauthorized use, or unauthorized viewing; whether such devices should be relocated; the physical security controls for workstations that are in use (e.g., cable locks, privacy screens, secured rooms, cameras) and whether they are easy to use; and whether there are additional physical security controls that could reasonably be put into place. [648]

Back to Citation 36. ·DODIG-2019-105 ·Audit of Protection of DoD CUI on Contractor-Owned Networks and Systems.· Back to Citation 37. ·The number of unique awardees impacted each year is 1/3 of the average number of annual awardees according to the Electronic Data Access system (31,338/3 = 10,446). This estimate does not address new entrants or awardees who discontinue doing business with DoD. Back to Citation 38. ·Includes all businesses with the exception of those defined under the small business criteria and size standards provided in 13 CFR 121.201 (See FAR Part 19.102) Back to Citation 39. ·The Level I self-assessment and Level 2 self- assessment information collection reporting and recordkeeping requirements will be included in a modification of an existing DFARS collection approved under OBM Control Number 0750-0004, Assessing Contractor Implementation of Cybersecurity Requirements. Modifications to this DFARS collection will be addressed as part of the 48 CFR part 204 CMMC Acquisition rule. 40. ·The Level 1 self-assessment and Level 2 self-assessment information collection reporting and recordkeeping requirements will be included in a modification of an existing DFARS collection approved under OBM Control Number 0750-0004, Assessing Contractor Implementation of Cybersecurity Requirements. Modifications to this DFARS collection will be addressed as part of the 48 CFR part 204 CMMC Acquisition rule. Back to Citation 41. ·The terms nonrecurring engineering costs and recurring engineering costs are terms of art and do not only encompass actual engineering costs. Back to Citation 42. ·IT = Information Technology, MGMT = Management. 43. ·IT and MGMT rates represent an estimate for in-house labor and includes the labor rate plus fringe and employee-related expenses. 44. ·Background assumes a Bachelor's degree as the minimum education level, additional requirements are noted including required years of experience. A Master's degree may reduce the required years of experience as noted. 45. ·The ESP/C3PAO rate represents an estimate for outsourced labor and includes the labor rate, overhead expense, G&A expense, and profit. Back to Citation 46. ·CMMC Level 1 consists of the same 15 basic safeguarding requirements specified in FAR clause 52.204-21. This cost analysis assumes that defense contractors and subcontractors already have contracts with FAR clause 52.204-21 and, therefore, have already implemented the 15 basic safeguarding requirements. Back to Citation 47. ·Again, it is assumed that that defense contractors and subcontractors have already implemented the 15 basic safeguarding requirements in FAR clause 52.204-21.

We believe these obligations would be clarified by the proposals in this NPRM. For example, the Department proposes to require that a regulated entity not only conduct an accurate assessment of potential risks and vulnerabilities to the confidentiality, integrity, and availability of the ePHI it creates, receives, maintains, or transmits, but would add an express requirement that the assessment be comprehensive and in writing. We also propose to specify that the required assessment include, among other things, identification of all reasonably anticipated threats and potential vulnerabilities and predisposing conditions, making a reasonable determination and documentation of the likelihood that each identified threat will exploit the identified vulnerabilities, and performing a written assessment of the risk level for each identified threat and vulnerability. Under the NPRM, a regulated entity would be expected to, as part of the risk analysis, consider whether quantum computing poses a reasonably anticipated threat to the confidentiality, integrity, or availability of its ePHI and whether there is a vulnerability or predisposing condition that corresponds to that threat, and to document those considerations; make a reasonable determination and document the likelihood that the threat will exploit the identified vulnerabilities; and assign a risk level to the identified threat and vulnerability.

2. Artificial Intelligence (AI) Section 238(g) of the John S. McCain National Defense Authorization Act for Fiscal Year 2019 defined AI to include the following: [892] Any artificial system that performs tasks under varying and unpredictable circumstances without significant human oversight, or that can learn from experience and improve performance when exposed to data sets. An artificial system developed in computer software, physical hardware, or other context that solves tasks requiring human-like perception, (printed page 990) cognition, planning, learning, communication, or physical action. An artificial system designed to think or act like a human, including cognitive architectures and neural networks. A set of techniques, including machine learning, that is designed to approximate a cognitive task. An artificial system designed to act rationally, including an intelligent software agent or embodied robot that achieves goals using perception, planning, reasoning, learning, communicating, decision making, and acting. AI requires enormous amounts of data to develop, but it also has enormous potential benefits. The Department has previously stated that these technologies have the potential to drive innovation, increase market competition, and vastly improve care for patients and

populations. [893] According to experts, "[. . .]AI is unlocking new possibilities by advancing medicine in entirely unimaginable ways and solving some of the grand global healthcare challenges. [894]

verify, or state) under penalty of perjury that the foregoing is true and correct. Executed on (date). (Signature). (ii) If executed outside of the United States: I declare under perjury or penalty under the laws of the United States of America that the foregoing is true and correct. Executed on (date). (Signature). (3) When an individual seeks access in person, identification can be verified by documents normally carried by the individual (such as identification card, driver's license, or other license, permit or pass normally used for identification purposes). However, level of proof of identity is commensurate with the sensitivity of the records sought. For example, more proof is required to access medical records than is required to access parking records. (4) Telephonic requests will not be honored. (5) An individual cannot be denied access solely for refusal to provide his or her Social Security Number (SSN) unless the SSN was required for access by statute or regulation adopted prior to January 1, 1975. (6) If an individual wishes to have his or her records released directly to a third party or to be accompanied by a third party when seeking access to his or her records, reasonable proof of authorization must be obtained. The individual may be required to furnish a signed access authorization with a notarized signature or other proof of authenticity (i.e. telephonic confirmation) before granting the third party access. (d) Individual access to medical records. (1) An individual must be given access to his or her medical and psychological records unless a judgment is made that access to such records could have an adverse effect on the mental or physical health of the individual. This determination normally should be made in consultation with a medical doctor. Additional guidance is provided in DOD 5400.11-R, Department of Defense Privacy Program. In this instance, the individual will be asked to provide the name of a personal health care provider, and the records will be provided to that health care provider, along with an explanation of why access without medical supervision could be harmful to the individual. (2) Information that may be harmful to the record subject should not be released to a designated individual unless the designee is qualified to make psychiatric or medical determinations. (3) DA activities may offer the services of a military physician, other than the one who provided the treatment. (4) Do not require the named health care provider to request the records for the individual. (5) The agency's decision to furnish the records to a medical designee and not directly to the individual is not considered a denial for reporting purposes under the Act and cannot be appealed. (6) However, no matter what the special procedures are, DA has a statutory obligation to ensure that access is provided the individual.

5. Maintenance Agency. 1 An information system is a discrete set of information resources organized for the collection, processing, maintenance, use, sharing, dissemination, or disposition of information. Information resources include information and related resources, such as personnel, equipment, funds, and information technology. The minimum security requirements cover seventeen security-related areas with regard to protecting the confidentiality, integrity, and availability of federal information systems and the information processed, stored, and transmitted by those systems. The security-related areas include: (i) access control; (ii) awareness and training; (iii) audit and accountability; (iv) certification, accreditation, and security assessments; (v) configuration management; (vi) contingency planning; (vii) identification and authentication; (viii) incident response; (ix) maintenance; (x) media protection; (xi) physical and environmental protection; (xii) planning; (xiii) personnel security; (xiv) risk assessment; (xv) systems and services acquisition; (xvi) system and communications protection; and (xvii) system and information integrity. The seventeen areas represent a broad-based, balanced information security program that addresses the management, operational, and technical aspects of protecting federal information and information systems.

HIPAA Security Rule section 164.314 (Organizational Requirements) addresses business associate contracts. Covered entities and business associates must implement appropriate safeguards to protect electronic protected health information (ePHI). For business associate contracts, organizations should: 1. Establish and document policies specific to business associate contracts 2. Implement technical and procedural controls 3. Train workforce members on their responsibilities 4. Conduct periodic risk assessments addressing business associate contracts 5. Maintain documentation of compliance efforts Under 45 CFR 164.314, this is an organizational requirements requirement that applies to all covered entities and business associates that create, receive, maintain, or transmit ePHI.

(ii) Intermediate Proficiency Level for Career Pathway Certified Assessor 612 from DoD Manual 8140.03 Cyberspace Workforce Qualification & Management Program. (7) Qualify as a Lead CCA by having at least 5 years of cybersecurity experience, 5 years of management experience, 3 years of assessment or audit experience, and at least one baseline certification aligned to either paragraph (b)(7)(i) or (ii) of this section through 15 February 2025 and aligned to paragraph (b)(7)(ii) of this section only beginning 16 February 2025. (i) IAM Level II from DoD Manual 8570 Information Assurance Workforce Improvement Program. (ii) Advanced Proficiency Level for Career Pathway Certified Assessor 612 from DoD Manual 8140.03 Cyberspace Workforce Qualification & Management Program. (8) Only use IT, cloud, cybersecurity services, and end-point devices provided by the authorized/accredited C3PAO that they support and has received a CMMC Level 2 Certification Assessment or higher for all assessment activities. Individual assessors are prohibited from using any other IT, including IT that is personally owned, to include internal and external cloud services and end-point devices, to store, process, handle, or transmit CMMC assessment reports or any other CMMC assessment-related information. (9) Immediately notify the responsible C3PAO of any breach or potential breach of security to any CMMC-related assessment materials under the assessors' purview. (10) Not share any CMMC assessment-related outcomes or advance information with any person not assigned to that specific assessment, except as otherwise required by law. § 170.12 CMMC Certified Instructor (CCI). (a) Roles and responsibilities. A CMMC Certified Instructor (CCI) teaches CMMC assessor candidates. A CCI is trained, tested, and

certified to perform CMMC instructional duties by the CAICO to teach CMMC assessor candidates. Candidate CCIs are certified by the CAICO after successful completion of the CCI training and testing requirements set forth in paragraph (b) of this section. (b) Requirements. CCIs shall:

Purpose The purpose of the Implement step is to implement the controls in the security and privacy plans for the system and for the organization and to document in a baseline configuration, the specific details of the control implementation. NIST SP 800-37, REVISION 2 RISK MANAGEMENT FRAMEWORK FOR INFORMATION SYSTEMS AND ORGANIZATIONS A System Life Cycle Approach for Security and Privacy

CHAPTER THREE PAGE 59 This publication is available free of charge from:

<https://doi.org/10.6028/NIST.SP.800-37r2> System Development Life Cycle Phase: New · Development/Acquisition; Implementation/Assessment. Existing · Operations/Maintenance. Discussion: Organizations implement the controls as described in the security and privacy plans. The control implementation is consistent with the organization's enterprise architecture and associated security and privacy architectures. Organizations use best practices when implementing controls, including systems security and privacy engineering methodologies, concepts, and principles. Risk assessments guide and inform decisions regarding the cost, benefit, and risk trade-offs in using different technologies or policies for control implementation. Organizations also ensure that mandatory configuration settings are established and implemented on system elements in accordance with federal and organizational policies. When organizations have no direct control over what controls are implemented in a system element, for example, in commercial off-the-shelf products, organizations consider the use of system elements that have been tested, evaluated, or validated by approved, independent, third-party assessment facilities (e.g., NIST Cryptographic Module Validation Program Testing Laboratories, National Information Assurance Partnership Common Criteria Testing Laboratories). The tests, evaluations, and validations consider products in specific configurations and in isolation; control implementation addresses how the product is integrated into the system while preserving security functionality and assurance. Organizations also address, where applicable, assurance requirements when implementing controls. Assurance requirements are directed at the activities that control developers and implementers carry out to increase the level of confidence that the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security and privacy requirements for the system. The assurance requirements address quality of the design, development, and implementation of the controls.⁸⁵ For the common controls inherited by the system, systems security and privacy engineers with support from system security and privacy officers, coordinate with the common control provider to determine the most appropriate way to implement common controls. System owners can refer to the authorization packages prepared by common control providers when making determinations regarding the adequacy of common controls inherited by their systems. During implementation, it may be determined that common controls previously selected to be inherited by the system do not meet the specified security or privacy requirements for the system. For common controls that do not meet the requirements for the system inheriting the controls or when common controls have unacceptable deficiencies, the system owners identify compensating or supplementary controls to be implemented. System owners can supplement the common controls with system-specific or hybrid controls to achieve the required protection for their systems or they can accept greater risk with the acknowledgement and approval of the organization. Risk assessments may determine how gaps in security or privacy requirements between systems and common controls affect the risk associated with the system, and how to prioritize the need for compensating or supplementary controls to mitigate specific risks. Consistent with the flexibility allowed in applying the tasks in the RMF, organizations conduct initial control assessments during system development and implementation. Conducting such assessments in parallel with the development and implementation phases of the SDLC facilitates early identification of deficiencies and provides a cost-effective method for initiating corrective actions. Issues discovered during these assessments can be referred to authorizing officials for resolution. The results of the initial control assessments can also be used during the authorize step to avoid delays or costly repetition of assessments. Assessment results that are subsequently reused in other phases of the SDLC meet the reuse requirements established by the organization.⁸⁶ ⁸⁵ [SP 800-53] provides a list of assurance-related security and privacy controls. ⁸⁶ See the RMF Assess step and [SP 800-53A] for information on assessments and reuse of assessment results.

65. A person needs to enter the information into SPRS, which should only take five minutes.

Back to Citation 66. ·An Organization Seeking Certification (OSC) is an entity seeking to contract, obtain, or maintain CMMC certification for a given information system at a particular CMMC Level. An OSC is also an OSA. Back to Citation 67. ·An Organization Seeking Assessment (OSA) is an entity seeking to conduct, obtain, or maintain a CMMC assessment for a given information system at a particular CMMC Level. The term OSA includes all OSCs. Back to Citation 68. ·Respondent is equivalent to an entity; an entity provides one response annually. 69. ·Hours per Response represents the estimated burden hours to complete the indicated assessment. 70. ·Hourly Rate represents a composite hourly rate derived from the detailed type of labor and associated rates estimated in the CMMC cost estimate model. 71. ·The entity type refers to the size of the OSC as either Small or Other Than Small; the entity type does not refer to the size of the C3PAO. Back to Citation 72. ·Respondent is equivalent to an entity; an entity provides one response annually. 73. ·Hours per Response represents the estimated Government burden hours to complete the indicated assessment. 74. ·The Hourly Rate represents a composite hourly rate derived from the detailed type of Government labor and associated rates estimated in the CMMC cost estimate model. 75. ·The entity type refers to the size of the OSC as either Small or Other Than Small; the entity type does not refer to the size of DCMA DIBCAC. CIS Safeguard 13.1 · Centralize Security Event Alerting Centralize security event alerting across enterprise assets for log correlation and analysis. Best practice implementation requires the use of a SIEM, which includes vendor-defined event correlation alerts. A log analytics platform configured with security-relevant correlation alerts also satisfies this Safeguard. Implementation Groups: 2,3 Asset Type: network Security Function: detect Parent Control: Network Monitoring and Defense

According to Cryptographic Key Management Workshop Summary -- June 8-9, 2009, 2.4.4 Leap-Ahead Technologies: Miles Smid, Orion Security Solutions: per and lower air bags. Yes, we pay more for our cars, but we expect safety to be built in. There may also be smaller leaps in security that could help solve our cryptographic key management problems. What if we had the capability to automatically validate key establishment protocols or even use provably-secure protocols? Quantum cryptography could also improve security by permitting us to easily distribute secret values in a secure manner. But, there is more to key management than key establishment. Many key management problems involve the secure generation, storage, access and recovery of the keys, either before or after they are distributed. - Leaps in ease of implementation, management, and use: We have already made significant progress in this area. Electronic distribution of wrapped keys led to an improvement over manually distributed keys, and public key-based key distribution led to an improvement over key wrapping. Today, PKI, even with all of its problems, provides a major leap ahead over previously used systems. But, we still seem to be repeating some of the mistakes of the past. We build systems, we implement them, and then we find out that the users consider them unacceptable. We must not wait until the last minute to get the user's opinion. We need to build prototypes of a system and test them with real users before we extensively field the final product. - We need to explore the advantages of alternative approaches like identity-based key management. - What if we had cloud key management? By that I mean that I could go to some trusted part of the cloud and say, 'Please give me a key to communicate securely with jsmith@verizon.net.' Better yet would be if I could go to the trusted part of the cloud and say, 'Please give me a secure channel to jsmith@verizon.net.' Best of all would probably be if the security was provided by the cloud for all my communications. - I like a holistic approach to enterprise key management.

- (i) This includes CUI that the Government provides to the Contractor or CUI that the Contractor collects, develops, receives, transmits, uses, handles, or stores in performance of the contract.
- (ii) For CUI located within a Federally-controlled facility, the Contractor shall follow agency CUI policies and shall ensure that any Contractor employees handling CUI within Federally-controlled

facilities meet the prerequisites identified within Part B on the SF XXX for training and for access to CUI. (iii) For CUI located within a non-Federally-controlled facility, the Contractor shall follow CUI policies and shall ensure that any Contractor employees handling CUI within the non-Federally-controlled facility comply with the requirements identified in Part C of the SF XXX. (iv) Any applicable agency-specific policies for safeguarding or handling CUI will be identified in the SF XXX. (v) When information is not identified as CUI, it may be covered Federal information requiring information system security controls in accordance with Federal Acquisition Regulation clause 52.204-21, Basic Safeguarding of Covered Contractor Information Systems. (2) The Contractor shall permit access to CUI only as described in the SF XXX. (3) Except for its own information, the Contractor is not responsible for identifying or marking unmarked or mismarked CUI unless doing so is specifically included in the SF XXX, such as when the Contractor generates or develops the CUI. (4) No Contractor employee shall be permitted to have or retain access to, create, collect, use, process, store, maintain, disseminate, disclose, dispose of, or otherwise handle CUI unless the employee has completed training on properly handling CUI that, at a minimum, includes the elements required in the SF XXX. (5) Contractors operating information systems that access, use, process, store, maintain, or transmit CUI identified in the contract, shall implement the following requirements: (i) When the Contractor is operating an information system identified in the SF XXX as a Federal information system: (A) The Contractor shall comply with agency-identified security requirements from the latest version of National Institute of Standards and Technology (NIST) Special Publication (SP) 800-53 and any CUI Specified requirements identified in the SF XXX; and (B) If using cloud computing services, the Contractor shall comply with agency-identified security requirements, but at no less than the Federal Risk and Authorization Management Program (FedRAMP) Moderate baseline (<https://www.fedramp.gov/documents/>). (ii) When the Contractor is operating a non-Federal information system, the Contractor shall: (A) Comply with the security requirements of NIST SP 800-171 Revision 2, Protecting Controlled Unclassified Information in Non-Federal Information Systems and Organizations (available via the internet at <https://dx.doi.org/10.6028/NIST.SP.800-171>

Many executives are not aware of the central role SSH keys play in the secure management and operation of mission critical infrastructure and the significant breaches that can occur if they are exploited. Without sufficient executive education for both security and operationally focused executives, SSH key management initiatives can get derailed by other seemingly higher priorities, leaving an organization vulnerable. To ensure the proper level of priority is placed on the implementing and sustaining SSH key management, it is important that executives understand the systems on which SSH is used, the levels of access granted to users and automated processes via SSH, the risks and potential impacts of an SSH-based breach (including pivoting), and the basic steps needed to implement an SSH key management program (as outlined in this document).

From the NIST SP 800-172 Rev 3 Final Public Draft: This includes approved CUI categories and category descriptions, the basis for safeguarding and dissemination controls, and procedures for the use of CUI. 2 Procedures for the use of CUI include marking, safeguarding, transporting, disseminating, reusing, and disposing of the information. The CUI federal regulation provides guidance to federal agencies on the designation, safeguarding, marking, dissemination, decontrolling, and disposition of CUI; establishes self-inspection and oversight requirements; and delineates other facets of the program. [5] The CUI regulation requires federal agencies that use federal information systems 3 A federal information system is a system that is used or operated by an executive agency, by a contractor of an executive agency, or by another organi

From the NIST SP 800-172 Rev 3 Final Public Draft: A condition that results from the establishment and maintenance of protective measures that enable an organization to perform its mission or critical functions despite risks posed by threats to its use of systems. Protective measures may involve a combination of deterrence, avoidance, prevention, detection, recovery, and correction that should form part of the organization's risk management approach. security assessment See security control assessment . security control The safeguards or countermeasures prescribed for an information system or an organization to protect the confidentiality, integrity, and availability of the system and its information. [18] security control assessment The testing or evaluation of security controls to determine the extent to which the contro

A director (MGMT5) for 8 hours (\$190.52/hr × 8hrs = \$1,524) A staff IT specialist (IT4-SB) for 48 hours (\$86.24/hr × 48hrs = \$345) Reaffirmations: It is estimated that the costs to reaffirm a CMMC

Level 3 Certification Assessment annually is \$1,876 (three-year cost is \$5,628, or \$1,876 × 3) A director (MGMT5) for 8 hours (\$190.52/hr × 8hrs = \$1,524) A staff IT specialist (IT4-SB) for 4.08 hours (\$86.24/hr × 4.08hrs = \$352) The Level 3 Affirmations cost burden will be addressed as part of the 48 CFR acquisition rule. Summary: The following is the annual small entities total cost summary for CMMC Level 3 Certifications and Affirmations over a ten-year period. Example calculation, Year 2 (reference per entity amounts shown): *(\$9,050 Certification per entity × 45 entities) + (\$1,876 Annual Affirmation per entity × 3 entities) = \$412,897, and \$121,500,000 Nonrecurring Engineering cost (\$2,700,000 per entity × 45 entities being certified), and \$23,520,000 Recurring Engineering cost (\$490,000 per entity × 45 entities being certified) + (\$490,000 per entity × 3 entities performing affirmations) \$145,432,897 Total Cost = Certification and Affirmation Cost (\$412,897) + Nonrecurring Engineering cost (\$121,500,000) + Recurring Engineering cost (\$23,520,000), or \$145,432,897. (printed page 89098) All Entities Summary The following is a summary of the cost to all entities regardless of size for Level 3 CMMC Certification Assessments and affirmations over a ten-year period: (printed page 89099) Government Costs Summary of Impact The following is a summary of the estimated Government costs calculated for a 20-year horizon in 2023 dollars at a 7 percent and 3 percent discount rate. The Government costs include conducting Level 3 Certification Assessments, uploading results into the CMMC instantiation of eMASS, and the CMMC PMO costs. Government Costs (All Levels) The estimated Government costs utilize the entity numbers and phased roll-out detailed in the Public cost section. The DIBCAC estimated the detailed hours for all activities and other costs in a manner similar to the details shown in the Public cost section. Labor efforts for the Government are focused in Level 3. For purposes of the cost estimate, Government labor is based on the average of step one, five, and ten for GS-11 through GS-15 labor elements for the Washington, DC area. The cost of labor was increased by a factor of approximately 51 percent which includes an estimated fringe factor (fringe factor includes estimated average insurance and pension benefits) plus overhead (overhead factor represents supervision and management of the labor) to arrive at the estimated labor rates. The Government labor in this estimate is performed by DCMA, which is a labor-intensive agency with limited overhead expenses. Therefore, the overall added factor of 51 percent is appropriate versus a typical full overhead factor of 100 percent. CMMC Database Infrastructure Costs

· Assets that are in the Level 3 CMMC Assessment Scope Controlled Unclassified Information (CUI) Assets · Assets that process, store, or transmit CUI · Assets that can, but are not intended to, process, store, or transmit CUI (defined as Contractor Risk Managed Assets in Table 2 to paragraph (c)(1) of this section CMMC Scoping). · Document in the asset inventory · Document in the System Security Plan (SSP). · Document in the network diagram of the CMMC Assessment Scope. · Prepare to be assessed against CMMC security requirements. · Assess against all CMMC security requirements. (printed page 89135) Security Protection Assets · Assets that provide security functions or capabilities to the OSC's CMMC Assessment Scope, irrespective of whether or not these assets process, store, or transmit CUI · Document in the asset inventory · Document in the System Security Plan (SSP). · Document in the network diagram of the CMMC Assessment Scope. · Prepare to be assessed against CMMC security requirements. · Assess against all CMMC security requirements. Specialized Assets · Assets that can process, store, or transmit CUI but are unable to be fully secured, including: Internet of Things (IoT) devices, Industrial Internet of Things (IIoT) devices, Operational Technology (OT), Government Furnished Equipment (GFE), Restricted Information Systems, and Test Equipment · Document in the asset inventory · Document in the System Security Plan (SSP). · Document in the network diagram of the CMMC Assessment Scope. · Prepare to be assessed against CMMC security requirements. · Assess against all CMMC security requirements. · Intermediary devices are permitted to provide the capability for the specialized asset to meet one or more CMMC security requirements. · Assets that are not in the Level 3 CMMC Assessment Scope Out-of-Scope Assets · Assets that cannot process, store, or transmit CUI; and do not provide security protections for CUI Assets · Assets that are physically or logically separated from CUI assets. · Assets that fall into any in-scope asset category cannot be considered an Out-of-Scope Asset. · Prepare to justify the inability of an Out-of-Scope Asset to store, process, or transmit CUI · None. (2) If the organization seeking CMMC Level 3 Certification Assessment utilizes an ESP, other than a CSP, the ESP must also have a CMMC Level 3 Final Certification Assessment. If the ESP is internal to the OSC, the security requirements implemented by the ESP should be listed in the OSC's SSP to show connection to its in-scope environment. If using a CSP, see § 170.18(c)(5). In the CMMC Program, CUI or Security Protection Data (e.g., log data, configuration data), must be processed, stored, or transmitted on the ESP assets to be considered an ESP. (e) Relationship between Level 2 and Level 3 CMMC Assessment Scope. The Level 3 CMMC Assessment Scope must be equal to or a subset

of the Level 2 CMMC Assessment Scope in accordance with § 170.18(a), e.g.,

(Comment 141) Several comments offer suggestions on where the required records should be maintained. One comment recommends that, for intracorporate transfers, companies should be permitted to make all required records accessible at one location. The comment states that this would not delay, and could even enhance, efficiencies in an FDA traceback investigation. Several comments state that companies should have flexibility for determining where to maintain the required records. The comments note that it should be sufficient that the records are maintained and are accessible at some location, including the headquarters office for specific locations within a company. One comment requests clarification on whether records may be stored in separate locations, as long as the combined records adequately provide the required information. The comment notes that confidentiality requirements may cause records that contain part of the required information to be maintained in different locations. One comment states that, in the context of air transportation of food, the location where the activity occurred may be difficult to determine, and may not be a feasible place to store records or to make them available to FDA at a future date. According to the comment, the option to store records offsite, combined with the flexibility to maintain records in an electronic format, is critical to ensuring prompt access to the records. (Response) FDA requires in the final rule that the required records must be retained at the establishment where the covered activities described in the records occurred (onsite) or at a reasonably accessible location. The agency clarifies that the intent of this provision of the regulation is to provide flexibility for a company to determine the most efficient and readily accessible means of storage, consistent with the company's business practices. Access to the records may be provided to FDA electronically, by facsimile, or by other appropriate means consistent with the availability requirements in § 1.361 of this final rule, once FDA makes a written request under section 414(a) or 704(a) of the FD&C Act. Each individual company may determine the appropriate location for maintaining the required records and for ensuring that the record availability requirements can be met. L. Comments on What Are the Record Availability Requirements? (Proposed § 1.361)

3.4.2 Emergency Discontinuance ... 3.4.2 Emergency Discontinuance If a participating organization detects an attack, intrusion attempt, or other contingency that exploits or jeopardizes the information or systems involved in the information exchange, it might be necessary to abruptly terminate the information exchange without providing written notice to the other party.

(Response) Manufacturers and third party warehouses are both important links in the supply chain and are required to keep records under the provisions of this regulation. It allows FDA to determine whether what was sent at each stage is what was received, and if not, to be able to locate the unaccounted-for food. In a traceback investigation, it is critical that FDA be able to locate and remove from commerce any adulterated food that presents a threat of serious adverse health consequences or death to humans or animals. (Comment 197) Several comments suggest that the information required by the proposed regulation is excessive and that it would require significant changes in business practices to collect and maintain the required information. One comment suggests that requiring records of names, addresses, and telephone numbers of each supplier for each transaction is excessive. A comment suggests that its firm has no way to capture all of the proposed data elements through current sources of transaction documentation. (Response) FDA assumes, and comments agree, that most of the information required by this regulation is already collected and maintained through currently used transaction documents. The final rule requires lot codes or other identifiers only of persons who manufacture, process, or pack food, and only to the extent this information exists. The final rule also does not require that a responsible individual be identified for the immediate previous source and immediate subsequent recipient for each transaction, as was required by the proposed rule. Accordingly, FDA does not modify its assumptions underlying the estimate of the costs of establishing and maintaining records. 6. Estimates of Additional Records Maintenance Costs Too Low In the PRIA, FDA assumed that the burden of maintaining and collecting additional information would be shared among more than one facility. (Comment 198) Comments state that FDA's estimates of recordkeeping burden obtained from the juice HACCP rule are inappropriate. The comments state that using the juice HACCP model substantially underestimates time requirements because most other types of firms would require more resources to achieve the proficiency required under the HACCP rule. (Response) The juice HACCP cost estimates that we used to estimate costs in the PRIA were published before the juice HACCP rule took effect. The cost estimates for that rule were for firms that were not yet in compliance. FDA continues to believe that those cost estimates are an appropriate reference for this final rule, because they represent a precedent for cost

estimates of activities similar to those required in this regulation. (Comment 199) According to numerous discussions with those who are subject to HACCP regulations, the time and money estimates of the costs FDA provided in the seafood HACCP (printed page 71637) rule were about 1/10 the actual values. This represents a big underestimate of the true costs of the regulation.

Level 2 certification assessment. To comply with Level 2 certification assessment requirements, the OSC must meet the requirements set forth in paragraphs (a)(1) and (2) of this section. An OSC undergoes a Level 2 certification assessment as detailed in paragraph (c) of this section to achieve a CMMC Status of either Conditional or Final Level 2 (C3PAO). Achieving a CMMC Status of Level 2 (C3PAO) also (printed page 83229) satisfies the requirements for a CMMC Statuses of Level 1 (Self) and Level 2 (Self) set forth in §§ 170.15 and 170.16 respectively for the same CMMC Assessment Scope. (1) Level 2 certification assessment requirements. The OSC must complete and achieve a MET result for all security requirements specified in § 170.14(c)(3) to achieve the CMMC Status of Level 2 (C3PAO). The OSC must obtain a Level 2 certification assessment from an authorized or accredited C3PAO following the procedures outlined in paragraph (c) of this section. The C3PAO must submit the Level 2 certification assessment results into the CMMC instantiation of eMASS, which then provides automated transmission to SPRS. To maintain compliance with the requirements for a CMMC Status of Level 2 (C3PAO), the Level 2 certification assessment must be completed within three years of the CMMC Status Date associated with the Conditional Level 2 (C3PAO). (i) Inputs into the CMMC instantiation of eMASS. The Level 2 certification assessment results input into the CMMC instantiation of eMASS shall include, at minimum, the following information: (A) Date and level of the assessment. (B) C3PAO name. (C) Assessment unique identifier. (D) For each Assessor conducting the assessment, name and business contact information. (E) All industry CAGE codes associated with the information systems addressed by the CMMC Assessment Scope. (F) The name, date, and version of the SSP. (G) CMMC Status Date. (H) Assessment result for each requirement objective. (I) POA&M usage and compliance, as applicable. (J) List of the artifact names, the return value of the hashing algorithm, and the hashing algorithm used. (ii) Conditional Level 2 (C3PAO). The OSC has achieved the CMMC Status of Conditional Level 2 (C3PAO) if the Level 2 certification assessment results in a POA&M and the POA&M meets all CMMC Level 2 POA&M requirements listed in § 170.21(a)(2). (A) Plan of Action and Milestones. A Level 2 POA&M is allowed only in accordance with the CMMC POA&M requirements listed in § 170.21. (B) POA&M closeout.

CMMC Acquisition rule, prospective DoD contractors and subcontractors should be actively preparing for DoD contract opportunities that will include CMMC Program requirements when performance will require the contractor or subcontractor to process, store, or transmit FCI or CUI. The respective phases of the implementation plan provide adequate time to complete CMMC requirements and DoD program requirements and timelines will dictate the programs that may warrant CMMC Level 3 requirements during the phased implementation of CMMC. DoD considered many alternatives before deciding upon the current CMMC implementation plan. The phased implementation plan is based on CMMC assessment level and type, which DoD believes to be a fair approach for all prospective offerors. Defining the phase-in based on contract type, company size standard, or other potential bases could lead to unfair advantage. Program Managers will have discretion to include CMMC Status requirements or rely upon existing DFARS clause 252.204-7012 requirements, in accordance with DoD policy. The DoD will monitor the Program Managers' exercise of this discretion to ensure a smooth phase-in period. The decision to rely upon CMMC self-assessment in lieu of certification assessment is a Government risk-based decision based upon the nature of the effort to be performed and CUI to be shared. Note that section § 170.20 Standards acceptance states OSCs that completed a DCMA DIBCAC High Assessment with a score of 110 and aligned with CMMC Level 2 Scoping, will receive Final CMMC Status for a Level 2 certification assessment. As noted by one commenter, self-assessments against NIST SP 800-171 are already required, and verifying compliance with applicable security requirements is necessary for the protection of DoD CUI. For all CMMC independent assessments (i.e., Level 2 or 3), DoD policy guides Program Managers in appropriately including these requirements in DoD solicitations. DoD systems that support the procurement process can identify the number of contracts issued that include any specific clause. Such metrics for the CMMC Program are not within the scope of this rule. The seven-year timespan reflects the DoD's estimate for all defense contractors to achieve CMMC compliance. The implementation plan ramps up CMMC assessment requirements over 4 phases, such that the ecosystem will reach maximum capacity by year four. One commenter referenced the response to a specific comment to the 2020 CMMC rule. Those earlier questions about the 2020 rule publication are no longer relevant due to changes made in the more recent 2023 rule publication. DoD estimates acknowledge that contractors with existing contracts may not receive

another contract award or even submit another proposal immediately.

The information safeguarding requirements and cyber incident reporting requirements set forth in DFARS clause 252.204-7012 will not be phased out as a result of this rule. CMMC Program requirements provide DoD with verification, through self or third-party assessment, that defense contractors have, in fact, implemented DoD's cybersecurity protection requirements. In addition, the requirements of this rule will not be fully implemented (and will not appear in all DoD contracts) until 2026 or later. As such, DoD will continue to require the current cybersecurity protections as reflected in the identified DFARS provisions and clauses for contracts that do not include a CMMC requirements. Applicability The CMMC Program will require DoD to identify CMMC Level 1, 2, or 3 as a solicitation requirement for any effort that will cause a contractor or subcontractor to process, store, or transmit FCI or CUI on its unclassified information system(s). Once CMMC is implemented in 48 CFR , DoD will specify the required CMMC Level in the solicitation and the resulting contract.

Summary of Program Changes: DFARS Case 2019-D041 implemented DoD's original model for assessing contractor information security protections, which is referred to as 'CMMC 1.0.' CMMC 1.0 was comprised of five progressively advanced levels of cybersecurity standards and required defense contractors and subcontractors to undergo a certification process to demonstrate compliance with the cybersecurity standards associated with a given CMMC Level. In March 2021, the Department initiated an internal review of CMMC's implementation that engaged DoD's cybersecurity and acquisition leaders to refine policy and program implementation, focusing on the need to reduce costs for small businesses and align cybersecurity requirements to other federal standards and guidelines. This review resulted in CMMC 2.0, which streamlines assessment and certification requirements and improves implementation of the CMMC Program. These changes include: Eliminating Levels 2 and 4, and renaming the remaining three CMMC Levels as follows: Level 1 will remain the same as CMMC 1.0 Level 1; Level 2 will be similar to CMMC 1.0 Level 3; Level 3 will be similar to CMMC 1.0 Level 5. Removing CMMC-unique requirements and maturity processes from all levels; For CMMC Level 1, allowing annual self-assessments with an annual affirmation by company leadership; Allowing a subset of companies at Level 2 to demonstrate compliance through self-assessment rather than C3PAO assessment. For CMMC Level 3, requiring Department-conducted assessments; and Developing a time-bound and enforceable POA&M process. The CMMC Program will be implemented through publication of rules for both title 32 CFR and title 48 CFR. Both rules will have public comment periods.

Background A. Statement of Need for This Rule

Further, the court added that the requirement does not 'say anything about how effective a mechanism must be, how universally it must be enforced, or how impervious to human error or hacker malfeasance it must be.' [355] Therefore, the Department believes it is necessary to add definitions that distinguish between implementation of the administrative and technical safeguards by separately describing how regulated entities can comply with requirements to implement technical safeguards and install technical solutions.

b. Proposal The Department proposes to define the term 'deploy' to identify a specific type of 'implementation.' We believe that the new term and definition would help to better describe the compliance obligations for implementation specifications related to the use of technology for securing the confidentiality, integrity, or availability of ePHI. As proposed, the definition would require a regulated entity to ensure that technology is in place, configured for use, and actually in use and operational throughout the regulated entity. The Department's proposed use of the term helps illustrate its purpose and utility in clarifying that policies and procedures, while necessary, are insufficient to meet requirements for technical safeguards. For example, the Department is proposing to create a new requirement for regulated entities to verify that business associates have deployed technical safeguards—that is, the technology is configured and operational, not only addressed in policies and procedures. [356] In another example, the Department is proposing new implementation specifications under the access control standard that would require a regulated entity to deploy technical controls for relevant electronic information systems so that the system is configured and applied to limit access to only users and technology assets that have been granted access rights. [357] In the automatic logoff implementation specification for that same standard, the Department is proposing to replace the requirement to implement electronic procedures for terminating an electronic session with a requirement to deploy technical controls that terminate an electronic session after a period of inactivity. [358] In each case, the technical controls must not only be configured for use, but they also must be applied to and in effect in all ePHI and relevant electronic information systems. The Department proposes to define the term 'implement' to clarify that a safeguard must be put into place and be in effect throughout the enterprise, as opposed to only some components of a regulated entity's relevant information

systems (e.g., some laptops or servers) or applied to a subset of ePHI. The Department also proposes the term to further clarify what it means to configure and put technology, technical controls, and related policies and procedures into effect and be in use, operational, and function as expected throughout the regulated entity's enterprise (i.e.,

(Comment 47) One comment states it is not clear in the proposed regulations whether retail bakeries and delicatessens are subject to these regulations. Although the registration requirements exempt them entirely, the recordkeeping rule only contains an exemption from establishing and maintaining records with the names of immediate subsequent recipients of foods sold directly to consumers. This implies that they still need to keep track of ingredient lots used in each production. In such operations, production usually consists of a wide variety of products made daily and in very small quantities. Keeping track of ingredients used in each and every product made daily is virtually impossible, and if required, would financially break every retail bakery or delicatessen, most of which are already struggling to compete in the dwindling market being taken over by supermarket chains. The comment requests that FDA look seriously at totally exempting any retail food operation with 10 or less employees from any of the requirements of the proposed regulations, particularly recordkeeping. If this is not possible, the comment proposes that FDA consider an alternative choice if they do not keep records of ingredients used in products, that if any contaminated ingredient is found, or brought to their attention, that they agree to destroy all manufactured products currently in stock (made from this ingredient or not). This alternative would have the same safety effect, but would be a lot less costly than keeping records. (Response) A bakery or delicatessen is excluded from all of the requirements in subpart J of this final rule if its sales of food it prepares and sells to consumers for immediate consumption are more than 90 percent of its total food sales. (printed page 71580) Food is for immediate consumption when the food is capable of being eaten immediately with no further preparation. However, if the bakery or delicatessen does not qualify for the restaurant/retail facility exclusion in § 1.327(b) of this final rule, there is also an exclusion for retail food establishments that may apply. Under § 1.327(f) of this final rule, retail food establishments that employ 10 or fewer full-time equivalent employees are excluded from all of the requirements in this subpart, except the record access requirements for existing records. The exclusion is based on the number of full-time equivalent employees at each retail food establishment and not the entire business, which may own numerous retail stores.

means information that identifies the DIB participant, whether directly or indirectly, by the grouping of information that can be traced back to the DIB participant (e.g., program description, facility locations). (b) Compromise means disclosure of information to unauthorized persons or a violation of the security policy of a system in which unauthorized intentional, or unintentional, disclosure, modification, destruction, loss of an object, or the copying of information to unauthorized media may have occurred. (c) Covered defense information means unclassified information that: (1) Is: (i) Provided by or on behalf of the DoD to the DIB participant in connection with an official DoD activity; or (ii) Collected, developed, received, transmitted, used, or stored by the DIB participant in support of an official DoD activity; and (2) Is: (i) Technical information marked for restricted distribution in accordance with DoD Directive 5230.25, Withholding of Unclassified Technical Data From Public Disclosure, or DoD Directive 5230.24, Distribution Statements on Technical Documents; (ii) Information subject to export control under the International Traffic in Arms Regulations (ITAR) (http://pmddtc.state.gov/regulations_laws/itar_official.html), or the Export Administration Regulations (EAR) (<http://ecfr.gpoaccess.gov> , Title 15, part 730); (iii) Information designated as Critical Program Information (CPI) in accordance with DoD Instruction 5200.39, Critical Program Information (CPI) Protection within the Department of Defense; (iv) Information that hostile intelligence systems might obtain that could be interpreted or pieced together to derive critical intelligence in time to be useful to adversaries as described in 5205.02-M, DoD Operations Security (OPSEC Program Manual; (v) Personally Identifiable Information (PII) that can be used to distinguish or trace an individual's identity in accordance with DoD Directive 5400.11, DoD Privacy Program; (vi) Information bearing current and prior designations indicating unclassified controlled information (e.g., For Official Use Only, Sensitive But Unclassified, and Limited Official Use, DoD Unclassified Controlled Nuclear Information, Sensitive Information) that has not been cleared for public release in accordance with DoD Directive 5230.29, Clearance of DoD Information for Public Release (see also Appendix 3 of DoD 5200.1-R, Information Security Program Regulation); or (vii) Any other information that is exempt from mandatory public disclosure under DoD Directive 5400.07, DoD Freedom of Information Act (FOIA) Program, and DoD Regulation 5400.7-R,

·DoD Freedom of Information Program·. (d) Covered DIB systems means an information system that is owned or operated by or for a DIB participant and that processes, stores, or transmits covered defense information. (e) Cyber incident

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense General Services Administration National Aeronautics and Space Administration [Docket No. 2024-0054; Sequence No. 1] AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA). ACTION: Notice of request for information (RFI). SUMMARY: DoD, GSA, and NASA recently established Federal Acquisition Regulation (FAR) part 40, Information Security and Supply Chain Security. The intent of this RFI is to solicit feedback from the general public on the scope and organization of FAR part 40. DATES: Interested parties should submit written comments to the Regulatory Secretariat Division at the address shown below on or before June 10, 2024 to be considered in the formation of the changes to FAR part 40. ADDRESSES: Submit comments in response to this RFI to the Federal eRulemaking portal at <https://www.regulations.gov> by searching for ·RFI FAR part 40·. Select the link ·Comment Now· that corresponds with ·RFI FAR part 40·. Follow the instructions provided on the ·Comment Now· screen. Please include your name, company name (if any), and ·RFI FAR part 40· on your attached document. If your comment cannot be submitted using <https://www.regulations.gov> , call or email the points of contact in the FOR FURTHER INFORMATION CONTACT section of this document for alternate instructions. Instructions: Response to this RFI is voluntary. Respondents may answer as many or as few questions as they wish. Each individual or entity is requested to submit only one response to this RFI. Please identify your answers by responding to a specific question or topic if possible. Please submit responses only and cite ·RFI FAR part 40· in all correspondence related to this RFI. Comments received generally will be posted without change to <https://www.regulations.gov> , including any personal and/or business confidential information provided. Public comments may be submitted as an individual, as an organization, or anonymously (see frequently asked questions at <https://www.regulations.gov/faq>). To confirm receipt of your comment(s), please check <https://www.regulations.gov> , approximately two-to-three days after submission to verify posting. FOR FURTHER INFORMATION CONTACT: For clarification of content, contact Ms. Malissa Jones, Procurement Analyst, at 571-882-4687 or by email at malissa.jones@gsa.gov . For information pertaining to status, publication schedules, or alternate instructions for submitting comments if <https://www.regulations.gov>

Third phrase of PE.L1-b.1.ix (FAR b.1.ix.*) 3.10.5 SC.L1-b.1.x 3.13.1 SC.L1-b.1.xi 3.13.5 SI.L1-b.1.xii 3.14.1 (printed page 89130) SI.L1-b.1.xiii 3.14.2 SI.L1-b.1.xiv 3.14.4 SI.L1-b.1.xv 3.14.5 *.Three of the FAR 52.204-21 requirements were broken apart by ·phrase· when NIST SP 800-171 Rev 2 was developed. (iii) Additional explanatory material can be found in the CMMC Level 1 Assessment Guide located at <https://DoDcio.defense.gov/·CMMC/·> . (2) [Reserved]. §.170.16 CMMC Level 2 Self-Assessment and Affirmation requirements. (a) Level 2 Self-Assessment. To comply with CMMC Level 2 Self-Assessment requirements, the OSA must meet the requirements detailed in paragraphs (a)(1) and (2) of this section. Meeting the CMMC Level 2 Self-Assessment requirements detailed in paragraphs (a)(1) and (2) of this section also satisfies the CMMC Level 1 Self-Assessment requirements detailed in §.170.15 for the same CMMC Assessment Scope. (1) Self-Assessment. The OSA must complete and achieve a MET result for all security requirements specified in §.170.14(c)(3). The OSA must conduct a self-assessment in accordance with the procedures set forth in paragraph (c)(1) of this section and submit assessment results in SPRS. To maintain compliance with CMMC Level 2 Self-Assessment requirements, the OSA must perform a CMMC Level 2 Self-Assessment on a triennial basis and submit the results in SPRS. (i) SPRS inputs. The self-assessment results in the Supplier Performance Risk System (SPRS) shall include, at minimum, the following information: (A) CMMC Level. (B) Assessment Date. (C) Assessment Scope. (D) All industry CAGE code(s) associated with the information system(s) addressed by the CMMC Assessment Scope. (E) Overall self-assessment score (e.g., 105 out of 110). (F) POA&M usage and compliance status, as applicable. (ii) Conditional self-assessment. OSAs have achieved CMMC Level 2 Conditional Self-Assessment if the Level 2 self-assessment results in a POA&M and the POA&M meets all the CMMC Level 2 POA&M requirements listed in §.170.21(a)(2). (A) Plan of Action and

Milestones. A Level 2 POA&M is allowed only in accordance with the CMMC POA&M requirements listed in § 170.21. (B) POA&M closeout. The OSA must implement all CMMC Level 2 security requirements and close out the POA&M within 180 days of the initial self-assessment. Upon remediation of the remaining requirements, the OSA must perform a POA&M closeout self-assessment and post compliance results to SPRS. If the POA&M is not closed out within the 180-day timeframe, the Conditional Level 2 Self-Assessment status of the OSA will expire. If Conditional Level 2 Self-Assessment expires within the period of performance of a contract, standard contractual remedies will apply, and the OSA will be ineligible for additional awards with CMMC Level 2 Self-Assessment or higher requirements for the information system within the CMMC Assessment Scope. (iii) Final Self-Assessment.

Numerous comments requested that the DoD provide a definition for Security Protection Data (SPD) and configuration data, as well as requirements for SPD to help understand the scope of SPD and how that impacts the scope of Security Protection Assets and the assessment requirements of ESPs. One comment recommended the removal of the definition and use of SPD. Multiple comments requested more information on the definition and scoping of Security Protection Assets, their relationship to CUI, and their requirements. Some comments suggested that the definition narrow the scope of Security Protection Assets and/or their security and assessment requirements. Other comments recommended eliminating the concept of SPA. Additional comments recommended changing the assessment requirements for SPAs to be the same as CRMAs Specialized Assets applicable NIST SP 800-171 R2 requirements, commensurate with the level of involvement with the security of CUI or to only assess the requirements provided by the SPA. Two comments recommended that the phrase ·irrespective of whether these assets process, store, or transmit CUI· be removed from the definition of SPA. Two comments asked for clarification on the requirements for CSPs that only handle SPD. Two comments recommended different security and assessment requirements for ESPs that host SPD but do not process, store, or transmit CUI. Response: DoD added a CMMC definition for Security Protection Data to the rule. The DoD considered the NIST definitions for System Information and Security Relevant Information in the development of the CMMC definition for SPD. This rule does not regulate OSA Security Protection Data, but instead implements existing regulatory requirements for the safeguarding of CUI, as defined in 32 CFR 2002.14(h)(2) and implemented by DFARS clause 252.204-7012. This clause requires protection of security protection assets and security protection data through its specification of NIST SP 800-171. DoD does not agree with the commentor's statement that the definition of Security Protection Assets ·is an exceedingly dangerous adjustment to the NIST SP 800-171 Revision 2 Paragraph 1.1 Scope of Applicability·. Security Protection Assets provide security to the entirety of an OSA's assessment scope which includes CUI Assets and other in-scope assets. The SPD definition also defines configuration data as data required to operate a security protection asset. This limits the possible interpretations of configuration data. Further, the rule has been updated to reflect that ESPs that do NOT process, store, or transmit CUI do not require CMMC assessment or certification.

(Response) FDA agrees with the comment that a model is needed to determine the savings in investigation traceback times, and the numbers of illnesses that would be avoided from this regulation. FDA has developed a model of the benefits, which is described later in this section. However, FDA does not agree that the benefits should be compared to the current system for recalling products since few investigations result in recalls. Instead, FDA believes that benefits from this final rule will primarily be from faster investigations leading up to preventive actions, including recalls. A recall or other preventive action is made only after a product has been implicated. The benefits from the recordkeeping rule are to improve the accuracy and speed with which a product is implicated. If recalls or other preventive actions are made too quickly and cover too wide a range of products, there is the very real danger of a recurrence of the outbreak if the source is not investigated. For that reason, the benefits from the regulation include not only faster traceback investigation times, but also higher rates of completed traceback investigations, and the commensurate reduction in outbreak recurrences. (Comment 181) One comment states that the analysis failed to meet Office of Management and Budget (OMB) guidelines for regulatory impact analysis by failing to do the following: (1) Adequately consider the need and consequences of the regulation and (2) show that the benefits outweigh the costs of the regulation. In addition, the comment states that the purpose of the regulation is to expand the agency's jurisdiction, rather than to maximize the net benefits to society, and that alternatives with the highest net benefits (including the alternative not to regulate) were not chosen. Finally, the comment states that the analysis failed to consider the condition of the affected food industries, potential future regulatory actions, and

the weak state of the national economy as required. (Response) In the PRIA, we stated that the need for these regulations is to enable FDA to respond to, and help contain, food for which the agency has a reasonable belief that it is adulterated and presents a threat of serious adverse health consequences or death to humans or animals. In the final rule we bolster the explanation of the need for the regulation by analyzing vulnerabilities due to shortfalls in current recordkeeping practices. These shortfalls are shown to inhibit current outbreak investigation efforts and, by extension, efforts to mitigate serious adverse health consequences or death to humans or animals. The perceived vulnerability of the U.S. food supply to an attack, as articulated by Congressional passage of the (printed page 71614) Bioterrorism Act, elevates the importance of addressing these shortfalls.

Scope. This section implements 10 U.S.C. 2327(b) . 225.771-1 Definition. ·State sponsor of terrorism,· as used in this section, is defined in the provision at 252.225-7050, Disclosure of Ownership or Control by the Government of a Country that is a State Sponsor of Terrorism. 225.771-2 Prohibition. (a) The contracting officer shall not award a contract of \$150,000 or more to a firm when a foreign government that is a state sponsor of terrorism owns or controls, either directly or indirectly, a significant interest in· (i) The firm; (ii) A subsidiary of the firm; or (iii) Any other firm that owns or controls the firm. (b) For restrictions on subcontracting with a firm, or a subsidiary of a firm, that is identified by the Secretary of Defense as being owned or controlled by the government of a country that is a state sponsor of terrorism, see 209.405-2. 225.771-3 Notification. Any disclosure that the government of a country that is a state sponsor of terrorism has a significant interest in an offeror, a subsidiary of an offeror, or any other firm that owns or controls an offeror shall be forwarded through agency channels to the address at PGI 225.771-3. 225.771-4 Waiver of prohibition. The prohibition in 225.771-2 may be waived if the Secretary of Defense determines that a waiver is not inconsistent with the national security objectives of the United States in accordance with 10 U.S.C. 2327(c) . 225.771-5 Solicitation provision. Use the provision at 252.225-7050, Disclosure of Ownership or Control by the Government of a Country that is a State Sponsor of Terrorism, in solicitations, including solicitations using FAR part 12 procedures for the acquisition of commercial items (other than commercial satellite services), that are expected to result in contracts of \$150,000 or more. If the solicitation includes the provision at FAR 52.204-7, do not separately list the provision 252.225-7050 in the solicitation. (printed page 73490) PART 252·SOLICITATION PROVISIONS AND CONTRACT CLAUSES 11. Amend section 252.204-7007 by· a. Removing the clause date ·(AUG 2014)· and adding ·(DEC 2014)· in its place; b. Removing paragraph (d)(1)(i); c. Redesignating paragraphs (d)(1)(ii) through (v) as (d)(1)(i) through (iv); and d. Adding a new paragraph (d)(1)(v). The addition reads as follows: 252.204-7007 Alternate A, Annual Representations and Certifications. * * * * * (d)(1) * * * (v) 252.225-7050, Disclosure of Ownership or Control by the Government of a Country that is a State Sponsor of Terrorism. Applies to all solicitations expected to result in contracts of \$150,000 or more. * * * * * 252.209-7001 [Removed and Reserved] 12. Remove and reserve section 252.209-7001. 252.209-7002 [Amended] 13. Amend section 252.209-7002 introductory text by removing ·209.104-70(b)· and adding ·209.104-70· in its place. 14. Revise section 252.209-7004 to read as follows: 252.209-7004 Subcontracting with Firms that are Owned or Controlled by the Government of a Country that is a State Sponsor of Terrorism.

fectively monitor and address IoT product security risks. Jasyn briefly summarized the threat landscape and some recent high-profile events as motivating factors for OEMs to consider product security. He then described in detail Zebra's approach, based on three principles: There were some discussions on distinctions between IT and IoT, and how some assumptions about how security is implemented in IT products do not hold for IoT products, particularly when addressing safety, privacy, different types of supply chains, and the often unique and highly-diverse and complex environments within which the IoT devices are used. Panelists generally agreed that consideration of complete IoT products, instead of the specific IoT devices, will require changes in the ways in which associated risk assessments are performed, necessarily widening the scope. It will also change the ongoing risk management activities, requiring more types of activities to address the full IoT product instead of just considering the IoT device. This, in turn, will require the ability to obtain more information from throughout the supply chain. For

The Department intends and has always intended the physical safeguards to apply to any location where a regulated entity might possess ePHI, including the physical premises and interior and exterior of a building, and any location that might affect the confidentiality, integrity, or

availability of ePHI. Additionally, given the mobility of technology today, including workstations that may access ePHI, we believe it would be more appropriate to use the term facility to make clear that the physical safeguards are to apply throughout the premises of the regulated entity. For the same reasons discussed above, we also propose to clarify that the physical safeguards serve to protect relevant electronic information systems, as we propose to define the term elsewhere in this NPRM, rather than all electronic information systems. Further, the Department proposes to better standardize the administrative, physical, and technical safeguard requirements by using defined terms where they exist. 13. Adding a Definition of ‘Relevant Electronic Information System’

a. Issues To Address The Security Rule requires a regulated entity to ensure the confidentiality, integrity, and availability of all of the ePHI it creates, receives, maintains, or transmits. [377] To protect the ePHI as required, a regulated entity must also protect the electronic information systems that create, receive, maintain, or transmit ePHI and the electronic information systems that otherwise affect the confidentiality, integrity, or availability of ePHI. The Department believes that regulated entities are not consistently protecting ePHI in a manner that is consistent with their Security Rule obligations and believes that it is necessary to clarify the scope of those obligations. We believe that creating a new defined term for the electronic information systems to which the Security Rule requirements apply will help achieve this goal by ensuring that regulated entities fully understand how their technology assets and the architecture of their electronic information systems affect the confidentiality, integrity, and availability of ePHI.

b. Proposal The Department proposes to add and define the term ‘relevant electronic information system’ to mean an electronic information system that creates, receives, maintains, or transmits ePHI or that otherwise affects the confidentiality, integrity, or availability of ePHI. We believe that distinguishing between a relevant electronic information system and an electronic information system, as proposed, would further clarify the scope of regulated entities’ compliance obligations, including the obligation of regulated entities to understand the relationship between their various electronic information systems and the confidentiality, integrity, and availability of ePHI.

(7) In addition to mailing or delivering notice of the proposed sale to prospective bidders, the Contractor may (when the results are expected to justify the additional expense) display a notice of the proposed sale in appropriate public places, e.g., publish a sales notice on the Internet in appropriate trade journals or magazines and local newspapers. (8) The plant clearance officer or representative will witness the bid opening. The Contractor shall submit, either electronically or manually, two copies of the bid abstract. (9) The following terms and conditions shall be included in sales contracts involving the demilitarization, mutilation, or destruction of property: (i) Demilitarization, mutilation, or destruction on Contractor or subcontractor premises. Item(s) ___ require demilitarization, mutilation, or destruction by the Purchaser. Insert item number(s) and specific demilitarization, mutilation, or destruction requirements for item(s) shown in Defense Demilitarization Manual, DoDM 4160.28-M, edition in effect as of the date of this contract. Demilitarization shall be witnessed and verified by a Government representative using DRMS Form 145 or equivalent. (ii) Demilitarization, mutilation, or destruction off Contractor or subcontractor premises. (A) Item(s) ___ require demilitarization, mutilation, or destruction by the Purchaser. Insert item number(s) and specific demilitarization, mutilation, or destruction requirements for item(s) shown in Defense Demilitarization Manual, DoDM 4160.28-M, edition in effect as of the date of this contract. Demilitarization shall be witnessed and verified by a Government representative using DRMS Form 145 or equivalent. (B) Property requiring demilitarization shall not be removed, and title shall not pass to the Purchaser, until demilitarization has been accomplished and verified by a Government representative. Demilitarization (printed page 52145) will be accomplished as specified in the sales contract. Demilitarization shall be witnessed and verified by a Government representative using DRMS Form 145 or equivalent. (C) The Purchaser agrees to assume all costs incident to the demilitarization and to restore the working area to its present condition after removing the demilitarized property. (iii) Failure to demilitarize. If the Purchaser fails to demilitarize, mutilate, or destroy the property as specified in the contract, the Contractor may, upon giving 10 days written notice from date of mailing to the Purchaser: (A) Repossess, demilitarize, and return the property to the Purchaser, in which case the Purchaser hereby agrees to pay to the Contractor, prior to the return of the property, all costs incurred by the Contractor in repossessing, demilitarizing, and returning the property;

Headquarters Services White House Military Office AP2.2.2. Department of the Army. Address requests for Headquarters, U.S. Army, records, or if there is uncertainty as to which Army activity may have the records, address requests to: Department of the Army, Freedom of Information and Privacy Acts Office, TAPC-PDR-PF, 7798 Cissna Road, Suite 205, Springfield, VA 22150-3166. <https://www.rmda.belvoir.army.mil/rmdaxml/rmda/FPHomePage.asp> . Avi Gopstein Smart Grid and Cyber Physical Systems Office Engineering Laboratory The North American Electric Reliability Corporation (NERC) Critical Infrastructure Protection (CIP) Reliability Standards [NERC CIP] are a set of requirements designed to mitigate the risk of a compromise that could lead to misoperation or instability in the Bulk Electric System (BES). The scope of the CIP Cyber Security Standards is restricted to BES Cyber Systems that would impact the reliable operation of the BES. The Reliability Standards cover topics like the identification and protection of BES Cyber Assets, defining logical isolation perimeters, personnel and training, BES Cyber System security management, disaster recovery planning, physical security, and supply chain risk management.

Potential Assessment Considerations · Are system components (e.g., workstations, servers, email gateways, mobile devices) for which malicious code protection must be provided identified and documented [a]? SI.L2-3.14.2 · Malicious Code Protection [CUI Data] CMMC Assessment Guide · Level 2 | Version 2.13 251 KEY REFERENCES · NIST SP 800-171 Rev. 2 3.14.2 · FAR Clause 52.204-21 b.1.xiii

(Response) Growers of raw agricultural commodities that meet the definition of “farm” in § 1.328 are excluded from the requirements of subpart J of this final rule. A cooperative that accumulates raw agricultural commodities from growers, and does not meet the exemption for retail food establishments that employ 10 or fewer full-time equivalent employees in § 1.327(f) of the final rule, is subject to the requirements in § 1.337 of the final rule regarding the immediate previous sources of food. Distribution of food from the cooperative directly to consumers is excluded from the requirements of § 1.345 of the final rule regarding the immediate subsequent recipients of food.

2. Intrastate (Comment 24) One comment agrees that the requirement for U.S. domestic firms, whether shipping interstate or intrastate, to establish and maintain records as provided in the proposed regulation will maximize FDA’s capability to implement traceback procedures within the borders of the United States. Another comment states that a finding that a certain food is intentionally contaminated—even if only distributed or sold locally—could have widespread, nationwide, even international, economic implications. The comment states that the recent “mad cow” episode in Canada demonstrates that restrictions might be imposed on the distribution and sale of implicated products, or consumers across the country may decide not to buy the products thus impacting the economy as a whole. As a result, the comment states that FDA is correct in concluding that all persons who

manufacture, process, pack, transport, distribute, receive, hold, or import food should be subject to the recordkeeping requirements whether or not they directly engage in interstate activities involving food.

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analysis to advance the development and productive use of information technology. ITL's responsibilities include the development of technical, physical, administrative, and management standards and guidelines for the cost-effective security and privacy of sensitive unclassified information in Federal computer systems. This Interagency Report discusses ITL's research, guidance, and outreach efforts in computer security and its collaborative activities with industry, government, and academic organizations. 3 There are other types of vulnerabilities, such as physical vulnerabilities, that are not included in these categories.

) would require a regulated entity to establish and implement written procedures for terminating a workforce member's access to ePHI and relevant electronic information systems, (printed page 950) and to locations where ePHI or relevant electronic information systems might be accessed. Proposed paragraph (a)(9)(ii)(C)(2) would require that the workforce member's access be terminated as soon as possible, but no later than one hour after the workforce member's employment or other arrangement ends. A proposed implementation specification for notification at proposed 45 CFR 164.308(a)(9)(ii)(D) would require a regulated entity to establish and implement written procedures for notifying another regulated entity of a change in, or termination of, a workforce member's authorization to access ePHI or relevant electronic information systems. Proposed paragraph (a)(9)(ii)(D)(1) would require the regulated entity to establish and implement written procedures for notifying another regulated entity after a change in or termination of a workforce member's authorization to access ePHI or relevant electronic information systems that are maintained by such other regulated entity where the workforce member is or was authorized to access such ePHI or relevant electronic information systems by the regulated entity making the notification. Proposed paragraph (a)(9)(ii)(D)(2) would require the notice to be provided as soon as possible, but no later than 24 hours after the workforce member's authorization to access ePHI or relevant electronic information systems is changed or terminated. Finally, a proposed new implementation specification for maintenance at proposed 45 CFR 164.308(a)(9)(ii)(E) would require a regulated entity to review and test its written workforce security policies and procedures at least once every 12 months and to modify them as reasonable and appropriate. [564] The proposed implementation specifications for termination procedures and notification implementation align with the Department's essential CPG for Revoke Credentials for Departing Workforce Members, Including Employees, Contractors, Affiliates, and Volunteers by requiring a regulated entity to promptly remove access following a change in or termination of a user's authorization to access ePHI. [565] I. Section 164.308(a)(10)(i)-Standard: Information Access Management The purpose of the standard for information access management is to protect ePHI by reducing the risk that other persons or technology assets may access the information for their own reasons. Existing HHS guidance explains that restricting access to only those persons and entities with a need for access is a basic tenet of security. [566]

3.2.2 Step 2: Execute the Implementation Plan ... 3.2.2 Step 2: Execute the Implementation Plan
After the implementation plan is developed, reviewed, and approved by senior members of the planning team, the plan may then be executed. 3.2.2.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the

development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. The purpose of this publication is to evaluate NFT technology and identify potential security concerns. This will promote the secure development of NFT implementations and raise awareness as to possible security concerns. The focus is on the smart contract representation and sales of NFTs and associated blockchain aspects.

The HIPAA Security Rule update follows this timeline: - December 27, 2024: HHS OCR published the Notice of Proposed Rulemaking (NPRM) - March 2025: Public comment period closed (approximately 5,000 comments received) - Current status: OCR is reviewing comments and drafting the final rule - Expected finalization: May 2026 (per the HHS regulatory agenda) Once finalized, covered entities and business associates will have an implementation period (typically 180 days to 1 year) to comply with the new requirements. The OCR estimated first-year compliance costs of approximately \$9 billion across all covered entities and business associates.

(C) From subsections (d) and (f) because requiring OSD to grant access to records and agency rules for access and amendment of records would unfairly impede the investigation of allegations of unlawful activities. To require OSD to confirm or deny the existence of a record pertaining to a requesting individual may in itself provide an answer to that individual relating to an ongoing investigation. The investigation of possible unlawful activities would be jeopardized by agency rules requiring verification of record, disclosure of the record to the subject, and record amendment procedures. (21) System identifier and name. DWHS E05, Mandatory Declassification Review Files. (i) Exemption. Information classified under E.O. 13526, as implemented by DoD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1). (ii) Authority. 5 U.S.C. 552a(k)(1). (iii) Reasons. From subsection 5 U.S.C. 552a(d) because granting access to information that is properly classified pursuant to E.O. 13526, as implemented by DoD 5200.1-R, may cause damage to the national security. (22) System identifier and name. DPFPA 05, Computer Aided Dispatch and Records Management System (CAD/RMS). (i) Exemption. Portions of this system that fall within 5 U.S.C. 552a(j)(2) and/or (k)(2) are exempt from the following provisions of 5 U.S.C. 552a, section (c)(3) and (4); (d); (e)(1) through (e)(3); (e)(4)(G) through (I); (e)(5); (e)(8); (f) and (g) of the Act, as applicable. (ii) Authority. 5 U.S.C. 552a(j)(2) and (k)(2). (iii) Reasons. (A) From subsections (c)(3) and (4) because making available to a record subject the accounting of disclosure from records concerning him or her would specifically reveal any investigative interest in the individual. Revealing this information could reasonably be expected to compromise ongoing efforts to investigate a known or suspected offender by notifying the record subject that he or she is under investigation. This information could also permit the record subject to take measures to impede the investigation, e.g. destroy evidence, intimidate potential witnesses, or flee the area to avoid or impede the investigation.

While outside the requirements of the NISPOM, when a classified contract also includes provisions for protection of CUI, contractors will comply with those contract requirements. § 117.16 Visits and meetings. (a) Visits. This paragraph applies when, for a lawful and authorized USG purpose, it is anticipated that classified information will be disclosed during a visit to a cleared contractor facility or to a USG facility. (1) Classified visits. The number of classified visits will be held to a minimum. The contractor: (i) Must determine that the visit is necessary and the purpose of the visit cannot be achieved without access to, or disclosure of, classified information. (ii) Will establish procedures to ensure positive identification of visitors, appropriate PCL, and need-to-know prior to the disclosure of any classified information. (iii) Will establish procedures to ensure that visitors are only afforded access to classified information consistent with the purpose of the visit. (2) Need-to-know determination. The responsibility for determining need-to-know in connection with a classified visit rests with the individual who will disclose classified information during the visit. Need-to-know is generally based on a contractual relationship between the contractors. In other circumstances, disclosure of the information will be based on an assessment that the receiving contractor has a bona fide need to access the information in furtherance of a GCA purpose. (3) Visits by USG representatives. Representatives of the USG, when acting in their official capacities as inspectors, investigators, or auditors, may visit a contractor's facility, provided these representatives present appropriate USG credentials upon arrival. (4) Visit authorization. (i) If a visit requires access to classified information, the host contractor will verify the visitor's PCL level. Verification of a visitor's PCL may be

accomplished by a review of a CSA-designated database that contains the information or by a visit authorization letter (VAL) provided by the visitor's employer. (ii) If a CSA-designated database is not available and a VAL is required, contractors will include in all VALs: (A) Contractor's name, employee's name, address, and telephone number, assigned commercial and government entity (CAGE) code, if applicable, and certification of the level of the entity eligibility determination. (B) Name, date and place of birth, and citizenship of the employee intending to visit. (C) Certification of the proposed visitor's PCL and any special access authorizations required for the visit. (D) Name of person(s) to be visited. (E) Purpose and sufficient justification for the visit to allow for a determination of the necessity of the visit. (F) Date or period during which the VAL is to be valid. (5) Long term visitors. (i) When USG employees or employees of one contractor are temporarily stationed at another contractor's facility, the security procedures of the host contractor will govern.

3.1.1 Facilities, Fleet, and Equipment Management Information Type... 3.1.1 Facilities, Fleet, and Equipment Management Information Type Facilities, Fleet, and Equipment management involves the maintenance, administration, certification, and operation of office buildings, fleets, machinery, and other capital assets considered as possessions of the Federal government.

Control OC-01: anization uses real-time or near real-time information to understand and consistently act upon the cybersecurity risks associated with its suppliers and the products and services it acquires and uses. Cybersecurity information is constantly shared throughout the organization and with authorized third parties. | ## Appendix C. Glossary ## CSF Category A group of related cybersecurity outcomes that collectively comprise a CSF Function. ## CSF Community Profile A baseline of CSF outcomes that is created and published to address shared interests and goals among a number of organizations. A Community Profile is typically developed for a particular sector, subsector, technology, threat type, or other use case. An organization can use a Community Profile as the basis for its own Target Profile. ## CSF Core A taxonomy of high-level cybersecurity outcomes that can help any organization manage its cybersecurity risks. Its components are a hierarchy of Functions, Categories, and Subcategories that detail each outcome. ## CSF Current Profile A part of an Organizational Profile that specifies the Core outcomes that an organization is currently achieving (or attempting to achieve) and characterizes how or to what extent each outcome is being achieved. ## CSF Function The highest level of organization for cybersecurity outcomes. There are six CSF Functions: Govern, Identify, Protect, Detect, Respond, and Recover. ## CSF Implementation Example A concise, action-oriented, notional illustration of a way to help achieve a CSF Core outcome. ## CSF Informative Reference A mapping that indicates a relationship between a CSF Core outcome and an existing standard, guideline, regulation, or other content. ## CSF Organizational Profile A mechanism for describing an organization's current and/or target cybersecurity posture in terms of the CSF Core's outcomes. ## CSF Quick Start Guide A supplementary resource that gives brief, actionable guidance on specific CSF-related topics.

and creating additional case studies that showcase mature C-SCRM programs that can be used by aspiring organizations as guidance. <!-- image --> The authors conducted in-depth interviews with six organizations that represented a variety of industry sectors and sizes. The purpose of this research was to better understand organizational viewpoints on Cyber Supply Chain Risk Management as well as the challenges faced by organizations. The goal was not to gain an understanding of the general consensus around the topic but rather to dive deeply into the experiences of a few organizations. The authors chose semistructured interviews as the most appropriate method for collecting data about C-SCRM key practices for three reasons: 1. The status of C-SCRM key practices is often considered sensitive and is not broadly shared. 2. The subject matter is complex and non-standardized, meaning that organizations may use different terms for the same concepts. 3. Semi-structured interviews are superior to more quantitative data collection methods for studies that have these types of qualitative research goals. The interviews were designed to capture organizations' viewpoints regarding C-SCRM key practices. Interview questions were developed and refined based on the expertise of Supply Chain Risk Management experts at NIST and Boston Consulting

Group (BCG).

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Office of the Secretary 32 CFR Part 117 [Docket ID: DOD-2020-OS-0045] RIN 0790-AK85 AGENCY: Office of the Under Secretary of Defense for Intelligence & Security, Department of Defense (DoD). ACTION: Final rule with request for comment. SUMMARY: The Department of Defense (DoD) is codifying the National Industrial Security Program Operating Manual (NISPOM) in regulation. The NISPOM establishes requirements for the protection of classified information disclosed to or developed by contractors, licensees, grantees, or certificate holders (hereinafter referred to as contractors) to prevent unauthorized disclosure. In addition to adding the NISPOM to the Code of Federal Regulations (CFR), this rule incorporates the requirements of Security Executive Agent Directive (SEAD) 3, Reporting Requirements for Personnel with Access to Classified Information or Who Hold a Sensitive Position. SEAD 3 requires reporting by all contractor cleared personnel who have been granted eligibility for access to classified information. This NISPOM rule provides for a single nation-wide implementation plan which will, with this rule, include SEAD 3 reporting by all contractor cleared personnel to report specific activities that may adversely impact their continued national security eligibility, such as reporting of foreign travel and foreign contacts. NISP Cognizant Security Agencies (CSAs) shall conduct an analysis of such reported activities to determine whether they pose a potential threat to national security and take appropriate action. Finally, the rule also implements the provisions of Section 842 of Public Law 115-232, which removes the requirement for a covered National Technology and Industrial Base (NTIB) entity operating under a special security agreement pursuant to the NISP to obtain a national interest determination as a condition for access to proscribed information. DATES: Effective date: This rule is effective February 24, 2021. Comments must be received by February 19, 2021. ADDRESSES: You may submit comments, identified by docket number and/or Regulatory Information Number (RIN) and title, by any of the following methods: Federal Rulemaking Portal: <http://www.regulations.gov>. Follow the instructions for submitting comments. Mail: DoD cannot receive written comments at this time due to the COVID-19 pandemic. Comments should be sent electronically to the docket listed above. Instructions:

(b) The Director, Defense Security Service (DSS), in addition to the responsibilities in paragraph (d) of this section, under the authority, direction, and control of the USD(I) will in accordance with DoD Instruction 5220.22, National Industrial Security Program (available at <http://www.dtic.mil/whs/directives/corres/pdf/522022p.pdf>). (1) Make FOCI determinations on a case-by-case basis for U.S. contractors or companies under consideration for an FCL under the NISP. (2) Collect information necessary to examine the source, nature, and extent of a company's ownership, control, or influence by foreign interests. (3) Determine, on behalf of the GCAs, whether a U.S. company is under FOCI to such a degree that the granting of an FCL would be inconsistent with the U.S. national security interests. (4) Determine the security measures necessary to negate or mitigate FOCI and make recommendations to the U.S. company and to those GCAs with a contractual interest or other equity in the matter. (5) Provide GCAs a guide to clarify their roles and responsibilities with respect to the FOCI process and to national interest determinations (NIDs), in particular. Update the guide, as needed, in coordination with the Office of the Under Secretary of Defense for Intelligence (OUSD(I)) Security Directorate. (6) Determine a U.S. company's eligibility for an FCL on an initial and continuing basis depending on recurring security reviews and other interactions. (7) Develop proposed changes to maintain the currency and effectiveness of this part. Forward proposed changes and associated justification to the OUSD(I) Security Directorate for consideration as future changes to this part. (8) Consider and, as warranted, approve requests for exception to DoD 5220.22-M in consultation with affected GCAs for specific contractors and for specific periods of time (such as, to the completion date of a contract) when a contractor is unable to comply with the requirements of DoD 5220.22-M. Consideration of such requests will include an evaluation of any proposed alternative procedures with supporting justification and coordination as applicable, consistent with paragraph (a)(4) of this section. (9) Coordinate and receive the concurrence of the OUSD(I) Security Directorate on requests for exception to DoD 5220.22-M and consistent with paragraph (a)(4) of this section when any of the following provisions apply: (i) The request exceeds the authority of the Director, DSS

as defined in this section; (printed page 19472) (ii) The proposed exception applies to more than one contractor location; or, (iii) The exception would be contrary to U.S. national policy or international agreements, including those relating to foreign government information (FGI) and international issues under the cognizance of the USD(P) with coordination as applicable, consistent with paragraph (a)(4) of this section.

(Comment 40) One comment asserts that there is no added public health protection from requiring retailers to establish and maintain records of the immediate previous holder of a food product. The proposed rule ensures that all information desired by FDA (e.g., the product and lot number going to a particular retail store) is already recorded by both the distributor of the product and by the transporter of the product. Therefore, traceability of a product will exist without requiring the retailer to also keep that information. The comment believes that the added burden of requiring retailers to establish and maintain records on immediate previous sources of the food it receives is not necessary based on the limited public health and safety benefit that would result. (Response) As discussed in response to comment 37 of this document, the Bioterrorism Act did not exempt retail food establishments from recordkeeping requirements. FDA decided to exclude persons who distribute food directly to consumers from the requirement to establish and maintain records of subsequent recipients because sick consumers can provide information as to where they obtained food in a traceback, and FDA can notify consumers of a food threat in a trace forward. In the case of a traceback from a retailer, the retailer's records of the immediate previous sources are needed by FDA to address credible threats of serious adverse health consequences or death to humans or animals. In a traceback, it is unlikely that a retailer's source for certain foods would be apparent. Accordingly, in order for FDA to be able to identify the retailer's immediate previous nontransporter and transporter sources, to gain access to those sources records and identify its sources or other recipients of the food, the retailer has to have records identifying those sources. Therefore, the final rule requires retailers to establish (printed page 71577) and maintain records containing this information. However, retail food establishments that employ 10 or fewer full-time equivalent employees are excluded from all of the requirements in subpart J of the final rule, except §§ 1.361 and 1.363. (See response to comment 38 of this document for a further discussion of FDA's rationale underlying this exclusion.)

to the extent such provisions have been identified and an exemption claimed for the original record and the purposes underlying the exemption for the original record still pertain to the record which is now contained in this system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided to the President and others are not compromised, to protect records used solely as statistical records, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, to preserve the confidentiality and integrity of Federal testing materials, and to safeguard evaluation materials used for military promotions when furnished by a confidential source. The exemption rule for the original records will identify the specific reasons why the records are exempt from specific provisions of 5 U.S.C. 552a . (27) System identifier and name. A0381-100a DAMI, Intelligence/Counterintelligence Source Files. (i) Exemption. (A) Information specifically authorized to be classified under E.O. 12958 , as implemented by DoD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1) . (B) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (C) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (D) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(1) , (k)(2), or (k)(5) from subsections 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(1) , (k)(2), and (k)(5). (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the

nature of that investigation which will present a serious impediment to law enforcement.

(e) NIST SP 800-53, titled "Security and Privacy Controls for Information Systems and Organizations," Revision 5 (NIST SP 800-53 R5), provides a catalog of security and privacy controls for information systems and organizations to protect organizational operations and assets, individuals, other organizations, (printed page 83098) and the Nation from a diverse set of threats and risks, including hostile attacks, human errors, natural disasters, structural failures, foreign intelligence entities, and privacy risks. The controls are flexible and customizable and implemented as part of an organization-wide process to manage risk. The controls address diverse requirements derived from mission and business needs, laws, executive orders, directives, regulations, policies, standards, and guidelines. Finally, the consolidated control catalog addresses security and privacy from a functionality perspective (i.e., the strength of functions and mechanisms provided by the controls) and from an assurance perspective (i.e., the measure of confidence in the security or privacy capability provided by the controls). Addressing functionality and assurance helps to ensure that information technology products and the systems that rely on those products are sufficiently trustworthy. This document is incorporated by reference as a source for definitions. (f) NIST SP 800-82r3, titled "Guide to Operational Technology (OT) Security," September 2023 (NIST SP 800-82r3), provides guidance on how to secure ICS, including Supervisory Control and Data Acquisition (SCADA) systems, Distributed Control Systems (DCS), and other control system configurations such as Programmable Logic Controllers (PLC), while addressing their unique performance, reliability, and safety requirements. The document provides an overview of ICS and typical system topologies, identifies typical threats and vulnerabilities to these systems, and provides recommended security countermeasures to mitigate the associated risks. This document is incorporated by reference as a source for definitions.

The Renewable Energy Company recommends that companies interested in maturing or developing new C-SCRM programs should focus on uplifting the cyber hygiene practices of their vendors. Instead of focusing exclusively on manufacturing or logistics processes, companies and vendors should work together to improve their entire security posture, allowing them to fully appreciate and benefit from mechanisms such as multi-factor authentication and logical segmentation.

OMB collection requirements. If information is to be collected from members of the public, the requirements of reference () apply and OMB must be advised. 10. Supporting documentation. The following are typical enclosures that may be required: a. An advance copy of the system notice for a new or altered system that is proposed for publication. b. An advance copy of a proposed exemption rule if the new or altered system is to be exempted in accordance with subpart F. c. Any other supporting documentation that may be pertinent or helpful in understanding the need for the system or clarifying its intended use. Attachment 2-SAMPLE NARRATIVE STATEMENT DEPARTMENT OF DEFENSE Office of the Secretary Narrative Statement on a New System of Records Under the Privacy Act of 1974 1. System identifier and name: NSLRB 01, entitled "The National Security Labor Relations Board (NSLRB)." 2. Responsible official: Mr. John Miller, National Security Labor Relations Board (NSLRB), 0000 Smith Boulevard, Arlington, VA 22209, Telephone (703) 000-0000. 3. Purpose of establishing the system: The Office of the Secretary of Defense is proposing to establish a system of records that will document adjudication of unfair labor practice charges, negotiability disputes, exceptions to arbitration awards, and impasses filed with the National Security Labor Relations Board. 4. Authority for the maintenance of the system: The National Defense Authorization Act for FY 2004, Pub Law 108-136 , Section 1101; 5 U.S.C. 9902(m) , Labor Management Relations in the Department of Defense; and 5 CFR 9901.907 , National Security Labor Relations Board. 5. Probable or potential effects on the privacy of individuals: None 6. Is the system, in whole or in part, being maintained by a contractor? No 7. Steps taken to minimize risk of unauthorized access: Records are maintained in a controlled facility. Physical entry is restricted by the use of locks, guards, and is accessible only to authorized personnel. Access to records is limited to person(s) responsible for servicing the record in performance of their official duties and who are properly screened and cleared for need-to-know. Access to computerized data is restricted by passwords, which are changed periodically. 8. Routine use compatibility: Any release of information contained in this system of records outside of the DoD will be compatible with purposes for which the information is collected and maintained. The DoD "Blanket Routine Uses" apply to this system of records. 9. OMB information collection requirements: None. 10. Supporting documentation: None. Appendix G to Part 310-Sample Amendments or Deletions to System Notices in Federal Register Format (See §.310.34) (printed page 18789) Amendment of system

notice DEPARTMENT OF DEFENSE Department of the Army Privacy Act of 1974; System of Records
AGENCY: Department of the Army, DoD. ACTION: Notice to Amend a System of Records. SUMMARY:

IoT devices are acquired and used by many customers: individuals, companies, government agencies, educational institutions, and other organizations. Unfortunately, IoT devices often lack device capabilities that customers can use to help mitigate their cybersecurity risks, such as the functionality customers routinely expect their desktop and laptop computers, smartphones, tablets, and other IT devices to have. Consequently, IoT device customers may have to select, implement, and manage additional or new cybersecurity controls or alter the controls they already have. Compounding this task, customers may not know they need to alter their existing processes to accommodate the unique characteristics of IoT. The result is many IoT devices are not secured in the face of evolving threats; therefore, attackers can more easily compromise IoT devices and use them to harm device customers and conduct additional nefarious acts (e.g., distributed denial of service [DDoS] attacks) against other organizations. 1. Which types of people are expected customers for this device? (e.g., musicians, small business owners, cyclists, police officers, chefs, home builders, preschoolers, electrical engineers) 2. Which types of organizations are expected customers for this device? (e.g., individual home users, small retail businesses, large hospitals, energy companies with solar farms, educational institutions with buses) The core baseline is just one set of device cybersecurity capabilities that may be needed in an IoT device, and manufacturers should consult other sources to derive or identify appropriate device cybersecurity capabilities and implementations for expected customers and use cases, as discussed in Section 3.2. Manufacturers can follow a process of linking cybersecurity mitigation, needs, and goals with specific device cybersecurity capabilities.

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft)
Enhanced Security Requirements for Protecting CUI September 2025 A condition that results from the establishment and maintenance of protective measures that enable an 3069

(vi) DSS will review and consider the FOCI action plan itself, the factors identified in paragraph (b)(3)(i) of this section, and any threat or risk assessments or other relevant information. If an action plan is determined to be unacceptable, DSS can recommend and negotiate an acceptable action plan including, but not limited to, the measures identified in paragraphs (b)(4)(ii) and (b)(4)(iii) of this section. In any event, DSS will provide written feedback to a company or the company's designated representative on the acceptability of the FOCI action plan within 30 calendar days of receipt. (4) Options To Address FOCI. (i) Under all FOCI action plans, management positions requiring PCLs in conjunction with the FCL must be filled by eligible U.S. citizens residing in the United States in accordance with DoD 5220.22-M. (ii) When factors related to foreign control or influence are present, but unrelated to ownership, the plan must provide positive measures that assure that the foreign interest can be effectively denied access to classified information and cannot otherwise adversely affect performance on classified contracts. Non-exclusive examples of such measures include: (A) Adoption of special board resolutions. (B) Assignment of specific oversight duties and responsibilities to independent board members. (C) Formulation of special executive-level security committees to consider and oversee matters that affect the performance of classified contracts. (D) The appointment of a technology control officer. (E) Modification or termination of loan agreements, contracts, and other understandings with foreign interests. (F) Diversification or reduction of foreign-source income. (G) Demonstration of financial viability independent of foreign interests. (printed page 19474) (H) Elimination or resolution of problem debt. (I) Physical or organizational separation of the contractor component performing on classified contracts. (J) Other actions that negate or mitigate foreign control or influence. (iii) FOCI concerns related to foreign ownership of a company or corporate family arise when a foreign interest has the ability, either directly or indirectly, whether exercised or exercisable, to control or influence the election or appointment of one or more members to the company's governing board (e.g., Board of Directors, Board of Managers, or Board of Trustees) or its equivalent, by any means. Some methods that may be applied to mitigate the risk of foreign ownership are outlined in DoD 5220.22-M and further described in this section. While these methods are mentioned in relation to specific ownership and control thresholds, these descriptions should not be construed as DoD-sanctioned criteria mandating the selection or acceptance of a certain FOCI action plan. DSS retains the authority to reject or modify any proposed FOCI action plan in consultation with the affected GCAs. (A) Board Resolution.

(1) The Contractor shall implement and maintain security and privacy safeguards and controls with the security level and services required in accordance with the Federal Risk and Authorization Management Program (FedRAMP) authorization level specified. (i) Cloud continuous monitoring requirement. The Contractor shall engage in continuous monitoring activities and provide continuous monitoring deliverables as required for FedRAMP approved capabilities (see FedRAMP Continuous Monitoring Strategy Guide). (ii) Cryptographic key services. The Government reserves the right to implement and operate its own cryptographic key management, key revocation and key escrow services. (2) For cloud computing services required to meet FIPS Publication 199 high impact requirements, the Contractor shall maintain within the United States and its outlying areas (see FAR 2.101) all Government data that is not physically located on U.S. Government premises, unless otherwise specified in the contract. (d) Limitations on access to, and use and disclosure of, Government data and Government-related data. (1) The Contractor shall not access, use, or disclose Government data or Government-related data unless specifically authorized under the contract or task or delivery order or in writing by the Contracting Officer. (i) When authorized, any access to, or use or disclosure of, Government data or Government-related data shall only be for purposes specified in the contract or task order or delivery order. (ii) The Contractor shall ensure that its employees are subject to all such access, use, and disclosure prohibitions and obligations of this paragraph. (iii) The access, use, and disclosure prohibitions and obligations of this paragraph shall survive the expiration or termination of this contract. (2) The Contractor shall use Government-related data only to manage the operational environment that supports the Government data and for no other purpose unless otherwise permitted with the prior written approval of the Contracting Officer. (e) Notifiable incident reporting, incident response and threat reporting. For contract coverage on security incident and cyber threat reporting, see FAR clause 52.239-ZZ, Incident and Threat Reporting and Incident Response Requirements for Products or Services Containing Information and Communications Technology, in this contract. (f) Records management and Government access. (1) The Contractor shall provide the Contracting Officer with all Government data and Government-related data in the format specified in the contract. (2) The Contractor shall dispose of Government data and Government-related data in accordance with the terms of the contract and provide the confirmation of disposition to the Contracting Officer in accordance with contract closeout procedures. (3)(i) To the extent required to carry out a program of inspection to safeguard against threats and hazards to the security, (i.e.,

We assume that a 10-day reduction in the duration of the traceback component of an outbreak investigation would reduce the time required to take an initial preventive action by 10 days as well. A savings of 10 days would reduce the average amount of time required to take a preventive action to 68 days (based on the estimated current time of 78 days), and a savings of 5 days would reduce the time required to take a preventive action to 73 days. From data used to generate the cumulative distribution displayed earlier in this document in figure 2 entitled ‘Cumulative Distribution of the Fraction of Total Illnesses by Outbreak Duration (2000-2003),’ we find that between 15 and 18 percent of all outbreak victims became ill from outbreaks that lasted more than 65 days. Consequently, the benefits from (printed page 71629) reducing traceback times by either 10 days for the 4-and 8-hour records access requirement, or 5 days for the 24-hour records access requirement can be considerable. We assume that with comprehensive coverage, the number of traceback investigations that are prematurely terminated because of poor records quality will fall to zero under either the 24-hour records access requirement, or under the proposed 4-and 8-hour records access requirement. The reduced durations of traceback investigations computed in the previous paragraphs are based on the assumed comprehensive coverage of the proposed recordkeeping rule. Excluding certain persons from all or part of the requirements of the regulation results in a reduction in the benefits as measured by reduced times for traceback investigations. The extent of the reduction in benefits from reduced traceback durations depends on the number of persons (and facilities for which the persons are responsible) that may be excluded from the regulation and the position along the supply chain of the excluded facilities. The position along the supply chain influences the probability of contamination, as well as the probability of losing the paper trail. We assess the relative benefits of excluding certain sectors as policy options later in this document. Finally, if there is a deliberate attack on the food supply, with catastrophic consequences, then the duration of the preliminary and decision making parts of the outbreak investigation will likely be substantially compressed, and the importance of the traceback investigation in preventing additional illnesses from an outbreak will be elevated. If firms fully understand the seriousness of an outbreak, their reaction times may be compressed as well, which would tend to reduce the computed benefits from this rule. However, we expect FDA to be more likely

than all firms to fully understand the seriousness of an outbreak.

It is estimated that the costs to perform an initial and annual affirmation of compliance with CMMC Level 1 for an other than small entity is \$584 A director (MGMT5) for 2 hours ($\$190.52/\text{hr} \times 2\text{hrs} = \381) A staff IT specialist (IT4) for 2.08 hours ($\$97.49/\text{hrs} \times 2.08\text{hrs} = \203) The Level 1 self-assessment and affirmations cost burden will be addressed as part of the 48 CFR part 204 CMMC Acquisition rule. Summary: The following is the annual other than small entities total cost summary for Level 1 self-assessments and affirmations over a ten-year period: (Example calculation, Year 1: $\$4,042$ per entity $\times 246$ entities (cumulative) = $\$994,233$) Small Entities Nonrecurring and recurring engineering costs: There are no nonrecurring or recurring engineering costs associated with CMMC Level 1 since it is assumed the contractor or subcontractor has implemented the applicable security requirements. [47] Assessment Costs and Initial Affirmation Costs: It is estimated that the cost to support a CMMC Level 1 self-assessment and affirmation is $\$5,977$ (as summarized in 4.1.2, table 10). A Level 1 self-assessment is conducted annually, and is based on the assumptions detailed: Phase 1: Planning and preparing for the self-assessment: $\$1,803$ A director (MGMT5) for 4 hours ($\$190.52/\text{hr} \times 4\text{hrs} = \762) An external service provider (ESP) for 4 hours ($\$260.28 \times 4\text{hrs} = \$1,041$) Phase 2: Conducting the self-assessment: $\$2,705$ A director (MGMT5) for 6 hours ($\$190.52/\text{hr} \times 6\text{hrs} = \$1,143$) An external service provider (ESP) for 6 hours ($\$260.28 \times 6\text{hrs} = \$1,562$) Phase 3: Reporting of assessment results into SPRS: $\$909$ A director (MGMT5) for 2 hours ($\$190.52/\text{hr} \times 2\text{hrs} = \381) An external service provider (ESP) for 2 hours ($\$260.28/\text{hr} \times 2\text{hrs} = \521) A staff IT specialist (IT4-SB) for 0.08 hours 48 ($\$86.24/\text{hr} \times 0.08\text{hrs} = \7) Affirmation: initial affirmation post assessment: $\$560$ Reaffirmations: It is estimated that the costs to reaffirm a CMMC Level 1 annually for a small entity is $\$560$ A director (MGMT5) for 2 hours ($\$190.52/\text{hr} \times 2\text{hrs} = \381) A staff IT specialist (IT4-SB) for 2.08 hours ($\$86.24/\text{hr} \times 2.08\text{hrs} = \179) The Level 1 self-assessment and affirmations cost burden will be addressed as part of the 48 CFR part 204 CMMC Acquisition rule. Summary: The following is the annual small entities total cost summary (printed page 83182) for Level 1 self-assessments and affirmations over a ten-year period: (Example calculation, Year 1: $\$5,977$ per entity $\times 699$ entities (cumulative) = $\$4,177,845$) All Entities Summary The following is a summary of the combined costs for both small and other than small entities for Level 1 self-assessments and affirmations over a ten-year period: CMMC Level 2 Self-Assessment and Affirmation Costs Other Than Small Entities Nonrecurring and Recurring Engineering Costs: There are no nonrecurring or recurring engineering costs associated with Level 2 self-assessment since it is assumed the contractor or subcontractor has implemented the NIST SP 800-171 R2 security requirements.

includes provisions for the DOE with regard to privately generated RD, whereby the DOE may classify such information in accordance with the AEA. (g) Improperly released classified information appearing in public media. Improperly released classified information is not automatically declassified. When classified information has been improperly released, and even when that classified information has become publicly available, contractors will: (1) Continue to protect the information at the appropriate classification level until formally advised to the contrary by the GCA. (2) Bring any questions about the propriety of continued classification in these cases to the immediate attention of the GCA. (3) Notify the applicable CSA if an employee downloads the improperly released classified information to determine how to resolve a data spill. (h) Downgrading or declassifying classified information. Information is downgraded or declassified based on the loss of sensitivity of the information due to the passage of time or on occurrence of a specific event. Downgrading or declassifying actions constitute implementation of a directed action based on a review by either the OCA or the USG-designated classification authority. Declassification is not an approval for public disclosure. (1) Downgrading. Contractors will refer information for classification or downgrade to the GCA based on the guidance provided in a contract security classification specification, or equivalent, or upon formal notification. (2) Declassification. Contractors are not authorized to implement downgrading or declassification instructions even when the material is marked for automatic downgrading or declassification. If the material is marked for automatic declassification and the contractor notes that the date or event for the automatic declassification has occurred, the contractor will seek guidance from the GCA. (i) RD, FRD, and TFNI. Protection requirements for RD, FRD, and TFNI are pursuant to § 117.23(e). Information about classification and declassification of RD, FRD, or TFNI documents is in § 117.23(e)(5). § 117.14 Marking requirements. (a) Purpose for marking. (1) Physically marking classified information with appropriate classification markings serves to warn and inform holders of the information of the degree of protection required. Other notations facilitate downgrading and declassification, and aid

in derivative classification actions. (2) Contractors will clearly mark all classified information and material to convey to the holder the level of classification assigned, the portions that contain or reveal classified information, the period of time protection is required, the identity (by name and position or personal identifier) of the classifier, the source(s) for derivative classification, and any other notations required for protection of the information. (b) Marking guidance for classified information and material. Contractors will use the marking guidance conveyed in 32 CFR 2001.22 through 2001.26

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Office of the Secretary [Docket ID: DOD-2018-OS-0008] RIN 0790-AJ20 32 CFR Part 310 AGENCY: Department of Defense. ACTION: Final rule. SUMMARY: The Department of Defense (DoD) is revising its Privacy regulation to implement the Privacy Act of 1974, as amended. The rule conforms to the requirements of the Office of Management and Budget Circular A-108, December 23, 2016. This part establishes and promotes uniformity in the DoD Privacy Program, creating a single privacy rule for the Department, while incorporating other administrative changes. It takes precedence over all DoD component publications that supplement and implement the DoD Privacy program. Subsequently, DoD plans to remove individual component Privacy Program rulemakings, given that the individual component exemption rules have been incorporated into this rule. DATES: This final rule is effective on May 13, 2019. FOR FURTHER INFORMATION CONTACT: Cindy Allard, (703) 571-0086. SUPPLEMENTARY INFORMATION: The DoD is revising 32 CFR part 310 to implement section 552a of Title 5, United States Code, thus establishing procedures for access and other Privacy Act protections. It supersedes the current parts 310 through 329 and parts 505, 701, and 806b to promote uniformity in the DoD Privacy program and streamline the existing rules. The existing system of records exemption rules that have been promulgated in accordance with the requirements of 5 U.S.C. 553(b)(1) , (2), and (3), (c) and (e) and published in parts 310 through 329 and parts 505, 701, and 806b remain effective; however, for streamlining and ease of use for the reader we are moving the existing exemption rules from parts 311 through 329 and parts 505, 701, and 806b into part 310 without amendment. Repeal of the individual DoD Component Privacy rules will be published in the Federal Register after this rule is effective. This rule conforms to the requirements of the Office of Management and Budget Circular A-108, 'Federal Agency Responsibilities for Review, Reporting, and Publication under the Privacy Act,' dated December 23, 2016, which can be found at https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/circulars/A108/omb_circular_a-108.pdf , and Office of Management and Budget Circular A-130, 'Managing Information as a Strategic Resource,' dated July 28, 2016, which can be found at <https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/circulars/A130/a130revised.pdf> .

In addition, as explained further in response to comment 13, intra-company transfers of food are not subject to additional recordkeeping requirements. Once a covered person (including individuals, partnerships, corporations, and associations) receives food and keeps information on its immediate previous sources, that person or company does not need to keep additional records until it releases the food to another person or company. Unless otherwise exempt, at the time that person or company releases the food, it is required to identify the immediate subsequent recipients of that food. 9. Nontransporter Immediate Previous Source There were no comments on this issue. (printed page 71589) 10. Nontransporter Immediate Subsequent Recipient There were no comments on this issue. 11. Perishable Food (Comment 72) Several comments propose that FDA use existing National Institute of Standards and Technology (NIST) Handbook 130 Regulations for Uniform Open Dating Definition for Perishable; Semi-Perishable and Long Term Shelf Life to define 'perishable food.' One comment states that the definition of 'perishable food' proposed by FDA is inconsistent with prevailing regulatory definitions of that term. The NIST Handbook defines 'perishable food' as 'any food for which a significant risk of spoilage, loss of value, or loss of palatability occurs within 60 days of the date of packaging.' 'Semi-Perishable food' means 'any food for which a significant risk for spoilage, loss of value, or loss of palatability occurs only after a minimum of 60 days, but within 6 months, after the date of packaging.' 'Long Shelf-Life food' is defined as 'any food for which a significant risk of spoilage, loss of value, or loss of palatability does not occur sooner than six months after the date of packaging, including foods preserved by freezing, dehydrating, or being placed in a hermetically sealed container.' These definitions have a history of use and acceptance

by industry and government, and were developed 30 years ago by the National Conference of Weights and Measures, working in conjunction with state agencies responsible for the regulation of foods. The comments note that the National Conference undertook this task to assist in the establishment of a uniform method for presenting open code date labeling for foods. The definitions have since been adopted by numerous states and local jurisdictions with open date code regulations.

According to Cryptographic Key Management Workshop Summary -- June 8-9, 2009, 2.4.3 Cryptographic Key Management Framework: Miles Smid, Orion Security: CKM solution. In addition, the key management policies for all key types and related keying material over the key management lifecycle need to be consistent with the overall data protection policies. - In order to ensure that the CKM solution provides adequate support for the application, the framework needs to define necessary inputs regarding the unique requirements or constraints that are imposed by the application or the organization performing it. For example, input should include the desired target security strength for the managed information, the assurances that the CKM solution must meet to achieve the target security strength, and how conformance of the implementation to the CKM solution is to be verified. - CKM components from the framework must be selected to support the specified organizational and application policies, requirements and constraints. CKM components include keys, algorithms, primitives, and protocols. Components may also include modules, products, and even the combination or composition of other components in an innovative manner to provide a secure CKM solution. - For interoperability, certain interfaces will need to be specified. Possible interfaces include: the cryptographic algorithm interface, the key management interface, the cryptographic module interface, the product interface, and the application interface. In general, only the interfaces that are used by entities outside the application need to be specified. - Finally, the framework should encourage a CKM solution developer to think about future transitions. When will the CKM solution need maintenance, when will it need to be replaced, and how might it best be phased out? These questions are usually overlooked by today's CKM solutions. As a result, it is often considered preferable to live with an insecure CKM solution, than to suffer the pain of replacing it. - Frameworks can be strong supporting structures.

(g) NIST SP 800-115, titled "Technical Guide to Information Security Testing and Assessment," September 2008 (NIST SP 800-115 Sept2008), assists organizations in planning and conducting technical information security tests and examinations, analyzing findings, and developing mitigation strategies. The guide provides practical recommendations for designing, implementing, and maintaining technical information security test and examination processes and procedures. These can be used for several purposes, such as finding vulnerabilities in a system or network and verifying compliance with a policy or other requirements. The guide is not intended to present a comprehensive information security testing and examination program but rather an overview of key elements of technical security testing and examination, with an emphasis on specific technical techniques, the benefits and limitations of each, and recommendations for their use. This document is incorporated by reference as a source for definitions. (h) NIST SP 800-160, Volume 2, titled "Developing Cyber-Resilient Systems: A Systems Security Engineering Approach," Revision 1, December 2021 (NIST SP 800-160 V2R1), focuses on cyber resiliency engineering—an emerging specialty systems engineering discipline applied in conjunction with systems security engineering and resilience engineering to develop survivable, trustworthy secure systems. Cyber resiliency engineering intends to architect, design, develop, implement, maintain, and sustain the trustworthiness of systems with the capability to anticipate, withstand, recover from, and adapt to adverse conditions, stresses, attacks, or compromises that use or are enabled by cyber resources. From a risk management perspective, cyber resiliency is intended to help reduce the mission, business, organizational, enterprise, or sector risk of depending on cyber resources. This document is incorporated by reference as a source for definitions.

proprietary business information), the contracting officer shall determine whether the information must be marked and protected in accordance with applicable law, policy, guidance, and agency procedures. Individuals who are unsure how to handle such information should consult with agency officials as necessary. (d) Except as provided in paragraph (d)(3) of this section, the contracting officer must promptly notify the offeror or contractor in writing if the contracting officer believes that contractor proprietary business information, contractor-attributional information, contractor bid or proposal information, or information marked in accordance with 52.215-1(e) has been inappropriately marked. Notification should occur upon discovery and may be made prior to award. The offeror or contractor that has affixed the marking must be given an opportunity to

justify the marking. (1) If the offeror or contractor agrees that the marking is not justified or does not respond within the time specified in the notice, the contracting officer may remove the marking and release the information. (2) If, after reviewing the contractor's justification, the contracting officer determines that the marking is not justified, the contracting officer must notify the offeror or contractor in writing before releasing the information. (3) For technical data marked as proprietary by an offeror or contractor, the contracting officer must follow the procedures in 27.404-5. * * * * PART 4-ADMINISTRATIVE AND INFORMATION MATTERS 5. Revise the heading of subpart 4.4 to read as follows: Subpart 4.4-Safeguarding Information and Information Systems 6. Add section 4.401 to read as follows: 4.401 Definition. Information, as used in this subpart, means any communication or representation of knowledge such as facts, data, or opinions in any medium or form, including textual, numerical, graphic, cartographic, narrative, electronic, or audiovisual forms (see Office of Management and Budget (OMB) Circular A-130). 4.402 [Redesignated as 4.402-1] 7. Redesignate section 4.402 as section 4.402-1. 8. Add section 4.402 to read as follows: 4.402 Classified information. 4.403 [Redesignated as 4.402-2]. 9. Redesignate section 4.403 as section 4.402-2. 10. Amend the newly redesignated section 4.402-2 by: a. Revising paragraphs (b)(2)(i) and (ii); and b. Removing from paragraph (c)(1) the reference ·4.402(d)(1)· and adding ·4.402-1(d)(1)· in its place. The revisions read as follows: 4.402-2 Responsibilities of contracting officers. * * * * (b) * * * (2) * * * (i) An appropriate Security Requirements clause in the solicitation (see 4.402-3(a)); and (ii) As appropriate, in solicitations and contracts when the contract may require access to classified information, a requirement for security safeguards in addition to those provided in the clause 52.204-2, Security Requirements for Classified Information. * * * * 11. Add sections 4.402-3, and 4.403 through 4.403-7 to read as follows: 4.402-3 Contract clause.

(Response) ·Direct sellers· are not required to establish and maintain records to identify the nontransporter and transporter immediate subsequent recipients for sales directly to consumers. Direct sellers that qualify as a retail food establishment under §1.327(e) are required to establish and maintain records for sales to other direct sellers, when such information is reasonably available. FDA explains the rationale for distinguishing between sales to consumers and businesses in response to comment 40. Direct sellers, like other covered persons, are required to establish and maintain records to identify the nontransporter and transporter immediate previous sources of food, as required by §1.337 of this final rule. However, retail food establishments that employ 10 or fewer full-time equivalent employees are excluded from all of the requirements of subpart J in this final rule, except the record access provisions for existing records under §§1.361 and 1.363. (See response to comment 38 of this document for a further discussion of FDA's rationale underlying this exclusion.) Thus, if a direct seller qualifies as a retail food establishment and employs 10 or fewer full-time equivalent employees, it is exempt from all recordkeeping requirements under this rule, except for the record access provisions for existing records. (Comment 51) One comment states the Secretary has the full discretion to determine who shall be required to maintain records and what records shall be kept. Congress has clearly communicated its intention to protect small businesses by stating: ·The Secretary shall take into account the size of the business in promulgating regulations under this section.· The comment states that individual direct sellers who distribute nutritional or related products should be exempt from the requirement to maintain records under the proposed rule. (Response) As stated in the proposed rule, FDA carefully considered the size of a business when developing these regulations. FDA found that most products and ingredients pass through (printed page 71581) at least one very small business when moving through the distribution process. If FDA were to exempt all very small businesses with 10 or fewer employees, not just those in the retail sector, this would create a ·Swiss Cheese· approach to trace back, as there would be a potential failure of entities to keep records throughout the distribution chain. The number of very small entities account for a large fraction of the total number of food establishments. We used U.S. Census data to estimate the percentage of the total number of food establishments that are very small, as well as their revenues, by sector and report them in table A of this document. The fraction of the total number of facilities that are very small ranges from an estimated 73 percent of convenience outlets to 90 percent of transporters. Table A.·Estimated Total Number of Very Small Food Establishments Sector

Both approaches involve a combination of hardware-based, or physical, TPM and a softwarebased vTPM (virtual TPM). The difference between the two approaches is in the location where vTPM is placed in the container stack. The security solution where vTPM is placed in the Linux kernel is discussed in section 3.1, and the solution where vTPM is placed in a dedicated container is the topic of section

3.2.

(1) Certain documents under the physical control of DoD personnel and used to assist them in performing official functions, are not considered "Agency records" within the meaning of this part. Uncirculated personal notes and records that are not disseminated or circulated to any person or organization (for example, personal telephone lists or memory aids) that are retained or discarded at the author's discretion and over which the Component exercises no direct control are not considered Agency records. However, if personnel are officially directed or encouraged, either in writing or orally, to maintain such records, they may become "Agency records," and may be subject to this part. (2) The personal uncirculated handwritten notes of unit leaders, office supervisors, or military supervisory personnel concerning subordinates are not systems of records within the meaning of this part. Such notes are an extension of the individual's memory. These notes, however, must be maintained and discarded at the discretion of the individual supervisor and not circulated to others. Any established requirement to maintain such notes (such as, written or oral directives, regulations, or command policy) may transform these notes into "Agency records" and they then must be made a part of a system of records. If the notes are circulated, they must be made a part of a system of records. Any action that gives personal notes the appearance of official Agency records is prohibited, unless the notes have been incorporated into a system of records. (i) Relationship between the Privacy Act (5 U.S.C. 552a) and the FOIA (5 U.S.C. 552). Not all requesters are knowledgeable of the appropriate statutory authority to cite when requesting records. In some instances, they may cite neither Act, but will imply one or both Acts. The below guidelines are provided to ensure requesters are given the maximum amount of information as authorized under both statutes. (1) Process requests for individual access as follows: (i) If the records are required to be released under the Privacy Act, the FOIA (32 CFR part 286) does not bar release even if a FOIA exemption could (printed page 18768) be invoked if the request had been processed solely under FOIA. Conversely, if the records are required to be released under the FOIA, the Privacy Act does not bar disclosure. (ii) Requesters who seek records about themselves contained in a Privacy Act system of records, and who cite or imply only the Privacy Act, will have their records processed under the provisions of this part and the FOIA (32 CFR part 286). If the system of records is exempt from the access provisions of this part, and if the records, or any portion thereof, are exempt under the FOIA, the requester shall be advised and informed of the appropriate Privacy and FOIA exemption. Only if the records can be denied under both statutes may the Department withhold the records from the individual. Appeals shall be processed under both Acts.

From the NIST SP 800-172 Rev 3 Final Public Draft: The benefit of periodic refreshes of system components and services is that it does not require organizations to determine in advance whether compromises have occurred, NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 which may be difficult or impossible. The refresh of selected system components 2323

Adoption of health IT that is certified through the ONC Health IT Certification Program as meeting the proposed MFA criterion, should the proposal be finalized, may contribute to a regulated entity's compliance with the proposed implementation specification for MFA in this NPRM. Under proposed 45 CFR 164.312(f)(2)(ii)(B) , a regulated entity would be required to deploy MFA for any action that would change a user's privileges to the regulated entity's relevant electronic information systems in a manner that would alter the user's ability to affect the confidentiality, integrity, or availability of ePHI. These modified privileges may provide a user with a level of access inconsistent with a regulated entity's policies and procedures and increase the risk to ePHI by affording a user who does not need to have access to certain systems or information the opportunity to remove security measures deployed to protect ePHI. Because a user may affect the confidentiality, integrity, or availability of ePHI by accessing a relevant electronic information system, a regulated entity would be expected to (printed page 975) deploy MFA for changed privileges in both types of systems. Similar to the proposed standard for encryption, the Department proposes three exceptions at proposed 45 CFR 164.312(f)(2)(iii) to the proposed specific requirement to implement MFA. The first proposed exception at proposed 45 CFR 164.312(f)(2)(iii)(A) would be for a technology asset that does not support MFA but is currently in use by a regulated entity. Because the requirements for authentication under the existing Security Rule today do not expressly refer to MFA, a regulated entity that is not using MFA to meet the requirement to authenticate user identities may argue that it is in compliance with the authentication standard without using MFA. The Department recognizes that it may take some time for a regulated entity to adopt compliant

software or hardware, and thus we propose an exception where such software or hardware does not support MFA. To meet this exception, a regulated entity would be required to establish a written plan to migrate ePHI to technology assets that supports MFA and to actually migrate the ePHI to such technology assets in accordance with the written plan. Accordingly, a regulated entity would be required to establish the plan, implement the plan, and actually migrate ePHI to technology assets that supports MFA within a reasonable and appropriate period of time. For example, it would not be reasonable and appropriate for a regulated entity to establish a plan to migrate to a new practice management system that supports MFA and fail to take any steps to perform the migration for an entire year. Applying the standard flexibly and at scale, a reasonable and appropriate timeframe for a system with 5,000 users may be different than one for a solo practitioner; however, both entities would be expected to progress to completion.

the United Service Organizations (USO). If any one of the above criteria is met, all employees engaged in such employment, regardless of nationality (including U.S. citizens and residents, host country nationals (local hires), and third country nationals (individuals hired from another country to work in the host country)), are covered under the Act. Comment: Requirements jeopardize NGO security posture Response: This Rule applies only to personnel performing private security functions under a covered contract. A covered contract is defined by Section 864(a)(3) of the FY 2008 NDAA, as amended by Section 813(b) of the FY 2010 NDAA. Comment: USAID involvement is not evident Response: USAID has been actively involved in various working groups implementing the Interim Final Rule and developing the Final Rule. Comment: PSC rules should be consistent with the spirit and intent of Guidelines for Relations between U.S. Armed Forces and Non-Governmental Humanitarian Agencies in Hostile or Potentially Hostile Environments Response: The purpose of publishing the IFR in the Federal Register was to obtain the comments of affected agencies, NGOs, contractors and the public. The respondent was not specific about any perceived conflicts that needed to be addressed in the PSC rule, and should work with their USAID and other agency counterparts to provide specific inputs on implementing the Final Rule. Comment: PSC rules should not apply to unarmed guard forces Response: We believe that the current language is correct. When contractors providing guard services are not armed, those aspects of the rule which are specific to armed contractors (i.e. arming procedures) are not relevant. Comment: Procedures associated with PSC rules must be adapted to contexts in which NGOs have long-standing programs or minor amounts of U.S. Government funding Response: This Rule applies only to personnel performing private security functions under a covered contract. A covered contract is defined by Section 864(a)(3) of the FY 2008 NDAA, as amended by Section 813(b) of the FY 2010 NDAA. Comment: SPOT's use for intelligence gathering and vetting is unclear Response: The Synchronized Pre-deployment and Operational Tracker (SPOT) is a Web-based database which is used to gain visibility over contracts and contractors supporting U.S. Government agencies during contingency operations. The SPOT system serves multiple purposes; it allows contractors to request and receive specific logistics support such as meals, housing, transportation, medical support while working in-country; it provides Contracting Officer Representatives and Grants Officer Representatives with information on what contractor and grantee employees are working in what locations which makes approval of invoices and inspection of work easier; it allows Contracting Officer Representatives, (printed page 49654)

(8) Each CSA will maintain a record of entity eligibility determinations made by that CSA. (9) A contractor will not use its favorable entity eligibility determination for advertising or promotional purposes. This does not prohibit the contractor from advertising employee positions that require a PCL in connection with the position. (10) A contractor or prospective contractor cannot apply for its own entity eligibility determination. A GCA or a currently cleared contractor may sponsor an entity for an entity eligibility determination at any point during the contracting or agreement life cycle at which the entity must have access to classified information to participate (including the solicitation or competition phase). (b) Reciprocity. If an entity has an appropriate, final entity eligibility determination, a CSA will not duplicate the entity eligibility determination processes performed by another CSA. If a CSA cannot acknowledge an entity eligibility determination to another CSA, the involved entity may be subject to duplicate processing in accordance with 32 CFR part 2004 . (c) Eligibility requirements. To be eligible for an initial entity eligibility determination or to maintain an existing entity eligibility determination, the entity must: (1) Need access to classified information in connection with a legitimate USG or foreign government requirement, and access must be consistent with U.S. national security interests as determined by the CSA. (2) Be organized and existing: (i) Under the laws of the United States, one of the fifty States, the District of Columbia, or an organized U.S. territory (Guam,

Commonwealth of the Northern Marianas Islands, Commonwealth of Puerto Rico, and the U.S. Virgin Islands); or (ii) Under the laws of an American Indian/Alaska Native tribal entity if: (A) The American Indian or Alaska Native tribe under whose laws the entity is chartered has been formally acknowledged by the Assistant Secretary-Indian Affairs, of the U.S. Department of the Interior. (B) The contractor is organized and continues to exist, during the period of the eligibility under a tribal statute or code, or pursuant to a resolution of an authorized tribal legislative body. (C) The contractor has submitted or will submit records such as a charter, certificate of organization, or other applicable tribal documents and statute or code provisions governing the formation and continuation of the entity, for CSA determination that the entity is tribally chartered. (3) Be located in the United States or its territorial areas. (4) Have a record of integrity and lawful conduct in its business dealings. (5) Have a SMO, FSO, and ITPSO who have and who maintain eligibility for access to classified information and are not excluded from participating in USG contracts or agreements in accordance with § 117.7(b)(1) through § 117.7(b)(3).

to the extent such provisions have been identified and an exemption claimed for the original record and the purposes underlying the exemption for the original record still pertain to the record which is now contained in this system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided the President and others are not compromised, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, and to preserve the confidentiality and integrity of Federal evaluation materials. The exemption rule for the original records will identify the specific reasons why the records are exempt from specific provisions of 5 U.S.C. 552a . (24) System identifier and name. N05800-2, Professional Responsibility Files. (i) Exemptions. Investigatory material compiled for law enforcement purposes, may be exempt pursuant to 5 U.S.C. 552(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or which he would otherwise be eligible, as a result of maintenance of the information, the individual will be provided access to the information except to the extent that disclosure would reveal the identity of a confidential source. Any portion of this record system which falls within the provisions of 5 U.S.C. 552a(k)(2) may be exempt from the following subsections of 5 U.S.C. 552a : (c)(3), (d)(1) through (5), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I). (ii) Authority. 5 U.S.C. 552a(k)(2) (ii) Reason. The reason for asserting this exemption (k)(2) is to ensure the integrity of the litigation process. (25) System identifier and name. NM03800-1, Naval Global Maritime, Foreign, Counterterrorism and Counter Intelligence Operation Records. (i) Exemptions. Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) but only to the extent that such material would reveal the identity of a confidential source. An exemption rule for this system has been promulgated in accordance with the requirements of 5 U.S.C. 553(b)(1) , (2) and (3)(c) and (e) and is published as 32 CFR part 701 . (ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reason. The reason for asserting this exemption is ensure the integrity of the security and investigative material compiled for law enforcement purposes by the Department of the Navy and the Department of Defense. § 310.17 Exemptions for specific Marine Corps record systems. (a) [Reserved] (1) System identifier and name. MIN00001, Personnel and Security Eligibility and Access Information System. (i) Exemption.

The total estimated Government costs associated with this FAR rule in billions over a ten-year period are as follows: (printed page 4285) Government cost Undiscounted 2 Percent Present Value \$4.69 \$4.21 Annualized 0.47 0.47 Undiscounted Government costs (in billions) by year over the ten-year period are summarized as follows: Year 1 Year 2 Year 3 Year 4 Year 5 Year 6 Year 7 Year 8 Year 9 Year 10 0.47 \$0.47 \$0.47 \$0.47 \$0.47 \$0.47 \$0.47 \$0.47 \$0.47 \$0.47 The following is a summary from the RIA of the Government costs associated with reviewing contractor training records, investigating reports of suspected or confirmed CUI incidents, and other action associated with this FAR rule. 1. Prepare the SF XXX While an SF XXX is required to be included in every solicitation and contract that involves CUI, except those exclusively for COTS items, the Government only incurs a significant cost when the CUI is identified on the form. The contracting officer is responsible for ensuring that the SF XXX identifies the protected information involved in the system of records and includes any safeguarding and marking requirements applicable to the information in accordance with FAR 4.403. Of the 2,092,918 forms expected to specify requirements

for safeguarding CUI (see section IV.C.1.b. of this preamble), 1,573,582 are expected to be prepared by the Government (see section IV.C.1.c. of this preamble for the estimate of forms prepared by contractors and subcontractors). The total estimated annual Government cost is \$453,191,616 (1,573,582 forms * 4 hour/form * \$72/hour). 2. Review Training Records It is estimated that it will take a Government employee 30 minutes to review evidence of training submitted by the contractors (see section IV.C.1.d. of this preamble). Therefore, the estimated annual reporting cost is \$51,480 (1,430 requests * 0.5 hours/response * \$72/hour). 3. Review CUI Incident Reports It is estimated that it will take a Government employee four hours to review the CUI incident information reported by a contractor (see section IV.C.2.b. of this preamble). The estimated annual cost to the Government is \$292,900 (580 reports * 5 hours/response * \$101/hour). 4. Review Media and Data for Damage Assessment It is estimated that it will take a Government employee 10 hours to conduct a damage assessment of media and data submitted by a contractor (see section IV.C.2.c. of this preamble). The estimated annual cost to the Government is \$48,480 (48 submissions * 10 hours/response * \$101/hour). 5. Review System Security Plan It is estimated that it will take a Government employee four hours to review a system security plan submitted by a contractor (see section IV.C.1.g. of this preamble). The estimated annual cost to the Government is \$577,720 (1,430 reports * 4 hours/response * \$101/hour). 6. Conduct Validation Actions for Non-Federal Information Systems

(E) From subsection (f) because the agency's rules are inapplicable to those portions of the system that are exempt and would place the burden on the agency of either confirming or denying the existence of a record pertaining to a requesting individual might in itself provide an answer to that individual relating to an on-going investigation. The conduct of a successful investigation leading to the indictment of a criminal offender precludes the applicability of established agency rules relating to verification of record, disclosure of the record to that individual, and record amendment procedures for this record system. (2) [Reserved] §-310.19 Defense Information Systems Agency (DISA) exemptions. (a) Section 5 U.S.C. 552a(3)(j) and (3)(k) authorize an agency head to exempt certain systems of records or parts of certain systems of records from some of the requirements of the act. This part reserves to the Director, DISA, as head of an agency, the right to create exemptions pursuant to the exemption provisions of the act. All systems of records maintained by DISA shall be exempt from the requirements of 5 U.S.C. 552a(d) pursuant to 5 U.S.C. 552a(k)(1) to the extent that the system contains any information properly classified under Executive Order 11652, Classification and Declassification of National Security Information and Material, dated March 8, 1972 (37 FR 10053, May 19, 1972) and which is required by the executive order to be kept secret in the interest of national defense or foreign policy. This exemption, which may be applicable to parts of all systems of records, is necessary because certain record systems not otherwise specifically designated for exemptions may contain isolated information which has been properly classified. (1) System identifier and name. K890.23, DISA Inspector General Investigative Tracker (DIGit). (i) Exemption. Any portion of this record system which falls within the provisions of 5 U.S.C. 552a(j)(2), (k)(2) and (k)(5) may be exempt from the following subsections of 5 U.S.C. 552a: (c)(3), (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I). (ii) Authority. 5 U.S.C. 552a(j)(2), (k)(2), and (k)(5). (iii) Reasons. To ensure the integrity of the privacy and civil liberties process. The execution requires that information be provided in a free and open manner without fear of retribution or harassment in order to facilitate a just, thorough, and timely resolution of the complaint or inquiry. Disclosures from this system can enable individuals to conceal their wrongdoing or mislead the course of the investigation by concealing, destroying, or fabricating evidence or documents. In addition, disclosures can subject sources and witnesses to harassment or intimidation which may cause individuals not to seek redress for wrongs through privacy and civil liberties channels for fear of retribution or harassment. (2) [Reserved] §-310.20 Defense Intelligence Agency (DIA) exemptions.

(7) A DA activity may refer a Privacy Act request for records that originated in an agency outside of DOD, or that is based on information obtained from an agency outside the DOD, to that agency for direct response to the requester, only if that agency is subject to the Privacy Act. Otherwise, the DA activity must respond to the request. (8) DA activities will not honor any Privacy Act requests for investigative, intelligence, or any other type of records that are on loan to the Department of Defense for a specific purpose, if the records are restricted from further release in writing. Such requests will be referred to the agency that provided the records. (9) A DA activity will notify requesters seeking National Security Council (NSC) or White House documents that they should write directly to the NSC or White House for such documents. DA documents in which the NSC or White House

have a concurrent reviewing interest will be forwarded to the Department of Defense, Office of Freedom of Information and Security Review, which will coordinate with the NSC or White House, and return the documents to the originating DA activity after NSC or White House review. NSC or White House documents discovered in DA activity files which are responsive to a Privacy Act request will be forwarded to DOD for coordination and return with a release determination. (10) To the extent referrals are consistent with the policies expressed above; referrals between offices of the same DA activity are authorized. (l) Reproduction fees. (1) Use fees only to recoup direct reproduction costs associated with granting access. (2) DA activities may use discretion in their decision to charge for the first copy of records provided to an individual to whom the records pertain. Thereafter, fees will be computed pursuant to the fee schedule set forth in AR 25-55, including the fee waiver provisions. (3) Checks or money orders for fees should be made payable to the Treasurer of the United States and will be deposited in the miscellaneous receipts of the treasury account maintained at the activity's finance office. (4) Reproduction costs shall only include the direct costs of reproduction and shall not include costs of: (i) Time or effort devoted to searching for or reviewing the records by personnel; (ii) Fees not associated with the actual cost of reproduction; (iii) Producing a copy when it must be provided to the individual without cost under another regulation, directive, or law; (iv) Normal postage; (v) Transportation of records or personnel; or (vi) Producing a copy when the individual has requested only to review the records and has not requested a copy, and the only means of allowing review is to make a copy (e.g., the records are stored in a computer and a copy must be printed to provide individual access, or the activity does not wish to surrender temporarily the original records for the individual to review). (m) Privacy Act case files.

This document is for security managers, engineers, administrators, and others who are responsible for planning, acquiring, testing, implementing, and maintaining SSH solutions. Portions of the document may be of interest to executives and SSH users. - - Mapping all trust relationships that result from deployed identity and authorized keys and requiring review and approval from their owners (including description of the purpose of the key or other justification for the existence of the key). Trust relationships created by public key authentication must be reviewed and evaluated based on the potential for chains of trust relationships coming in and out of systems to be used to pivot. Source and command restriction information should be included to enable evaluation of proper access controls and restrictions. Any keys for which such approval is not deemed appropriate (such keys may be backdoors and may have been left behind by attackers) should be removed. Ideally, trust relationship information can be imported into existing privilege access management systems for review through standard processes.

, as providing access to records of a civil or administrative investigation, and the right to contest the contents of those records and force changes to be made to the information contained therein, would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would: Provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal wrongdoing or mislead the course of the investigation; and result in the secreting (printed page 14777) of or other disposition of assets that would make them difficult or impossible to reach to satisfy any Government claim arising from the investigation or proceeding. (C) From 5 U.S.C. 552a(e)(1) , as it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From 5 U.S.C. 552a(e)(4)(G) and (H) , as this system of records is compiled for law enforcement purposes and is exempt from the access provisions of 5 U.S.C. 552a(d) and (f) . (E) From 5 U.S.C. 552a(e)(4)(I) , because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. DLA, nevertheless, will continue to publish such a notice in broad generic terms as is its current practice. (5) System identifier and name. S500.60 (Specific exemption), Defense Logistics Agency Enterprise Hotline Program Records. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . If an individual, however, is denied any right, privilege, or benefit for

which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information, except to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (c)(5)(i)(A): When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. (B) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to

. The Department believes this is unlikely to occur more frequently than once per year and that the time to do so would be minimal because the proposed requirement does not specify the means or scope of such notification. The Department estimates that business associates would need an average of 30 minutes (with 15 minutes as a low estimate and 45 minutes as a high estimate) to report to other regulated entities, as applicable, when their contingency plan is activated at the wage rate of an information security analyst for a total annual cost of \$59,970,000 [= 1,000,000 business associates × 0.5 hours × \$119.94], with a low estimated total of \$29,985,000 [= 1,000,000 business associates × 0.25 hours × \$119.94] and high estimated total of \$89,955,000 [= 1,000,000 business associates × 0.75 hours × \$119.94]. j. Revised Health Plan Documents The Department estimates that health care insurers and third-party administrators would need to revise health plan documents to reflect that health plan sponsors that receive ePHI (that is not limited to summary health information or disenrollment information) are protecting ePHI with the administrative, physical, and technical safeguards detailed in the Security Rule, as proposed. These 6,162 entities collectively would be responsible for updating approximately 742,411 health plan documents at the wage rate of a compensation and benefits manager. The Department's estimate assumes that on average each plan document requires 30 minutes to update for a total estimated cost of \$53,876,766 [742,411 × 0.5 hours × \$145.14]. The Department has attributed these costs solely to health plans and not health plan sponsors because the health plan is the regulated entity. k. Estimated Costs for Developing New or Modified Policies and Procedures

3.3.4 Moderate Baseline Security Control Item Narratives ... 3.3.4). 3.3.4) | (3) High Control Items (Section 3.

FDA estimates the number of Mexican carriers that are subject to DOT regulations from a study conducted for DOT by Economic Data Resources under the auspices of the International Association of Chiefs of Police (Ref. 23). Using 1999 U.S. Customs and Border Protection data on the use of annual decals and per-trip payments by commercial vehicles at Southwest border crossings, that study estimated the total number of vehicles that cross the Southwest border to be approximately 76,177. Furthermore, using 1998 data on Mexican interstate commercial vehicle registrations, the DOT study estimated the number of commercial carriers of Mexican origin that use the Southwest border crossings to be approximately 63,000, or approximately 83 percent of the total. If one half of the total number of these trucks carry food items, then approximately 31,500 carriers of Mexican origin are subject to this final rule and would not be counted in the CBP or NES data. In order to estimate the number of commercial carriers of Canadian origin that would be covered by this final rule, from the DOT study we obtain an estimate of approximately 79,643 carriers that purchase annual decals at the Northern border. We assume the same ratio of the total number of trucks that purchase annual decals for Southwest border crossings as that for northern border crossings (42 percent) and estimate the total number of trucks that cross the northern border to be approximately 191,167. Furthermore, we assume the percentage of these carriers that are of Canadian origin is the same as that used to estimate Southwest border crossings by Mexican carriers (83 percent). This assumption yields a total of 158,099 carriers of Canadian origin that are subject to DOT regulations. If one half of the total number of these trucks carry food items, then approximately 79,050 carriers of Canadian origin are subject to this final rule and would not be counted in the CBP or NES data. The number of transport facilities is revised upward by 110,550 (i.e., 79,050 plus 31,500) to account for the number of foreign based transporters that are subject to the final rule and not counted in the NES or CBP data. (Comment 183) One comment states that direct selling businesses are clearly not accounted for because there are millions of such entities involved on either a full or part-time basis, while the combined estimate of domestic retailers and wholesalers used in the analysis is only slightly more than 300,000. Furthermore, the comment states that the burden on these retailers would be higher than for other retailers. (printed page 71632)

ent users, such as giving some users read-only access to the administrative interface of a guest OS, other users control over particular guest OSs, and yet other users complete administrative control. Most hypervisor software currently only uses passwords for access control; this may be too weak for some organizations' security policies and may require the use of compensating controls, such as a separate authentication system used for restricting access to the host on which the virtualization management system is installed.

been performed prior to granting access? Do the organization's systems have the capacity to set access controls? Are there additional access control requirements for users who would be accessing privileged functions? Have organizational personnel been explicitly authorized to approve user requests to access ePHI and/or systems with ePHI? The Department proposes three additional implementation specifications for authentication management, maintenance, and network segmentation. These specifications clarify the Department's expectations for compliance and are consistent with NIST guidance. We believe that the proposed additions would assist regulated entities in their efforts to prevent or mitigate attacks by malicious internal and external actors. For the implementation specification on authentication management at proposed 45 CFR 164.308(a)(10)(ii)(C), we propose to require a regulated entity to establish and implement written policies and procedures for verifying the identities of users and technology assets before accessing the regulated entity's relevant electronic information systems, including written policies and procedures for implementing MFA technical controls. [579] The proposed implementation specification for network segmentation at proposed 45 CFR 164.308(a)(10)(ii)(E) would require a regulated entity to establish and implement written policies and procedures that ensure that its relevant electronic information systems are segmented to limit access to ePHI to authorized workstations. Finally, to address the Department's general concerns regarding the ongoing failure of many regulated entities to regularly review and revise their policies and procedures, the proposed implementation specification for maintenance at proposed 45 CFR (printed page 952) 164.308(a)(10)(ii)(F) would require a regulated entity to review the written policies and procedures required by this standard at least once every 12 months and to modify them as reasonable and appropriate. m. Section 164.308(a)(11)(i)·Standard: Security Awareness Training A covered entity's workforce is its frontline not only in patient care and patient service, but also in safeguarding the privacy and security of PHI. [580] The health care sector's risk landscape continues to grow with the increasing number of interconnected, smart devices of all types, the increased use of interconnected medical record and billing systems, and the increased use of applications and cloud computing. This standard reflects the fact that training on data security for workforce members is essential for protecting an organization against cyberattacks.

CM.L2-3.4.7 · Nonessential Functionality CMMC Assessment Guide · Level 2 | Version 2.13 105
CM.L2-3.4.7 · NONESSENTIAL FUNCTIONALITY Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services. ASSESSMENT OBJECTIVES [NIST SP 800-171A]92
Determine if: [a] essential programs are defined; [b] the use of nonessential programs is defined; [c] the use of nonessential programs is restricted, disabled, or prevented as defined; [d] essential functions are defined; [e] the use of nonessential functions is defined; [f] the use of nonessential functions is restricted, disabled, or prevented as defined; [g] essential ports are defined; [h] the use of nonessential ports is defined; [i] the use of nonessential ports is restricted, disabled, or prevented as defined; [j] essential protocols are defined; [k] the use of nonessential protocols is defined; [l] the use of nonessential protocols is restricted, disabled, or prevented as defined; [m] essential services are defined; [n] the use of nonessential services is defined; and [o] the use of nonessential services is restricted, disabled, or prevented as defined. POTENTIAL ASSESSMENT METHODS AND OBJECTS [NIST SP 800-171A]92 Examine [SELECT FROM: Configuration management policy; procedures addressing least functionality in the system; configuration management plan; system security plan; system design documentation; security configuration checklists; system configuration settings and associated documentation; specifications for preventing software program execution; documented reviews of programs, functions, ports, protocols, and/or services; change control records; system audit logs and records; other relevant documents or records]. 92 NIST SP 800-171A, p. 29.

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) has the broad mission of supporting U.S. industry, government, and academia by promoting U.S. innovation and industrial competitiveness through advancement of information technology measurement science, standards, and technology in ways that enhance economic security and improve our quality of

life. ITL researchers have developed detailed protocols and operational standards that improve safety of their operation, and established assessment criteria and test data sets for validation of industrial products. ITL formulates metrics, tests, and tools for a wide range of subjects such as information complexity and comprehension, high confidence software, space-time coordinated mobile and wireless computing, as well as, issues of information quality, integrity, and usability. Under the Federal Information Security Management Act, ITL is directed to develop cyber security standards, guidelines, and associated methods and techniques. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of non national-securityrelated information in federal information systems. This Interagency Report provides an overview of the NIST Program Review for Information Security Management Assistance (PRISMA) methodology. NIST would like to thank the many people who assisted with the development of this handbook. NIST management officials who supported this effort include: Joan Hash, William C. Barker, Elizabeth Chew, and Matthew Scholl. The structure of a PRISMA Review is based upon the Software Engineering Institute's (SEI) former Capability Maturity Model (CMM), where an organization's developmental advancement is measured by one of five maturity levels.

3.5.1 | Group Attribute Use Metadata... 3.5.1 Group Attribute Use Metadata In the course of managing attributes, metadata is applied to subjects and objects as extended attribute information useful for enforcing fine-grained access control policies that incorporate information about the attributes and manage the volumes of data required for enterprise attribute management.

tion architectures are information system developers and integrators, information system owners, information system/security engineers, and end users. Vulnerability identification occurs at all tiers. Vulnerabilities related to organizational governance (e.g., inconsistent decisions about the relative priorities of mission/business processes, selection of incompatible implementations of security controls) as well as vulnerabilities related to external dependencies (e.g., electrical power, supply chain, telecommunications), are most effectively identified at Tier 1. However, most vulnerability identification occurs at Tiers 2 and 3. At Tier 2, process and architecture-related vulnerabilities (e.g., exploitable weaknesses or deficiencies in mission/business processes, enterprise /information security architectures including embedded information security architectures) are more likely to be identified. At Tier 3, information system vulnerabilities are the primary focus. These vulnerabilities are commonly found in the hardware, software, and firmware components of information systems or in the environments in which the systems operate. Other areas of potential vulnerabilities include vulnerabilities associated with the definition, application/implementation, and monitoring of processes, procedures and services related to management, operational, and technical aspects of information security. Vulnerabilities associated with architectural design and mission/business processes can have a greater impact on the ability of organizations to successfully carry out missions and business functions due to the potential impact across multiple information systems and mission environments. The refined vulnerability assessments conducted at Tiers 2 and 3 are shared with organizational personnel responsible for assessing risks more strategically.

The proposed rule introduces a new standard form (SF) to support uniformity in Governmentwide implementation of these policies. It identifies roles and responsibilities for agencies and contractors when controlled unclassified information (CUI) is located on Federal information systems within a Federal facility or resides on or transits through contractor information systems or within contractor facilities, and it adds two new clauses and a provision to enable contractor reporting and compliance responsibilities in Federal solicitations and contracts. The proposed rule is intended to provide for the following: (1) SF XXX, Controlled Unclassified Information (CUI) Requirements, was developed to promote consistency, assist Federal agencies and contractors in the identification of CUI in agency requirements, and uniformly define all associated handling requirements in accordance with 32 CFR part 2002 . The SF XXX will be included in solicitations and contracts that may result in the handling of CUI that will ultimately become performance requirements during contract performance. (2) FAR 2.101 definitions for ·contractor-attributional information,· ·controlled unclassified information (CUI),· ·CUI incident,· and ·CUI Registry· are added to provide clarification as these terms are new to the FAR. The definition of ·information system· is moved from FAR subpart 4.19 to 2.101. The term ·Federally-controlled information system· is updated to ·Federal information system.· (3) FAR 3.104-4 is amended to clarify that certain information must be marked by the contractor before submitting it to the Government (contractor bid

or proposal information, contractor-attributional information, contractor proprietary business information, and source selection information). Contracting officers should consult with the contractor if they are unsure whether information provided by the contractor falls into one of these categories. Contracting officers who are unsure how to handle such information, including whether it is CUI, should consult with agency officials as necessary. (4) FAR subpart 4.4: The subpart heading is revised to read 'Safeguarding Information and Information Systems' since the information referred to in subpart 4.4 is not limited to classified information and now includes CUI. Section 4.401 is amended to add a definition for 'information' which was moved and revised from the definition currently at FAR 4.1901. At FAR 4.403 and 4.404, the current content is moved to FAR 4.402.

The OSA will achieve CMMC Level 2 Final Self-Assessment compliance for the information system(s) within the CMMC Assessment Scope upon implementation of all security requirements and close out of the POA&M, as applicable. (iv) CMMC status revocation. If the CMMC PMO determines that the provisions of Level 1 or Level 2 of this rule have not been achieved or maintained, as addressed in § 170.6, a revocation of the validity status of the CMMC Level 2 Self-Assessment may occur. At that time, standard contractual remedies will apply and the OSA will be ineligible for additional awards with CMMC Level 2 Self-Assessment or higher requirements for the information system within the CMMC Assessment Scope until such time as a valid CMMC Level 2 Self-Assessment is achieved. (2) Affirmation. Affirmations are required at the time of each assessment, and annually thereafter, for all CMMC Level 2 Self-Assessments. Affirmation procedures are provided in § 170.22. (b) Contract eligibility. In order to be awarded a contract from DoD with a CMMC Level 2 Self-Assessment requirement, the following two requirements must be met: (1) OSAs must achieve, as specified in paragraph (a)(1) of this section, either CMMC Level 2 Conditional Self-Assessment or CMMC Level 2 Final Self-Assessment. (2) OSAs must submit an affirmation of compliance into SPRS, as specified in § 170.16(a)(2). (c) Procedures. (1) Self-Assessment. The OSA must perform a CMMC Level 2 Self-Assessment in accordance with NIST SP 800-171A (incorporated by reference, see § 170.2) and the CMMC Level 2 scoping requirements set forth in § 170.19(a) and (c) for the information systems within the CMMC Assessment Scope. The assessment must be scored in accordance with the CMMC Scoring Methodology described in § 170.24. If a POA&M exists, a POA&M closeout assessment must be performed by the OSA when all remaining requirements have been remediated. The POA&M closeout assessment must be performed within the 180-day closeout period. Additional guidance can be found in the guidance document listed in paragraph (c) of appendix A to this part. (2) Self-Assessment of Cloud Service Provider. An OSA may use a Federal Risk and Authorization Management Program (FedRAMP) Moderate (or higher) cloud environment to process, store, or transmit CUI in execution of a contract or subcontract with a requirement for CMMC Level 2 under the following circumstances: (i) The Cloud Service Provider's (CSP) product or service offering is FedRAMP Authorized at the FedRAMP Moderate (or higher) baseline in accordance with the FedRAMP Marketplace; or

, the 110 Level 2 requirements from NIST SP 800-171 R2 (incorporated by reference, see § 170.2), and the 24 Level 3 requirements selected from NIST SP 800-172 Feb2021 (incorporated by reference, see § 170.2). CMMC Status is the result of meeting or exceeding the minimum required score for the corresponding assessment. The CMMC Status of an OSA information system is officially stored in SPRS and additionally presented on a Certificate of CMMC Status, if the assessment was conducted by a C3PAO or DCMA DIBCAC. The potential CMMC Statuses are outlined in the paragraphs that follow. (CMMC-custom term) (i) Final Level 1 (Self) is defined in § 170.15(a)(1) and (c)(1). (CMMC-custom term) (ii) Conditional Level 2 (Self) is defined in § 170.16(a)(1)(ii). (CMMC-custom term) (iii) Final Level 2 (Self) is defined in § 170.16(a)(1)(iii). (CMMC-custom term) (iv) Conditional Level 2 (C3PAO) is defined in § 170.17(a)(1)(ii). (CMMC-custom term) (v) Final Level 2 (C3PAO) is defined in § 170.17(a)(1)(iii). (CMMC-custom term) (vi) Conditional Level 3 (DIBCAC) is defined in § 170.18(a)(1)(ii). (CMMC-custom term) (vii) Final Level 3 (DIBCAC) is defined in § 170.18(a)(1)(iii). (CMMC-custom term) CMMC Status Date means the date that the CMMC Status results are submitted to SPRS or the CMMC instantiation of eMASS, as appropriate. The date of the Conditional CMMC Status will remain as the CMMC Status Date after a successful POA&M closeout. A new date is not set for a Final that follows a Conditional. (CMMC-custom term) CMMC Third-Party Assessment Organization (C3PAO) means an organization that has been authorized or accredited by the Accreditation Body to conduct Level 2 certification assessments and has the roles and responsibilities identified in § 170.9. (CMMC-custom term) Contractor is defined in 48 CFR 3.502-1. Contractor Risk Managed Assets are defined in table 3 to § 170.19(c)(1). (CMMC-custom term) Controlled Unclassified Information (CUI) is defined in 32 CFR 2002.4(h). Controlled

Unclassified Information (CUI) Assets means assets that can process, store, or transmit CUI. (CMMC-custom term) DCMA DIBCAC High Assessment means an assessment that is conducted by Government personnel in accordance with NIST SP 800-171A Jun2018 and leveraging specific guidance in the DoD Assessment Methodology that: (i) Consists of: (A) A review of a contractor's Basic Assessment; (B) A thorough document review; (C) Verification, examination, and demonstration of a contractor's system security plan to validate that NIST SP 800-171 R2 security requirements have been implemented as described in the contractor's system security plan; and (D) Discussions with the contractor to obtain additional information or clarification, as needed; and (ii) Results in a confidence level of 'High' in the resulting score. (Source: 48 CFR 252.204-7020). Defense Industrial Base (DIB) is defined in 32 CFR 236.2 . DoD Assessment Methodology (DoDAM)

For ubiquitous access to these applications from multiple remote locations using different types of devices, it is necessary to build the concept of zero trust [1] into this application environment. Zero trust assumes that there is no implicit trust granted to assets or user accounts based solely on their physical or network location (i.e., local area networks versus the internet) or based on asset ownership (enterprise or personally owned) [1]. Zero trust focuses on protecting resources (e.g., assets, services, workflows, and network accounts) rather than network segments since the network location is no longer seen as the prime component to the security posture of the resource. Furthermore, the loosely coupled nature of the components (i.e., microservices) of these cloud-native applications facilitates independent design, development, and agile deployment (e.g., Continuous Integration/ Continuous Delivery or Deployment (CI/CD) [2]) of the constituent microservices, enabling paradigms such as DevSecOps [3] (representing Development, Security and Operations) to be used.

Identification and Authentication 20 - Precision in Terminology - Identification and Authentication - Access Control - Availability & Fault Tolerance - Policy Neutral Criteria - TCB & Reference Monitor Focus - Integrity - Open-Ended Criteria - Issues from the attendees ## Identification and Authentication

Rather than abandon the CMMC ecosystem model entirely, some commenters recommended only that DoD revise the CMMC Accreditation Body's roles and responsibilities. Three recommended the DoD eliminate the CMMC AB and take on its responsibilities; of these, one further suggested the DoD publish detailed Security Technical Implementation Guides describing how to implement the applicable NIST requirements. One commenter questioned the reasons for creating a CMMC AB rather than accepting another existing accreditation body or multiple accreditation bodies. One comment expressed doubt in the ability of the ecosystem to scale sufficiently to meet the demand for C3PAO assessments and assessor training. Multiple comments called for organizations other than the current CMMC AB to run the CMMC ecosystem such as a CMMC Advisory Council or a Civilian Cybersecurity Corps comprised of government and private sector staff. One such comment requested that, unlike the current CMMC AB, the proposed body would be funded and managed by the government. Two commenters recommended the DoD consider accepting other types of conformance assessment such as ISO/IEC 27001:2022(E) and Health Information Trust Alliance (HITRUST) certification. One noted this would require guidance to describe how to address the gaps between standards those assessments are aligned to and those that CMMC are aligned to (e.g., NIST SP 800-171 R2 for CMMC Level 2). This commenter further suggested that DoD accept alternate industry certifications in lieu of the training requirements identified for CMMC Assessors. One commenter suggested the DoD accept FedRAMP authorization to meet CMMC assessment requirements. Response:

Finally, because the HITECH Act made business associates directly liable for compliance with the Security Rule, the 2013 Omnibus Rule modified the Security Rule to clarify that a covered entity is not required to obtain satisfactory assurance from a business associate that is a subcontractor that the subcontractor will appropriately safeguard its ePHI. Rather, the business (printed page 906) associate of the covered entity must obtain the required satisfactory assurances from the subcontractor to protect the security of ePHI. [107] III. Justification for This Proposed Rulemaking HIPAA and the HIPAA Rules promote access to high-quality and effective health care by establishing standards for the security of ePHI. The standards, when implemented appropriately by regulated entities, protect the confidentiality, integrity, and availability of individuals' health information. Such protections promote the electronic transmission of PHI through a national health information system. To ensure access to high-quality health care services, regulated entities must assure their customers (e.g., individuals, health care providers, and health plans) of the

security of the sensitive and confidential health information the regulated entities electronically create, receive, maintain, or transmit. As discussed above, the Security Rule carefully balances the benefits of safeguarding against security risks with the burdens of implementing protective measures by permitting regulated entities to consider several factors, including costs and available technology for preventing and mitigating security risks, [108] when determining which security measures are reasonable and appropriate for protecting the security of individuals' ePHI. [109] For example, the Security Rule requires that a regulated entity implement policies and procedures to limit physical access to its electronic information systems and the facilities in which they are housed, while ensuring that users who are authorized to access such information systems and facilities are permitted to do so. [110] The implementation specifications associated with this standard only address the need for operationalized policies and procedures related to specific aspects of physical security. [111] They do not dictate the specifics of such policies and procedures because we recognize that the nature of the physical safeguards should depend on the type of regulated entity, its size, its level of access to ePHI, and a number of other factors. Since the Security Rule's promulgation in 2003, the environment in which health care is provided and in which regulated entities operate has changed significantly, including transformative changes in how regulated entities create, receive, maintain, and transmit ePHI. For example, as of 2021, almost 80 percent of physician offices and 96 percent of hospitals had adopted certified EHRs. [112]

- (1) Data Integrity, - (2) Data Confidentiality, - (3) Data Origination Authentication, and - (4) Access Control. The SP4E Entity is composed of two types of submodules: the SP4 Machine and the Timer Facility. The SP4 Machine submodule encapsulates and decapsulates Transport Protocol data units within a security envelope for protection. It can provide the full functionality of SP4, although not fully utilized by the SP4E Entity. The SP4 Machine submodule uses the interface to the Key Manager module to request, replace, return, and verify traffic key assignment. Assigned keys are used, in turn, through the interface to the Cryptographic Facility to encipher/decipher information and compute integrity check values. The Timer Facility submodule provides the SP4 Machine with a mechanism for determining protracted delays with the Key Manager. The two submodules communicate with each other through an internal interaction point. Like the Access Control Facility, a group of function and procedure definitions makes up the interface to the SMIB. Collectively they provide the capability to create new objects, to manipulate existing objects that populate the SMIB, to enter, access, or modify information stored as attributes of those objects, and to destroy objects no longer needed. The interface operates at the object level. It is used exclusively by the Key Manager and its submodules, who are relied upon to maintain the integrity of the SMIB.

(ii) USG personnel assigned to or visiting a contractor facility and engaged in oversight of an acquisition program (printed page 83345) will retain control of their work product. Classified work products of USG employees will be handled in accordance with this rule. Contractor procedures will not require USG employees to relinquish control of their work products, whether classified or not, to a contractor. (iii) Contractor employees at USG installations will follow the security requirements of the host. This does not relieve the contractor from security oversight of their employees who are long-term visitors at USG installations. (b) Classified meetings. This paragraph applies to a conference, seminar, symposium, exhibit, convention, training course, or other such gathering during which classified information is disclosed, hereafter called a meeting. Disclosure of classified information to large diverse audiences such as conferences increases security risks. Classified disclosure at such meetings may occur when it serves a government purpose and adequate security measures have been provided in advance. (1) Meeting conducted by a cleared contractor. If conducted by a cleared contractor, the meeting is authorized by a USG agency that has agreed to assume security jurisdiction. The USG agency: (i) Must approve security arrangements, announcements, attendees, and the location of the meeting. (ii) May delegate certain responsibilities to a cleared contractor for the security arrangements and other actions necessary for the meeting under the general supervision of the USG agency. (2) Request for authorization. Contractors desiring to conduct meetings that require sponsorship will submit their requests to the USG agency that has principal interest in the subject of each meeting. Requests for authorization will include: (i) An explanation of the USG purpose to be served by disclosing classified information at the meeting and why the use of conventional channels for release of the classified information will not advance those interests. (ii) The subject of the meeting and scope of classified topics, to include the classification level, to be disclosed at the meeting. (iii) The expected dates and location of the meeting. (iv) The general content of the proposed announcement or invitation to be sent to prospective attendees or participants. (v) The identity of any other

non-government organization involved and a full description of the type of support it will provide. (vi) A list of any foreign representatives (including their nationality, name, organizational affiliation) whose attendance at the meeting is proposed. (vii) A description of the security arrangements necessary for the meeting to comply with the requirements of this rule. (3) Locations of meetings.

DoD, GSA, and NASA are proposing to amend the FAR to update and clarify the requirements for using the DD Form 254, Contract Security Classification Specification. The Government uses the DD Form 254 to convey security requirements to contractors when contract performance requires access to classified information. Prime contractors also use the DD Form 254 to convey security requirements to subcontractors that require access to classified information to perform on a subcontract. Subcontractors may also use the DD Form 254 if access to classified information is required to convey security requirements to additional subcontractors. The Defense Security Service has oversight responsibilities for contractors and subcontractors requiring access to classified information under contracts awarded by agencies covered by the National Industrial Security Program, i.e., DoD components, and nondefense agencies that have industrial security services agreements with DoD. The National Industrial Security Program was established under Executive Order (E.O.) 12829 as a single, integrated program across the Executive Branch designed to safeguard classified information released to contractors. As one of five National Industrial Security Program cognizant security agencies, DoD is responsible for providing industrial security oversight services to DoD and those nondefense agencies that have industrial security services agreements with DoD. The National Industrial Security Program Contracts Classification System is a module within the Procurement Integrated Enterprise Environment (PIEE), (formerly the Wide Area Workflow application). The module provides a centralized repository for classified contract security requirements and automates DD Form 254 processes and workflows.

II. Discussion and Analysis This rule proposes to amend the FAR to provide procedures for use of the DD Form 254 and the requirement to use the PIEE, to:

- Streamline the submission process for the existing DD Form 254 and enable businesses to submit an electronic form once, instead of repeated paper submissions;
- Require use of the DD Form 254 by nondefense agencies that have industrial security services agreements with DoD, and DoD components, to specify the security classification for a contract involving access to information classified as Confidential, Secret, or Top Secret;
- Require agency preparation of the DD Form 254 using the National Industrial Security Program Contracts Classification System module of the PIEE unless a nondefense agency has an existing DD Form 254 information system;
- Clarify that (printed page 33202) Each contractor and subcontractor location of performance listed on a DD Form 254 is required to have a unique CAGE code; and
- Registration in the System for Award Management is not required for contractor and subcontractor performance locations solely for the purposes of the DD Form 254.

A few comments asked about the assumptions used to estimate numbers of assessments by category and stated the labor rates for ESPs and C3PAOs were too low, and costs associated with small entities were incorrect. Two comments also suggested the number of hours estimated for self-assessment are too low, and three questioned the accuracy of small and medium sized business labor rates and asserted that the assessment costs for small businesses were not sustainable. One comment suggested that cost data in existing/past contracts should be used as a part of CMMC cost analysis and Section H costs should apply to the current CMMC cost estimate. One comment claimed it is cost prohibitive for individuals to obtain a CCP or CCA certification, which will hamper the CMMC Program's scalability. One comment requested the government elaborate on how the estimated 417.83 hours per response was derived for table 39, C3PAOs Level 1 Certification and Assessment, in section §.170.17(a). Another comment asserted that assessments conducted by Defense Technical Risk

Assessment Methodology (DTRAM) assessment teams require more manhours than are anticipated for CMMC certification assessments. One comment stated that while DoD included an estimate for annual senior official affirmations in the Regulatory Impact Analysis, it assumed a minimal number of hours will be required to complete this task which may not be adequate to complete a full compliance review. One comment stated the DoD self-assessment resource allocations for an ESP for both CMMC Level 1 and Level 2 are estimated 125% to 175% too low based on the belief that a self-assessment should have more rigor than a gap analysis. Specifically, the commenter posed questions on what inputs from potential OSAs were used and identifying the rigor a Certifying Official would require for attestation. Recommendations include that the DoD clearly state its assumptions regarding self-assessment rigor, have OSA legal counsel review assumptions and cost factors, and identify a representative cross-section of stakeholders to determine appropriate rigor assumptions for company's ESPs and new to CMMC self-assessments. One comment stated that the DoD's assumptions for the level of effort expressed as Director and staff IT specialist hours are too low. Although there are continuous monitoring requirements of NIST 800-171 R2, those requirements do not invoke the level of effort necessary for an executive to make an attestation corresponding to the level of personal risk and corporate liability incurred under the False Claims Act. The comment asserted that DoD's assumptions failed to account for an SMB to acquire and manage technical tools or manage the reaffirmation or an enterprise change management effort. (printed page 83154)

Addressing the harmonization between the DoD, contractors, and subcontractors is beyond the scope of this rule. These are functions of the DIB Sector Coordinating Council and the DIB Government Coordinating Council. Additionally, non-DoD programs are outside the control and scope of the 32 CFR part 170 CMMC Program rule. The DoD encourages prime contractors to work with its subcontractors to flow down CUI with the required security and the least burden. DoD is aware organizations may receive multiple contracts that may require different CMMC levels based upon programmatic data security needs. It is beyond the scope of this rule to (printed page 83156) dictate how OSAs manage varying contract requirements. Contractors that have achieved a CMMC Level 2 or Level 3 certification automatically meet a stated requirement of a lower CMMC level if the same system/assessment scope will be used in performance of the contract. 30. Alternatives a. Alternate Programs Comment: Many comment submissions included lengthy proposals for alternatives to the CMMC program purported to alleviate specific concerns with aspects of CMMC program requirements. In some cases, the concerns were based on a misreading of the rule's content. The DoD has addressed some valid concerns through rule revisions that differ from the recommendations. One commenter suggested eliminating compliance assessments in favor of establishing a DoD office to conduct penetration testing of each DIB company's network every two years. Other commenters also recommended the DoD establish a secure portal and share CUI with contractors only through that portal, as a way for the DIB to avoid the cost of securing their information systems. One commenter suggested the DoD monitor use of waivers and utilize this secure portal approach when CMMC waivers apply. Similar recommendations included sharing CUI only through password encrypted files or requiring contractors to store CUI in restricted access folders. In similar suggestions, several commenters thought the DoD should provide its contractors with training, GFE and other tools necessary to secure the contractor owned information systems being used to process or store CUI. One such commenter stated that the Government should appropriate funding for secure solutions rather than phasing in compliance assessments. One commenter suggested the DoD consider industry's application of alternate security mechanisms in lieu of CMMC Levels 2 and 3. Another recommended the DoD stand up a voluntary DIB Cyber Protection Program to improve real-time monitoring of the DIB, improve cybersecurity for firms that cannot afford the needed professional staff, and offer data and legal protections to DIB firms. Another such commenter suggested that DoD fund securing the DIB through contract incentives.

(A) Information specifically authorized to be classified under E.O. 12958 , as implemented by DOD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1) . (B) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (C) Testing or examination material used solely to determine individual qualifications for appointment or promotion in the Federal service may be exempt pursuant to 5 U.S.C. 552a(k)(6) , if the disclosure would compromise the objectivity or fairness of the test or examination process. (D) Evaluation material used to determine potential for promotion in the Military Services may be exempt pursuant to 5 U.S.C. 552a(k)(7) , but only to the extent that the disclosure of such material would reveal the identity of a confidential source. (E) Portions of

this system of records are exempt from the following subsections of the Privacy Act: (c)(3), (d), (e)(1), (e)(4)(G) through (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(1), (k)(5), (k)(6), and (k)(7). (iii) Reasons. Granting individuals access to portions of this system of records could result in the disclosure of classified material, or the identification of sources who provided information to the government under an express or implied promise of confidentiality. Material will be screened to permit access to unclassified material and to information that does not disclose the identity of a confidential source. (4) System identifier and name. N01640-1, Individual Correctional Records. (i) Exemption. (A) Parts of this system may be exempt pursuant to 5 U.S.C. 552a(j)(2) if the information is compiled and maintained by a component of the agency which performs as its principle function any activity pertaining to the enforcement of criminal laws. (printed page 14765) (B) Portions of this system of records are exempt from the following subsections of the Privacy Act: (c)(3), (c)(4), (d), (e)(2), (e)(3), (e)(4)(G) through (I), (e)(5), (e)(8), (f), and (g). (ii) Authority. 5 U.S.C. 552a(j)(2). (iii) Reason.

Foreign visitors will not be given custody of classified material except when they are acting as official couriers of the government and the CSA authorizes the transfer. (iii) Visitor records. The contractor will maintain a record of foreign visitors for one year when the visit involves access to classified information. (iv) Temporary approval of safeguarding. (A) Classified U.S. and foreign government material at a U.S. contractor location is to remain under U.S. contractor custody and control and is subject to self-inspection and CSA security reviews. (B) This does not preclude the contractor from furnishing a foreign visitor with a security container for the temporary storage of classified material, consistent with the purpose of the visit or assignment, provided the CSA approves and responsibility for the container and its contents remains with the U.S. contractor. (1) The CSA may approve exceptions to this policy on a case-by-case basis for the storage of foreign government classified information furnished to the visitor by the visitor's government through government channels. (2) The CSA must approve such exceptions in advance in writing with (printed page 83354) agreement from the visitor's government. The agreed procedures will be included in the contractor's TCP, will require the foreign nationals to provide receipts for the material, and will include an arrangement for the CSA to ensure compliance, including provisions for the CSA to inspect and inventory the material. (v) TCP. A TCP is required to control access by foreign nationals assigned to, or employed by, cleared contractor facilities, and when foreign nationals visit cleared contractor facilities on a long-term or extended basis, unless the CSA determines that procedures already in place at the contractor's facility are adequate. The TCP will contain procedures to control access for all export-controlled information. A sample TCP may be obtained from the CSA. (f) Contractor operations abroad. (1) Access by contractor employees assigned outside the United States. (i) Contractor employees assigned outside the United States, its possessions, or territories may have access to classified information in connection with performance on a specified U.S., NATO, or foreign government classified contract. (ii) The assignment of an employee who is a non-U.S. citizen outside the United States on programs that will involve access to classified information is prohibited. (2) Storage, custody, and control of classified information abroad by contractor employees. (i) The USG is responsible for the storage, custody, and control of classified information required by a U.S. contractor employee abroad. Therefore, the storage of classified information by contractor employees at any location abroad that is not under USG control is prohibited. The storage may be at a U.S. military facility, an American Embassy or consulate, or other location occupied by a USG organization.

Some types of credentials are very easy to transfer to another individual. For instance, PINs and passwords can be physically or electronically sent to another individual as part of a vote selling attack, as described in Section 4.3.3 or in attempts to coerce voters, as described in Section 4.3.2. As noted in those sections, it is difficult to estimate the likelihood of such attacks or how motivated potential attackers would be to conduct these types of attacks. However, depending on the types of credentials used, these attacks could scale fairly well, potentially allowing individuals or organizations to collect large numbers of voters' credentials and cast votes on their behalf. ## 7.4.6 Security Awareness and Training Many of the threats described in this section are attacks on users, rather than on the voting system components. In some cases, users are not aware of the security threats faced by a system, or what actions might pose a security risk. Security awareness presentations and materials can educate users about these threats in the hopes that they will be less likely to fall to a phishing or social engineering attack and more likely to use safe computing behaviors. Security training can educate users about relevant security skills and competencies that are necessary for them to conduct their jobs effectively and safely.

In 1996, Congress enacted HIPAA [28] to reform the health care delivery system to improve portability and continuity of health insurance coverage in the group and individual markets [29] and to simplify the administration of health insurance. [30] Through subtitle F of HIPAA, Congress amended title XI of the Social Security Act of 1935 (SSA) by adding part C, entitled Administrative Simplification. [31] A primary purpose of part C is to improve the Medicare and Medicaid programs and the efficiency and effectiveness of the health care system, by encouraging the development of a health information system through the establishment of uniform standards and requirements for the electronic transmission of certain health information. [32] Congress recognized that the development of a health information system that enabled the electronic transmission of IIHI as required by HIPAA would pose risks to the privacy of confidential health information and viewed individual privacy, confidentiality, and data security as critical to support the shift from a paper-based recordkeeping system for health information to a digital one. [33] Congress intended for the law to enhance individuals' trust in health care providers, which required that the law provide additional protection for the confidentiality of IIHI. As described by a Member of Congress at the time of the law's passage: "[t]his standardization, however, accelerates the creation of large databases containing personally identifiable information. All this information is transmitted over electronic networks. We need to be very careful about how safe and secure that information is from prying eyes. Some of it may be extremely sensitive and could be used in a malicious or discriminatory manner. [34] Moreover, Congress considered that health care reform required an approach that would not compromise privacy as health information became more accessible. [35] Congress applied the Administrative Simplification provisions directly to three types of persons referred to in regulation as covered entities: health plans, health care clearinghouses, and health care providers who transmit information electronically in connection with a transaction for which HHS has adopted a standard. [36] Under HIPAA, covered entities are required to maintain reasonable and appropriate administrative, physical, and technical safeguards [37] to: (1) ensure the integrity and confidentiality of information; [38] (2) protect against any reasonably anticipated threats or hazards to the security or integrity of the information and unauthorized uses or disclosures of the information; [39] and (3) otherwise ensure compliance with HIPAA by the officers and employees of covered entities. [40] HIPAA required the Secretary to adopt uniform standards to enable health information to be exchanged electronically. [41] Congress also directed the Secretary to, among other things, adopt standards for the security of IIHI. [42]

The DIB CS/IA program will continue to evaluate outreach opportunities to enhance engagement with industry, to include industry associations. No change is made to the rule. Comment: Two comments recommended that the infrastructure of the internet be upgraded and that the rule should incorporate technology neutral terms. Response: Other activities within the Government are examining the infrastructure of the internet. The rule focuses on cyber threat sharing and the risk of compromise of DoD information that resides on, or transits, DIB unclassified information systems. No change is made to the rule. Regulatory Procedures Executive Orders 12866, Regulatory Planning and Review and 13563, Improving Regulation and Regulatory Review. It has been certified that 32 CFR part 236 does not: (a) Have an annual effect on the economy of \$100 million or more, or adversely affect in a material way, the economy; a section of the economy; productivity; competition; jobs; the environment; public health or safety; or State, local, or tribal Governments or communities; (b) Create a serious inconsistency, or otherwise interfere with, an action taken or planned by another Agency; (c) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients thereof; or (d) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles as set forth in these Executive Orders. Public Law 104-121 , Congressional Review Act (5 U.S.C. 801) It has been determined that 32 CFR part 236 is not a major rule under 5 U.S.C. 801 , enacted by Public Law 104-121 , because it will not result in an annual effect on the economy of \$100 million or more; a major increase in costs or prices for consumers, individual industries, Federal, State, or local Government agencies, or geographic regions; or significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic and export markets. Sec. 202, Public Law 104-4 , Unfunded Mandates Reform Act. It has been certified that 32 CFR part 236 does not contain a Federal mandate that may result in expenditure by State, local and tribal Governments, in aggregate, or by the private sector, of \$100 million or more in any one year. Public Law 96-354, Regulatory Flexibility Act (5 U.S.C. 601) It has been certified that 32

CFR part 236 is not subject to the Regulatory Flexibility Act (5 U.S.C. 601) because it would not, if promulgated, have a significant economic impact on a substantial number of small entities. DIB participation in the DIB CS/IA Program is voluntary. Public Law 96-511, "Paperwork Reduction Act" (44 U.S.C. Chapter 35)

Assessing the SP 800-53 controls of the system itself should ideally have a continual assessment component utilizing a monitoring program [13]. Frequent automated checks or scans should be conducted to detect changes in the system (as part of the MONITOR step below). Logging data should be used to detect possible malicious behavior that requires further investigations or remediation. This assessment may also include active processes such as red team testing of the system as input into the assessments.

FDA recognizes that some facilities that are predominantly retail distribute some food to businesses (that then may further distribute the food before it is consumed) and that some facilities that are predominantly nonretail distribute some food to consumers. FDA concludes that to require such facilities to keep records of each individual recipient consumer would be too burdensome, and not necessary to help address credible threats of serious adverse health consequences or death to humans or animals. If a traceback or trace forward is necessary, FDA can learn from sickened consumers the sources of the food they purchased, or notify consumers generally about food that presents a threat. Therefore, FDA is changing the final rule from the proposal so that it does not require records of subsequent recipients for sales directly to consumers, regardless of whether the seller is a retailer or another type of entity. The final rule excludes persons who distribute food directly to consumers from keeping records of those transactions. Moreover, if a person prepares and sells food directly to consumers for immediate consumption, then those sales qualify for the restaurant exemption. However, persons who operate retail food establishments that distribute food to persons who are not consumers are subject to all of the requirements in subpart J of this final rule. However, the requirements in § 1.345 of the final rule to establish and maintain records to identify the nontransporter and transporter immediate subsequent recipients that are not consumers applies as to those transactions only to the extent the information is reasonably available. Furthermore, retail food establishments that employ 10 or fewer full-time equivalent employees are excluded from all of the requirements of subpart J of this final rule, except the record access provisions for existing records under §§ 1.361 and 1.363. 4. Fishing Vessels FDA received no comments on this issue and has made no changes to the definition for fishing vessels or to the exemption in the final rule. 5. Retail Facilities (Comment 38) One comment states that it operates a business that is essentially the same as any other retailer (although they sell to restaurants). Sales to its customers are recorded using a checkout register, and thus, it should not be required to keep records of individual items purchased by customers. Requiring such records from it, but not requiring retailers to keep such records, would be unfair and would be extremely burdensome.

, when access to accounting disclosures and access to or amendment of records would cause the identity of a confidential source to be revealed. Disclosure of the confidential source's identity not only will result in the Department breaching the express promise of confidentiality made to the source but it would impair the Department's future ability to compile investigatory material for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, Federal contracts, or access to classified information. Unless sources may be assured that a promise of confidentiality will be honored, they will be less likely to provide information considered essential to the Department in making the required determinations. (B) From 5 U.S.C. 552a(e)(1) , as in the collection of information for investigatory purposes, it is not always possible to determine the relevance and necessity of particular information in the early stages of the investigation. In some cases, it is only after the information is evaluated in light of other information that its relevance and necessity becomes clear. Such information permits more informed decision making by the Department when making required suitability, eligibility, and qualification determinations. § 310.22 Defense Security Service (DSS) exemptions. (a) General. The Director of the Defense Security Service establishes the following exemptions of records systems (or portions thereof) from the provisions of these rules, and other indicated portions of Public Law 93-579, in this section. They may be exercised only by the Director, Defense Security Service and the Chief of the Office of FOI and Privacy. Exemptions will be exercised only when necessary for a specific, significant and legitimate reason connected with the purpose of a records system, and not simply because they are authorized by statute. Personal records releasable under the provisions of 5 U.S.C. 552 will not be withheld from subject individuals based on these exemptions. (b) All

systems of records maintained by DSS shall be exempt from the requirements of 5 U.S.C. 552a(d) pursuant to 5 U.S.C. 552a(k)(1) to the extent that the system contains any information properly classified under Executive Order 12958 and which is required by the Executive Order to be withheld in the interest of national defense or foreign policy. This exemption, which may be applicable to parts of all systems of records, is necessary because certain record systems not otherwise specifically designated for exemptions herein may contain items of information that have been properly classified. (1) System identifier and name. V1-01, Privacy and Freedom of Information Request Records. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2)

This section contains a description of the proposed amendments to the Security Rule and the Department's rationale for its proposals. As part of this rationale, we often include a discussion of best practices contained in previously published guidance documents issued by the Department, NIST, and other Federal agencies. We request comment on previously published guidance documents that are not discussed herein that were issued by the Department or other Federal agencies and contain best practices but may be relevant or applicable to regulated entities, including the names of and citations for such guidance documents. We do not propose to adopt referenced best practices as the standard or implementation specifications unless otherwise specified in the proposed regulatory text. Rather, we include such discussion to provide regulated entities with context for the aforementioned proposals. We recognize that regulated entities are of varying types and sizes and may be concerned that requiring the adoption of such best practices might not be appropriate for all. However, we request comment on whether we should require implementation of certain aspects of a particular guidance document. If so, please explain which aspect(s) we should require, the rationale, and information about the burden of implementing such aspect(s).

A. Section 160.103-Definitions

1. Current Provision Electronic media are used by many health care organizations to process, transmit, and maintain ePHI. As defined by the Security Rule, the term "electronic media" [334] encompasses both (1) electronic storage material on which data is or may be electronically recorded; and (2) transmission media used to exchange information already in electronic storage media. It specifically excludes certain transmissions, such as those of paper, via facsimile ("fax"), and voice, via telephone, from being considered transmissions via electronic media if the information being exchanged did not exist in electronic form immediately before the transmission.

2. Issues To Address The Department revised the definition of "electronic media" in 2013 by replacing the term "electronic storage media" with "electronic storage material" in recognition that there may be storage material other than "media" that houses electronic data in the future. [335] At that time, the Department said that a fax machine accepting a hardcopy document for transmission is not a covered transmission even though the document may have originated from printing from an electronic file. [336] In response to commenter concerns, we also clarified that ePHI maintained, intentionally or otherwise, in a photocopier, fax machine, or other device is subject to the Security Rule and reminded regulated entities that they should be aware of the capabilities of such devices with respect to their ability to maintain ePHI. [337] Additionally, a regulated entity should consider the appropriateness of implementing security measures that account for such capabilities. [

means a discrete identifiable information and operational technology asset that represents a building block of a system and may include hardware, software, and firmware. Cyber supply chain risk means the potential for harm or compromise that arises as a result of cybersecurity risks from suppliers, their supply chains, and their products or services. This includes risks that arise from threats exploiting vulnerabilities or exposures within products and services traversing the supply chain as well as threats or exposures within the supply chain itself. The level of risk depends on the likelihood that relevant threats may exploit applicable vulnerabilities and the consequential potential impacts. (NIST SP 800-161 and 800-203).

Federal information system (1) Means an information system (44 U.S.C. 3502(8)) used or operated by an agency, by a contractor of an agency, or by another organization, on behalf of an agency; (2) On behalf of an agency as used in this definition, means when a contractor uses or operates an information system or maintains or collects information for the purpose of processing, storing, or transmitting Government data, and those activities are not incidental to providing a service or product to the Government (32 CFR part 2002).

Full access means, for all contractor information systems used in performance, or which support performance, of the contract (1) Physical and electronic access to (i) Contractor networks; (ii) Systems; (iii) Accounts with access to Government systems; (iv) Other infrastructure housed on the same computer network; (v) Other infrastructure with a shared identity

boundary or interconnection to the Government system; and (2) Provision of all requested Government data or Government-related data, including: (i) Images; (ii) Log files; (iii) Event information; and (iv) Statements, written or audio, of contractor employees describing what they witnessed or experienced in connection with the contractor's performance of the contract. Government data means any information, (including metadata), document, media, or machine-readable material regardless of physical form or characteristics that is created or obtained by the Government, or a contractor on behalf of the Government, in the course of official Government business. Government-related data means any information, document, media, or machine-readable material regardless of physical form or characteristics that is created or obtained by a contractor through the storage, processing, or communication of Government data. Government-related data does not include: (1) A contractor's business records (e.g., financial records, legal records) that do not incorporate Government data; or (2) Data such as operating procedures, software coding or algorithms that are not primarily applied to the Government data. High value asset

(1) Have at least one transducer (sensor or actuator) for interacting directly with the physical world, have at least one network interface, and are not conventional information technology devices, such as smartphones and laptops, for which the identification and implementation of cybersecurity features is already well understood; and (2) Can function on their own and are not only able to function when acting as a component of another device, such as a processor. Media means physical devices or writing surfaces including, but not limited to, magnetic tapes, optical disks, magnetic disks, large-scale integration memory chips, and printouts onto which information is recorded, stored, or printed within an information system (NIST SP 800-53). Metadata means information describing the characteristics of data including, but not limited to, structural metadata that describes data structures (e.g., data format, syntax, and semantics) and descriptive metadata that describes data contents (e.g., information security labels) (NIST SP 800-37). Operational technology (OT) means programmable systems or devices that interact with the physical environment or manage devices that interact with the physical environment. These systems or devices detect or cause a direct change through the monitoring and/or control of devices, processes, and events. Examples of operational technology include industrial control systems, building management systems, fire control systems, and physical access control mechanisms (NIST SP 800-160 vol 2). Overlay means a specification of security or privacy controls, control enhancements, supplemental guidance, and other supporting information employed during the tailoring process, that is intended to complement and further refine security control baselines. An overlay specification may be more stringent or less stringent than the original security control baseline specification and can be applied to multiple information systems (OMB Circular No. A-130). Telemetry means the automatic recording and transmission of data from remote or inaccessible sources to an information system in a different location for monitoring and analysis. Telemetry data may be relayed using radio, infrared, ultrasonic, cellular, satellite or cable, depending on the application. (b) Applicability. The requirements of this clause shall only apply to aspects of a Federal information system (FIS) that do not involve cloud computing services. (c) Records management and Government access. (1) The Contractor shall provide the Contracting Officer with all Government data and Government-related data in the format specified in the contract. (2) The Contractor shall dispose of Government data and Government-related data in accordance with the terms of the contract and provide the confirmation of disposition to the Contracting Officer in accordance with contract closeout procedures.

FDA has analyzed this final rule in accordance with the principles set forth in Executive Order 13132 . FDA has determined that the proposed rule does not contain policies that have substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. Accordingly, the agency concludes that the final rule does not contain policies that have federalism implications as defined in the Executive order and, consequently, a federalism summary impact statement is not required. XI. (c) The agency point of contact shall return to the offeror any unsolicited proposal marked with an administrative marking different from that provided in paragraph (a) of this section. The return letter will state that the proposal cannot be considered because it is impracticable for the Government to comply with the administrative marking and that the agency will consider the proposal if it is resubmitted with the proper administrative marking. * * * * (f) When an agency receives an unsolicited proposal without any restrictive administrative marking from an educational or nonprofit organization or institution, and an evaluation outside the Government is necessary, the agency point of contact shall· (1) Attach a cover sheet clearly marked with the administrative marking in paragraph (d) of this section; (2) Change the beginning of this administrative marking by deleting ·All Government personnel· and adding ·All Government and non-Government personnel·; and (3) Require any non-Government evaluator to agree in writing that data in the proposal will not be disclosed to others outside the Government. * * * * PART 27·PATENTS, DATA AND COPYRIGHTS 31. Revise the heading of section 27.203 to read as follows: 27.203 Security requirements for patent applications and other patent information. * * * * 32. Redesignate sections 27.203-1 and 27.203-2 as sections 27.203-2 and 27.203-3, and adding a new section 27.203-1 to read as follows: 27.203-1 Security requirements for controlled unclassified information. Contracts involving patent applications or other patent-related controlled unclassified information require safeguarding or dissemination controls that must be identified in the SF XXX, Controlled Unclassified Information (CUI) Requirements. See 4.403. 33. Revise the heading of newly redesignated section 27.203-2 to read as follows: 27.203-2 Security requirements for classified information. * * * * PART 33·PROTESTS, DISPUTES, AND APPEALS 34. Amend section 33.104 by· a. Revising paragraph (a)(2); and b. Removing from paragraph (a)(5) introductory text the phrase ·development or commercial information· and adding ·development, commercial information, or other controlled unclassified information· in its place. The revision reads as follows: 33.104 Protests to GAO. * * * * (a)*** (2) Immediately after receipt of the GAO's written notice that a protest has been filed, the agency shall give notice of the protest to the contractor if the award has been made, or, if no award has been made, to all parties who appear to have a reasonable prospect of receiving award if the protest is denied. (printed page 4296) The agency shall furnish copies of the protest submissions to such parties with instructions to· (i) Communicate directly with the GAO; and

3.6.2 | Element-Level Judgment Assistance ... 3.6.2 Element-Level Judgment Assistance Each element has an associated discussion to assist in making a judgment.

·Not applicable· was removed from §·170.24(c)(9) for the case where the DoD CIO previously approved a variance. The rule has been updated to reflect the language of DFARS clause 252.204-7012 and the DoDAM, including nonapplicable or to have an alternative, but equally effective, security measure. Regarding the comment on N/A objectives, §·170.23 is clear that MET means all applicable objectives for the requirement and that if an objective does not apply, then it is equivalent to being MET. A security requirement can be applicable, even with one or more objectives that are N/A. The overall requirement is only NOT MET when one or more applicable objectives is not satisfied. The

determination of assessment findings is made by an Assessor following the assessment methodology. In the case of a self-assessment, the Assessor is from the OSA. In the case of a certification assessment, the Assessor is from the C3PAO or DIBCAC. An assessment finding of NOT APPLICABLE (N/A) means a security requirement (or assessment objective) does not apply at the time of the CMMC assessment. For each assessment objective or security requirement marked N/A, the Certified Assessor includes a statement that explains why it does not apply to the contractor. The OSC should document in its SSP why the security requirement does not apply and provide justification. There is no standard set of artifacts required to justify a finding of N/A. A System Security Plan as described in security requirement CA.L2-3.12.4 is required to conduct an assessment. The rule has been updated at § 170.24(c)(2)(i)(B)(6) for clarity. Security requirement CA.L2-3.12.4 does not have an associated point value. The OSA will not receive a -1 for a missing or incomplete SSP. The absence of an up-to-date system security plan at the time of the assessment would result in a finding that 'an assessment could not be completed due to incomplete information and noncompliance with DFARS clause 252.204-7012.' The rule has been updated in § 170.24(c)(6) to clarify this.

e. Artifacts

Comment: Several comments and requests for clarification dealt with artifacts that are reviewed or created during a CMMC assessment, or as part of compliance with other contractual requirements, including DFARS clause 252.204-7012. Some commenters asked whether standardized SSP and POA&M templates would be provided to assist with compliance. Other templates requested included pre-assessment planning materials, final assessment reports, and the resulting Certificate of CMMC Status.

We recognize that emergencies or other occurrences may render it infeasible for a regulated entity to use MFA, so we propose a second exception for when MFA is infeasible during an emergency or other occurrence that adversely affects the regulated entity's relevant electronic information systems or the confidentiality, integrity, or availability of ePHI. [779] For the proposed exception to apply, a regulated entity would be required to implement reasonable and appropriate compensating controls in accordance with its contingency plan [780] and emergency access procedures. [781] For example, if an optical scanner used by a regulated entity as one of the required factors for MFA is rendered inoperable (e.g., is temporarily broken or adversely affected by a cyberattack), a compensating control may be to temporarily allow users to log in with their user name and a unique password, rather than with a PIN and retinal scan. The Department would make this proposed exception applicable only for the limited period of time in which MFA is infeasible for the regulated entity during the emergency or other occurrence, regardless of whether the emergency or other occurrence continues. At proposed 45 CFR 164.312(f)(2)(iii)(C) , we propose three exceptions that would be for a technology asset in use that is a device within the meaning of section 201(h) of the Food, Drug, and Cosmetic Act that has been authorized for marketing by the FDA. The first would be for a device authorized by the FDA for marketing pursuant to a submission received before March 29, 2023, while the second would be for a device authorized by the FDA for marketing pursuant to a submission received on or after March 29, 2023, that is no longer supported by its manufacturer. In both cases, the exception would only apply where, the regulated entity has deployed any updates or patches required or recommended by the manufacturer of the device. Similar to our proposal for exceptions to encryption at proposed 45 CFR 164.312(b)(3)(iv)(A) and (B) , we recognize that some regulated entities may incur costs of replacing legacy devices because of the limitations on the proposed exception to MFA where a device was submitted to the FDA for authorization before March 29, 2023 or a device submitted for authorization on or after that date that is no longer supported by its manufacturer. [782] However, as discussed above, such devices can pose significant risks to the confidentiality, integrity, and availability of ePHI. [783]

(4) Notification sent to the last known address of the individual as reflected in the records is considered a reasonable effort to notify. (5) Make a disclosure accounting each time a record is disclosed under a court order or compulsory legal process. (I) Disclosures to Consumer Reporting Agencies. (1) Certain personal information may be disclosed to consumer reporting agencies as provided in the Federal Claims Collection Act (31 U.S.C. 3711(e)). (2) Under the provisions of paragraph (I)(1) of this section, the following information may be disclosed to a consumer reporting agency: (i) Name, address, taxpayer identification number (SSN), and other information necessary to establish the identity of the individual. (ii) The amount, status, and history of the claim. (iii) The Agency or program under which the claim arose. (3) The Federal Claims Collection Act (31 U.S.C. 3711(e)) requires the system notice for the system of records from which the information will be disclosed, indicates that the information may be disclosed to a consumer reporting agency.

§ 310.23 Disclosures to commercial enterprises. (a) General policy. (1) Make releases of personal information to commercial enterprises under the criteria established by 32 CFR part 286 . (2) The relationship of commercial enterprises to their clients or customers and to the Department of Defense is not changed by this part. (3) The DoD policy on personal indebtedness for military personnel is contained 32 CFR part 112 , 'Indebtedness of Military Personnel,' and for civilian employees in 5 CFR part 735 . (b) Release of personal information. (1) Any information that must be released under 32 CFR part 286 , the 'DoD Freedom of Information Act Program,' may be released to a commercial enterprise without the individual's consent (see paragraph (b) of § 310.22). (2) Commercial enterprises may present a signed consent statement setting forth specific conditions for release of personal information. Statements such as the following, if signed by the individual, are considered valid: I hereby authorize the Department of Defense to verify my Social Security Number or other identifying information and to disclose my home address and telephone number to authorized representatives of (name of commercial enterprise) so that they may use this information in connection with my commercial dealings with that enterprise. All information furnished shall be used in connection with my financial relationship with (name of commercial enterprise). (3) When a statement of consent as outlined in paragraph (b)(2) of this section is presented, provide the requested information if its release is not prohibited by some other regulation or statute. (4) Blanket statements of consent that do not identify the Department of Defense or any of its Components, or (printed page 18774)

manufacture, process, pack, transport, distribute, receive, hold, or import the finished container that contacts food and foreign based transporters that transport food in the United States are assumed to not incur additional records maintenance costs. FDA assumes the 34,634 convenience store facilities will spend 2.5 hours per year and that persons who directly market food are excluded from the rule. All other facilities (344,859) will spend 13 hours per year on additional records maintenance at an hourly cost of \$25.10. The undiscounted total additional records maintenance costs 2 years following enactment of the rule are \$70,745,000. After 3 years, and for each subsequent year, the undiscounted additional records maintenance costs are \$114,701,000. The annual costs for records access planning and for records retention for all persons are assumed to be zero in the final rule. The following table includes the estimated reduction in benefits relative to the proposal from policy options that would exclude select sectors from recordkeeping requirements, or that would relax certain provisions, which are considered in detail earlier in this analysis. The benefits from each policy option are ranked by size, so that policy options that would result in large reductions in benefits relative to the proposal are ranked highest, where a ranking of one represents the largest reduction in benefits relative to the proposal. The reduction in benefits from relaxing the requirement for all persons to establish and maintain records containing lot numbers is very high. With lot codes contained on all records, the duration of a traceback investigation for many products would likely be between 1 and 14 days (estimated current times for many packaged products that contain all lot code information on the package). Relaxing the lot code requirement may increase the traceback times of these products to between 6 to 8 weeks (estimated current times for many fresh products not accompanied by lot code information). Relaxing the requirement for all records to contain lot code information leads to the largest reduction in benefits relative to the baseline.

) An assessment and documentation of the security measures the covered entity or business associate uses to ensure the confidentiality, integrity, and availability of the electronic protected health information created, received, maintained, or transmitted by the covered entity or business associate. (5) A reasonable determination of the likelihood that each threat identified in accordance with paragraph (a)(2)(ii)(A)(2) of this section will exploit the vulnerabilities identified in accordance with paragraph (a)(2)(ii)(A)(3) of this section. (6) A reasonable determination of the potential impact of each threat identified in accordance with paragraph (a)(2)(ii)(A)(2) of this section successfully exploiting the vulnerabilities identified in accordance with paragraph (a)(2)(ii)(A)(3) of this section. (printed page 1013) (7) An assessment of risk level for each threat identified in accordance with paragraph (a)(2)(ii)(A)(2) of this section and vulnerability identified in accordance with paragraph (a)(2)(ii)(A)(3) of this section, based on the determinations made in accordance with paragraphs (a)(2)(ii)(A)(5) and (6) of this section. (8) An assessment of the risks to electronic protected health information posed by entering into or continuing a business associate contract or other written arrangement with any prospective or current business associate, respectively, based on the written verification obtained from the prospective or current business associate in accordance with

paragraph (b)(1) of this section. (B) Maintenance. Review, verify, and update the written assessment on an ongoing basis, but at least once every 12 months and, in accordance with paragraph (a)(1)(ii)(C)(2) of this section, in response to a change in the covered entity's or business associate's environment or operations that may affect electronic protected health information. (3) Standard: Evaluation ·(i) General. Perform a written technical and nontechnical evaluation to determine whether a change in the covered entity's or business associate's environment or operations may affect the confidentiality, integrity, or availability of electronic protected health information. (ii) Implementation specifications ·(A) Performance. Perform a written technical and nontechnical evaluation within a reasonable period of time before making a change in the covered entity's or business associate's environment or operations as described in paragraph (a)(1)(ii)(C)(2) of this section. (B) Response. Respond to the written technical and nontechnical evaluation in accordance with the covered entity's or business associate's risk management plan required by paragraph (a)(5)(ii)(A) of this section. (4) Standard: Patch management ·(i) General. Implement written policies and procedures for applying patches and updating the configuration(s) of the covered entity's or business associate's relevant electronic information systems. (ii) Implementation specifications ·(A) Policies and procedures.

This publication describes an approach for the development of Information Security Continuous Monitoring (ISCM) program assessments that can be used to evaluate ISCM programs within federal, state, and local governmental organizations and commercial enterprises. An ISCM program assessment provides organizational leadership with information on the effectiveness and completeness of the organization's ISCM program, including the review of ISCM strategies, policies, procedures, operations, and analysis of continuous monitoring data. The ISCM assessment approach can be used as presented or as the starting point for an organization-specific methodology. It includes example evaluation criteria and assessment procedures that can be applied to organizations. Organizations need a way to determine and evaluate if an established ISCM program is effectively managing the organization's security posture commensurate with risk. This publication describes one approach to developing an ISCM program assessment based on evaluation criteria derived from multiple sources, (including NIST Special Publications (SP) 800-137, Information Security Continuous Monitoring (ISCM) for Federal Information Systems and Organizations, SP 800-37, Risk Management Framework for Information Systems and Organizations: A Life Cycle Approach for Security and Privacy, SP 800-39, Managing Information Security Risk: Organization, Mission and Information System View, and Office of Management and Budget (OMB) Circulars and Memoranda). An ISCM program assessment developed under guidance in this publication evaluates the ISCM program itself (i.e., the structure and governance of the ISCM program), not the results of the ISCM program or the continuous monitoring technologies used. An effective ISCM program assessment provides consistent results regardless of the entity conducting the assessment.

3.6.4 | Secure Subsystem Approach | 10-11 10-11 | | 3. 3.6.4 Secure Subsystem Approach : TSie idea behind the secure subsystem approach is to have the host operating system environment so configured that only the data management system may be used.

(d) When a DoD Component makes a determination to grant a request for access in whole or in part, the DoD Component shall notify the requester in writing or simply provide the requested record. The response to the request may be made in lieu of the acknowledgment of receipt provided the response will be made within 10 days (excluding Saturdays, Sundays, and legal public holidays). The DoD Component shall inform the requester of any fee charged for duplication of the record(s). If the request is made in person, the individual may receive the records directly in a manner not unreasonably disruptive of the DoD Component's operations, upon payment of any applicable fee. If the individual is accompanied by another person, the individual may be required to authorize in writing any discussion of the records in the presence of the other person. (e) A DoD Component denying a request for access in any respect shall notify the requester of that determination in writing. (1) The notice of denial consists of: (i) A determination to withhold any requested record in whole or in part; (ii) A determination that a requested record does not exist or cannot be located; or (iii) A determination that what has been requested is not a record subject to the Privacy Act. (2) The denial notification letter shall be signed by the head of the DoD Component, or the DoD Component head's designee, and shall include: (i) The date of the denial; (ii) A brief statement of the reason(s) for the denial, including any Privacy Act exemption(s) applied by the DoD Component in denying the request; and (iii) A statement that the denial can be appealed within 60 calendar days in accordance with § 310.6. The statement will include the position title and the

address of the appellate authority. § 310.6 Appeals from denials of requests for access to records. (a) If the requester is dissatisfied with a DoD Component's response, the requester can appeal an adverse determination denying the request to the appellate authority listed in the notification of denial letter. The appeal must be made in writing, and it must be postmarked within 60 calendar days of the date of the letter denying the initial request for records. The letter of appeal should include a copy of the DoD Component's determination (including the assigned request number, if known). For the quickest possible handling, the appeal letter and the envelope should be marked: ·Privacy Act Appeal·.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. The author, Vincent C. Hu of the National Institute of Standards and Technology (NIST), wishes to thank Isabel Van Wyk and Jim Foti (NIST) who reviewed drafts of this document. The author also gratefully acknowledges and appreciates the comments and contributions made by government agencies, private organizations, and individuals in providing direction and assistance in the development of this document.

Numerous comments asked the DoD to expand on the definition, explanation, and guidance for Security Protection Data (SPD) and Security Protection Assets (SPA). Several other comments requested that the rule and supplemental documents add or expand definitions for ·Asset·, including various specific types of assets like ·Technology Assets·, ·Personnel Assets·, ·Organizational Assets·, ·Specialized Assets·. Some comments asked to modify the definition for ·Security Protection Asset·, ·CUI Asset·, ·FCI Asset·, and ·Out-of-Scope Assets·. Response: The DoD modified the rule to add a definition for ·Security Protection Data (SPD)·. The DoD considered the NIST definitions for ·System Information· and ·Security Relevant Information· in the development of the new SPD definition. CMMC does not regulate the OSA's SPD, but instead implements existing regulatory requirements for the safeguarding of CUI. The DoD does not agree with the statement that the ESP definition conflates SPA with CUI assets. The definition of Security Protection Assets is consistent with its application in the NIST SP 800-171 R2 abstract. The phrase ·FCI Assets are part of the Level 1 CMMC Assessment Scope and are assessed against all CMMC Level 1 requirements· was removed from the rule. The DoD declined to rephrase the term ·CUI Assets·. The DoD reviewed the recommended edit and declined to make an update to ·Out-of-Scope Assets·. The definition, as written, provides a clear distinction with Security Protection Assets (SPAs). b. Senior Official Comment: Several comments asked for additional definition or guidance about the Senior Official role. Response: The DoD modified the rule to replace all references to the ·Senior Official· with ·Affirming Official· and provided additional clarity on this term. It is beyond the purview of the DoD to define technical qualifications for an OSA Affirming Official. c. ESP/CSP/MSP Comment: Some comments asked for additional clarification of the terms related to External Service Providers (ESPs) and Cloud Service Providers (CSPs). Two comments requested the rule add a definition and acronym for ·Managed Service Provider·. Response: The DoD received numerous comments about the use of ESPs which do not process, store, or transmit CUI. In response to these comments, the DoD modified the rule to reduce the assessment burden on ESPs. An ESP that utilizes staff augmentation, where the OSA provides all processes, technology, and facilities, does not require a CMMC assessment. The rule was also updated to add a definition of ·CSP· that is based on the NIST SP 800-145 Sept2011 definition of cloud computing. The term ·Managed Service Provider· is not used in the rule; therefore, the acronym was removed from § 170.4. d. IoT/OT/ICS Comment: Several comments recommended DoD clarify the definition of IoT, OT, and ICS. Regarding IoT, one comment requested the rule specify that the exchange of data and information between devices occurs over the internet. Response:

This guidance applies to contracts involving a custom-build system. Contractors will reference the current version of this guidance for considerations, concepts, tasks, and activities to be taken when designing a system. As such, the Government assumes all 6 contractors awarded a contract involving a custom-build, non-cloud FIS will expend effort to read and familiarize themselves with the publication and make any requisite adjustments to their security design process to be compliant with the guidance. It is estimated that a contractor will expend approximately 40 hours reading to become more familiar and adjusting the FIS design process to comply with NIST SP 800-160 Volume 1 in year one. Using an average loaded wage rate of \$91.10 for FIS occupations, the total estimated labor cost for a contractor to comply with NIST SP 800-160 Volume 1 is approximately \$3,600 (40 hours * \$91.10). vii. NIST SP 800-160, Volume 2. When requested by the Government, contractors will reference the current version of this guidance to select, adapt, and use cyber resiliency constructs for new systems, system upgrades, or repurposed systems. This guidance applies to contracts involving a custom-build system. As such, the Government assumes all 6 contractors awarded a (printed page 68408) contract involving a custom-build, non-cloud FIS will expend effort to read and become more familiar with the publication. It is estimated that a contractor will expend approximately 16 hours reading NIST SP 800-160 Volume 2 to become more familiar with its requirements in year one. Using an average loaded wage rate of \$91.10 for FIS occupations, the total estimated labor cost for a contractor to comply with NIST SP 800-160 Volume 2 is \$1,500(16 hours * \$91.10). viii. NIST SP 800-30. Contractors will reference the current version of this guidance to develop and ensure existing processes prepare for, conduct, communicate results from, and maintain risk assessments over time. This guidance is applicable to all contracts involving a custom-build system, as these processes will need to be developed for those FIS, as well as some contracts involving existing systems where current processes need to be modified to comply with the guidance. As such, the Government assumes all 6 contractors awarded a contract involving a custom-build, non-cloud FIS, and 4 (20 percent * 22) contractors awarded a contract involving an existing, non-cloud FIS will expend effort to read and better familiarize themselves with the publication and develop new or adapt existing processes to the guidance of NIST SP 800-30.

(2) Before issuing a solicitation for the procurement of an end product identified by a material identifier that is available as described at PGI 204.7603, the contracting officer shall ensure a SPRS item risk search has been performed and shall consider any item risk warnings provided. When evaluating quotations or offers for an end product identified by a material identifier, a SPRS item risk search is required for any end product that did not have an item risk search performed prior to solicitation. If there are item risk warnings, the contracting officer shall consider strategies to mitigate risk, such as the following: (i) Consulting with the program office. (ii) Including mitigating requirements in the statement of work, as provided by the requiring activity. (iii) Including FAR and DFARS clauses identified in the SPRS application, as appropriate. (b) Price risk. (1) When procuring a service or an end product identified by a material identifier that is available as described at PGI 204.7603, the contracting officer shall consider price risk assessment in determining if a proposed price is consistent with historical prices paid for an item or otherwise creates a risk to the Government. Contracting officers shall not rely solely on the price risk assessment when determining prices to be fair and reasonable. (2) The contracting officer shall consider strategies to mitigate price risk, such as the following: (i) Not awarding to offerors or quoters with high risk price ratings unless there is a way to justify the price through additional price or cost analysis. (ii) Utilizing appropriate price negotiation techniques and procedures. (iii) Using price reasonableness or price realism techniques at FAR 13.106 or 15.4. See also 215.403-3 when making award decisions. (c) Supplier risk. The contracting officer shall consider supplier risk, to assess the risk of unsuccessful performance and supply chain risk, in award decisions. Supplier risk assessments in SPRS include quality, delivery, and other contractor performance information. 204.7604 Solicitation provision. Except for supplies or services exempted by DoDI 5000.79, use the provision at 252.204-7024, Notice on the Use of the Supplier Performance Risk System, in solicitations for supplies and services, including solicitations using FAR part 12 procedures for the acquisition of commercial products and commercial services. PART 208-REQUIRED SOURCES OF SUPPLIES AND SERVICES 3. Amend section 208.405 by adding paragraph (4) to read as follows: 208.405 Ordering procedures for Federal Supply Schedules. * * * * (4) See 204.7603 for procedures on the required use of the Supplier Performance Risk System (SPRS) risk assessments. (i) The contracting officer shall ensure SPRS assessments of price risk and supplier risk are considered as a part of the award decision. (printed page 17339)

AU.L2-3.3.9 · Audit Management CMMC Assessment Guide · Level 2 | Version 2.13 90 FURTHER DISCUSSION Companies should restrict access to audit logging functions to a limited number of privileged users who can modify audit logs and audit settings. General users should not be granted permissions to perform audit management. All audit managers should be privileged users, but only a small subset of privileged users will be given audit management responsibilities. Functions performed by privileged users must be distinctly separate from the functions performed by users who have audit-related responsibilities to reduce the potential of fraudulent activities by privileged users not being detected or reported. When possible, individuals who manage audit logs should not have access to other privileged functions. Example You are responsible for the administration of select company infrastructure that contains CUI, but you are not responsible for managing audit information. You are not permitted to review audit logs, delete audit logs, or modify audit log settings [b]. Full control of audit logging functions has been given to senior system administrators [a,b]. This separation of system administration duties from audit logging management is necessary to prevent possible log file tampering. Potential Assessment Considerations · Are audit records of nonlocal accesses to privileged accounts and the execution of privileged functions protected [b]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.3.9

IR.L2-3.6.1 · Incident Handling CMMC Assessment Guide · Level 2 | Version 2.13 136 Incident Response (IR) IR.L2-3.6.1 · INCIDENT HANDLING Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities. ASSESSMENT OBJECTIVES [NIST SP 800-171A]120 Determine if: [a] an operational incident-handling capability is established; [b] the operational incident-handling capability includes preparation; [c] the operational incident-handling capability includes detection; [d] the operational incident-handling capability includes analysis; [e] the operational incident-handling capability includes containment; [f] the operational incident-handling capability includes recovery; and [g] the operational incident-handling capability includes user response activities. POTENTIAL ASSESSMENT METHODS AND OBJECTS [NIST SP 800-171A]120 Examine [SELECT FROM: Incident response policy; contingency planning policy; procedures addressing incident handling; procedures addressing incident response assistance; incident response plan; contingency plan; system security plan; procedures addressing incident response training; incident response training curriculum; incident response training materials; incident response training records; other relevant documents or records]. Interview [SELECT FROM: Personnel with incident handling responsibilities; personnel with contingency planning responsibilities; personnel with incident response training and operational responsibilities; personnel with incident response assistance and support responsibilities; personnel with access to incident response support and assistance capability; personnel with information security responsibilities]. Test [SELECT FROM: Incident-handling capability for the organization; organizational processes for incident response assistance; mechanisms supporting or implementing incident response assistance]. 120 NIST SP 800-171A, p. 36.

The Department believes it is important to clarify that the requirements of the Security Rule do not only apply to electronic information systems that create, receive, maintain, or transmit ePHI. After all, cybercriminals may be able to access ePHI by leveraging vulnerabilities in some electronic information systems that do not themselves create, receive, maintain, or transmit ePHI where such information systems are connected to or otherwise affect electronic information systems that do create, receive, maintain, or transmit ePHI. For example, while a payment processing system used in a covered entity's food and beverage outlets or gift shops may not create, receive, maintain, or transmit ePHI, it may affect the confidentiality, integrity, or availability of ePHI in certain circumstances, such as where such systems are connected to the same network as servers that contain ePHI. [378] Accordingly, we would interpret an electronic information system as otherwise affecting the confidentiality, integrity, or availability of ePHI if it is insufficiently segregated physically and electronically from an electronic information system that creates, receives, maintains, or transmits ePHI or one that otherwise affects the confidentiality, integrity, or availability of ePHI. An electronic information system would also fit the category of ·otherwise affecting· if it contains information that relates to an electronic information system that creates, receives, maintains, or transmits ePHI or to another electronic information system that otherwise affects the confidentiality, integrity, or availability of ePHI. For example, a compromised

electronic information system used to provide administrative functions, such as user authentication or management of storage area network infrastructure, that does not contain ePHI may allow unauthorized access to ePHI (affecting the confidentiality of ePHI) or disruption of storage configuration data (affecting the integrity and availability of ePHI). An electronic information system that is not connected to a covered health care provider's EHR but that maintains user IDs and passwords for the EHR also may not create, receive, maintain, or transmit ePHI; however, the confidentiality, integrity, or availability of the ePHI in the EHR would be affected if an unauthorized person gained access to that electronic information system. And the same is true for an electronic information system that contains the decryption keys for a regulated entity's encryption algorithms. Thus, it is important that administrative, physical, and technical safeguards be implemented not only for electronic information systems that create, receive, maintain, or transmit ePHI, but also for electronic information systems that otherwise affect the confidentiality, integrity, or availability of ePHI. (printed page 928) 14. Adding a Definition of 'Risk' a. Issues To Address

to require a regulated entity to configure and implement technical controls to install software patches and critical updates in a timely manner in accordance with the regulated entity's patch management program. [811] The proposed standard for patch management, an administrative safeguard discussed above, would require a regulated entity to establish and implement written policies and procedures for applying patches and updating relevant electronic information system configurations, while this proposal would require the regulated entity to implement technical controls to implement those written policies and procedures. In other words, proposed 45 CFR 164.312(h)(2)(iv) addresses the technical controls to effectuate a regulated entity's patch management plan. Applying patches for technology assets, including workstations, is an effective mechanism to mitigate known vulnerabilities and limit the risk of exploitation. [812] Although older applications or devices may no longer be supported with patches for new vulnerabilities, regulated entities still must take appropriate action if a newly discovered vulnerability affects an older application or device. If an obsolete, unsupported system cannot be upgraded or replaced, additional safeguards should be implemented or existing safeguards enhanced to mitigate known vulnerabilities until upgrade or replacement can occur (e.g., increase access restrictions, remove or restrict network access, disable unnecessary features or services). [813] Deployment of such technical controls would help to ensure that a regulated entity's relevant electronic information systems are updated as quickly as possible after a vulnerability has been identified and a patch released. The proposed standard for patch management, discussed above, would work in tandem with the proposed standard for vulnerability management to ensure that regulated entities substantially reduce the risk to ePHI from known vulnerabilities. [814] Together, these proposals would clarify that a regulated entity is required to affirmatively seek out information about known vulnerabilities, assess the risks to the confidentiality, integrity, and availability of ePHI, and implement effective mechanisms through both policies and procedures and technical controls to reduce the risk, as well the actual occurrence, of breaches resulting from known vulnerabilities. For example, known vulnerabilities should be readily identified by a regulated entity through monitoring of (printed page 979)

As a result, when an adversary's attack on one supplier causes it to shut down, the defender can increase its use of the other suppliers, thus shortening the time when it is without the critical components. NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025

(B) From subsection (d) because the application of these provisions could impede or compromise an investigation or prosecution if the subject of an investigation had access to the records or were able to use such rules to learn of the existence of an investigation before it would be completed. In addition, the mere notice of the fact of an investigation could inform the subject and others that their activities are under or may become the subject of an investigation and could enable the subjects to avoid detection or apprehension, to influence witnesses improperly, to destroy evidence, or to fabricate testimony. (C) From subsection (e)(1) because during an investigation it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. In other cases, what may appear to be a relevant and necessary piece of information may become irrelevant in light of further investigation. In addition, during the course of an investigation, the investigator may obtain

information that related primarily to matters under the investigative jurisdiction of another agency, and that information may not be reasonably segregated. In the interest of effective law enforcement, DSS investigators should retain this information, since it can aid in establishing patterns of criminal activity and can provide valuable leads for Federal and other law enforcement agencies. (D) From subsections (e)(4)(G), (e)(4)(H), (e)(4)(I) and (f) because this system is exempt from subsection (d) of the Act, concerning access to records. These requirements are inapplicable to the extent that these records will be exempt from these subsections. However, DSS has published information concerning its notification and access procedures, and the records source categories because under certain circumstances, DSS could decide it is appropriate for an individual to have access to all or a portion of his/her records in this system of records. (6) [Reserved]

§ 310.23 Defense Threat Reduction Agency (DTRA) exemptions. (a) Exemption for classified material. All systems of records maintained by the Defense Threat Reduction Agency shall be exempt under section (k)(1) of 5 U.S.C. 552a, to the extent that the systems contain any information properly classified under E.O. 12598 and that is required by that E.O. to be kept secret in the interest of national defense or foreign policy. This exemption is applicable to parts of all systems of records including those not otherwise specifically designated for exemptions herein which contain isolated items of properly classified information. (1) System identifier and name. HDTRA 007, Security Operations. (i) Exemption. Portions of this system of records may be exempt from the provisions of 5 U.S.C. 552a(c)(3), (d)(1) through (d)(4), (e)(1), (e)(4)(G), (H), (I), and (f). (ii) Authority.

These competencies pulled from a 2011 U.S. Office of Personnel Management (OPM) memorandum that introduced a 'Competency Model for Cybersecurity,' which itself followed a coordinated effort with the Federal Chief Information Officers (CIO) Council and NICE in November 2009 [3]. 3 The OPM model presented 117 competencies related to four occupation series and the pay grades of personnel in those occupations. A subject matter expert panel review of the OPM model conducted at that time identified 50 competencies to align with the NICE Framework KSAs found in five of the seven categories of work. 4 3 Berry, J. (2011, February 16). U.S. Office of Personnel Management Memorandum. Competency model for cybersecurity. (k)(4) and (k)(5) may be exempt from the following subsections of 5 U.S.C. 552a : (c)(3); (d)(1), (d)(2), (d)(3), (d)(4), (d)(5); (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I); (f)(1), (f)(2), (f)(2), (f)(3), (f)(4), (f)(5). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5). (iii) Reasons. The reasons for asserting these exemptions are to ensure the integrity of an investigative or administrative process and to protect (printed page 14775) statistical records. The execution requires that information be provided in a free and open manner without fear of retribution or harassment in order to facilitate a just, thorough, and timely resolution during an investigation or administrative action. Disclosures from this system can enable individuals to conceal their wrongdoing or mislead the course of the investigation by concealing, destroying, or fabricating evidence or documents. In addition, disclosures can subject sources and witnesses to harassment or intimidation which may cause individuals to not seek redress for concerns about occupational safety, health, environmental issues and accident reporting. Information is used to comply regulatory reporting requirements. § 310.21 Defense Logistics Agency (DLA) exemptions. (a) The Director, DLA or designee may claim an exemption from any provision of the Privacy Act from which an exemption is allowed. (b) An individual is not entitled to access information that is compiled in reasonable anticipation of a civil action or proceeding. The term civil action or proceeding is intended to include court proceedings, preliminary judicial steps, and quasi-judicial administrative hearings or proceedings (i.e., adversarial proceedings that are subject to rules of evidence). Any information prepared in anticipation of such actions or proceedings, to include information prepared to advise DLA officials of the possible legal or other consequences of a given course of action, is protected. The exemption is similar to the attorney work-product privilege except that it applies even when the information is prepared by non-attorneys. The exemption does not apply to information compiled in anticipation of criminal actions or proceedings. (c) Exempt Records Systems. All systems of records maintained by the Defense Logistics Agency will be exempt from the access provisions of 5 U.S.C. 552a(d) and the notification of access procedures of 5 U.S.C. 552a(e)(4)(H) pursuant to 5 U.S.C. 552a(k)(1) to the extent that the system contains any information properly classified under Executive Order 13526 and which is required by the Executive Order to be kept secret in the interest of national defense or foreign policy. This exemption, which may be applicable to parts of all DLA systems of records, is necessary because certain record systems not otherwise specifically designated for exemptions herein may contain isolated items of information which have been properly classified. (1) System identifier and name. S170.04 (Specific exemption), Debarment and Suspension Files. (i)

(G) For records that are copies of exempt records from external systems of records, such records are only exempt from pertinent provisions of 5 U.S.C. 552a to the extent such provisions have been identified and an exemption claimed for the original record and the purposes underlying the exemption for the original record still pertain to the record that is now contained in this system of records. In general, the exemptions were claimed to properly protect classified information relating to national defense and foreign policy; to avoid interference during the conduct of criminal, civil, or administrative actions or investigations; to ensure protective services provided to the President and others are not compromised; to protect records used solely as statistical records; to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations; to preserve the confidentiality and integrity of Federal testing materials; and to safeguard evaluation materials used for military promotions when provided by a confidential source. The exemption rule for the original records will identify the specific reasons the records are exempt from specific provisions of 5 U.S.C. 552a. (h) Exempt OPM records. Three Office of Personnel Management systems of records apply to Army employees, except for non-appropriated fund employees. These systems, the specific exemptions

determined to be necessary and proper, the records exempted, provisions of the Privacy Act from which exempt, and justification are set forth below: (1) Personnel Investigations Records (OPM/CENTRAL-9). (i) Exemption. (A) Information specifically authorized to be classified under E.O. 12958, as implemented by DoD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1). (B) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2), may be exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (C) Records maintained in connection with providing protective services to the President of the United States or other individuals pursuant to Title 18 U.S.C. 3056 may be exempt pursuant to 5 U.S.C. 552a(k)(3). (D) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5), but only to the extent that such material would reveal the identity of a confidential source.

In addition, DCMA DIBCAC is responsible for leading the Department's contractor cybersecurity risk mitigation efforts. As part of this work, the DIBCAC assesses the defense industrial base companies to ensure they are meeting contractually required cybersecurity standards. The DIBCAC team ensures contractors have the ability to protect controlled unclassified information for government contracts they are awarded. DIBCAC conducts NIST SP 800-171 assessments in support of DFARS clause 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting, and DFARS clause 204.204-7020, NIST SP 800-171 DoD Assessment Requirements. The DFARS 204.204-7020 DIBCAC prioritization process is designed to adjust as DoD's cyber priorities evolve based on ongoing threats. DIBCAC analysts collect and analyze data on DoD contractors to include: Mission critical programs, technologies, and infrastructure and the contractors (prime or lower tier) that support DoD capabilities. Cyber threats, vulnerabilities, or incidents. DoD Leadership requests. Regulatory Impact Analysis FAR Subpart 4.19 and DFARS clause 252.204-7012 address safeguarding of FCI and CUI in contractor information systems and prescribe contract clauses requiring protection of FCI and CUI within the supply chain. The FAR and DFARS requirements for safeguarding FCI and CUI predate the CMMC Program by many years, and baseline costs for their implementation are assumed to vary widely based on factors including, but not limited to, company size and complexity of the information systems to be secured. FAR clause 52.204-21 is prescribed at FAR section 4.1903 for use in solicitations and contracts when the contractor or subcontractor at any tier may have FCI residing in or transiting through its information system. This clause requires contractors and subcontractors to apply basic safeguarding requirements and procedures to protect applicable contractor information systems that process, store, or transmit FCI. In addition, DFARS clause 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting, is prescribed at DFARS section 204.7304(c) for use by DoD in all solicitations and contracts, including solicitations and contracts using FAR part 12 procedures for the acquisition of commercial items, except for solicitations and contracts solely for the acquisition of commercially available off-the-shelf items. This clause applies when a contractor information system processes, stores, or transmits covered defense information and requires contractors and subcontractors to provide adequate security to safeguard that information when it resides on or transits through a contractor information system, and to report cyber incidents that affect that system or network. The clause states that to provide adequate security, the contractor shall implement, at a minimum, the security requirements in National Institute of Standards and Technology (NIST) Special Publication (SP) 800-171 R2,

via email or messaging technologies implemented by the covered entity. At proposed 45 CFR 164.312(b)(4)(i), the Department proposes to require that where a proposed exception applies, a regulated entity would also be required to implement an alternative measure or measures that are reasonable and appropriate compensating controls under proposed 45 CFR 164.312(b)(4)(ii). Compensating controls would be implemented in the place of encryption to protect ePHI from unauthorized access. [745] The Department does not propose to require that compensating controls be limited to technical controls. Rather, a regulated entity should consider the nature of the exception, operating environment, and other appropriate circumstances to determine what controls are reasonable and appropriate and implement compensating controls effective for those circumstances. For example, a regulated entity may use physical access controls, such as physically

limiting access to a device, in combination with other controls to compensate for the absence of encryption. Proposed paragraph (b)(4)(ii)(A) would require that if the regulated entity has determined that an exception applies, it must secure ePHI by implementing reasonable and appropriate compensating controls that are reviewed and approved by the regulated entity's designated Security Official. Because exceptions are a departure from the Security Rule framework, the Department proposes to ensure appropriate focus and review by the Security Official of the controls chosen to compensate for the absence of encryption. With respect to the exception at proposed 45 CFR 164.312(b)(3)(iv)(C), the Department proposes at paragraph (b)(4)(ii)(B) to presume that a regulated entity had implemented reasonable and appropriate compensating controls where the regulated entity has deployed the security measures prescribed and as instructed by the FDA-authorized label for the device. This would include any updates, including patches recommended or required by the manufacturer of the device. The proposed language recognizes that while the device's label may not specifically require deployment of an encryption solution, it may provide for a specific compensating control and the manner in which that control is to be implemented. While not required, a regulated entity would be permitted to implement additional alternative security measures and compensating controls in accordance with best practices and/or its risk analysis. Finally, at proposed paragraph (b)(4)(ii)(C), the Department proposes to require that the regulated entity's Security Official review and document the implementation and effectiveness of the compensating controls during any period in which such compensating controls are in use to continue securing ePHI and relevant electronic (printed page 971)

(9) Conducting FOIA training if it involves issues of DoD policy. (10) Making final determination of requests for expedited processing, fee category, and fee waivers. (m) Records management. FOIA records shall be maintained and disposed of in accordance with the National Archives and Records Administration General Records Schedule and DoD Component records schedules. (n) Relationship between the FOIA and the Privacy Act. Not all requesters are knowledgeable of the appropriate statutory authority to cite when requesting records, nor are all of them aware of appeal procedures. In some instances, requesters may cite either the FOIA or 5 U.S.C. 552a, commonly known as the Privacy Act, or they may cite neither the FOIA nor the Privacy Act but will imply one or both. For these reasons, the below guidelines are provided to ensure requesters receive the greatest access rights under both statutes. Privacy Act requests can be made only by requesters asking for information on themselves contained within a Privacy Act system of records. If the requested information is on another person, the Privacy Act does not apply. These requests shall be processed under the FOIA. (1) Requesters who seek records about themselves contained in a Privacy Act system of records, and who cite or imply the FOIA and/or the Privacy Act, will have their requests processed under the provisions of both the Privacy Act and the FOIA. If the Privacy Act system of records is exempt from the provisions of 5 U.S.C. 552a(d)(1), and if the records, or any portion thereof, are (printed page 71852) exempt under the FOIA, the requester shall be so advised with the appropriate Privacy Act and FOIA exemption(s). Appeals shall be processed under both the FOIA and the Privacy Act. (2) Requesters who seek records about themselves that are not contained in a Privacy Act system of records and who cite or imply the Privacy Act will have their requests processed under the provisions of the FOIA, since the Privacy Act does not apply to these records. Appeals shall be processed under the FOIA. (3) Requesters who seek access to agency records and who cite or imply the FOIA will have their requests and appeals processed under the FOIA. (4) If the record is required to be released under the FOIA, the Privacy Act does not bar its disclosure. Unlike the FOIA, the Privacy Act applies only to U.S. citizens and aliens admitted for permanent residence. (5) Requesters shall be advised in the final response letter which statutory authorities were used, inclusive of appeal rights. (o) Non-responsive information in responsive records.

This guide provides example proof-of-concept solutions demonstrating how available open-source and commercial off-the-shelf (COTS) products could be implemented in discrete-based manufacturing environments to satisfy the requirements in the Cybersecurity Framework (CSF) Manufacturing Profile Low Impact Level. The example proof-of-concept solutions include measured network, device, and operational performance impacts observed during the implementation. Manufacturers should make their own determinations about the breadth of the proof-of-concept solutions they voluntarily implement. Some important factors to consider include: company size, cybersecurity expertise, risk tolerance, and the threat landscape. The CSF Manufacturing Profile can be used as a roadmap for managing cybersecurity risk for manufacturers and is aligned with manufacturing sector goals and industry best practices. The Manufacturing Profile provides a voluntary, risk-based approach for managing cybersecurity activities and cyber risk to manufacturing systems. The Manufacturing Profile is meant

to complement but not replace current cybersecurity standards and industry guidelines that the manufacturer is embracing. This guide describes a proof-of-concept solution for securing manufacturing environments that has only been tested in a lab environment. Manufacturers should make their own determinations about the breadth of the proof-of-concept solutions they voluntarily implement. Some important factors to consider include: company size, cybersecurity expertise, risk tolerance, and the threat landscape. We welcome feedback on its contents and your input. Comments, suggestions, and success stories will improve subsequent versions of this guide. Please contribute your thoughts to CSF_Manufacturing_Profile_Implementation@nist.gov. The example proof-of-concept solutions include measured network, device, and operational performance impacts observed during the implementation.

(Comment 41) One comment states that a "retail facility" is defined as a facility that sells food directly to consumers only. Thus, a warehouse store or "cash and carry" store that sells food both to consumers and to commercial accounts would not qualify for this exemption. As the name implies, a "cash and carry" store sells food products to anyone who wishes to buy bulk quantities in cash transactions (e.g., from an individual consumer planning a party or providing for a large family to intermittent supply to restaurants). Such stores typically do not retain detailed records of cash sales. For cash and carry stores that do engage in regular commercial transactions, or which provide credit to commercial customers, ordinary business practices should normally generate records that could be tailored to serve the requirements of the proposed rule. FDA should clarify that, if an entity conducts both exempt and nonexempt activities at the same location, it would be required to retain records only with respect to its nonexempt activities. Under such a clarification, a "cash and carry" store that sells food to individual consumers would not be required to maintain records regarding its retail sales to consumers. The comment requests that the agency adopt and confirm this interpretation.

·Discussion of performance and effectiveness of Federal Risk and Authorization Management Program

(FedRAMP) and cloud computing for the Federal Government, ·Discussion on Executive Order 13556 , Controlled Unclassified Information (CUI), and safeguarding information, ·Panel Discussion of US-CERT · United States Computer Emergency Readiness·Use and Outcomes, ·Discussion on Advancing Information Security in Medical Technologies and Medical Devices, and ·Updates on NIST Computer Security Division. Note that agenda items may change without notice. The final agenda will be posted on the Web site indicated above. Seating will be available for the public and media. Public Participation: The ISPAB agenda will include a period of time, not to exceed thirty minutes, for oral comments from the public (Friday, June 13, 2014, between 9:30 a.m. and 10:00 a.m.). Speakers will be selected on a first-come, first-served basis. Each speaker will be limited to five minutes. Questions from the public will not be considered during this period. Members of the public who are interested in speaking are requested to contact Annie Sokol at the contact information indicated in the FOR FURTHER INFORMATION CONTACT section of this notice. Speakers who wish to expand upon their oral statements, those who had wished to speak but could not be accommodated on the agenda, and those who were unable to attend in person are invited to submit written statements. In addition, written statements are invited and may be submitted to the ISPAB at any time. All written statements should be directed to the ISPAB Secretariat, Information Technology Laboratory, 100 Bureau Drive, Stop 8930, National Institute of Standards and Technology, Gaithersburg, MD 20899-8930. Dated: May 12, 2014. Willie E. May, Associate Director for Laboratory Programs. [FR Doc. 2014-11424 Filed 5-15-14; 8:45 am] BILLING CODE 3510-13-P

3.3.1 | Example 1: Incident Response Roster ... 3.3.1 Example 1: Incident Response Roster A Federal government agency maintains an electronic roster of its computer incident response team members.

documents describing the Department's data governance role because the content is beyond the scope of CMMC requirements. The DoD issued policy guidance to its program managers regarding programmatic indicators to consider when selecting CMMC requirements. Program managers have a vested interest in knowing whether a contractor can comply with these existing requirements to adequately safeguard CUI. The DoD elected not to make any recommended edits to the CMMC Program related to FCI or CUI marking requirements or provide clarifying examples of the differences between Basic CUI and Specified CUI, as these are beyond the scope of this rule. Mishandling of information by the government is beyond the scope of this rule. DCMA DIBCAC processes, stores, and transmits all data on DoD-approved networks. DoD's adherence to NARA's CUI Program policies is beyond the scope of this rule. d. Applicability and Governance of CUI Requirements Comment: In addition, one utilities sector representative submitted a lengthy analysis of data types often generated by electric or other utilities, with regulatory references and rationale for why such data would not likely be subject to DoD's CUI safeguarding requirements or CMMC compliance assessments. Such rationale included the fact that some Government-Private CUI categories, such as DoD Critical Infrastructure Information, require explicit designation in that category which (according to the commenter) has not occurred in the electricity subsector. One contractor requested that CMMC clarify requirements around U.S. persons and foreign dissemination of CUI for both contractors, subcontractors' employees, and contingent workers. Two comments suggested it would be appropriate to reference data governance in §.170.1 and the DoD's role as the data owner of FCI and CUI across the ecosystem. Another comment stated the classification efforts must themselves be audited. Response: The quantity of FCI and CUI a defense contractor possesses, including copies of the same material, is irrelevant to the CMMC assessment required. All copies of FCI or CUI related to the DoD contract must be safeguarded. The CMMC Program is not intended to validate compliance with cybersecurity requirements of non-DoD agencies' contracts. The requirements for sharing of CUI with non-US persons is beyond the scope of this rule. The CMMC program provides a mechanism to assess contractor compliance with applicable security requirements for the safeguarding of FCI or CUI. CMMC program requirements make no change to existing policies for information security requirements implemented by DoD. Policies for CUI and creation of program documentation, to include Security Classification Guides, are separate from this rule. Discussion in this rule regarding DoD programs providing CUI training and the implementation of E.O. 13556 are beyond the scope of this rule.

The tool assumes if there are costs in the first month of the program there will be a Progress Based Payment in the first month of the program. Invoices for PBP's are submitted after the end of the month and thus cannot be paid before about the middle of the 2nd month of the program. This flaw skews the results by assuming the contractor receives payment nearly a month before it is possible. The tool does not provide a mechanism for adjusting calculations based on specific contract requirements when such requirements impact payment lag time either positively or negatively. The

PBP tool is intentionally structured to keep a contractor cash flow negative regardless of how well the contractor performs. Response: The DoD tool takes into account a 22-day lag time between when expenditures occur and when progress payments are made. This accounts for the fact that all expenditures do not occur on the first day of a month or the last day. This is an industry average, and does not accommodate unique lag times by contract. Contractors are supposed to have a positive investment in the effort. FAR 32.1004(b)(3)(ii) states that the contracting officer must ensure that PBPs are not expected to result in an unreasonably low or negative level of contractor investment in the contract. Therefore, contracting officers are still required to use the PBP analysis tool to objectively measure both the benefits and risks of the PBP financing arrangement, and negotiate a mutually beneficial settlement position that reflects adequate consideration to the Government for the improved contractor cash flow. However, the PBP Tool has been revised to remove the cost limitation in accordance with this final rule.

3. Compliance With Generally Accepted Accounting Principles

a. Audited financial statement. Comment: One respondent found the requirement to evidence compliance with Generally Accepted Accounting Principles (GAAP) through audited financial statements burdensome to the contractor. Response: The requirement that the contractors compliance with GAAP must be evidenced through audited financial statements has been removed from the final rule.

b. Make language of rule mirror the statute. Comment: One respondent was concerned that the proposed DFARS rule does not exactly mirror the statute when it requires that the output of a contractor's accounting system shall be in compliance with GAAP, whereas the statute requires a contractor's accounting system to be in compliance (or noncompliance) with GAAP. Response: The wording of the statute is imprecise, because an accounting system cannot be in compliance with GAAP. Compliance with GAAP means that the financial statements are fairly presented, i.e.,

(A) The blanket routine use for Congressional Inquiries (see Appendix C, section D) applies to all systems. When an individual requests the assistance of the Congressional member, the blanket routine use permits the disclosure of records pertaining to the individual without the express written consent of the individual. (B) If necessary, accept constituent letters requesting a member of Congress to investigate a matter pertaining to the individual as written authorization to provide access to the records to the congressional member or his or her staff. (C) When a Congressional inquiry indicates that the request is being made on the basis of a request from the individual to whom the record pertains, consent can be inferred even if the constituent request is not provided the Component. The verbal statement by a Congressional staff member is acceptable to establish that a request has been received by the Member of Congress from the person to whom the records pertain. (D) If the constituent inquiry is being made on behalf of someone other than the individual to whom the record pertains, the Member of Congress shall be provided only that information releasable under DoD 5400.7-R. Advise the Congressional member that the written consent of the individual to whom the record pertains is required before any additional information may be disclosed. Do not contact individuals to obtain their consents for release to Congressional members unless a Congressional office specifically requests that this be done. (E) Nothing in paragraph (i)(2)(ii)(A) of this section prohibits a Component, when appropriate, from providing the record directly to the individual and notifying the Congressional office that this has been done without providing the record to the Congressional member. (3) See paragraph (e) of § 310.20 for the policy on assessing fees for Members of Congress. (4) Make a disclosure accounting each time a record is disclosed to either House of Congress, to any committee, joint committee, or subcommittee of Congress, or to any congressional member. (j) Disclosures to the General Accountability Office. Records may be disclosed to the Comptroller General, or any of his authorized representatives, in the course of the performance of the duties of the General Accountability Office. (k) Disclosures under court orders. (1) Records may be disclosed without the consent of the person to whom they pertain under a court order signed by a judge of a court of competent jurisdiction. (2) When a record is disclosed under this provision, make reasonable efforts to notify the individual to whom the record pertains, if the legal process is a matter of public record. (3) If the process is not a matter of public record at the time it is issued, seek information as to when the process is to be made public and make reasonable efforts to notify the individual at that time.

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and

privacy of other than national security-related information in federal information systems. Smart inverters used in home and small business solar power systems are examples of IoT devices. IR 8259, Foundational Cybersecurity Activities for IoT Device Manufacturers [7], describes its guidance as applying to devices that 'have at least one transducer (sensor or actuator) for interacting directly with the physical world and at least one network interface (e.g., Ethernet, Wi-Fi, Bluetooth, Long-Term Evolution [LTE], Zigbee, Ultra-Wideband [UWB]) for interfacing with the digital world.' Smart inverters sense the state of the power grid, provide power to the grid, and communicate with owners and grid operators through communications interfaces that satisfy this description. Emerging inverter controllers may also require the autonomous exchange of information between inverters. Hence, the general cybersecurity guidance presented in IR 8259 [7] is applicable to smart inverters.

(n) The Surgeon General/Commander, U.S. Army Medical Command, is authorized to act on requests for medical research and development records, and the medical records of active duty military personnel, dependents, and persons given physical examination or treatment at DA medical facilities, to include alcohol and drug treatment/test records. (o) The Chief of Chaplains is authorized to act on requests for records involving ecclesiastical relationships, rites performed by DA chaplains, and nonprivileged communications relating to clergy and active duty chaplains' military personnel files. (p) The Judge Advocate General is authorized to act on requests for records relating to claims, courts-martial, legal services, administrative (q) The Chief, National Guard Bureau, is authorized to act on requests for all personnel and medical records of retired, separated, discharged, deceased, and active Army National Guard military personnel, including technician personnel, unless such records clearly fall within another Denial Authority's responsibility. This authority includes, but is not limited to, National Guard organization and training files; plans, operations, and readiness files, policy files, historical files, files relating to National Guard military support, drug interdiction, and civil disturbances; construction, civil works, and ecology records dealing with armories, facilities within the States, ranges, etc.; Equal Opportunity investigative records; aviation program records and financial records dealing with personnel, operation and maintenance, and equipment budgets. (r) The Chief, Army Reserve and Commander, U.S. Army Reserve Command are authorized to act on requests for all (printed page 46067) personnel and medical records of retired, separated, discharged, deceased, and reserve component military personnel, and all U.S. Army Reserve (USAR) records, unless such records clearly fall within another Denial Authority's responsibility. Records under the responsibility of the Chief, Army Reserve and the Commander, U.S. Army Reserve Command include records relating to USAR plans, policies, and operations; changes in the organizational status of USAR units; mobilization and demobilization policies, active duty tours, and the Individual Mobilization Augmentation program; and all other Office of the Chief, Army Reserve (OCAR) records and Headquarters, U.S. Army Reserve Command records. (s) The Commander, United States Army Materiel Command (AMC) is authorized to act on requests for the records of AMC headquarters and to subordinate commands, units, and activities that relate to procurement, logistics, research and development, and supply and maintenance operations.

; In 2016, PHI was valued at 50 times the worth of financial information on the black market. to Citation 214. Change Healthcare is a health care clearinghouse and a subsidiary of UnitedHealth Group, <https://www.changehealthcare.com/>. On the morning of Feb. 21, 2024, Optum (another subsidiary of UnitedHealth Group) reported that it was experiencing enterprise-wide connectivity issues. By that afternoon, the announcement changed to a network interruption related to a cyber security issue and explained that [o]nce [Change Healthcare] became aware of the outside threat, in the interest of protecting our partners and patients, we took immediate action to disconnect our systems to prevent further impact. See Optum Solution Status, Optum, Inc., UnitedHealth Group, <https://solution-status.optum.com/incidents/hqpjz25fn3n7> (last accessed on July 16, 2024). On Mar. 13, 2024, the Department announced that it would be initiating an investigation into the incident. See Letter from OCR Director Melanie Fontes Rainer to Colleagues (Mar. 13, 2024), <https://www.hhs.gov/sites/default/files/cyberattack-change-healthcare.pdf>.

3.5.5 | Delegation ... 3.5.5 Delegation Proper enforcement of data resource policies is dependent on the enforcement of attribute administrative policies.

§ 170.10 CMMC Assessor and Instructor Certification Organization (CAICO). (a) Roles and responsibilities. The CAICO is responsible for training, testing, authorizing, certifying, and recertifying CMMC assessors, instructors, and related professionals. Only the CAICO may make decisions relating to examination certifications, including the granting, maintaining, recertifying, expanding, and reducing the scope of certification, and suspending or withdrawing certification in accordance with current ISO/IEC 17024:2012(E) (incorporated by reference, see § 170.2). At any given point in time, there will be only one CAICO for the DoD CMMC Program. (b) Requirements. The CAICO shall: (1) Comply with the Accreditation Body policies for Conflict of Interest, Code of Professional Conduct, and Ethics set forth in § 170.8(b)(17) ; and achieve and maintain ISO/IEC 17024(E) accreditation within 12 months of December 16, 2024. (2) Provide all documentation and records in English. (3) Train, test, and designate PIs in accordance with the requirements of this section. Train, test, certify, and recertify CCPs, CCAs, and CCIs in accordance with the requirements of this section. (4) Ensure the instructor and assessor certification examinations are certified under ISO/IEC 17024:2012(E) (incorporated by reference, see § 170.2), by a recognized US-based accreditor who is not a member of the CMMC Accreditation Body. The US-based accreditor must be a signatory to International Laboratory Accreditation Cooperation (ILAC) or relevant International Accreditation Forum (IAF) Mutual Recognition Arrangement (MRA) and must operate in accordance with ISO/IEC 17011:2017(E) (incorporated by reference, see § 170.2). (5) Establish quality control policies and procedures for the generation of training products, instruction, and testing materials. (6) Oversee development, administration, and management pertaining to the quality of training and examination materials for CMMC assessor and instructor certification and recertification. (7) Establish and publish an authorization and certification appeals process to receive, evaluate, and make decisions on complaints and appeals in accordance with ISO/IEC 17024:2012(E) (incorporated by reference, see § 170.2). (8) Address all appeals arising from the CCA, CCI, and CCP authorizations and certifications process through use of internal processes in accordance with ISO/IEC 17024:2012(E) (incorporated by reference, see § 170.2). (9) Maintain records for a period of six (6) years of all procedures, processes, and actions related to fulfillment of the requirements set forth in this section and provide the Accreditation Body access to those records. (10) Provide the Accreditation Body information about the authorization and accreditation status of assessors, instructors, training community, and publishing partners. (11) Ensure separation of duties between individuals involved in testing activities, training activities, and certification activities. (12) Safeguard and require any CAICO training support service providers, as applicable, to safeguard the confidentiality of applicant, candidate, and certificate-holder information and ensure the overall security of the certification process. (13) Ensure that all PII is encrypted and protected in all CAICO information systems and databases and those of any CAICO training support service providers. (14) Ensure the security of assessor and instructor examinations and the fair and credible administration of examinations. (15) Neither disclose nor allow any CAICO training support service providers, as applicable, to disclose CMMC data or metrics related to authorization or certification activities to any entity other than the Accreditation Body and DoD, except as required by law. (16) Require retraining and redesignation of PIs upon significant change to DoD's CMMC Program requirements. Require retraining and recertification of CCPs, CCAs, and CCIs upon significant change to DoD's CMMC Program requirements, as determined by the DoD or the CAICO. (17) Require CMMC Ecosystem members to report to the CAICO within 30 days of convictions, guilty pleas, or no contest pleas to crimes of fraud, larceny, embezzlement,

misappropriation of funds, misrepresentation, perjury, false swearing, conspiracy to conceal, or a similar offense in any legal proceeding, civil or criminal, whether or not in connection with activities that relate to carrying out their role in the CMMC Ecosystem.

blication 800-series reports on ITL's research, guidelines, and outreach efforts in information system security, and its collaborative activities with industry, government, and academic organizations. - Federal agencies responsible for managing and protecting CUI - Nonfederal organizations responsible for protecting CUI - Individuals with system development life cycle responsibilities (e.g., program managers, mission/business owners, information owners/stewards, system designers and developers, system/security engineers, systems integrators) - Individuals with acquisition or procurement responsibilities (e.g., contracting officers) - Individuals with system, security, or risk management and oversight responsibilities (e.g., authorizing officials, chief information officers, chief information security officers, system owners, information security managers) - Individuals with security assessment and monitoring responsibilities (e.g., auditors, system evaluators, assessors, analysts, independent verifiers and validators)

(B) From subsection (d), because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement. (C) From subsection (e)(1) because in the course of criminal investigations, information is often obtained concerning the violation of laws or civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this valuable information be retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought. (D) From subsections (e)(4)(G) and (e)(4)(H) because portions of this system of records have been exempted from the access provisions of subsection (d), making these subsections not applicable. (E) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (F) From subsection (f) because portions of this system of records have been exempted from the access provisions of subsection (d). (23) System identifier and name. A0351-17a USMA, U.S. Military Academy Candidate Files. (i) Exemption. (A) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (B) Testing or examination material used solely to determine individual qualifications for appointment or promotion in the Federal service may be exempt pursuant to 5 U.S.C. 552a(k)(6) , if the disclosure would compromise the objectivity or fairness of the test or examination process. (C) Evaluation material used to determine potential for promotion in the Military Services may be exempt pursuant to 5 U.S.C. 552a(k)(7) , but only to the extent that the disclosure of such material would reveal the identity of a confidential source. (D) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(5) , (k)(6) or (k)(7) from subsections 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(5) , (k)(6) and (k)(7). (iii) Reasons. (A) From subsections (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement.

. This provision is followed by paragraph (d), which explains that regulated entities are required to implement a specific implementation specification if described as 'required.' If the implementation specification is described as 'addressable,' regulated entities are required to implement the implementation specification if it is reasonable and appropriate to do so; or, if it is not reasonable and appropriate, document why and implement an equivalent alternative measure. Finally, the maintenance provision at 45 CFR 164.306(e) requires regulated entities to review and modify security measures implemented under the Security Rule as needed to continue providing reasonable and appropriate protection of ePHI. It also requires regulated entities to update documentation of such security measures in accordance with the requirements for documentation at 45 CFR 164.316(b)(2)(iii) . 2. Issues To Address We believe that we can improve consistency in language between this section and other Security Rule provisions and better align this section with

statutory terms and intent. For example, we are concerned that regulated entities are misinterpreting 45 CFR 164.306(a) to apply the requirements of the Security Rule to only some ePHI, rather than all ePHI. This interpretation could lead to inadequate protection of ePHI and relevant electronic information systems. [412] We also believe that consistency in language facilitates clear understanding and less ambiguity about how regulated entities must apply Security Rule standards. Flexibility and scalability are among the Security Rule's defining characteristics, and we intend to preserve those elements to the extent possible. However, we believe that in this era of increased reliance on technology, more sophisticated cyber capabilities, and increasing cyberattacks, it is critical for regulated entities to implement and deploy strong security measures to protect ePHI and related information systems. We are concerned that regulated entities have focused their attention primarily on the cost of security measures, rather than considering the reasonableness and appropriateness of security measures in the context of all of the listed factors, including the probability and criticality of potential risks to ePHI. [413] Further, the Department believes that providing additional clarity would improve the ability of regulated entities to evaluate security measures for the protection of ePHI and the ability of a security measure to facilitate a regulated entity's recovery from emergencies and to support continued operations. With these proposed modifications, the Department seeks to ensure that regulated entities' reliance on the Security Rule's flexibility and scalability does not come at the expense of adequate security. The current regulation's framework in 45 CFR 164.306(b) lacks any express factor that would require an evaluation of the effectiveness of the security measures in supporting the resiliency of the regulated entity.

3.1.1 Achievement of Goals and Objectives ... 3.1.1 Achievement of Goals and Objectives Cyber resiliency techniques and associated implementation approaches are employed to achieve mission or business objectives. 3.1.1.

(iii) Inform the requester of the right to file a ·Statement of Disagreement· with the Board's action and to seek judicial review of the Army's refusal to amend. A ·Statement of Disagreement· must be received by the system manager within 120 days and it will be made an integral part of the pertinent record. Anyone who may have access to, use of, or need to disclose information from the record will be aware that the record was disputed. The disclosing authority may include a brief summary of the Board's reasons for not amending the disputed record. (7) It is inappropriate for the Privacy Act Review Board to consider any record which is exempt from the amendment provision of the Privacy Act. § 505.7 Disclosure of personal information to other agencies and third parties. (a) Disclosing records to third parties. (1) DA is prohibited from disclosing a record from a Privacy Act system of records to any person or agency without the prior written consent of the subject of the record, except when· (i) Pursuant to the twelve Privacy Act exceptions. The twelve exceptions to the ·no disclosure without consent· rule are those exceptions which permit the release of personal information without the individual's/subject's consent (See appendix C of this part). (ii) The FOIA requires the release of the record. One of the twelve exceptions to Privacy Act is the FOIA Exception. If the FOIA requires the release of information, the information must be released. The Privacy Act can not prevent release to a third party if the FOIA requires release. However, information must not be discretionarily released under the FOIA if the information is subject to the Privacy Act's ·no disclosure without consent· rule. (iii) A routine use applies. Another major exception to the ·no disclosure without consent· rule is the routine use exception. The Privacy Act allows federal agencies to publish routine use exceptions to the Privacy Act. Some routine uses are Army specific, DOD specific, and Government-wide. Routine uses exceptions are listed in the Privacy Act system of records notice(s) applicable to the Privacy Act records in question. The Army and other agencies' system of records notices may be accessed at the Defense Privacy Office's Web site <http://www.defenselink.mil/privacy> . (2) The approved twelve exceptions to the Privacy Act ·no disclosure without consent· rule are listed at appendix C of this part. (b) Disclosing records to other DOD components and to Federal agencies outside the DOD. (1) The twelve Privacy Act exceptions referred to in appendix C of this part are available to other DOD components and to Federal agencies outside the DOD as exceptions to the Privacy Act's ·no disclosure without consent· rule, with the exception of the FOIA exception. The FOIA is not an appropriate mechanism for providing information to other DOD components and to Federal agencies outside the DOD.

specification for unique user identification requires a regulated entity to assign unique identifiers to users to facilitate the identification of specific users of an information system. [666] By assigning a unique identifier to each user, a regulated entity can track the specific

activity of that user when they are logged into an information system and hold the user accountable for functions they perform in the information system when they access that system. Under the implementation specification for emergency access procedures, a regulated entity is required to establish procedures, such as documented operational practices and instructions to workforce members, for obtaining access to necessary ePHI during an emergency and to implement such procedures as needed. [667] In accordance with this implementation specification, a regulated entity must identify the types of situations in which its normal procedures for accessing an information system or application that contains ePHI may not work and establish procedures for obtaining access in those situations. [668] These procedures must be established prior to an emergency to instruct workforce members on possible ways to gain access to needed ePHI where, for example, the electrical system has been severely damaged or rendered inoperative, or where a software update fails and prevents the regulated entity from accessing ePHI in its EHR. The implementation specification for automatic logoff associated with the standard for access control addresses the need for a regulated entity to, when reasonable and appropriate, implement electronic procedures that terminate an electronic session after a period of inactivity. [669] Automatic logoff is an effective way to prevent unauthorized users from accessing ePHI on a workstation when it is left unattended for a period of time. [670] While many applications have configuration settings that automatically log a user out of the system after a period of inactivity, some systems have more limited capabilities and may activate a screen saver that is password protected. [671] The implementation specification under the standard for access control addresses encryption and decryption and requires regulated entities, when it is reasonable and appropriate, to implement a mechanism to encrypt and decrypt ePHI. [672] Encrypting data, including ePHI, reduces the likelihood that anyone other than the party that has the key to the encryption algorithm would be able to decrypt (i.e., translate) the data and convert it into plain, comprehensible text. [673] The standard for audit controls requires a regulated entity to implement hardware, software, and/or procedural mechanisms that record and examine activity in electronic information systems that contain or use ePHI. Most electronic information systems provide some level of audit controls with a reporting method, such as audit reports. [674]

This scoring methodology is designed to provide a measurement of an OSA's implementation status of the NIST SP 800-171 Rev 2 security requirements (incorporated by reference elsewhere in this part, see §.170.2) and the specified NIST SP 800-172 security requirements (incorporated by reference elsewhere in this part, see §.170.2). The CMMC Scoring Methodology is designed to credit partial implementation only in limited cases (e.g., multi-factor authentication, CMMC Level 2 security requirement IA.L2-3.5.3, a Derived Security Requirement). (b) Assessment findings. Each security requirement assessed under the CMMC Scoring Methodology must result in one of three possible assessment findings, as follows: (1) MET. All applicable objectives for the security requirement are satisfied based on evidence. All evidence must be in final form and not draft. Unacceptable forms of evidence include working papers, drafts, and unofficial or unapproved policies. (2) NOT MET. One or more applicable objectives for the security requirement is not satisfied. During an assessment, for each security requirement objective marked NOT MET, the assessor will document why the evidence does not conform. (3) NOT APPLICABLE (N/A). A security requirement and/or objective does not apply at the time of the CMMC (printed page 89137) assessment. For example, CMMC security requirement SC.L1-3.13.5 -Public-Access System Separation- might be N/A if there are no publicly accessible systems within the CMMC Assessment Scope. During an assessment, an assessment objective assessed as N/A is equivalent to the same assessment objective being assessed as MET. (c) Scoring. At each CMMC Level, security requirements are scored as follows: (1) CMMC Level 1. All CMMC Level 1 security requirements must be fully implemented to be considered MET. No POA&M is permitted for CMMC Level 1, and self-assessment results are scored as MET or NOT MET in their entirety; therefore, no score is calculated, and no scoring methodology is needed. (2) CMMC Level 2 Scoring Methodology. The maximum score achievable for a CMMC Level 2 assessment is equal to the total number of CMMC Level 2 security requirements. If all CMMC Level 2 security requirement objectives are MET, OSAs are awarded the maximum score. For each requirement objective NOT MET, the associated value of the security requirement is subtracted from the maximum score, which may result in a negative score. (i) Procedures (A) Scoring methodology for CMMC Level 2 assessment is based on all CMMC Level 2 security requirement objectives, including those NOT MET. (B) In the CMMC Level 2 Scoring Methodology, each security requirement has a value (e.g., 1, 3 or 5). (1) For NIST SP 800-171 Rev 2 Basic and Derived Security Requirements that, if not implemented, could lead to significant exploitation of the network, or exfiltration of CUI, 5 points are subtracted from the maximum score. The Basic and Derived security requirements with a value of 5 points include: (i

Except requests that are for a commercial use, the Component may not charge for the first 2 hours of search time or for the first 100 pages of reproduction. However, a requester may not file multiple requests at the same time, each seeking portions of a document or documents, solely in order to avoid payment of fees. When a Component reasonably believes that a requester or, on rare occasions, a group of requesters acting in concert, is attempting to break a request down into a series of requests for the purpose of avoiding the assessment of fees, the Component may aggregate any such requests and charge accordingly. One element to be considered in determining whether this belief would be reasonable is the time period in which the requests have occurred. For example, it would be reasonable to presume that multiple requests of this type made within a 30 day period had been made to avoid fees. For requests made over a longer period however, such a presumption becomes harder to sustain and Components should have a solid basis for determining that aggregation is warranted in such cases. Components are cautioned that before aggregating requests from more than one requester, they must have a concrete basis on which to conclude that the requesters are acting in concert and are acting specifically to avoid payment of fees. In no case may Components aggregate multiple requests on unrelated subjects from one requester. (f) Effect of the Debt Collection Act of 1982 (Pub. L. 97-365). The Debt Collection Act of 1982 provides for a minimum annual rate of interest to be charged on overdue debts owed the Federal Government. Components may levy this interest penalty for any fees that remain outstanding 30 calendar days from the date of billing (the first demand notice) to the requester of the amount owed. The interest rate shall be as prescribed in DoD 7000.14-R, Volume 11A. Components should verify the current interest rate with respective Finance and Accounting Offices. After one demand letter has been sent, and 30 calendar days have lapsed with no payment, Components may submit the debt to respective Finance and Accounting Offices for collection pursuant to the Debt Collection Act of 1982. (g) Computation of fees. The fee schedule in this subchapter shall be used to compute the assessable fees based upon the time actually spent on the search, review (in the case of commercial requesters) and duplication costs associated with processing a given FOIA request. Neither time-based nor dollar-based minimum charges for search, review and duplication are authorized. The appropriate fee category of the requester shall be determined before computing fees. All time computations will be to the nearest 15 minutes or quarter hour. (h) Refunds. In the event a Component discovers it has overcharged a requester or a requester has overpaid, the Component shall promptly refund the charge to the requester by reimbursement methods that are agreeable to the requester and the Component.

HIPAA Security Rule section 164.308 (Administrative Safeguards) addresses information access management. Covered entities and business associates must implement appropriate safeguards to protect electronic protected health information (ePHI). For information access management, organizations should:

1. Establish and document policies specific to information access management
2. Implement technical and procedural controls
3. Train workforce members on their responsibilities
4. Conduct periodic risk assessments addressing information access management
5. Maintain documentation of compliance efforts

Under 45 CFR 164.308, this is a administrative safeguards requirement that applies to all covered entities and business associates that create, receive, maintain, or transmit ePHI.

3.3.4 | Management APIs, Management Software, and In-Band Management ... 3.3.4 Management APIs, Management Software, and In-Band Management Storage infrastructure components expose management software User Interfaces (UI), APIs, and other in-band or out-of-band management protocols for administering the devices and managing data storage.

(i) When line security is not available, installation will require two independent means of transmission of the alarm signal from the alarmed area to the monitoring station. (ii) Alarm installation provides a level of protection, e.g. UL's Extent 5, based on patrolling employees and CSA approval of security-in-depth. (iii) Where law enforcement personnel are the primary alarm response. Under those circumstances, the contractor must obtain written assurance from the police department regarding the ability to respond to alarms in the required response time. (iv) Alarm signal transmission is over computer-controlled data-networks (e.g., internet, intranet). The CSA will provide specific acceptance criteria (e.g., encryption requirements) for alarms monitored over data networks. (v) Alarm investigator response time exceeds the parameters outlined in paragraphs (c)(1) through (c)(3) in this section as applicable. (5) Certification of compliance. Evidence of compliance with the requirements of this section will consist of a valid (current) certification by an approved NRTL for the appropriate category of service. This certificate: (i)

Will have been issued to the protected facility by the NRTL, through the alarm service company.

(ii) Serves as evidence that the alarm service company that did the installation is: (A) Listed as furnishing security systems of the category indicated. (B) Authorized to issue the certificate of installation as representation that the equipment is in compliance with requirements established by NRTL for the class of alarm system. (C) Subject to the NRTL inspection program whereby periodic inspections are made of representative alarm installations by NRTL personnel to verify the correctness of certification practices. (6) Exceptional cases. (i) If the requirements in paragraphs (d)(1) through (d)(5) in this section cannot be met, the contractor may request CSA approval for an alarm system meeting one of these conditions, which will be documented on the alarm system description form: (A) Monitored by a central control station but responded to by a local (municipal, county, state) law enforcement organization. (B) Connected by direct wire to alarm receiving equipment located in a local (municipal, county, State) police station or public emergency service dispatch center. This alarm system is activated and deactivated by employees of the contractor, but the alarm is monitored and responded to by personnel of the monitoring police or emergency service dispatch organization. Personnel monitoring alarm signals at police stations or dispatch centers do not require PCLs. Police department response systems may be requested only when: (1) The contractor facility is located in an area where central control station services are not available with line security or proprietary security force personnel, or a contractually-dispatched response to an alarm signal cannot be achieved within the time limits required by the CSA. (2

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analysis to advance the development and productive use of information technology. ITL's responsibilities include the development of technical, physical, administrative, and management standards and guidelines for the cost-effective security and privacy of sensitive unclassified information in Federal computer systems. This Special Publication 800-series reports on ITL's research, guidance, and outreach efforts in computer security and its collaborative activities with industry, government, and academic organizations. In today's computing environment, there are many threats to the confidentiality of information stored on end user devices, such as personal computers, consumer devices (e.g., personal digital assistant, smart phone), and removable storage media (e.g., universal serial bus [USB] flash drive, memory card, external hard drive, writeable CD or DVD). Some threats are unintentional, such as human error, while others are intentional. Intentional threats are posed by people with many different motivations, including causing mischief and disruption and committing identity theft and other fraud. A common threat against end user devices is device loss or theft. Someone with physical access to a device has many options for attempting to view or copy the information stored on the device. Another concern is insider attacks, such as an employee attempting to access sensitive information stored on another employee's device.

Level 1 or 2); costs to prepare for and undergo Level 2 certification assessment; and costs required to implement the Level 3 security requirements and for preparing to undergo DCMA DIBCAC assessment (Level 3). CMMC Level 3 certification assessments against the NIST SP 800-172 Feb2021 baseline are performed free of cost by DoD assessors, which reduces the overall cost of achieving CMMC Status of Level 3 (DIBCAC). Notably, certification is never required for CMMC Level 1, and the requirement can be satisfied through self-assessment. When CMMC Level 2 requirements apply, they may be met via self-assessment, or a certification assessment conducted by a C3PAO, depending on the specific CMMC requirement cited in the solicitation or resulting contract. When the CMMC Program requirements are effective, solicitations for DoD contracts that will involve the processing, storing, or transmitting of FCI or CUI on any non-Federal system, notwithstanding the size or configuration of the non-Federal system, will specify the required CMMC Level (1, 2 or 3) and assessment type (self-assessment or certification assessment). An assumption for the cost estimates is that Non-Small Entities have a full-time team of cybersecurity professionals on staff while Small Entities do not. The assumptions, explained in the regulatory impact analysis, reflect Small Entities will likely obtain support from External Service Providers and have a staff member submit affirmations and SPRS scores for self-assessments. All (printed page 83197) these costs, except the open market cost of a C3PAO, are directly controllable by the organization seeking assessment. The CMMC rule does not make any change to cost allowability as defined in FAR 31.201-2 Determining Allowability. The DoD declined to modify the estimates, which are intended to be representative and to inform rulemaking. The cost estimates represent average derived estimates based on internal expertise and public

feedback in accordance with OMB Circular A-4 and represent average costs for companies to comply with the CMMC requirements. This rule does not provide the cost analysis for all actions, personnel, and security measures required to protect CUI information, data, systems, and technical products through the life cycle of the work and data generated. The size and complexity of the network within scope of the assessment impacts the costs as well. As required by rulemaking guidance, the DoD provided cost estimates and impact analyses. An analysis of profit margins is not required. Additionally, this rule and the required cost analysis and resulting cost estimates were reviewed by DoD cost analysts and OMB economists for realism and completeness.

NIST SP 800-171 and NIST SP 800-53 are related but serve different audiences: **NIST SP 800-53 Rev 5**: - Comprehensive catalog of ~1,000+ security controls - Designed for federal information systems - Organized into 20 control families - Used as the basis for FedRAMP - Includes controls at Low, Moderate, and High baselines **NIST SP 800-171 Rev 3**: - 97 security requirements (derived from 800-53) - Designed for non-federal systems handling CUI - Organized into 17 families - Used as the basis for CMMC Level 2 - Tailored specifically for the defense industrial base SP 800-171 is essentially a subset of SP 800-53 tailored for contractors. Appendix D of SP 800-171 provides the direct mapping between the two standards.

(iv) When access is requested by mail, identity verification may consist of the individual providing certain minimum identifying data, such as full name, date and place of birth, or such other personal information necessary to locate the record sought and information that is ordinarily only known to the individual. If the information sought is of a sensitive nature, additional identifying data may be required. An unsworn declaration under penalty of perjury (28 U.S.C. 1746 , ·Unsworn Declaration under Penalty of Perjury·) or notarized signatures are acceptable as a means of proving the identity of the individual. (printed page 18767) (A) If an unsworn declaration is executed within the United States, its territories, possessions, or commonwealths, it shall read ·I declare (or certify, verify, or state) under penalty of perjury that the foregoing is true and correct. Executed on (date). (Signature)· (B) If an unsworn declaration is executed outside the United States, it shall read ·I declare (or certify, verify, or state) under penalty of perjury under the laws of the United States of America that the foregoing is true and correct. Executed on (date). (Signature)· (v) If an individual wishes to be accompanied by a third party when seeking access to his or her records or to have the records released directly to a third party, the individual may be required to furnish a signed access authorization granting the third-party access. (vi) An individual shall not be refused access to his or her record solely because he or she refuses to divulge his or her SSN unless the SSN is the only method by which retrieval can be made. (See §310.15(b).) (vii) The individual is not required to explain or justify his or her need for access to any record under this part. (viii) Only a denial authority may deny access and the denial must be in writing and contain the information required by 310.18. (d) Granting individual access to records. (1) Grant the individual access to the original record or an exact copy of the original record without any changes or deletions, except when deletions have been made in accordance with paragraph (e) of this Section. For the purpose of granting access, a record that has been amended under §310.19(b) is considered to be the original. See paragraph (e) of this Section for the policy regarding the use of summaries and extracts. (2) Provide exact copies of the record when furnishing the individual copies of records under this part. (3) Explain in terms understood by the requestor any record or portion of a record that is not clear. (e) Illegible, incomplete, or partially exempt records. (1) Do not deny an individual access to a record or a copy of a record solely because the physical condition or format of the record does not make it readily available (for example, deteriorated state or on magnetic tape). Either prepare an extract or recopy the document exactly.

To withhold information under this privilege, the information must be both deliberative and predecisional, and part of the decision-making process. Deliberative means the information is internal advice, recommendations, or subjective evaluations, as contrasted with factual matters, that are reflected in records relied upon in the decision-making process of an agency, whether within or among agencies. Predecisional means the information was created before the decision maker reached a final decision. Factual information cannot be withheld from a requester under Exemption 5 except under one of two circumstances. The first circumstance is when the author of a document selects specific facts out of a larger group of facts and this very act is deliberative in nature. This information qualifies for withholding because its release would reveal the author's internal thought processes. The second circumstance exists when the factual information is so inextricably

connected to the deliberative material that its disclosure would expose or cause harm to the agency's deliberations. A direction or order from a superior to a subordinate generally does not qualify as a deliberative process document if it constitutes policy guidance or a decision. However, correspondence from a superior to a subordinate may qualify if it constitutes a discussion of preliminary matters or a request for information or advice that would be relied upon in the decision-making process. An agency's final decision cannot be withheld under the privilege unless it becomes part of another, higher-level decision-making process (such as the agency budgetary process). The deliberative process privilege is temporal in nature because once the final agency decision is made the privilege cannot be used to withhold the final decision or any post-decisional documents related to the decision. Examples of deliberative process documents include: (A) Staff papers, to include after-action reports, inspection reports, lessons learned, and situation reports containing staff evaluations, advice, opinions, or suggestions. (B) Advice, suggestions, or evaluations prepared on behalf of the Department of Defense by individual consultants or by boards, committees, councils, groups, panels, conferences, commissions, task forces, or other similar groups that are formed for the purpose of obtaining advice and recommendations. (C) Evaluations by DoD Component personnel of contractors and their products. (D) Information of a speculative, tentative, or evaluative nature, or such matters as proposed plans to procure, lease, or otherwise acquire and dispose of materials, real estate, facilities or functions, when such information would provide undue or unfair competitive advantage to private personal interests or would impede legitimate Government functions.

A CMMC Certified Instructor (CCI) teaches CCP, CCA, and CCI candidates and performs CMMC instructional duties. Candidate CCIs are certified by the CAICO after successful completion of the CCI training and testing requirements. A CCI is required to obtain and maintain assessor and instructor certifications from the CAICO in accordance with the requirements set forth in § 170.10 and in paragraph (c) of this section. A CCI with a valid CCP certification may instruct CCP candidates, while a CCI with a valid CCA certification may instruct CCP, CCA, and CCI candidates. Certifications are valid for 3 years from the date of issuance. CCIs are required to meet requirements in paragraph (c) of this section. (c) Requirements. CMMC Instructors shall: (1) Obtain and maintain instructor designation or certification, as appropriate, from the CAICO in accordance with the requirements set forth in § 170.10. (2) Obtain and maintain CCP or CCA certification to deliver CCP training. (3) Obtain and maintain a CCA certification to deliver CCA training. (4) Comply with the Accreditation Body policies for Conflict of Interest, Code of Professional Conduct, and Ethics set forth in § 170.8(b)(17). (5) Provide all documentation and records in English. (6) Provide the Accreditation Body and the CAICO annually with accurate information detailing their qualifications, training experience, professional affiliations, and certifications, and, upon reasonable request, submit documentation verifying this information. (7) Not provide CMMC consulting services while serving as a CMMC instructor; however, subject to the Code of Professional Conduct and Conflict of Interest policies, can serve on an assessment team. (8) Not participate in the development of exam objectives and/or exam content or act as an exam proctor while at the same time serving as a CCI. (9) Keep confidential all information obtained or created during the performance of CMMC training activities, including trainee records, except as required by law. (10) Not disclose any CMMC-related data or metrics that is PII, FCI, or CUI to anyone without prior coordination with and approval from DoD. (11) Notify the Accreditation Body or the CAICO if required by law or authorized by contractual commitments to release confidential information. (12) Not share with anyone any CMMC training-related information not previously publicly disclosed. § 170.13 CMMC Certified Professional (CCP). (a) Roles and responsibilities. A CMMC Certified Professional (CCP) completes rigorous training on CMMC and the assessment process to provide advice, consulting, and recommendations to their OSA clients. Candidate CCPs are certified by the CAICO after successful completion of the CCP training and testing requirements set forth in paragraph (b) of this section. CCPs are eligible to become CMMC Certified Assessors and can participate as a CCP on Level 2 certification assessments with CCA oversight where the CCA makes all final determinations. (b) Requirements. CCPs shall:

provided other recommended edits to the POA&M section, including addition of terms of art such as ·assessment-related· and ·non-assessment-related·, and deletion of the words ·as applicable·.

Response: The CMMC Program allows the use of POA&Ms. Section 170.21 delineates the requirements that may be addressed as part of an assessment with a POA&M, that must be closed out by a POA&M closeout assessment within 180 days of the initial assessment to achieve the assessment requirement for Final certification. At Level 1, the OSA must affirm annually that it has reassessed its

environment. Security requirement CA.L2-3.12.2 allows for the development and implementation of an operational plans of action designed to correct deficiencies and reduce or eliminate vulnerabilities in organizational systems. The CMMC rule does not prohibit an OSA from using an operational plan of action at any CMMC level to address necessary information system updates, patches, or reconfiguration as threats evolve. These are different from POA&Ms permitted under a Conditional certification assessment. The DoD has updated the rule to make this distinction clear. The Department also updated the rule to include a definition and clarity for enduring exceptions. The DoD CIO option for variances in DFARS clause 252.204-7012 is beyond the scope of this rule. Operational plans of action are the appropriate mechanism to handle CSPs, ESPs (not a CSP) and third-party vendors that are no longer compliant with a CMMC requirement. Operational plans of action may be necessary when the relevant security requirement or control was fully implemented, but a vulnerability or deficiency is discovered after gaining a CMMC final compliance status, such as, but not limited to, routine updates, patches, or updates to CMMC compliance status. For purposes of CMMC compliance, operational plans of action are acceptable and are not subject to the 180-day timetable established for initial assessment. In addition, the rule has been modified to include a definition for Enduring Exceptions. The DoD does not accept the recommendation to change the criteria for POA&Ms or the timeline allowed to remediate open POA&M items. The 180-day period allowed for POA&Ms and the determination of which weighted practices can be placed on a POA&M was a risk-based decision. The determination considers the relative risk DoD is willing to accept when a particular practice is not met and the amount of risk the DoD is willing to accept for those security practices that go ·NOT MET· for an extended period. The DoD declined to edit the rule regarding the closeout of security requirements that are not allowed on the POA&M as stated in §.170.21. The decision in this scenario is a business decision between the applicable C3PAO and the OSC.

A record from a system of records maintained by a DOD Component may be disclosed to foreign law enforcement, security, investigatory, or administrative authorities in order to comply with requirements imposed by, or to claim rights conferred in, international agreements and arrangements including those regulating the stationing and status in foreign countries of DOD military and civilian personnel. (7) Disclosure to State and Local Taxing Authorities Routine Use. Any information normally contained in Internal Revenue Service Form W-2, which is maintained in a record from a system of records maintained by a DOD component, may be disclosed to state and local taxing authorities with which the Secretary of the Treasury has entered into agreements pursuant to 5 U.S.C. sections 5516, 5517, and 5520 and only to those state and local taxing authorities for which an employee or military member is or was subject to tax regardless of whether tax is or was withheld. This routine use is in accordance with Treasury Fiscal Requirements Manual Bulletin 76-07. (8) Disclosure to the Office of Personnel Management Routine Use. A record from a system of records subject to the Privacy Act and maintained by a DA activity may be disclosed to the Office of Personnel Management concerning information on pay and leave, benefits, retirement deductions, and any other information necessary for Office of Personnel Management to carry out its legally authorized Government-wide personnel management functions and studies. (9) Disclosure to the Department of Justice for Litigation Routine Use. A record from a system of records maintained by a DOD component may be disclosed as a routine use to any component of the Department of Justice for the purpose of representing the Department of Defense, or any officer, employee, or member of the Department in pending or potential litigation to which the record is pertinent. (10) Disclosure to Military Banking Facilities Overseas Routine Use. Information as to current military addresses and assignments may be provided to military banking facilities who provide banking services overseas and who are reimbursed by the Government for certain checking and (printed page 46069) loan losses. For personnel separated, discharged, or retired from the Armed forces, information as to last known residential or home of record address may be provided to the military banking facility upon certification by a banking facility officer that the facility has a returned or dishonored check negotiated by the individual or the individual has defaulted on a loan and that if restitution is not made by the individual, the U.S. Government will be liable for the losses the facility may incur. (11) Disclosure of Information to the General Services Administration Routine Use.

3.2.1 Service Discovery Mechanism Threats The basic functions in a service discovery mechanism are:
 - Service registration and de-registration.

authoritative sources for known vulnerabilities, such as those referenced above, and remediating any identified vulnerabilities. When a vulnerability is discovered, a regulated entity, through its

patch management program, should have in place a policy and procedure for applying any available patches or implementing reasonable and appropriate compensating controls if a patch is not available. Remediation may be as simple as applying a vendor-offered software patch or, in the case of software no longer supported by a vendor, designing and implementing reasonable and appropriate compensating controls to reduce the risk of the vulnerability. The policies and procedures required by the proposed standard for patch management in proposed 45 CFR 164.308(a)(4)(i) also would be implemented in part by the proposed implementation specifications associated with the proposed standard for vulnerability management. Those proposed implementation specifications would require the deployment of technical controls to ensure the patch management program is carried out, automated vulnerability scans, and penetration testing, all of which may identify when a patch or compensating control has not been put in place. The Department envisions that the full implementation of all of the proposed standards and implementation specifications would effectively reduce the risk to ePHI.

j. Section 164.312(i)(1)-Standard: Data Backup and Recovery The Security Rule requires regulated entities to regularly create copies of ePHI to ensure that it can be restored in the event of a loss or disruption. [815] However, OCR's enforcement experience indicates that regulated entities could benefit from a more specific standard. Consistent with the proposed standard for contingency planning at 45 CFR 164.308(a)(13)(ii)(B) , the Department proposes to add a standard for a new technical safeguard for data backup and recovery. This new standard would require a regulated entity to deploy technical controls to create and maintain exact retrievable copies of ePHI. The proposed changes would remove the existing implementation specification for this activity from the physical safeguards section and place it within technical safeguards. The Department also proposes to modify the language of the existing requirement by removing the limitation that it applies before moving equipment, so that it applies broadly and comprehensively. Elevating data backup and recovery to a standard would also increase the prominence of this requirement and highlight the liability of regulated entities for creating the capacity to restore systems after a data breach. The Department proposes four new implementation specifications for the data backup and recovery standard. The first, 45 CFR 164.312(i)(2)(i)

Multiple commenters wanted more information about the roll-out of the CMMC pilot program, including transparency about which acquisition programs are being considered for inclusion prior to the release of a solicitation. Commenters requested details on the provisional period, whether there would be a break between the pilot program and the official launch of the CMMC Program, whether there would be an assessment on the effectiveness of the pilot, and if lessons learned from the pilot would be shared across the community. Response: CMMC 1.0 did include a CMMC Pilot program; however, CMMC 2.0 does not include pilots. Instead, upon the effective date of the associated CMMC DFARS rule, the Department intends to begin including CMMC self-assessment requirements when applicable, for protection of FCI and CUI. (printed page 89072)

c. Communicating CMMC Requirements Comment: Two commenters requested that, during the phased rollout of CMMC, defense contractors be forewarned of DoD plans to include a CMMC requirement in an upcoming solicitation. They asked for transparency with respect to which contracts were being considered for CMMC requirements. Response: Offerors and contractors will be informed of CMMC requirements in solicitations through (1) the specification of a required CMMC Level, and (2) inclusion of the appropriate DFARS provisions or clauses. There is no plan to advertise a list of solicitations that will or may include CMMC requirements. The implementation plan described in § 170.3(e) addresses phase-in of CMMC requirements.

d. Market Capacity for Assessments Comment: Multiple commenters wanted details about assessor availability and were concerned that a lack of assessors would impact the schedule for including CMMC requirements in solicitations and contractor planning to attain CMMC certification to meet those requirements. Response: The phased implementation plan described in § 170.3(e) is intended to address ramp-up issues, provide time to train the necessary number of assessors, and allow companies the time needed to understand and implement CMMC requirements. An extension of the implementation period or other solutions may be considered in the future to mitigate any C3PAO capacity issues, but the Department has no such plans at this time. If changes to the implementation plan occur, DoD policies that govern requirements definition in the acquisition process will be modified.

e. Certification Sustainment During Validity Period Comment:

Accordingly, timely implementation of patches for known vulnerabilities is crucial to maintaining the security of ePHI. Many cyberattacks could be prevented or substantially mitigated if regulated entities implemented activities to manage the implementation of patches, updates, and upgrades to comply with the Security Rule's requirements for risk management, which can deter one of the common types of attacks: exploitation of known vulnerabilities. If an attack is successful, the intruder

often will encrypt a regulated entity's ePHI to hold it for ransom, or exfiltrate the data for future purposes including identity theft or blackmail. Cyberattacks are especially concerning in the health care sector because they can disrupt the provision of health care services. Exploitable vulnerabilities can exist in many parts of a regulated entity's information systems, but often, known vulnerabilities can be mitigated by applying vendor patches, updating software or system configurations, or upgrading to a newer version of the product. If a patch, update, or upgrade is unavailable, vendors often suggest actions to take, that is, compensating controls, to mitigate a newly discovered vulnerability. Such actions could include modifications of configuration files or disabling of affected services. Regulated entities should pay careful attention to cybersecurity alerts describing newly discovered vulnerabilities. These alerts often include information on mitigation activities and patching. Risk management processes that are compliant with the Security Rule include identifying and mitigating risks and vulnerabilities that unpatched software poses to an organization's ePHI. Mitigation activities could include installing patches if patches are available and patching is reasonable and appropriate. In situations where patches are not available (e.g., obsolete or unsupported software) or testing or other concerns weigh against patching as a mitigation solution, [492] regulated entities should implement reasonable compensating controls to reduce the risk of identified vulnerabilities to a reasonable and appropriate level (e.g., restricting network access or disabling network services to reduce vulnerabilities that could be exploited via network access). Security vulnerabilities may be present in many types of software, including databases, EHRs, operating systems, email, and device firmware. Each type of program would have its own unique set of vulnerabilities and challenges for applying patches, but identifying and mitigating the risks unpatched software (printed page 943) poses to ePHI is important to ensuring that ePHI is protected. [493]

(Response) As discussed in response to comment 74, several statutes and the agency's information disclosure regulations at parts 20 and 21 govern the agency's ability to disclose information to the public, including information obtained under section 306 of the Bioterrorism Act. For example, section 301 of the FD&C Act prohibits any person from using *** to his own advantage, or revealing, other than to the Secretary or officers or employees of the Department, or to the courts ***, any information acquired under authority of [section 414 or 704] concerning any method or process which as a trade secret is entitled to protection ***. FDA already has procedures in place to ensure that FDA staff follow these laws. See, e.g., FDA Staff Manual Guide sections 2280.10, 3250.15, and 3291.5. Furthermore, the record provisions in the Bioterrorism Act recognize that FDA may obtain trade secret or confidential information, and direct the Secretary to *** take appropriate measures to ensure that there are in effect effective procedures to prevent the unauthorized disclosure of [such information] ***. (21 U.S.C. 414(c)). FDA is planning to reemphasize in instructions to FDA personnel the importance of current protections and legal requirements against the unauthorized disclosure of any trade secret or confidential information that is obtained. FDA has previously issued information disclosure regulations applicable to information FDA obtains, and these regulations are applicable to information FDA obtains under the Bioterrorism Act (parts 20 and 21). FDA notes that these regulations are applicable regardless of whether the person supplying the information is ultimately determined to be an unaffected source, incorrectly implicated source, or the victim of food contaminated in premeditated form. Therefore, it is not necessary for FDA to issue additional information disclosure regulations. Moreover, FDA routinely reviews, evaluates, investigates and maintains confidential, trade secret information that encompasses sophisticated, cutting edge technologies, as well as confidential records that contain formulations and other trade secret information. Based upon FDA's track record of consistently ensuring the confidentiality of this type of information, we have attained the trust of the pharmaceutical, medical device and biologics industries. Moreover, the utilization of such information by an FDA employee for his or her own advantage, or the revelation of such information to outside parties beyond the scope allowed by the FD&C Act, is a prohibited act (21 U.S.C. 331(j)) subject to criminal prosecution.

- Item 1: DPA Identification . Report your name, routing symbol and telephone number and copy the DPA's title and address from the DPI and DPA Identification . Figure 1, No. 5 on page 4. - Item 2: Configuration . The definition of "DPA" is on page 2 of these guidelines. There is additional information for identifying the DPA on page 3. Review this information and then check one of the six boxes on the form that most closely describes the particular DPA. If none of the types apply, check the box marked "Other" and write a brief description of the DPA. Later, you will use your answer to this item as the basis for selecting a method for assessing risks to the DPA. (See pages 17 and 28.)

- Item 3: Hardware Inventory . List the DPA's hardware. If the hardware is already listed in the System Inventory Directory maintained by AMS-300, the Personnel Property Management Information System (PPMIS) , or in another listing, check the appropriate box(es) and attach current print-outs.

2. CONFIGURATION Check the box that most closely describes the configuration of the DPA:

3.2.2 | Communication Channels... 3.2.2 Communication Channels Participants indicated how their organizations communicate and disseminate security awareness information.

Insert the clause at 52.204-21, Basic Safeguarding of Covered Contractor Information Systems, in solicitations and contracts excluding solicitations and contracts solely for the acquisition of-

(a) COTS items; or (b) Federally-funded basic and applied research in science, technology, and engineering at colleges, universities, and laboratories in accordance with National Security Decision Directive 189 when the agency does not provide any covered Federal information to the contractor.

4.1301 [Amended] 13. Amend section 4.1301 by-

a. Removing from paragraph (a) the phrases "PUB Number 201", and "Federally-controlled information" and adding the phrases "201" and "Federal information" in their places, respectively.

b. Removing from paragraph (b) the phrases "PUB 201", and "Federally-controlled information" and adding the phrases "201" and "Federal information" in their places, respectively.

4.1303 [Amended] 14. Amend section 4.1303 by removing the words "Federally-controlled information" and adding "Federal information" in its place.

Subpart 4.19 [Removed and Reserved] 15. Remove and reserve subpart 4.19.

PART 5-PUBLICIZING CONTRACT ACTIONS 5.202 [Amended] 16. Amend section 5.202 in paragraph (a)(8) by removing the phrase "proprietary information" and adding "controlled unclassified information (e.g., general proprietary business information)" in its place.

5.301 [Amended] 17. Amend section 5.301 in paragraph (b)(1) by removing the phrase "proprietary information" and adding "controlled unclassified information (e.g., general proprietary business information)" in its place.

PART 7-ACQUISITION PLANNING 18. Amend section 7.103 by adding paragraph (z) to read as follows:

7.103 Agency-head responsibilities. * * * * * (z) Ensuring agency planners-

(1) Comply with the requirements of Executive Order 13556 of November 4, 2010, as implemented at 32 CFR part 2002 and in agency procedures, for controlled unclassified information (CUI). This does not apply to acquisitions for commercially available off-the-shelf items or for Federally-funded basic and applied research in science, technology, and engineering at colleges, universities, and laboratories in accordance with National Security Decision Directive 189 when the agency does not provide any CUI to the contractor; and

(2) Identify all categories of CUI in proposed acquisitions and incorporate them and accompanying CUI standards in requirements planning and the SF XXX, Controlled Unclassified Information (CUI) Requirements, as appropriate (see 4.403-4, 11.002(i), and 39.105).

* * * * *

19. Amend section 7.105 by-

a. Removing from paragraph (b)(18)(i) the phrase "(see subpart 4.4)" and adding "(see 4.402)" in its place;

b. Removing from paragraph (b)(18)(iii) the phrase "Federally-controlled information" and adding "Federal information" in its place;

c. Revising paragraph (b)(18)(iv); and

d. Adding paragraph (b)(18)(v). The revision and addition read as follows:

7.105 Contents of written acquisition plans. * * * * * (b) * * * (18) * * *

865. "In 2003, the Department declined a commenter's suggestion to change the term "periodically" to "at least annually." At that time, we said that documentation must be updated as needed to reflect security measures currently in effect and that the requirement allowed individual entities to establish review and update cycles as deemed necessary because it would vary dependent upon a given entity's size, configuration, environment, operational changes, and the security measures implemented. 68 FR 8334 , 8361 (Feb. 20, 2003). In November 2021, the Department announced an updated program structure with revised requirements designed to achieve the primary goals identified by DoD's internal review of the CMMC Program. With the implementation of the revised CMMC program, the Department introduced several key changes that build on and refine the original program requirements. These include: Streamlining the CMMC model from five levels to three levels. Exclusively implementing National Institute of Standards and Technology (NIST) cybersecurity guidelines. Allowing all companies subject to CMMC Level 1 requirements and subset of companies subject to CMMC Level 2 requirements to demonstrate CMMC compliance through self-assessments. Increased oversight of professional and ethical standards of third-party assessors. (printed page 83195) Allowing Plans of Action & Milestones (POA&M) under limited circumstances to achieve conditional certification. In July 2022, the CMMC Program Management Office (PMO) met with the Office of Advocacy for the U.S. SBA to address the revisions planned for CMMC and again met in July 2023 to review the proposed 32 CFR part 170 CMMC Program rule updates that are responsive to prior SBA concerns. As a result of the alignment of CMMC requirements to NIST guidelines, the Department's requirements continue to evolve as changes are made to the underlying NIST SP 800-171 R2 and NIST SP 800-172 Feb2021 requirements. Such changes will not be effective as CMMC requirements unless and until made effective through rulemaking. Objectives of, and Legal Basis for, the Rule Legal Basis: 5 U.S.C. 301 ; Sec. 1648, Public Law 116-92 , 133 Stat. 1198. The objective of this final CMMC Program rule is to provide the Department with increased assurance that a defense contractor can adequately protect FCI and CUI commensurate with the risk, also accounting for information flow down to its subcontractors in a multi-tier supply chain. This rule meets the objective by providing a mechanism to assess contractor and subcontractor implementation of DoD's cyber security protection requirements for FCI and CUI. Implementation of the CMMC Program is intended to address the following policy issues: (a) Verification of a Contractor's Cybersecurity Posture Effective June 2016, FAR clause 52.204-21 Basic Safeguarding of Contractor Information Systems, requires Federal contractors and subcontractors to implement 15 basic safeguarding requirements, as applicable, to protect contractor information systems that process, store, or transmit FCI.

(4) Calculate each request on the basis of the price, costs (including the cost to complete), subcontractor financing, and progress payment liquidations of the lot to which it applies; and (5) Distribute costs among lots in a manner acceptable to the Administrative Contracting Officer. (c) Submit a separate progress payment request for U.S. and FMS requirements in accordance with the DFARS clause 252.232-7002, Progress Payments for Foreign Military Sales Acquisitions, of this contract. (End of clause) [FR Doc. 2023-11138 Filed 5-24-23; 8:45 am] BILLING CODE 5001-06-P

ial applications. This effort is being carried out through the Process Control Security Requirements Forum (PCSRF), an industry group organized under the National Information Assurance Program (NIAP). NIAP is a joint effort between the NIST and the National Security Agency (NSA). As part of the Critical Infrastructure Protection Program, NIST and NSA are working to provide technical support and guidance to industry to improve the Nation's security posture. The outcome of this work will be the development and dissemination of best practices and ultimately security specifications that will be used in the procurement, development, and retrofit of industrial control systems.

Pursuant to DFARS clause 252.204-7012, DoD has required certain defense contractors and subcontractors to implement the security protections set forth in the National Institute of

Standards and Technology (NIST) Special Publication (SP) 800-171 R2 to provide adequate security for CUI that is processed, stored, or transmitted on contractor information systems. The CMMC Program provides the Department the mechanism needed to verify that a defense contractor or subcontractor has implemented the security requirements at each CMMC Level and is maintaining that status across the contract period of performance, as required. In calendar year (CY) 2021 DoD paused the planned CMMC rollout to conduct an internal review of the CMMC Program. The internal review resulted in a refined and streamlined set of requirements that addressed many of the concerns identified in the public comments received relating to the initial CMMC Program. These changes have been incorporated into the revised CMMC Program structure and policies. In July 2022, the CMMC PMO met with the Office of Advocacy for the United States Small Business Administration (SBA) to address the revisions planned to the CMMC Program that are responsive to prior SBA concerns. The CMMC Program will enhance the ability of the DoD to safely share FCI and CUI with defense contractors and know the information will be suitably safeguarded. Once fully implemented, CMMC will incorporate a set of cybersecurity requirements into acquisition contracts to provide verification that applicable cyber protections have been implemented. Under the CMMC Program, defense contractors and subcontractors will be required to implement certain cybersecurity protection requirements tied to a designated CMMC level and either perform a self-assessment or obtain an independent assessment from either a C3PAO or DCMA DIBCAC as a condition of a DoD contract award. CMMC is designed to validate the protection of FCI and CUI that is shared with and generated by the Department's contractors and subcontractors. Through protection of information by adherence to the requirements verified in the revised CMMC Program, the Department and its contractors will prevent disruption in service and the loss of intellectual property and assets, and thwart access to FCI and CUI by the nation's adversaries.

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft)
Enhanced Security Requirements for Protecting CUI September 2025 Any circumstance or event with the potential to adversely impact organizational operations, organizational assets, 3110 individuals, other organizations, or the Nation through a system via unauthorized access, destruction, disclosure, modification of information, and/or denial of service. [21] threat information Any information related to a threat that might help an organization protect itself against the threat or detect the activities of an actor. Major types of threat information include indicators, TTPs, security alerts, threat intelligence reports, and tool configurations. [14] threat intelligence Threat information that has been aggregated, transformed, analyzed, i

Responsibilities upon completion of the subcontracts. (1) Upon completion of the subcontract, the subcontractor may retain classified material received or generated under the subcontract for a two-year period, in accordance with the provisions in § 117.13(d)(5). (2) If retention is required beyond the two-year period, the subcontractor must request written retention authority through the prime contractor to the GCA, including the information required by § 117.15(j). (3) If retention authority is approved by the GCA, the prime contractor will issue a final Contract Security Classification Specification, or equivalent, annotated to provide the retention period and final disposition instructions. (d) Notification of invalidation, marginal, or unsatisfactory conditions. The prime contractor will be notified if the CSA discovers marginal or unsatisfactory conditions at the subcontractor's facility or if the CSA invalidates the subcontractor's facility clearance. Once notified, the prime contractor will follow the instructions received on what action, if any, should be taken in order to safeguard classified material relating to the subcontract.

§ 117.18 Information system security. (a) General. (1) Contractor information systems that are used to capture, create, store, process, or distribute classified information must be properly managed to protect against unauthorized disclosure of classified information. The contractor will implement protective measures using a risk-based approach that incorporates minimum standards for their insider threat program in accordance with CSA-provided guidance. (2) The CSA will issue guidance based on requirements for federal systems, pursuant to 44 U.S.C. Ch. 35 of subchapter II, also known as the 'Federal Information Security Modernization Act,' and as set forth in National Institute of Standards and Technology (NIST) Special Publication 800-37 (available at: <https://csrc.nist.gov/publications/detail/sp/800-37/rev-2/final>), Committee on National Security Systems (CNSS) Instruction 1253 (available at: <https://www.cnss.gov/CNSS/openDoc.cfm?QwPYrAJ5Ldq+s+jvttTznQ=->), and other applicable CNSS and NIST publications (e.g., NIST Special Publication 800-53). (b) Information system security program. The contractor will maintain an information system security program that supports overall information security by incorporating a risk-based set of management, operational, and technical

security controls in accordance with CSA-provided guidance. The contractor will incorporate into the program: (1) Policies and procedures that reduce information security risks to an acceptable level and address information security throughout the information system life cycle. (2) Plans and procedures to assess, report, isolate, and contain data spills and compromises, to include sanitization and recovery methods. (3) Information system security training for authorized users, as required in CSA provided guidance.

Eight comments were received on safeguarding, § 117.15, to include four on open storage areas and another four on intrusion detection systems (IDS). Commenters also requested more guidance on open storage area requirements included in the previous NISPOM DoD Manual, to include procedures for leaving an open storage area unattended during business hours, whether self-approval authority can still be delegated to FSOs by a CSA, procedures to ensure the structural integrity of the space, and whether open bin and open shelf storage is still permitted. DoD is proposing updated text in § 117.15(a) and (c) to address several of these comments (e.g., procedures for leaving an open storage area unattended during business hours and delegation of approval authority to FSOs if agreed to by the CSA, respectively) and as a result added a definition for 'pedestrian door locks' from the added text on security checks. DoD is also proposing updated text in paragraph 117.15(d) to provide more clarity on required investigative response to alarms for IDS. More guidance on safeguarding for those contractors under DoD cognizance will be provided via forthcoming ISLs, as appropriate. DoD is also proposing additional text to § 117.15(e) regarding information management systems to more accurately reflect the terminology for classified information systems, and as a result added the term 'authorization to operate' to the definitions section in § 117.3. Finally, DoD is proposing additional text to § 117.15(e)(6) to provide more clarity on the requirements for the reproduction of classified information, to include accountability, control, and marking requirements of the reproduced classified information, and procedures for waste products resulting from the reproduction. A commenter questioned the accuracy of the text in § 117.17(a)(3) which stated that if an entity eligibility determination could not be completed in time to qualify the prospective subcontractor for participation in a procurement action, that the CSA will continue the entity eligibility determination processing for future contract consideration. After review of this text, DoD has concluded this text provides guidance to CSAs, rather than contractors and is proposing it for deletion. Joint Personnel Adjudication System Finally, the reference to the Joint Personnel Adjudication System is proposed for deletion from the list of approved information collections as part of the Paperwork Reduction Act section because it has been discontinued and replaced by the Defense Information System for Security. The text in § 117.5(d) has also been proposed for updating to reflect only the Defense Information System for Security is used for the initiation, investigation, and adjudication of information relevant to DoD security clearances and employment suitability determinations. Expected Impact of the Proposed Rule and Changes Being Proposed Based on Public Comment

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. that and now have automated tools. Our onboarding site is a self-registration site so that our new staff can go and self-register, take their training, and then that ties into our primary learning center once they're on board and approved. We reconcile those transcripts. So, we do have now the automated means where we do tie it into our backend account management system so that, truly, people aren't getting access to things before they've taken that training and signed the rules of behavior.

There are three types of documents relating to the Privacy Act Program that must be published in the Federal Register . They are the DA Privacy Program policy and procedures (AR 340-21), the DA exemption rules, and Privacy Act system of records notices. (b) Rulemaking procedures . (1) DA Privacy Program procedures and exemption rules are subject to the formal rulemaking process. (2) Privacy Act system of records notices are not subject to formal rulemaking and are published in the Federal Register as Notices, not Rules. (3) The Privacy Program procedures and exemption rules are incorporated into the Code of Federal Regulations (CFR). Privacy Act system of records notices are not published in the CFR. § 505.12 Privacy Act enforcement actions. (a) Judicial Sanctions. The

Act has both civil remedies and criminal penalties for violations of its provisions. (1) Civil remedies. The DA is subject to civil remedies for violations of the Privacy Act. In addition to specific remedial actions, 5 U.S.C. 552a(g) may provide for the payment of damages, court costs, and attorney's fees. (2) Criminal penalties. A DA official or employee may be found guilty of a misdemeanor and fined not more than \$5,000 for willfully: (i) Disclosing individually identifiable personal information to one not entitled to the information; (ii) Requesting or obtaining information from another's record under false pretenses; or (iii) Maintaining a system of records without first meeting the public notice requirements of the Act. (b) Litigation Status Sheet. (1) When a complaint citing the Privacy Act is filed in a U.S. District Court against the Department of the Army, an Army Component, a DA Official, or any Army employee, the responsible system manager will promptly notify the Army Litigation Division, 901 North Stuart Street, Arlington, VA 22203-1837. (2) The Litigation Status Sheet at appendix E of this part provides a standard format for this notification. At a minimum, the initial notification will have items (a) through (f) provided. (3) A revised Litigation Status Sheet must be provided at each stage of the litigation. (4) When a court renders a formal opinion or judgment, copies must be provided to the Defense Privacy Office by the Army Litigation Division. (c) Administrative Remedies-Privacy Act complaints. (1) The installation level Privacy Act Officer is responsible for processing Privacy Act complaints or allegations of Privacy Act violations. Guidance should be sought from the local Staff Judge Advocate and coordination made with the system manager to assist in the resolution of Privacy Act complaints. The local Privacy Act officer is responsible for: (i) Reviewing allegations of Privacy Act violations and the evidence provided by the complainants; (ii) Making an initial assessment as to the validity of the complaint, and taking appropriate corrective action;

9. Adjustments to Account for Records Requests Made on the Weekends If there are 4 sets of weekends during the 29 day traceback time period in which records are inaccessible, then the estimated calendar duration (including weekends) of a current traceback investigation becomes much longer. To allow more accurate comparison of the time savings between current traceback times with those projected under alternative policy options requiring 4 and 8 hours, and up to 24 hours records access, we adjust the estimate of current traceback times to account for requests that would be made on weekends following issuance of this final rule. Most current records requests are made during the week, because establishments may not be open or key personnel may be absent on weekends. However, this final rule requires records access when requests are made on either weekdays or weekends. Consequently, we assume that there is a 1 in 7 chance of requesting records on a Saturday, and a 1 in 7 chance of requesting records on a Sunday if FDA were conducting a traceback investigation of a food for which it had a reasonable belief the food was adulterated and presented a serious threat of serious adverse health consequences or death to humans or animals. A 24-hour records access requirement would improve current traceback times by allowing weekend records access requests. We assume that a records access request that would be made on a Saturday or Sunday following issuance of this final rule, would currently not be made until the following Monday. Taking this assumption into account, we estimate that the current time to satisfy a records request made on a Saturday to be 3 to 5 days (i.e., 2 days, plus 1 to 3 days), or an average of 4 days for 1/7 of all access requests (i.e., records requested on a Saturday), and 2 to 4 days (i.e., 1 day, plus 1 to 3 days), or an average of 3 days for 1/7 of all access requests (i.e., records requested on a Sunday). With the average of 1.2 days for records analysis times, the adjusted estimate of the total time for satisfying a records access request and records analysis is an average of 5.2 days (1.2 days, plus an average of 4 days) for requests made on a Saturday, and 4.2 days (1.2 days, plus an average of 3 days) for requests made on a Sunday. The adjusted estimate of current traceback times is computed as an expectation of traceback times taking into account the probabilities of records requests made on weekdays and weekends. Assuming nine investigative visits per traceback investigation, the adjusted estimate of the current traceback time is approximately 33 days $((3.3 \text{ days} \times 5/7) + (4.2 \text{ days} \times 1/7) + (5.2 \text{ days} \times 1/7)) \times 9 \text{ visits}$. The adjusted estimate of the current traceback duration is reasonably consistent with the current traceback durations reported by traceback personnel of between 6 and 8 weeks for eggs and fresh produce, and 3 days for packaged products that contain lot code information on the labeling.

(x) The Assistant Chief of Staff for Installation Management is authorized to act on requests for records relating to planning, programming, execution and operation of Army installations. This includes base realignment and closure activities, environmental activities other than litigation, facilities and housing activities, and installation management support activities. (y) The Commander, U.S. Army Intelligence and Security Command, is authorized to act on requests for intelligence and security records, foreign scientific and technological records, intelligence training, intelligence threat assessments, and foreign liaison information, mapping and geodesy information, ground surveillance records, intelligence threat assessment, and missile intelligence data relating to tactical land warfare systems. (z) The Commander, U.S. Army Combat Readiness Center (formerly U.S. Army Safety Center), is authorized to act on requests for Army safety records. (aa) The Commander, U.S. Army Test and Evaluation Command (ATEC), is authorized to act on requests for the records of ATEC headquarters, its subordinate commands, units, and activities that relate to test and evaluation operations. (bb) The General Counsel, Army and Air Force Exchange Service, is authorized to act on requests for Army and Air Force Exchange Service records, under AR 60-20/AFR 147-14. (cc) The Commandant, United States Disciplinary Barracks (USDB) is authorized to act on records pertaining to USDB functional area responsibilities relating to the administration and confinement of individual military prisoners at the USDB. This includes, but is not limited to, all records pertaining to the treatment of military prisoners; investigation of prisoner misconduct; management, operation, and administration of the USDB confinement facility; and related programs which fall directly within the scope of the Commandant's functional area of command and control.

(dd) The Commander, U.S. Army Community and Family Support Center (USACFSC) is authorized to act on requests for records pertaining to morale, welfare, recreation, and entertainment programs; community and family action programs; child development centers; non-appropriated funds issues, and private organizations on Army installations. (ee) The Commander, Military Surface Deployment and Distribution Command (formerly Military Traffic Management Command) is authorized to act on requests for records pertaining to military and commercial transportation and traffic management records. (ff) The Director, Installation Management Agency (IMA) is authorized to act on requests for all IMA records. (gg) Special Denial Authority's authority for time-event related records may be designated on a case-by-case basis. These will be published in the Federal Register . You may contact the Department of the Army, Freedom of Information and Privacy Office to obtain current information on special delegations. Appendix C to Part 505-Privacy Act Statement Format (a) Authority:

(3) The Judge Advocate General will serve as the Denial Authority on requests made pursuant to the Privacy Act of 1974 for access to or amendment of Army records, regardless of functional category, concerning actual or potential litigation in which the United States has an interest. (4) The Chief, DA Freedom of Information Act and Privacy Office (FOIA/P), U.S. Army Records Management and Declassification Agency will-

- (i) Develop and recommend policy;
- (ii) Execute duties as the Army's Privacy Act Officer;
- (iii) Promote Privacy Act awareness throughout the DA;
- (iv) Serve as a voting member on the Defense Data Integrity Board and the Defense Privacy Board;
- (v) Represent the Department of the Army in DOD policy meetings; and
- (vi) Appoint a Privacy Act Manager who will-

(A) Administer procedures outlined in this part; (B) Review and approve proposed new, altered, or amended Privacy Act systems of records notices and subsequently submit them to the Defense Privacy Office for coordination; (C) Review Department of the Army Forms for compliance with the Privacy Act and this part; (D) Ensure that reports required by the Privacy Act are provided upon request from the Defense Privacy Office; (E) Review Computer Matching Agreements and recommend approval or denial to the Chief, DA FOIA/P Office; (F) Provide Privacy Act training; (G) Provide privacy guidance and assistance to DA activities and combatant commands where the Army is the Executive Agent; (H) Ensure information collections are developed in compliance with the Privacy Act provisions; (I) Ensure Office of Management and Budget reporting requirements, guidance, and policy are accomplished; and (J) Immediately review privacy violations of personnel to locate the problem and develop a means to prevent recurrence of the problem. (5) Heads of Department of the Army activities, field-operating agencies, direct reporting units, Major Army commands, subordinate commands down to the battalion level, and installations will-

- (i) Supervise and execute the privacy program in functional areas and activities under their responsibility; and
- (ii) Appoint a Privacy Act Official who will-

(A) Serve as the staff advisor on privacy matters; (B) Ensure that Privacy Act records collected and maintained within the Command or agency are properly described in a Privacy Act system of records notice published in the Federal Register ; (C) Ensure no undeclared systems of records are being maintained; (D) Ensure Privacy Act requests are processed promptly and responsively; (E) Ensure a Privacy Act Statement is provided to individuals when information is collected that will be maintained in a Privacy Act system of records, regardless of the medium used to collect the personal information (i.e., forms, personal interviews, stylized formats, telephonic interviews, or other methods);

It is assumed that the mobile devices first responders will use on the future NPSBN-as is the case with their existing LMR devices-will remain under the physical control of first responders for the duration of their shifts. These LMR devices are often affixed to them via a physical tether. First responders need to be able to access the same mission-critical communication services on their next-generation mobile device in a manner similar to the way they currently use their LMR devices. Allowing the use of certain functions without authentication is not without precedent, as many modern mobile operating systems allow users to access certain features without authenticating at the time of use. Common examples include accessing the camera, performing emergency calls, and viewing and interacting with notifications from a variety of applications (e.g., texting). With that concept in mind, compensating controls may be necessary to mitigate threats raised by this security configuration, especially device loss or theft. These controls may include auditing and logging which entities access certain resources, and the ability to remotely wipe a portion, or the entire contents, of a mobile device's storage locations.

-To a consumer reporting agency in accordance with section 3711(e) of Title 31 of the U.S. Code. The name, address, SSN, and other information identifying the individual; amount, status, and history of the claim; and the agency or program under which the case arose may be disclosed. However, before

doing so, agencies must complete a series of steps designed to validate the (printed page 14764) debt and to offer the individual an opportunity to repay it. §-310.16 Department of the Navy exemptions. (a) All systems of records maintained by the DON shall be exempt from the requirements of the access provision of the Privacy Act (5 U.S.C. 552a(d)) under the (k)(1) exemption, to the extent that the system contains information properly classified under E.O. 12958 and that is required by that E.O. to be kept secret in the interest of national defense or foreign policy. This exemption is applicable to parts of all systems of records including those not otherwise specifically designated for exemptions herein that contain isolated items of properly classified information. (1) System identifier and name. N01070-9, White House Support Program. (i) Exemption. (A) Information specifically authorized to be classified under E.O. 12958 , as implemented by DOD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1) . (B) Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (C) Records maintained in connection with providing protective services to the President and other individuals under 18 U.S.C. 3506 , may be exempt pursuant to 5 U.S.C. 552a(k)(3) . (D) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (E) Portions of this system of records are exempt from the following subsections of the Privacy Act: (c)(3), (d), (e)(1), (e)(4)(G) through (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(1) , (k)(2), (k)(3), and (k)(5). (iii) Reasons. Exempted portions of this system contain information that has been properly classified under E.O. 12958

(i) Disclosure of the information is in the public interest because it is likely to contribute significantly to public understanding of the operations or activities of the Government. The factors identified must be met to some degree to warrant waiving or reducing assessable fees in the public interest. (A) The subject of the request . The Components should analyze whether the subject matter of the request involves issues will significantly contribute to the public understanding of the operations or activities of the Department of Defense. Requests for records in the possession of the Department of Defense that were originated by non-government organizations and are sought for their intrinsic content, rather than informative value, will likely not contribute to public understanding of the operations or activities of the Department of Defense. An example of such records might be press clippings, magazine articles, or records forwarding a particular opinion or concern from a member of the public regarding a DoD activity. Similarly, disclosures of records of considerable age may or may not bear directly on the current activities of the Department of Defense; however, the age of a particular record shall not be the sole criterion for denying relative significance under this factor. It is possible to envisage an informative issue concerning the current DoD activities, based on historical documentation. Requests of this nature must be closely reviewed consistent with the requester's stated purpose for desiring the records and the potential for public understanding of DoD operations and activities. (B) The informative value of the information to be disclosed . This factor requires a close analysis of the substantive contents of a record, or portion of the record, to determine whether disclosure is meaningful, and shall inform the public on the operations or activities of the Department of Defense. While the subject of a request may contain information that concerns the Department of Defense, it may not always hold great potential for contributing to a meaningful understanding of these operations or activities. An example of such would be a previously released record that has been heavily redacted, the balance of which may contain only random words, fragmented sentences, or paragraph headings. A determination as to whether a record in this situation will contribute to the public understanding of DoD operations or activities must be approached with caution, and carefully weighed against the arguments offered by the requester. Another example is information already known to be in the public domain. Disclosure of duplicative or nearly identical information already existing in the (printed page 71863) public domain may not add meaningful new information concerning the operations and activities of the Department of Defense. (C) The contribution to an understanding of the subject by the general public likely to result from disclosure

(Response) FDA does not agree that there are millions of direct marketers of food in the United

States. Nor does FDA agree that the burden on direct marketing retailers would be greater than for other retail establishments. However, FDA does agree that the data sources used in the PRIA may not account for many small direct marketers that may not have filed as a sole proprietorship business with the Internal Revenue Service (IRS). While these direct marketers may have been omitted in the PRIA, they are considered exempt in the final rule and are not included in the cost estimates in this analysis. Nevertheless, in order to respond to comments and to estimate the cost of policy options that include very small retailers, FDA does revise its estimate of the number of retail establishments to account for direct marketers that may not have been included in the PRIA. FDA found estimates of 10 million (Ref. 24) and 12 million (Ref. 25) direct marketers in the United States, but these estimates included all the direct marketers of both nonfood and food products in the United States. FDA does not have a complete census of the number of marketers of food versus nonfood products. To approximate the percentage of direct marketers selling food, FDA divided the number of direct marketing companies selling food by the number selling all types of products, using data from the directory of companies on the Web site of a large direct selling trade organization (Ref. 25). Of the 141 companies in the directory, approximately 5 market food or beverages, or approximately 3.5 percent of the total. The number of direct marketing establishments should be captured by the NES, which are generated chiefly from administrative records of the IRS. These data are primarily composed of sole proprietorship businesses filing IRS Form 1040, Schedule C (Ref. 22). Many of the nonemployer businesses are very small, and many are not the primary source of income for their owners. Furthermore, nonemployers account for 75 percent of all businesses.

· Document in the asset inventory · Document in the SSP. · Document in the network diagram of the CMMC Assessment Scope. · Prepare to be assessed against CMMC security requirements. · Review the SSP: i. If sufficiently documented, do not assess against other CMMC security requirements, except as noted. ii. If OSA's risk-based security policies, procedures, and practices documentation or other findings raise questions about these assets, the assessor can conduct a limited check to identify deficiencies. iii. The limited check(s) shall not materially increase the assessment duration nor the assessment cost. iv. The limited check(s) will be assessed against CMMC security requirements. Specialized Assets · Assets that can process, store, or transmit CUI but are unable to be fully secured, including: Internet of Things (IoT) devices, Industrial Internet of Things (IIoT) devices, Operational Technology (OT), Government Furnished Equipment (GFE), Restricted Information Systems, and Test Equipment · Document in the asset inventory · Document in the SSP. · Show these assets are managed using the contractor's risk-based security policies, procedures, and practices. · Document in the network diagram of the CMMC Assessment Scope. · Review the SSP. · Do not assess against other CMMC security requirements. · Assets that are not in the Level 2 CMMC Assessment Scope Out-of-Scope Assets · Assets that cannot process, store, or transmit CUI; and do not provide security protections for CUI Assets · Prepare to justify the inability of an Out-of-Scope Asset to store, process, or transmit CUI · None. · Assets that are physically or logically separated from CUI assets · Assets that fall into any in-scope asset category cannot be considered an Out-of-Scope Asset (2) If the OSA utilizes an External Service Provider (ESP), other than a Cloud Service Provider (CSP), the ESP must have a CMMC Level 2 Final Certification Assessment. If the ESP is internal to the OSA, the security requirements implemented by the ESP should be listed in the OSA's SSP to show connection to its in-scope environment. In the CMMC Program, CUI or Security Protection Data (e.g., log data, configuration data), must be processed, stored, or transmitted on the ESP assets to be considered an ESP. If using a CSP for Level 2 Self-Assessment, see §.170.16(c)(2). If using a CSP for Level 2 Certification Assessment, see §.170.17(c)(5). (d) CMMC Level 3 scoping. Prior to performing a Level 3 CMMC assessment, the CMMC Assessment Scope must be specified. (1) The CMMC Assessment Scope for Level 3 is based on the specification of asset categories and their respective requirements as set forth in table 2 to this paragraph. Additional information is available in the guidance document listed in paragraph (g) of appendix A to this part. Table 2 to §.170.19(d)(1)-CMMC Level 3 Asset Categories and Associated Requirements

Asset category	Asset description	OSC requirements	CMMC assessment requirements
----------------	-------------------	------------------	------------------------------

administrative, physical, and technical safeguards of the Security Rule. The Department relied on data from AHRQ and the U.S. Census to estimate the number of firms offering group health plans (1.9 million), [958] and multiplied that by the percentage that offer at least one self-insured plan to calculate the number of plan sponsors that would be likely to receive ePHI and be subject to the requirements of 45 CFR 164.314(b) [1,943,484 × .382 = 742,411]. We solicit comments on whether group health plans or third-party administrators address any Security Rule requirements for plan sponsors, so the plan sponsors would not have an additional burden or would have a smaller burden

than estimated below. **Individuals Affected** The number of individuals potentially affected by the proposed changes to the Security Rule includes most of the United States population (approximately 337 million), specifically those who have received any health care in the past seven years and whose ePHI is likely created, received, maintained, or transmitted by a regulated entity. Statistics about the number of individuals affected by breaches of PHI provide insight into known instances where safeguards were breached, although the effects of the Security Rule extend farther than that, to all ePHI. Data from the 2022 Annual Report to Congress on Breaches of Unsecured Protected Health Information for Calendar Year 2022 [959] revealed nearly 42 million individuals affected by breaches of PHI in that year. Third-party sources reported approximately 133 million individuals affected by health care breaches in 2023. [960] According to UnitedHealth Group, the 2024 breach of its clearinghouse subsidiary Change Healthcare may have affected approximately one-third of the U.S. population, or 112 million individuals. [961] The Department believes that the range of individuals potentially affected by the proposed regulatory changes would be from 42 million to 337 million. **HIPAA Breach Data** The Department has reported HIPAA/HITECH breach data annually since 2009. Table 5 shows the data as reported to Congress for the past five years. We relied on this data, combined with breach cost data from industry sources, to analyze the potential savings of the NPRM. **Table 5-Breaches of PHI**

Year	Small breaches (fewer than 500 affected individuals)	Large breaches (500+ affected individuals)	Total Breach count	Affected individuals
2018	63,098	296,948	302	12,196,601
2019	63,400	12,493,549	62,771	284,812
2020	408	38,732,966	63,179	39,017,778
2021	609	37,182,558	64,180	37,501,773
2022	626	41,747,613	64,592	42,004,718

3. Costs of the Proposed Rule

(A) From subsection (c)(3) because to grant access to the accounting for each disclosure as required by the Privacy Act, including the date, nature, and purpose of each disclosure and the identity of the recipient, could alert the subject to the existence of the investigation or prosecutable interest by the NGA or other agencies. This could seriously compromise case preparation by prematurely revealing its existence and nature; compromise or interfere with witnesses or make witnesses reluctant to cooperate; and lead to suppression, alteration, or destruction of evidence. (B) From subsections (d) and (f) because providing access to investigative records and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal their wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that (printed page 14782) would make them difficult or impossible to reach in order to satisfy any Government claim growing out of the investigation or proceeding. (C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsections (e)(4)(G) and (H) because this system of records is compiled for investigative purposes and is exempt from the access provisions of subsections (d) and (f). (E) From subsection (e)(4)(I) because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. NGA will, nevertheless, continue to publish such a notice in broad generic terms, as is its current practice.

MA.L2-3.7.3 · Equipment Sanitization CMMC Assessment Guide · Level 2 | Version 2.13 148
 MA.L2-3.7.3 · EQUIPMENT SANITIZATION Ensure equipment removed for off-site maintenance is sanitized of any CUI. **ASSESSMENT OBJECTIVES** [NIST SP 800-171A]130 Determine if: [a] equipment to be removed from organizational spaces for off-site maintenance is sanitized of any CUI. **POTENTIAL ASSESSMENT METHODS AND OBJECTS** [NIST SP 800-171A]130 Examine [SELECT FROM: System maintenance policy; procedures addressing controlled system maintenance; maintenance records; manufacturer or vendor maintenance specifications; equipment sanitization records; media sanitization records; system security plan; other relevant documents or records]. Interview [SELECT FROM: Personnel with system maintenance responsibilities; personnel with information security responsibilities;

personnel responsible for media sanitization; system or network administrators]. Test [SELECT FR OM: Organizational processes for scheduling, performing, documenting, reviewing, approving, and monitoring maintenance and repairs for systems; organizational processes for sanitizing system components; mechanisms supporting or implementing controlled maintenance; mechanisms implementing sanitization of system components]. DISCUSSION [NIST SP 800-171 REV. 2]131 This requirement addresses the information security aspects of system maintenance that are performed off- site and applies to all types of maintenance to any system component (including applications) conducted by a local or nonlocal entity (e.g., in- contract, warranty, in-house, software maintenance agreement). NIST SP 800-88 provides guidance on media sanitization. FURTHER DISCUSSION Sanitization is a process that makes access to data infeasible on media such as a hard drive. The process may overwrite the entire media with a fixed pattern such as binary zeros. In 130 NIST SP 800-171A, p. 39. 131 NIST SP 800-171 Rev. 2, p. 28.

The DoD has included the numbering scheme in the rule because the numbering scheme is a key element of the model. The CMMC numbering scheme for security requirements must pull together the independent numbering schemes of FAR clause 52.204-21 (for Level 1), NIST SP 800-171 R2 (for Level 2), and NIST SP 800-172 Feb2021 (for Level 3); it must also identify the domain and CMMC level of the security requirement. DoD developed the least complicated scheme that met all these criteria. The CMMC Program Office is unable to respond to comments proposing changes to the DFARS, which is subject to separate rulemaking procedures. One commenter described a hypothetical scenario wherein a solicitation is issued such that DFARS clause 252.204-7012 would require compliance with NIST SP 800-171 Revision 3, but the CMMC requirement identified is for assessment against NIST SP 800-171 R2. In this hypothetical scenario, it is possible that the bidder may meet the CMMC requirement by citing a valid CMMC assessment against NIST SP 800-171 R2, while also availing themselves of the flexibilities provided in DFARS clause 252.204-7012 (2)(ii)(B) to submit a written request to the Contracting Officer to vary from the current version of NIST SP 800-171. Recommendations for modification to or deviation from DFARS clause 252.204-7012 are beyond the scope of this rule. The DoD has evaluated the potential interaction between the CMMC program requirements and the existing requirements in DFARS clause 252.204-7012 and believes that potential conflicts have been resolved. NIST SP 800-53 R5 is incorporated by reference only for applicable definitions because DoD chose to use the latest definitions available. While it is also true that NIST SP 800-171 R2 was based on NIST SP 800-53 Revision 4, the origination of NIST SP 800-171 R2 is beyond the scope of this rule. Contractors and subcontractors will not be expected to stop work while they implement changing standards. Implementation of this rule will be introduced as a pre-award requirement in new DoD solicitations, as described in the timeline at § 170.3(e). Any substantive change to CMMC security requirements must go through rulemaking, and its associated timeline, which may include public comment. The new rule may include a transition period for implementation of the new security requirements. The commenter correctly identifies that the programmatic intent of this rule is for affirmations to signify systems in question remain compliant as indicated by the assessment that was conducted. Assessments are conducted against the specified NIST publication versions or the requirements in FAR clause 52.204-21. The 48 CFR part 204 CMMC Acquisition rule also reinforces this thought by providing specific wording of the affirmation. c. NIST SP 800-172 Feb2021 Requirements Comment:

The CMMC requirements established pursuant to DFARS Case 2019-D041 have not been revised as of the date of publication of this final rule. However, the CMMC Program requirements in this final rule will be implemented in the DFARS, as needed, which may result in changes to the current DFARS text, solicitation provisions, and contract clauses relating to DoD's cybersecurity protection requirements, including DFARS subpart 204.75 and DFARS clause 252.204-7021, Cybersecurity Maturity Model Certification (CMMC) Requirements. Context of the CMMC Program in Light of Other DoD-Related Work At present, and prior to the DFARS CMMC Acquisition rule becoming effective, the Department is using the DCMA DIBCAC to conduct CMMC Level 2-like assessments. To date, the DCMA DIBCAC has assessed 357 entities including DoD's major prime contractors. The CMMC Program's assessment phase- in plan, as described in § 170.3 Applicability, does not preclude entities from immediately and voluntarily seeking a CMMC certification assessment prior to the DFARS CMMC Acquisition rule being finalized and the clause being added to new or existing DoD contracts. The Department estimates 8,350 medium and large entities will require CMMC Level 2 certification assessments. Once the CMMC DFARS coverage is effective, the Department will contractually mandate CMMC Level (printed page 83171) 2 certification assessments on these entities. It is estimated that 135 CMMC Third-Party Assessment Organization (C3PAO)-led assessments will be completed in the first year. The Department

estimates 673 C3PAO-led assessments in year 2 followed by 2,252 C3PAO-led assessments in year 3. During the fourth year, the Department estimates 4,452 C3PAO-led assessments will be completed. The DCMA DIBCAC will perform assessments upon DoD's request. Additionally, the Department may include CMMC Level 2 certification requirements on contracts awarded prior to the CMMC DFARS coverage becoming effective, but doing so will require bilateral contract modification after negotiations. The CMMC Program has been incorporated in the Department's 2024 Defense Industrial Base Cybersecurity Strategy. [28] The strategy requires the Department to coordinate and collaborate across components to identify and close gaps in protecting DoD networks, supply chains, and other critical resources. Other prongs of the Department's cybersecurity strategy are described in the Department's National Industrial Security Program Operating Manual (NISPOM) which address implementation of the Security Executive Agent Directive (SEAD) 3, [29] including clarifications on procedures for the protection and reproduction of classified information; controlled unclassified information (CUI); National Interest Determination (NID) requirements for cleared contractors operating under a Special Security Agreement for Foreign Ownership, Control, or Influence; and eligibility determinations for personnel security clearance processes and requirements. The DDN Management Bulletin is distributed electronically by the Defense Data Network (DDN) Network Information Center under contract to the Defense Communications Agency. It is a means of communicating official policy, procedures, and other information of concern to management personnel at DDN facilities. The DDN Security Bulletin is distributed electronically by the DDN SCC (Security Coordination Center), also under contract to DCA, as a means of communicating information on network and host security exposures, fixes, and concerns to security and management personnel at DDN facilities.

(vi) The dispatching contractor will prepare three copies of a receipt based on the inventory and list the classified material that is being sent. The dispatching contractor will retain one copy of the receipt. The contractor will pack the other two copies with the classified material. The

contractor will obtain a receipt for the sealed package from the courier. (vii) The dispatching contractor will provide the receiving contractor with 24 work hours advance notification of the anticipated date and time of the courier's arrival and the identity of the courier. The receiving contractor must notify the dispatching contractor if the courier does not arrive within 8 hours of the expected time of arrival. The dispatching contractor will notify its DGR of any delay, unless officially notified otherwise of a change in the courier's itinerary. (printed page 83352)

(viii) The receiving DGR will verify the contents and sign the receipts enclosed in the consignment. The receiving DGR will return one copy to the courier. On return, the courier will provide the executed receipt to the dispatching contractor. (ix) Throughout the journey, the courier will maintain the classified material under direct personal control. The courier will not leave the material unattended at any time during the journey, in the transport being used, in hotel rooms, in cloakrooms, or other such location, and will not deposit it in hotel safes, luggage lockers, or in luggage offices. In addition, the courier will not open envelopes or packages containing the classified material en route, unless required by customs or other government officials. (x) When inspection by government officials is unavoidable, the courier will request that the officials provide written verification that they have opened the package. The courier will notify their employing contractor as soon as possible. The contractor will notify the U.S. DGR. If the inspecting officials are not of the same country as the dispatching contractor, the CSA will notify the designated security authority in the country whose officials inspected the consignment. Under no circumstances will the courier hand over the classified material to customs or other officials for their custody. (xi) When carrying classified material, the courier will not travel by surface routes through third countries, except as authorized by the CSA. The courier will travel only on carriers described in paragraph (d)(2)(iv) in this section, and will travel direct routes between the United States and the destination. (7) Classified material receipts. (i) The U.S. DGR and the DGR of the ultimate foreign recipient will maintain a continuous chain of receipts to record international transfers of all classified material from the contractor through the dispatching DGR and recipient DGR to the ultimate foreign recipient. The dispatching contractor will retain: (A) An active suspense record until return of applicable receipts for the material.

Roles and responsibilities of the CMMC PMO, the Accreditation Body, and its organizations are described in SUBPART C of this rule. The Accreditation Body accredits C3PAOs and the CAICO. The Accreditation Body authorizes the CAICO to certify CMMC assessors and instructors and the C3PAOs to conduct assessments using CAICO-certified assessors. Comment: Many commenters expressed concerns about how to ensure the necessary independence, quality assurance, integrity, and rigor of, and protection against potential conflicts of interest within the Accreditation Body and C3PAOs. Numerous commenters recommended the use of ISO/IEC standards to address these issues. Additionally, one commenter was concerned about high costs for assessments that could result if there is a lack of oversight for charging fees. Response: The Accreditation Body is required to become compliant with the ISO/IEC 17011:2017 standard (the international benchmark used in demonstrating an accreditation body's impartiality, technical competency, and resources) and the requirements set forth in §.170.8. Additionally, the C3PAOs and CAICO must comply with requirements as specified in §.170.9 and §.170.10, respectively, including the specified ISO/IEC standards. Comment: To address a perceived shortage of CMMC C3PAO assessors, two commenters suggested authorizing the use of other ISO/IEC-compliant accreditation bodies to increase the numbers of assessors. Another commenter wanted to know how a company could become an accreditation body. Response: Consistency in training is imperative due to the unique qualifications needed to understand requirements. Additionally, ISO/IEC 17024:2012 Conformity Assessment requirements are levied against the CAICO and may not be required by other entities. The number and level of assessors needed is relative to the number of companies seeking CMMC assessment. The demand level is influenced, but not solely determined by, the number of solicitations that include CMMC requirements, the CMMC Levels specified, and the estimated number of subcontractors that will also need to meet CMMC requirements, when flowed down by the prime contractor. To facilitate a smooth and orderly transition to CMMC, the Department will issue policy guidance to government Program Managers to govern the rate at which CMMC requirements are levied in new solicitations. The implementation phases are described in §.170.3(e). The CMMC PMO has visibility into the Accreditation Body's assessor training activities, tracks the anticipated number of trained assessors, and will use this information to inform policies that guide government Program Managers in identifying CMMC requirements in new solicitations. 23. Relationship to Existing Regulations Comment:

(ii) For litigation support contractors accessing litigation information, including that originating

from third parties, use and non-disclosure requirements are addressed through the use of the clause at 252.204-7014, as prescribed at 204.7403(a). Pursuant to the clause, litigation support contractors are not required to enter into non-disclosure agreements directly with any third party asserting restrictions on any litigation information. PART 212·ACQUISITION OF COMMERCIAL ITEMS 212.301 [Amended] 4. Amend section 212.301 by· a. Removing paragraph (f)(ii)(E); b. Redesignating paragraphs (f)(ii)(F) and (G) as paragraphs (f)(ii)(E) and (F), respectively; c. In the newly redesignated (f)(ii)(E) removing ·204.7403(b)· and adding ·204.7403(a)· in its place; and d. In the newly redesignated (f)(ii)(F) removing ·204.7403(c)· and adding ·204.7403(b)· in its place. PART 252·SOLICITATION PROVISIONS AND CONTRACT CLAUSES 252.204-7013 [Removed and Reserved] 5. Remove and reserve section 252.204-7013. 252.204-7014 [Amended] 6. Amend section 252.204-7014, in the introductory text, by removing ·204.7403(b)· and adding ·204.7403(a)· in its place. 252.204-7015 [Amended] 7. Amend section 252.204-7015, in the introductory text, by removing ·204.7403(c)· and adding ·204.7403(b)· in its place. [FR Doc. 2019-23802 Filed 10-30-19; 8:45 am] BILLING CODE 5001-06-P

DoD, GSA, and NASA seek responses to any or all the questions that follow this paragraph. Where possible, include specific examples of how your organization is or would be impacted negatively or positively by the recommended scope and subparts; if applicable, provide rationale supporting your position. If you believe the proposed scope and subparts should be revised, suggest an alternative (which may include not providing guidance at all) and include an explanation, analysis, or both, of how the alternative might meet the same objective or be more effective. Comments on the economic effects including quantitative and qualitative data are especially helpful. In addition to the FAR parts and subparts proposed for relocation to FAR part 40, let us know: 1. What specific section(s) of the FAR would benefit from inclusion in FAR part 40? 2. What specific suggestions do you have for otherwise improving the proposed scope or subparts of FAR part 40? William F. Clark, Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy. [FR Doc. 2024-07535 Filed 4-9-24; 8:45 am] BILLING CODE 6820-EP-P

A purpose of the phased implementation is to ensure adequate availability of authorized or accredited C3PAOs and assessors to meet the demand. CMMC 2.0·Flow Down CMMC Level requirements will be flowed down to subcontractors at all tiers as set forth in 32 CFR 170.23 ; however, the specific CMMC Level required for a subcontractor will be based on the type of unclassified information and the priority of the acquisition program and/or technology being developed. Key Changes Incorporated in the CMMC 2.0 Program In November 2021, the Department announced ·CMMC 2.0,· which is an updated program structure with revised requirements. In CMMC 2.0, the Department has introduced several key changes that build on and refine the original program requirements. These include: Streamlining the model from five levels to three levels. Exclusively implementing National Institute of Standards and Technology (NIST) cybersecurity standards and guidelines. Allowing all companies subject to Level 1, and a subset of companies subject to Level 2 to demonstrate compliance through self-assessments. Increased oversight of professional and ethical standards of CMMC third-party assessors. Allowing Plans of Action & Milestones (POA&M) under limited circumstances to achieve conditional certification. As a result of the alignment of CMMC 2.0 to NIST guidelines, the Department's requirements will continue to evolve as changes are made to the underlying NIST SP 800-171 Rev 2 and NIST SP 800-172 requirements. CMMC Assessment Assessment Criteria CMMC requires that defense contractors and subcontractors entrusted with FCI and CUI implement cybersecurity standards at progressively more secure levels, depending on the type and sensitivity of the information. CMMC Level 1 Self-Assessment An annual CMMC Level 1 Self-Assessment and annual affirmation asserts that an OSA has implemented all the Basic Safeguarding requirements to protect FCI as set forth in 32 CFR 170.14(c)(2) . An OSA can choose to perform the annual self-assessment internally or engage a third-party to assist with evaluating its Level 1 compliance. Use of a third party to assist with the (printed page 89084) assessment process is still considered a self-assessment and does not result in a CMMC certification. An OSA can be compliant with CMMC Level 1 requirements for an entire enterprise network or for a particular enclave(s), depending upon where the FCI is or will be processed, stored, or transmitted. CMMC Level 2 Self-Assessment A CMMC Level 2 Self-Assessment and triennial affirmation attests that an OSA has implemented all the security requirements to protect CUI as specified in 32 CFR 170.14(c)(3) . CMMC Level 2 Certification Assessment A CMMC Level 2 Certification Assessment, conducted by a C3PAO, verifies that an OSC is conforming to the security requirements to protect CUI as specified in 32 CFR 170.14(c)(3)

There were numerous comments regarding Contractor Risk Managed Assets. Several comments perceived conflicts in the changes between the current rule and previous intermediate documents regarding CRMA requirements. Multiple comments recommended additional details explaining risk-based management of assets. Two comments requested additional details on the limited checks that are permitted during assessment of CRMAs. Multiple comments requested clarification on CRMA requirements at Level 3 for the OSA and ESP. One comment requested clarification about the documentation requirements for CRMAs. One comment asserted that the rule co-mingled CRMAs with assets of an ESP. One comment questioned why CRMAs were being included as in-scope assets subject to CMMC security requirements. One comment asked for clarification between the security requirements and assessment requirements for CRMAs. Response: There was confusion and concern over conflicts from commenters regarding responses to comments on a previous version of the rule, other documentation, and the current rule. The DoD did not find any conflicting language around CRMAs. There is no conflict between CRMAs and the requirements for logical or physical boundaries. CRMAs are only applicable within the CMMC Assessment Scope. DoD does not agree with the statement that the wording change around Contractor Risk Managed Asset (CRMA) effectively makes the asset category moot. The CRMA category was created to ease the assessment burden, based on the Department's risk tolerance. It is not intended to reduce the level of protection and the CMMC security requirements which apply to the assets. Despite the wording changes identified by the commentor, the CMMC security requirements and the assessor's ability to conduct a limited check to identify deficiencies as addressed in table 3 to § 170.19(c)(1) are unchanged. Contractor Risk Managed Assets (CRMA) should be prepared to be assessed against CMMC security requirements at Level 2, and included in the SSP, asset inventory, and network diagrams. Table 3 to § 170.19(c)(1) clearly addresses the assessment requirements for Contractor Risk Managed Assets. All CMMC security requirements must be MET when the OSA chooses to designate certain assets as Contractor Risk Managed Assets. Eight guidance documents for the CMMC Program are listed in Appendix A to Part 170-Guidance. These documents provide additional guidance for the CMMC model, assessments, scoping, and hashing. Use of the guidance documents is optional.

The Department has explained in regulation and guidance the difference between required and addressable implementation specifications. The meaning of 'required' is clear. Regarding 'addressable,' we previously explained that its purpose is to provide regulated entities flexibility with respect to implementation compliance. [414] We also previously explained that a regulated entity must assess whether a given addressable implementation specification is a reasonable and appropriate security measure to apply within its environment, and if it is, the regulated entity must implement the addressable implementation specification. [415] However, the Department remains concerned that regulated entities believe that flexibility overrides the need for them to protect all ePHI and do not uniformly treat addressable implementation specifications as needing to be met if they are reasonable and appropriate. OCR's enforcement experience and interaction with regulated entities causes us to believe that 'addressable' is misunderstood to be optional, leading regulated entities to choose not to adopt the implementation specification, even when it would be reasonable and appropriate for them to do so. [416] In 2022, NCVHS recommended that the Department eliminate the choice to not implement a specification or alternative, and instead require that regulated entities implement the specification or adopt a documented reasonable alternative. [417] According to a survey referenced by NCVHS, despite private sector and government efforts to address a changing cybersecurity landscape, the majority of health care entities have failed to

maintain a comprehensive security program and (printed page 932) continue to neglect people and process measures necessary for a comprehensive security program. [418] NCVHS also pointed to a continued failure of regulated entities to develop adequate incident recovery plans and to assess their vulnerability to cyberattacks grounded in social engineering. [419] Finally, NCVHS opined that the current structure of the Security Rule is inadequate to protect U.S. health care infrastructure because it does not require regulated entities to adopt the basic building blocks of good security hygiene, or a documented, reasonable alternative. [420] We share NCVHS' concerns and believe that we must squarely confront the problem of regulated entities treating addressable implementation specifications as optional. Relatedly, we also believe that we must consider modifying the Security Rule to set an acceptable minimum level of security specifications. Circumstances have changed sufficiently since 2003 such that we now believe that good cyber hygiene requires regulated entities to implement more than the implementation specifications that we originally mandated. [421] Indeed, we believe that it requires compliance with all of the standards and implementation specifications we are proposing, with specific, limited exceptions.

(F) Review, biennially, recordkeeping practices to ensure compliance with the Act, paying particular attention to the maintenance of automated records. In addition, ensure cooperation with records management officials on such matters as maintenance and disposal procedures, statutory requirements, forms, and reports; and (G) Review, biennially Privacy Act training practices. This is to ensure all personnel are familiar with the requirements of the Act. (6) DA Privacy Act System Managers and Developers will-

- (i) Ensure that appropriate procedures and safeguards are developed, implemented, and maintained to protect an individual's personal information;
- (ii) Ensure that all personnel are aware of their responsibilities for protecting personal information being collected and maintained under the Privacy Act Program;
- (iii) Ensure official filing systems that retrieve records by name or other personal identifier and are maintained in a Privacy Act system of records have been published in the Federal Register as a Privacy Act system of records notice. Any official who willfully maintains a system of records without meeting the publication requirements, as prescribed by 5 U.S.C. 552a, as amended, OMB Circular A-130, 32 CFR part 310 and this part, will be subject to possible criminal penalties and/or administrative sanctions;
- (iv) Prepare new, amended, or altered Privacy Act system of records notices and submit them to the DA Freedom of Information and Privacy Office for review. After appropriate coordination, the system of records notices will be submitted to the Defense Privacy Office for their review and coordination;
- (v) Review, biennially, each Privacy Act system of records notice under their purview to ensure that it accurately describes the system of records;
- (vi) Review, every four years, the routine use disclosures associated with each Privacy Act system of records notice in order to determine if such routine use continues to be compatible with the purpose for which the activity collected the information;
- (vii) Review, every four years, each Privacy Act system of records notice for which the Secretary of the Army has (printed page 46054) promulgated exemption rules pursuant to Sections (j) or (k) of the Act. This is to ensure such exemptions are still appropriate;
- (viii) Review, every year, contracts that provide for the maintenance of a Privacy Act system of records to accomplish an activity's mission. This requirement is to ensure each contract contains provisions that bind the contractor, and its employees, to the requirements of 5 U.S.C. 552a(m)(1) ; and

Currently, the DIB CS Program has approximately 1,000 cleared defense contractors participating in the program. Program participants have access to technical exchange meetings, a collaborative web platform (DIBNet-U), and threat products and services through the DoD Cyber Crime Center (DC3). DC3 implements the program's operations by sharing cyber threat information and intelligence with the DIB, and offering a variety of products, tools, services, and events. DC3 serves as the single clearinghouse for unclassified Mandatory Incident Reports (MIRs) and voluntary threat information sharing reports. Changes to Definitions In addition to the program eligibility changes described above, DoD is also proposing the following changes. § 236.2-Definitions 1. Access to media-This definition is being removed as it is no longer used in the rule text. 3. DIB CS Program participant-This definition has been revised to align with the revised eligibility requirements set forth in this proposed rule. 4. Government furnished information (GFI)-This definition was revised to adopt the convention of referring to the DIB CS Program with a capital 'P'. Other Proposed Changes DoD is amending § 236.5 (DoD's DIB CS program) in order to align the program description with the revised eligibility requirements. As a result, references to cleared defense contractors have been replaced with contractors that own or operate a covered contractor information system. Security clearance information is only collected, when applicable, if a company elects to participate in classified information sharing. In addition, the language stating participation is

typically three to ten company-designated points of contact (POC) has been removed, to avoid confusion regarding the number of POCs, as some larger companies may wish to nominate a larger number of (printed page 27834) POCs and smaller companies may wish to nominate fewer. DoD is amending § 236.7 (DoD's DIB CS program requirements) to remove the requirement that a company have an existing active facility clearance (FCL) to at least the Secret level granted under 32 CFR part 117 , National Industrial Security Program Operating Manual (NISPOM), [12] to be eligible to participate in the DIB CS Program. In addition, references to cleared defense contractors have been replaced with contractors that own or operate a covered contractor information system. A foundational element of the activities described in this part is the recognition that the information shared between DoD and DIB CS Program participants pursuant to the DIB CS Program includes extremely sensitive information that requires protection. For additional information regarding the Government's safeguarding of information received from contractors that requires protection, see the Privacy Impact Assessment (PIA) for the DIB Cybersecurity Activities located at: https://dodcio.defense.gov/Portals/0/Documents/DIB_PIA.pdf .

From the NIST SP 800-172 Rev 3 Final Public Draft: component See system component . NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 c confidentiality 2852

(4) The requester shall be given access to any deletions or changes to records that are accessible.

(e) Access to Medical Records. (1) Medical records and other protected health information (PHI) shall be disclosed to the individual pursuant to Chapter 11 of DoD 6025.18-R, DoD Health Information Privacy Regulation (Available at <http://www.dtic.mil/whs/directives/corres/pdf/602518r.pdf>) and 32 CFR part 310, subpart D . (2) The individual may be charged reproduction fees for copies or records as outlined in 32 CFR part 310, subpart D . (f) Amending and Disputing Personal Information in Systems of Records. (1) The System Manager shall allow individuals to request amendments to the records covered by their system notice to the extent that such records are not accurate, relevant, timely, or complete. Amendments are limited to correcting factual matters and not matters of official judgment, such as performance ratings, promotion potential, and job performance appraisals. (2) Individuals seeking amendment to records that pertain to themselves, and that are filed or retrieved by their name or other personal identifier, may submit a request for amendment in person, by mail, or by email. All requests for amendment must be in accordance with the following: (i) Any individual making a request for amendment to records in person shall show personal identification to the appropriate System Manager, as identified in the SORN published in the FR, to verify his or her identity, as outlined in 32 CFR part 310, subpart D . (ii) Any individual making a request for amendment to records by mail or email shall address such request to the System Manager. If the System Manager is unknown, they may inquire to NGB-JA/OIP: AHS-Bldg 2, Suite T319B, 111 S. George Mason Drive, Arlington VA 22204-1382, or email privacy@ng.army.mil for assistance in locating the System Manager. (iii) Requests for amendment shall include a mailing address where the decision on the request for amendment can be sent and include either a signed notarized statement or a signed unsworn declaration to verify his or her identity to ensure that they are seeking to amend records about themselves and not, inadvertently or intentionally, the records of others. The Privacy Act (5 U.S.C. 552a) provides a penalty of a misdemeanor and a fine of not more than \$5,000 for any person who knowingly and willfully requests or obtains any record concerning an individual from an agency under false pretenses. The declaration shall read as follows: (A) Inside the US: I declare (or certify, verify, or state) under penalty of perjury that the foregoing is true and correct. Executed on (date). (Signature). (B) Outside the US: I declare (or certify, verify, or state) under penalty of perjury under the laws of the United States of America that the foregoing is true and correct. Executed on (date). (Signature).

includes that contractors must submit reports pursuant to this rule, SEAD 3 and CSA guidance to supplement unique CSA mission requirements. SEAD 3 reporting establishes a single nationwide implementation plan for covered individuals, which for this rule provides reporting by contractors and their employees eligible for access to classified information. SEAD 3 requirements will be implemented for all contractor cleared personnel to report specific activities that may adversely impact their continued national security eligibility. Contractor cleared personnel must be aware of risks associated with foreign intelligence operations and/or possible terrorist activities directed against them in the United States and abroad, and have a responsibility to recognize and avoid personal behaviors and activities that adversely affect their national security eligibility. NISP CSAs shall conduct an analysis of such reported activities, such as foreign travel or foreign

contacts, to determine whether they pose a potential threat to national security and take appropriate action. Contractors will be responsible for collecting the foreign travel data from cleared employees, providing pre- and post-travel briefings to those cleared employees when necessary, and tracking and reporting those foreign travel activities of its cleared employees through the CSA designated system of record for personnel security clearance data. § 117.9(m) Limited entity eligibility determination (Non-FOCI) and, § 117.11(e) Limited entity eligibility determination due to FOCI. In accordance with 32 CFR part 2004, NISP Directive, provisions for granting two new types of limited entity facility clearance eligibility determinations (FCLs) to meet government requirements for narrowly scoped requirements for a companies to access classified information. § 117.11(d)(2)(iii)(A) Requirement for National Interest Determinations (NIDs): This paragraph provides for the implementation of the provisions of Section 842 of Public Law 115-232, which was effective on October 1, 2020, and eliminates requirements for a covered NTIB entity operating under an SSA to obtain a NID for access to proscribed information: Top Secret, Special Access Program, Communications Security, Sensitive Compartmented Information, and Restricted Data. This provision will allow covered NTIB entities to begin performing on contracts that require access to proscribed information without having to wait on a NID, and thus removing costly contract performance delays. § 117.15(e)(2) TOP SECRET Information: Permits specific determinations by a CSA with respect to requirements for TOP SECRET accountability (e.g.,

(k) The Deputy Chief of Staff, G-1 is authorized to act on the following records: Personnel board records, Equal Opportunity (military) and sexual harassment, health promotions, physical fitness and well being, command and leadership policy records, HIV and suicide policy, substance abuse programs except for individual treatment records which are the responsibility of the Surgeon General, retiree benefits, services, and programs (excluding individual personnel records of retired military personnel, which are the responsibility of the U.S. Army Human Resources Command-St. Louis), DA dealings with Veterans Affairs, U.S. Soldier's and Airmen's Home; all retention, promotion, and separation records; all military education records including records related to the removal or suspension from a military school or class; Junior Reserve Officer Training Corps (JROTC) and Senior Reserve Officer Training Corps (SROTC) records; SROTC instructor records; U.S. Military Academy Cadet Records; recruiting and MOS policy issues, personnel travel and transportation entitlements, military strength and statistics, The Army Librarian, demographics, and Manprint. (l) The Deputy Chief of Staff, G-4 is authorized to act on requests for records relating to DA logistical requirements and determinations, policy concerning materiel maintenance and use, equipment standards, and logistical readiness. (m) The Chief of Engineers is authorized to act on requests for records involving civil works, military construction, engineer procurement, and ecology; and the records of the U.S. Army Engineer divisions, districts, laboratories, and field operating agencies. (n) The Surgeon General/Commander, U.S. Army Medical Command, is authorized to act on requests for medical research and development records, and the medical records of active duty military personnel, dependents, and persons given physical examination or treatment at DA medical facilities, to include alcohol and drug treatment/test records. (o) The Chief of Chaplains is authorized to act on requests for records involving ecclesiastical relationships, rites performed by DA chaplains, and nonprivileged communications relating to clergy and active duty chaplains' military personnel files. (p) The Judge Advocate General is authorized to act on requests for records relating to claims, courts-martial, legal services, administrative investigations, and similar legal records. The Judge Advocate General is also authorized to act on requests for the General Officer Management Office actions, and records described elsewhere in this part if those records relate to litigation in which the United States has an interest. In addition, The Judge Advocate General is authorized to act on requests for records that are not within the functional areas of responsibility of any other Denial Authority.

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analysis to advance the development and productive use of information technology. ITL's responsibilities include the development of technical, physical, administrative, and management standards and guidelines for the cost-effective security and privacy of sensitive unclassified information in Federal computer systems. This Special Publication discusses ITL's research, guidance, and outreach efforts in computer security, and its collaborative activities with industry, government, and academic organizations. The security objectives of an organization are a key factor for decisions about outsourcing information

technology services and, in particular, for decisions about transitioning organizational data, applications, and other resources to a public cloud computing environment. Organizations should take a risk-based approach in analyzing available security and privacy options and deciding about placing organizational functions into a cloud environment. The information technology governance practices of the organizations that pertain to the policies, procedures, and standards used for application development and service provisioning, as well as the design, implementation, testing, use, and monitoring of deployed or engaged services, should be extended to cloud computing environments.

(Response) The final rule applies to persons that manufacture, process, pack, hold, transport, distribute, receive, or import food in the United States. Section 201(a)(1) of the FD&C Act defines the term ‘State’ as, ‘any State or Territory of the United States, the District of Columbia, and the Commonwealth of Puerto Rico’, and section 201(a)(2) of the FD&C Act defines the term ‘Territory’ as, ‘any Territory or possession of the United States, including the District of Columbia, and excluding the Commonwealth of Puerto Rico and the Canal Zone’. Accordingly, any person in the 50 States of the United States, or in any Commonwealth or Territory of the United States, that performs a covered activity is subject to the requirements of this final rule. This includes both Puerto Rico (because, for purposes of the FD&C Act, it is considered a State) and the U.S. Virgin Islands (because, as a U.S. territory, it is considered a State for purposes of the FD&C Act). D. Comments on Who is Excluded From All or Part of the Regulations in This Subpart? (Proposed § 1.327) 1. General (Comment 29) Several comments argue that because the Bioterrorism Act specifically excludes those foods under the jurisdiction of USDA, alcoholic beverages should also be excluded, as they are already regulated by the Department of Treasury’s Alcohol and Tobacco Tax and Trade Bureau (TTB) as well as by CBP. One comment requests that FDA secure a legislative amendment to the Bioterrorism Act that exempts wines and spirits and other alcoholic beverages from its application, in the same way meat, poultry, and egg products under the jurisdiction of the USDA are excluded from its scope. Another comment states that the importer’s records enable a product to be traced from the point of importation to its destination, as well as back to the producer/supplier. The comment states that substantial information about a product imported legally into the United States is already held in the TTB database. (Response) Unlike products regulated under the exclusive jurisdiction of USDA under the FMIA, the PPIA, or the EPIA, Congress did not exempt alcoholic beverages from the scope of the recordkeeping requirements. FDA has not excluded alcoholic beverages from the scope of this final rule because FDA believes that these records are needed to help the Secretary to identify the immediate previous sources and the immediate subsequent recipients of food to address credible threats of serious adverse health consequences or death to humans or animals. Further, FDA reiterates that, to the extent that you already keep the information required by this final rule to comply with TTB requirements, or for any other reason, you do not need to establish and maintain duplicative records. In addition, securing a ‘legislative amendment’ to the Bioterrorism Act, as the comment suggests, is beyond the scope of this rulemaking.

The 7% discount rate is not a discount for organizations. The discount rate is a part of a formula used in a business impact analysis calculation. When calculating 20 years in the future, a discount rate is used to determine the net present value of money. Discount rates are explained in step seven of OMB Circular A-4: Regulatory Impact Analysis: A Primer. The DoD does not agree with the commenter’s assertion that the cost estimates greatly understate the costs and burden to Level 1 compliance. The 15 FAR security requirements that comprise CMMC Level 1 should already have the requirements implemented if an OSA network processes, stores, or transmits FCI. In addition to NIST SP 800-171A Jun2018, the CMMC Level 1 Assessment Guide provides supplemental information to help facilitate implementation and assessment of the Level 1 security requirements. b. Economic Impact Comment: One comment suggested the government evaluate the economic impact of implementing the rule’s reporting requirements at scale. Another comment expressed the notion that the cost impact analysis does not account for the free market response, referring to the associated cost increases and schedule delays that directly impact the warfighter and taxpayer. The commentor suggested the cost could dwarf both the cost of implementing compliance and achieving certification. One comment stated the CMMC Level 2 and Level 3 cost burdens for companies that were historically never subjected to such requirements may be disproportionate to the risk their operations pose to the inadvertent disclosure of CUI or FCI. It suggested ensuring requirements be proportional to the subcontractor’s activity and risk levels. The comment further mentioned that costs may be passed on to the prime contractor, and DoD should consider providing recovery costs in the price of implementation. One comment stated the 100% compliance to CMMC Level 2 certification may be financially unachievable and suggests if a risk assessment shows the likelihood of harm is

comparatively low, the DoD should direct CMMC Program assessors to use their professional judgments and not require seeking maximum evidence of compliance where there is evidence of sufficiency. Response: The DoD has already evaluated the reporting requirements and the analysis of the costs is provided in the Regulatory Impact Analysis published with this rule. The DoD declined to respond to speculative or editorial comments about downstream impacts of the market's reaction to CMMC, all of which are beyond the scope of this rule. The DoD declined the recommendation to restructure CMMC to be proportional to the subcontractor's activity and risk levels. DoD must enforce CMMC requirements uniformly across the Defense Industrial Base for all contractors and subcontractors who process, store, or transmit CUI. The value of information (and impact of its loss) does not diminish when the information moves to contractors and subcontractors.

- Establish configuration control for security purposes (Priority A). - Supercomputer sites are high priority. - Distribute/support use of automated security management tools (e.g. COPS). - Establish a security perimeter protection capability (Priority B) (e.g. filters, control gateways, Simple Network Management Protocol (SNMP)). - Establish security audit information collection and review capability (Priority B). 5. use of privacy enhanced mail for sensitive communication for administration and security officers, Kerberos, Distributed System Security Architecture (DASS); 6. raising the level of attention with respect to configuration and operation of security relevant portions of the system within a particular site, particularly the domain name service; and 7. a potpourri of administrative and operational considerations - development of security policies at each center, education of people, careful configuration of the cryptographic parts of each site, fire drills so that timely and effective action can take place when an intrusion is discovered to be in progress, and spending time keeping abreast of the technologies. Crocker inquired about the memory requirements needed to run Kerberos. Schiller stated the binary file 'rlogin' is required along with a few configuration files. This resides in about 50-60 Kbytes of memory on a VAX. The DES layer can be optimized to gain additional space. At one point, Kerberos was running on a 256K PC. It will presently run on a laptop computer.

CM.L2-3.4.7 · Nonessential Functionality CMMC Assessment Guide · Level 2 | Version 2.13 106
Interview [SELECT FROM: Personnel with responsibilities for reviewing programs, functions, ports, protocols, and services on the system; personnel with information security responsibilities; system or network administrators; system developers]. Test [SELECT FROM: Organizational processes for reviewing and disabling nonessential programs, functions, ports, protocols, or services; mechanisms implementing review and handling of nonessential programs, functions, ports, protocols, or services; organizational processes preventing program execution on the system; organizational processes for software program usage and restrictions; mechanisms supporting or implementing software program usage and restrictions; mechanisms preventing program execution on the system]. DISCUSSION [NIST SP 800-171 REV. 2]93 Restricting the use of nonessential software (programs) includes restricting the roles allowed to approve program execution; prohibiting auto-execute; program blacklisting and whitelisting; or restricting the number of program instances executed at the same time. The organization makes a security-based determination which functions, ports, protocols, and/or services are restricted. Bluetooth, File Transfer Protocol (FTP), and peer-to-peer networking are examples of protocols organizations consider preventing the use of, restricting, or disabling. FURTHER DISCUSSION Organizations should only use the minimum set of programs, services, ports, and protocols required for to accomplish the organization's mission. This has several implications: · All unnecessary programs and accounts are removed from all endpoints and servers. · The organization makes a policy decision to control the execution of programs through either whitelisting or blacklisting. Whitelisting means a program can only run if the software has been vetted in some way, and the executable name has been entered onto a list of allowed software. Blacklisting means any software can execute as long it is not on a list of known malicious software. Whitelisting provides far more security than blacklisting, but the organization's policy can direct the implementation of either approach. Control of execution applies to both servers and endpoints. · The organization restricts the use of all unnecessary ports, protocols, and system services in order to limit entry points that attackers can use. For example, the use of the FTP service is eliminated from all computers, and the associated ports are blocked unless a required service utilizes those ports. The elimination of nonessential functionality on the network and systems provides a smaller attack surface for an attacker to gain access and take control of your network or systems. This requirement, CM.L2-3.4.7, which requires limiting functionality to essential programs, ports, protocols, and services, extends CM.L2-3.4.6, which requires adherence to the 93 NIST SP 800-171 Rev. 2, pp. 22-23.

The primary food safety benefits from this rule are from the number of illnesses averted due to improved recordkeeping practices. Improved recordkeeping practices result in faster traceback investigations and higher traceback completion rates, which will reduce the expected number of illnesses from intentional and unintentional outbreaks. The following diagram visually depicts the benefits from faster traceback times from the recordkeeping rule. The number of onsets of new illnesses and outbreak investigation duration curves overlap to estimate the number of days that an investigation is likely to reduce the duration of an outbreak. With faster traceback times, the distribution of the durations of outbreak investigations shifts to the left from existing to improved, reducing even further the number of days of an outbreak. This diagram assumes the outbreak is still going on at the time the traceback investigation begins. The reduced number of days of an outbreak can then be translated into a reduced number of illnesses from an outbreak. There are two ways that the recordkeeping rule speeds up traceback investigations: (1) Higher records quality means that traceback investigators spend less time trying to find and analyze information that might have been missing or incomplete had there been no rule and (2) the rule makes failure to provide records within the required time period a violation, thus increasing cooperation with investigators who need rapid access to records. Greater traceback speeds result in more recalls (if the product is still in the marketplace), administrative detentions (under section 303 of the Bioterrorism Act), import actions, closures, and other preventive actions that reduce the number of illnesses during an outbreak. The following is a description of the model used to measure the benefits from the recordkeeping rule.

- i. Given the speed of the initial recognition and epidemiological investigation of an outbreak, the benefits from the recordkeeping rule (printed page 71616) depend on the following factors: (1) the average duration of a traceback investigation, (2) the average number of traceback investigations prematurely terminated for reasons of poor records quality, and (3) the distributions of outbreak durations and sizes.
- ii. The average duration of a traceback investigation depends on the number of point-of-service and distributor investigative visits per traceback investigation, and the average duration of an investigative visit. The quantity of records that needs to be reviewed is an important determinant of the duration of a traceback investigation. However, we assume that the change in the quantity of records requested is much smaller than the change in the quality of the records requested as a result of this final rule. We therefore omit the quantity of records reviewed during a traceback investigation as a modeling consideration when measuring the impact of the final rule.
- iii.

There are four stages in an outbreak investigation. The first stage is the preliminary investigation of laboratory results and epidemiological evidence used to determine the parameters of the outbreak, including the following: number ill, food vehicle contaminated, microbial or other agent responsible, potential commercial sources of contamination, as well as the degree of confidence in the information on each of these parameters. The second stage of the outbreak investigation is the decision making part, when FDA determines what resources will be committed to proceed further in the investigation. The third stage is the traceback investigation, which is conducted to do the following: (1) Identify the source and distribution of the implicated food and remove the contaminated food from the marketplace; (2) distinguish between two or more implicated food products; and (3) determine potential routes and sources of contamination in order to prevent future illnesses, or to treat persons sooner for the identified contaminants. The traceback investigation involves investigative visits by FDA inspectors to points of service, which are the facilities where consumers had purchased the contaminated food, and also distribution facilities. A fourth stage is the source investigation of the specific practices at the farm, transportation, or other facility that may have led to the outbreak. For many outbreaks, the source investigation occurs well after any preventive action can be taken to limit the number of illnesses. This would be true for outbreaks from contaminated foods with short shelf lives that no longer are in circulation at the time of the source investigation, or from contaminations occurring at banquets, parties, or other one-time events where the source investigation cannot limit the size of the outbreak. For these outbreaks, the improved recordkeeping practices specified in the final rule would not improve FDA's current ability to limit the size of the outbreak, or prevent additional illnesses. (printed page 71623) However, for certain products such as eggs, sprouts, and other fresh products, additional illnesses due to conditions at the source may continue if shipments from contaminated facilities continue. The same may also be true for perishable foods imported on a frequent basis from contaminated facilities. For these kinds of outbreaks, the ability to more rapidly implicate a contaminated farm or manufacturing source will improve FDA's ability to limit the size of the outbreak, or prevent its recurrence.

7. The Duration of Traceback Investigations, and Numbers of

Premature Terminations

(Response) In response to these comments and to ensure that FDA is fulfilling Congress's intent to exempt ·farms·, FDA has revised the definition of farm in the final rule to state that a ·farm· means ·a facility in one general physical location devoted to the growing and harvesting of crops, the raising of animals (including seafood), or both·, and that ·[w]ashing, trimming of outer leaves, and cooling produce are considered part of harvesting·. FDA considers several of the activities identified in the comments to be ·packing or holding·, including sorting, grading, wrapping, and boxing harvested food for the sole purpose of transporting this food off the farm. FDA also considers placing stickers on produce grown or consumed on a farm to be part of ·packing·. FDA notes that the definition of ·farm· includes facilities that pack or hold food, provided all food used in such activities is grown, raised, or consumed on that farm or another farm under the same ownership. Thus, a farm that performs these packing and holding activities will not necessarily cease to be a farm and therefore cease to be exempt from these regulations. Similarly, FDA considers several of the activities identified in the comment (waxing, milling, and grinding) to be manufacturing/processing. A farm that performs these activities will not necessarily cease to be a farm because the definition of ·farm· includes facilities that manufacture/process food, provided that all food used in these activities is consumed on that farm or another farm under the same ownership. FDA is aware that a number of other activities may affect an establishment's status as a ·farm· under this final rule. Thus, the agency is providing the following additional clarification. First, FDA considers application of a pesticide to a crop to be an integral part of growing and harvesting crops and therefore considers the activity to be covered by the ·farm· definition. Therefore, an establishment devoted to the growing and harvesting of crops that applies a pesticide to its crops is a ·farm· as defined in this final rule.

provides that if a provision of law contains criminal or civil penalties, or if the FAR Council makes a written determination that it is not in the best interest of the Federal Government to exempt contracts or subcontracts at or below the SAT, the law will apply to them. The Director, DPAP, is the appropriate authority to make comparable determinations for regulations to be published in the DFARS, which is part of the FAR system of regulations. DoD has made that determination, therefore this rule does apply below the SAT. Given that the requirements of section 806 of the NDAA for FY 2011 and section 806 of the NDAA for FY 2013 were enacted to protect the supply chain, which in turn protects NSS from malicious actions, DoD has determined that it is in the best interest of the Federal Government to apply the rule to contracts below the SAT, as defined at FAR 2.101. An exception for contracts for the acquisition below the SAT would exclude contracts intended to be covered by the law, thereby undermining the overarching public policy purpose of the law. B. Applicability to Contracts for the Acquisition of Commercial Items, Including COTS Items 41 U.S.C. 1906 governs the applicability of laws to contracts for the acquisition of commercial items, and is intended to limit the applicability of laws to contracts for the acquisition of commercial items. 41 U.S.C. 1906 provides that if a provision of law contains criminal or civil penalties, or if (printed page 67250) the FAR Council makes a written determination that it is not in the best interest of the Federal Government to exempt commercial item contracts, the provision of law will apply to contracts for the acquisition of commercial items. Likewise, 41 U.S.C. 1907 governs the applicability of laws to COTS items, with the Administrator for Federal Procurement Policy the decision authority to determine that it is in the best interest of the Government to apply a provision of law to acquisitions of COTS items in the FAR. The Director, DPAP, is the appropriate authority to make comparable determinations for regulations to be published in the DFARS, which is part of the FAR system of regulations. Given that the requirements of section 806 of the NDAA for FY 2011 and section 806 of the NDAA for FY 2013 were enacted to protect the supply chain, which in turn protects NSS from malicious actions, DoD has determined that it is in the best interest of the Federal Government to apply the rule to contracts for the acquisition of commercial items, including COTS items, as defined at FAR 2.101. An exception for contracts for the acquisition of commercial items, including COTS items, would exclude contracts intended to be covered by the law, thereby undermining the overarching public policy purpose of the law. IV. Executive Orders 12866 and 13563

These network switches and routers are highly reconfigurable, and therefore, allow the system to implement various network topologies for performance testing. - [1] R. Candell, T. Zimmerman and K. Guide to Auditing for Controls and Security: A System Development Life Cycle Approach in The National Bureau of Standards' was established by an act of Congress on March 3, 1901. The Bureau's overall goal is to strengthen and advance the nation's science and technology and facilitate their effective application for public benefit. To this end, the Bureau conducts research to assure international competitiveness and leadership of U.S. industry, science and technology. NBS work involves development and transfer of measurements, standards and related science and technology, in support of continually improving U.S. productivity, product quality and reliability, innovation and underlying science and engineering. The Bureau's technical work is performed by the National Measurement Laboratory, the National Engineering Laboratory, the Institute for Computer Sciences and Technology, and the Institute for Materials Science and Engineering. Conducts research and provides scientific and technical services to aid Federal agencies in the selection, acquisition, application, and use of computer technology to improve effectiveness and economy in Government operations in accordance with Public Law 89-306 (40 U.S.C. 759), relevant Executive Orders, and other directives; carries out this mission by managing the Federal Information Processing Standards Program, developing Federal ADP standards guidelines, and managing Federal participation in ADP voluntary standardization activities; provides scientific and technological advisory services and assistance to Federal agencies; and provides the technical foundation for computer-related policies of the Federal Government. The Institute consists of the following divisions:

The DoD has developed CMMC to increase consistency of implementation of NIST SP 800-171 R2 and NIST SP 800-172 Feb2021. Specifically, this rule provides extensive information on scoring methodology, in an effort to improve self-assessments. The use of independent C3PAOs further enforces consistency for those companies that need to meet a CMMC Level 2 certification requirement. The DoD has considered the suggestions and declines to modify the phase-in periods based on total score required, or other criteria, which would not provide the desired improvements in DIB cybersecurity. The DoD notes the commenter's concern that self-assessments go away after Phase 4. Requirements from earlier phases continue as each additional phase is implemented. When applicable, self-assessments will still be allowed, as appropriate, in Phase 4. This rule describes flow down requirements to subcontractors. This rule makes no change to 48 CFR 252.204-7008 . 8. Commercially Available Off-the-Shelf (COTS) Procurements Comment: One comment suggested the definition of COTS should be more explicitly defined or the model outlined in §170.2 should encompass COTS products. Two comments questioned the exemption of CMMC requirements for contracts or subcontracts exclusively for commercial off-the-shelf (COTS) items. Others questioned applicability of CMMC requirements to COTS procurements and/or purchases at or below the micro-purchase threshold. Finally, one commenter questioned the validity of a COTS exclusion, stating that no COTS components are exempt from DoD's

certification requirements from DISA or NSA. Response: The term Commercially available off-the-shelf (COTS) is defined in FAR part 2.101. Some comments pertained to content of the 48 CFR part 204 CMMC Acquisition rule, including applicability of CMMC clauses to COTS procurements and/or those below the micro-purchase threshold. Such comments are not within the scope of this CMMC 32 CFR part 170 CMMC Program rule, which outlines program requirements and not acquisition procedures. CMMC requirements do not apply to contracts and subcontracts that are exclusively for the delivery of COTS products to a DoD buyer. The exemption does not apply to a contractor's use of COTS products within its information systems that process, store, or transmit CUI. CMMC assessments are conducted on contractor owned information systems to ascertain compliance with the designated FAR, DFARS, and NIST requirements. 9. Specific Product Recommendations Comment: One managed service provider expressed concern that the specific tools they use to provide services might be considered Security Protection Assets or generate Security Protection Data in the context of CMMC assessment requirements, which might (printed page 83112)

This report features some of our most significant accomplishments during Fiscal Year (FY) 2017 in risk management, cryptography, identity and access management, vulnerability management, education and workforce development, and internet and communications infrastructure, as well as our efforts to transition our work into common practice. Below are just a few highlights of the work carried out in 2017. - In recent years, there has been a substantial amount of research on quantum computers - machines that exploit quantum mechanical phenomena to solve problems that are difficult or intractable for conventional computers. If large-scale quantum computers are ever built, they will be able to break the existing infrastructure of public-key cryptography. Employing NIST's proven approach of worldwide open competitions, in 2016 we solicited submissions for quantum-resistant public-key cryptographic algorithms for standards. These algorithms must be secure against both quantum and classical computers and should interoperate with existing communications protocols and networks. We now are engaging the cryptographic community in the difficult work of determining how the 69 submissions we received in 2017 meet the competition's exacting requirements. - In instances where many devices are interconnected and working in concert to accomplish some task, security and privacy can be very important but hard to achieve due to limited capabilities available to handle modern cryptographic algorithms. This includes automotive systems, sensor networks, healthcare, distributed control systems, the smart grid, and cyber-physical systems and the Internet of Things (IoT). Recognizing this special challenge and in order to gain greater awareness and involvement with the cryptographic community, NIST shared its findings in this area (known as lightweight cryptography) and presented our plans to address standardization issues for community feedback.

3.1.6 Step 6: Approve or Reject the Information Exchange... 3.1.6 Step 6: Approve or Reject the Information Exchange The joint planning team submits the proposed agreements to the relevant AO or other risk management official from each organization and requests approval for the information exchange.

Safeguard sensitive information to enable and protect the warfighter Enforce DIB cybersecurity standards to meet evolving threats Ensure accountability while minimizing barriers to compliance with DoD requirements Perpetuate a collaborative culture of cybersecurity and cyber resilience Maintain public trust through high professional and ethical standards The CMMC 2.0 Program has three key features: Tiered Model: CMMC requires companies entrusted with national security information to implement cybersecurity standards at progressively advanced levels, depending on the

type and sensitivity of the information. The program also describes the process for requiring protection of information flowed down to subcontractors. Assessment Requirement: CMMC assessments allow the Department to verify the implementation of clear cybersecurity standards. (printed page 89059) Implementation through Contracts: Once CMMC is fully implemented, certain DoD contractors handling sensitive unclassified DoD information will be required to achieve a particular CMMC level as a condition of contract award. CMMC 2.0-Overview as Proposed by This Rule Current Requirements for Defense Contractors and Subcontractors Currently, federal contracts (including defense contracts) involving the transfer of FCI to a non-Government organization follow the requirements specified in FAR clause 52.204-21, Basic Safeguarding of Covered Contractor Information Systems . [5] FAR clause 52.204-21 requires compliance with 15 security requirements, FAR 52.204-21(b)(1), items (i) through (xv). These requirements are elementary for any entity wishing to achieve basic cybersecurity. Defense contracts involving the transfer of CUI to a non-Government organization may include applicable requirements of DFARS clause 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting . [6] The DFARS clause 252.204-7012 requires defense contractors to provide adequate security on all covered contractor information systems by implementing the 110 security requirements specified in the National Institute of Standards and Technology (NIST) Special Publication (SP) 800-171, Protecting Controlled Unclassified Information in Nonfederal Systems and Organizations. The DFARS clause 252.204-7012 includes additional requirements; for example, defense contractors must meet Federal Risk and Authorization Management Program (FedRAMP) standards by confirming that their Cloud Service Providers (CSP) have achieved the FedRAMP Baseline Moderate or Equivalent standard. The DFARS clause 252.204-7012 also requires defense contractors to flow down all the requirements to their subcontractors. Currently, to comply with DFARS clause 252.204-7012, contractors are required to develop a System Security Plan (SSP) [7]

OSCs will submit in SPRS an initial affirmation of compliance, and, if necessary, a POA&M closeout affirmation, and then annually thereafter, an affirmation of continued compliance as set forth in 32 CFR 170.22 . The Level 3 Certification Assessment cost burdens are included in this part with the exception of the requirement for the OSC to upload the affirmation in SPRS that is included in the Title 48 acquisition rule and an update to DFARS collection approved under OMB Control Number 0750-0004, Assessing Contractor Implementation of Cybersecurity Requirements. Additionally, the information collection reporting requirements for the CMMC instantiation of eMASS are included in a separate ICR for this part and cover only those requirements pertaining to the CMMC process. As described, the CMMC Program couples an affirmation of compliance with certification assessment requirements to verify OSA implementation of cybersecurity requirements, as applicable. The CMMC Program addresses DoD's need to protect its sensitive unclassified information during the acquisition and sustainment of products and services from the DIB. This effort is instrumental in ensuring cybersecurity is the foundation of future DoD acquisitions. Policy Problems Addressed by CMMC 2.0 Implementation of the CMMC Program is intended to solve the following policy problems: Verifies the Contractor Cybersecurity Requirements Neither FAR clause 52.204-21 nor DFARS clause 252.204-7012 provide for DoD assessment of a defense contractor or subcontractor's implementation of the information protection requirements within those clauses. Defense contractors represent that they will implement the requirements in NIST SP 800-171 Rev 2 upon submission of their offer. Findings from DoD Inspector General report (DODIG-2019-105 ·Audit of Protection of DoD Controlled Unclassified Information on Contractor-Owned Networks and Systems·) indicate that DoD contractors did not consistently implement mandated system security requirements for safeguarding CUI and recommended that DoD take steps to assess a contractor's ability to protect this information. CMMC adds new assessment requirements for contractor implementation of underlying information security requirements, to allow DoD to assess a defense contractor's cybersecurity posture using authorized or accredited C3PAOs. The contractor and subcontractor must achieve the required CMMC Level as a condition of contract award. Implementation of Cybersecurity Requirements

and - Establishing and maintaining a privacy continuous monitoring program to maintain ongoing awareness of privacy risks and assess privacy controls at a frequency sufficient to ensure compliance with privacy requirements and manage privacy risks.

Access Control 20 correct Security targets allow flexibility by providing a vehicle for a producer to specify security objectives, services, and/or mechanisms that exceed those found an existing profile. For example, many C2 systems meet the B3 DiscreticMiary Access Control (DAQ mechanism requirements. Both groups felt that having a security target without having a protection profile may

be sufficient in cases where there is no need to have a general set of requirements that several vendors can build to, or when specifying the security aspects of a 'one shot' system or product prototype. If a single unique product is being built, a security target is all that is needed and can be evaluated against The Federal Criteria needs to be designed in such a way as to not shut out good security solutions. Allowing products to be evaluated solely against security targets provides a means of addressing this concern. Such an evaluation can encourage a vendor to find a solution to a user's problem, even if it doesn't meet an existing profile. - Precision in Terminology - Identification and Authentication - Access Control - Availability & Fault Tolerance - Policy Neutral Criteria - TCB & Reference Monitor Focus - Integrity - Open-Ended Criteria - Issues from the attendees

The DoD considered duration of assessment validity periods and has chosen to require self-assessment of the basic Level 1 requirements every year, rather than every three years. Levels 2 and 3 require implementation of a significantly larger number of more complex security requirements, which require more time and attention to assess. The DoD also declines to delete the annual affirmation requirement and does not agree that it equates to an annual assessment. The rule was modified to clarify that reassessments may be required based on post-assessment indicators of cybersecurity issues or non-compliance and are different from new assessments that occur when an assessment validity period expires. Reassessment is expected to be infrequent, conducted by the DoD, and necessary when cybersecurity risks, threats, or awareness have changed, or indicators of cybersecurity deficiencies and/or non-compliance are present. When required, DCMA DIBCAC will initiate the re-assessment process using established procedures. The rule has been further updated to add this DCMA DIBCAC responsibility in §170.7. OSCs seeking confirmation upon CMMC Level 2 POA&M close-out may undergo POA&M close-out assessment by a C3PAO, which is different from reassessment. Self-assessments and certification assessments are valid for a defined CMMC Assessment Scope as outlined in §170.19 CMMC Scoping. A new assessment is required if there are significant architectural or boundary changes to the previous CMMC Assessment Scope. Examples include, but are not limited to, expansions of networks or mergers and acquisitions. Operational changes within a CMMC Assessment Scope, such as adding or subtracting resources within the existing assessment boundary that follow the existing SSP do not require a new assessment, but rather are covered by the annual affirmations to the continuing compliance with requirements. The CMMC rule does not prohibit an OSA from using an operational plan of action at any CMMC Level to address necessary information system updates, patches, or reconfiguration as threats evolve. If the CMMC Assessment Scope changes, then the current assessment is no longer valid and a new assessment is required. Requirements to notify the contracting agency of compliance changes are described in the 48 CFR part 204 CMMC Acquisition rule. An annual affirmation is required at each CMMC level. 16. CMMC Assessment Scoping Policy Comment: One comment asked whether the requirements of DFARS clause 252.204-7012 apply to the entire contractor-owned information system, or only those components of the system that process, store, or transmit the CUI. Another questioned whether assets that process both FCI and CUI require CMMC Level 1 assessment.

According to Approaches for Federal Agencies to Use the Cybersecurity Framework, Executive Summary: dards and guidelines. This report illustrates eight example approaches through which federal agencies can leverage the Cybersecurity Framework to address common cybersecurity-related responsibilities. By doing so, agencies can integrate the Cybersecurity Framework with key NIST cybersecurity risk management standards and guidelines that are already in wide use. These eight approaches support a mature agency-wide cybersecurity risk management program: 1. Integrate enterprise and cybersecurity risk management 2. Manage cybersecurity requirements 3. Integrate and align cybersecurity and acquisition processes 4. Evaluate organizational cybersecurity 5. Manage the

cybersecurity program 6. Maintain a comprehensive understanding of cybersecurity risk 7. Report cybersecurity risks 8. Inform the tailoring process The key concepts and cybersecurity approaches described in this document are intended to promote more effective risk management and to encourage dialogue within and among federal agencies.

(E) From subsection (e)(3) because compliance would constitute a serious impediment to law enforcement in that it could compromise the existence of a confidential investigation or reveal the identity of witnesses or confidential informants. (F) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (G) From subsection (e)(5) because in the collection of information for law enforcement purposes it is impossible to determine in advance what information is accurate, relevant, timely, and complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light and the accuracy of such information can only be determined in a court of law. The restrictions of subsection (e)(5) would restrict the ability of trained investigators and intelligence analysts to exercise their judgment in reporting on investigations and impede the development of intelligence necessary for effective law enforcement. (H) From subsection (e)(8) because compliance would provide an impediment to law enforcement by interfering with the ability to issue warrants or subpoenas and by revealing investigative techniques, procedures, or evidence. (I) From subsection (f) and (g) because this record system is exempt from the individual access provisions of subsection (d). (J) Consistent with the legislative purpose of the Privacy Act of 1974, the (printed page 14770) DON will grant access to nonexempt material in the records being maintained. Disclosure will be governed by the DON's Privacy Regulation, but will be limited to the extent that the identity of confidential sources will not be compromised; subjects of an investigation of an actual or potential criminal violation will not be alerted to the investigation; the physical safety of witnesses, informants and law enforcement personnel will not be endangered, the privacy of third parties will not be violated; and that the disclosure would not otherwise impede effective law enforcement. Whenever possible, information of the above nature will be deleted from the requested documents and the balance made available. The controlling principle behind this limited access is to allow disclosures except those indicated above. The decisions to release information from these systems will be made on a case-by-case basis. (22) System identifier and name. NM05211-1, Privacy Act Request Files and Tracking System. (i) Exemption.

(1) Whenever an individual submits a Privacy Act request, a case file will be established. This Privacy Act case file is a specific type of file that is governed by a specific Privacy Act system of records notice. In no instance will the individual's Privacy Act request and (printed page 46061) corresponding Army actions be included in the individual's military personnel file or other military filing systems, such as adverse action files or general legal files, and in no instance will the Privacy Act case file be used to make an adverse determination about the individual. (2) The case file will be comprised of the request for access/amendment, grants, refusals, coordination action(s), and all related papers. § 505.6 Amendment of records. (a) Amended records. (1) Individuals are encouraged to periodically review the information maintained about them in Privacy Act systems of records and to familiarize themselves with the amendment procedures established by this part. (2) An individual may request to amend records that are retrieved by his or her name or personal identifier from a system of records unless the system has been exempted from the amendment provisions of the Act. The standard for amendment is that the records are inaccurate as a matter of fact rather than judgment, irrelevant, untimely, or incomplete. The burden of proof is on the requester. (3) The system manager or custodian must review Privacy Act records for accuracy, relevance, timeliness, and completeness. (4) Amendment procedures are not intended to permit individuals to challenge events in records that have actually occurred. Amendment procedures only allow individuals to amend those items that are factually inaccurate and not matters of official judgment (e.g. , performance ratings, promotion potential, and job performance appraisals). In addition, an individual is not permitted to amend records for events that have been the subject of judicial or quasi-judicial actions/proceedings. (b) Proper amendment requests. (1) Amendment requests, except for routine administrative changes, will be in writing. (2) When acting on behalf of a first party requester, an individual must provide written documentation of the first party requester's consent to allow the individual to view his or her records. (3) Amendment is appropriate if it can be shown that: (i) Circumstances leading up to the recorded event were found to be inaccurately reflected in the document; (ii) The record is not identical to the individual's

copy; or (iii) The document was not constructed in accordance with the applicable recordkeeping requirements prescribed in AR 25-400-2, The Army Records Information Management System (ARIMS). (4) Under the amendment provisions, an individual may not challenge the merits of an adverse determination.

, a covered entity that is a governmental entity is in compliance with the requirements of this section if it has in place an arrangement with a business associate that is also a governmental entity where the arrangement meets the (printed page 981) analogous requirements of the Privacy Rule at 45 CFR 164.504(e)(3) . [821] Additionally, 45 CFR 164.314(a)(2)(iii) requires that a business associate and its subcontractor enter into a business associate agreement that meets the same requirements as those that apply to a business associate agreement between a covered entity and business associate. As described above, a business associate agreement must include a provision that requires a business associate to report to the covered entity any known security incident. The term "security incident" includes both attempted and successful unauthorized events in an information system. [822] The Security Rule does not prescribe the timing and frequency with which a business associate reports a security incident to the covered entity (or subcontractor to a business associate). [823] Instead, regulated entities may determine the appropriate timing and frequency as part of their business associate agreement, consistent with the requirements of the Breach Notification Rule. [824] Depending on the size of the regulated entity, the number of security incidents it experiences may vary, ranging from the occasional incident experienced by a small regulated entity to more than 1,000 per hour for a large regulated entity. [825] Given that such incidents may have little to no effect if the regulated entity's electronic information systems are able to deter it, it may not be necessary for a business associate to report the security incidents immediately to a covered entity (or a subcontractor to a business associate). Additionally, as discussed above, regulated entities are required to establish, and implement as needed, a contingency plan [826] that includes the policies and procedures for responding to an emergency or other occurrence that damages systems that contain ePHI. Such emergencies or other occurrences could include a fire, vandalism, system failure, or a natural disaster. [827] The Department believes that, in some instances, a security incident would also be an emergency or other occurrence that could require a regulated entity to activate its contingency plan. [828] As the Department previously explained, a contingency plan is the only way to protect the confidentiality, integrity, and availability of ePHI during unexpected events that may expose ePHI because the usual security measures may be disabled, ignored, or not observed. [829] b. Issues To Address

(i)(A) A covered entity may permit a business associate to create, receive, maintain, or transmit electronic protected health information on the covered entity's behalf only if the covered entity obtains satisfactory assurances, in accordance with § 164.314(a), that the business associate will comply with this subpart and verifies that the business associate has deployed technical safeguards in accordance with the requirements of § 164.312. (B) A covered entity is not required to obtain such satisfactory assurances or verification from a business associate that is a subcontractor. (ii) A business associate may permit a business associate that is a subcontractor to create, receive, maintain, or transmit electronic protected health information on its behalf only if the business associate obtains satisfactory assurances, in accordance with § 164.314(a), that the subcontractor will comply with the requirements of this subpart and verifies that the business associate that is a subcontractor has deployed technical safeguards in accordance with the requirements of § 164.312. (2) Implementation specifications (i) Written contract or other arrangement. Document the satisfactory assurances required by paragraph (b)(1)(i) or (ii) of this section through a written contract or other arrangement with the business associate that meets the applicable requirements of § 164.314(a). (ii) Written verification. Obtain written verification from the business associate at least once every 12 months that the business associate has deployed the technical safeguards as required by § 164.312 through both of the following: (A) A written analysis of the business associate's relevant electronic information systems by a person with appropriate knowledge of and experience with generally accepted cybersecurity principles and methods for ensuring the confidentiality, integrity, and availability of electronic protected health information to verify compliance with each standard and implementation specification in § 164.312. (B) A written certification that the analysis has been performed and is accurate by a person who has the authority to act on behalf of the business associate. (3) Standard: Delegation to business associate. (i) A covered entity or business associate may permit a business associate to serve as their designated security official. (ii) A covered entity or business associate that delegates

actions, activities, or assessments required by this subpart to a business associate remains liable for compliance with all applicable provisions of this subpart. § 164.310 Physical safeguards. Each covered entity and business associate must, in accordance with §§ 164.306 and 164.316, implement all of the following physical safeguards to protect the confidentiality, integrity, and availability of all electronic protected health information that it creates, receives, maintains, or transmits: (a) Standard: Facility access controls (1) General.

. Once a requester's commercial interest has been determined, the Components should then determine if the disclosure would be primarily in that interest. This requires a balancing test between the commercial interest of the request against any public benefit to be derived as a result of that disclosure. Where the public interest is served above and beyond that of the requester's commercial interest, a waiver or reduction of fees would be appropriate. Conversely, even if a significant public interest exists, and the relative commercial interest of the requester is determined to be greater than the public interest, then a waiver or reduction of fees would be inappropriate. As examples, news media organizations have a commercial interest as business organizations; however, their inherent role of disseminating news to the general public can ordinarily be presumed to be of a primary interest. Therefore, any commercial interest becomes secondary to the primary interest in serving the public. Similarly, scholars writing books or engaged in other forms of academic research may recognize a commercial benefit, either directly, or indirectly (through the institution they represent); however, normally such pursuits are primarily undertaken for educational purposes, and the application of a fee charge would be inappropriate. Conversely, data brokers or others who merely compile Government information for marketing can normally be presumed to have an interest primarily of a commercial nature. (3) Components are reminded that the factors and examples used in this paragraph are not all inclusive. Each fee decision must be considered on a case-by-case basis and upon the merits of the information provided in each request. When the element of doubt as to charging or waiving the fee cannot be clearly resolved, Components should rule in favor of the requester. (4) In addition, the following additional circumstances describe situations where waivers or reductions of fees are most likely to be warranted: (i) A record is voluntarily created to prevent an otherwise burdensome effort to provide voluminous amounts of available records, including additional information not requested. (ii) A previous denial of records is reversed in total, or in part, and the assessable costs are not substantial (e.g. \$25.00-\$50.00). (d) Fee assessment . (1) Fees may not be used to discourage requesters. Assessable FOIA fees are limited to standard charges for direct search, review (in the case of commercial requesters), and duplication. (2) Fees are assessed based on the category determined to be appropriate for the requester's status and the FOIA request should contain a willingness to pay fees appropriate to that category. The categories are identified below: (i) Commercial . Requesters should indicate a willingness to pay all search, review, and duplication costs when the records are requested for commercial use.

The DoD established the voluntary DIB CS/IA program to enhance and supplement DIB participants' capabilities to safeguard DoD unclassified information that resides on, or transits, DIB unclassified information systems. At the core of the program is a bilateral cyber security information sharing activity, in which DoD provides cyber threat information and information assurance (IA) best practices to DIB companies to enhance and supplement DIB companies' capabilities to safeguard DoD unclassified information; and in return, DIB companies report certain types of cyber intrusion incidents to the Defense Cyber Crime Center's DoD-DIB Collaborative Information Sharing Environment (DCISE), DoD's operational focal point for cyber threat information sharing and incident response under this program. The DoD analyzes the information reported by the DIB company regarding any such cyber incident, to glean information regarding cyber threats, vulnerabilities, and the development of effective response measures. In addition to this initial reporting and analysis, the DoD and DIB company may pursue, on a voluntary basis, follow-on, more detailed, digital forensics analysis or damage assessments of individual incidents, including sharing of additional electronic media/files or information regarding the incident or the affected systems, networks, or information. The information sharing arrangements between the DoD and each participating DIB company are memorialized in a standardized bilateral Framework Agreement (FA), signed by the participating DIB company and the Government, that implements the requirements of this part and is signed by the participating DIB company and the Government. The FA is available to eligible DIB companies during the application process. As provided by the FA, participation in the program is entirely voluntary and does not obligate any DIB participant to change its information systems or otherwise alter its normal conduct of cyber security activities. In keeping with the voluntary, collaborative nature of the activity described in the FA, each Party bears responsibility

for its own actions under this FA. The FA emphasizes sharing to the greatest extent possible information to provide the clearest understanding of the cyber threat. This will allow the Company to improve defense and remediation efforts and allow the Government to assess the damage or impact to defense information and programs entrusted to the Company.

Tim Grance and Murugiah Souppaya of NIST and Lucinda Gagliano, Thomas Goff, and Pius Uzamere of Booz Allen Hamilton for their keen and insightful assistance throughout the development of the document. The authors would also like to express their thanks to security experts Mike Danseglio (Microsoft), Kurt Dillard (Microsoft), Michael Gerdes (Getronics RedSiren Security Solutions), Peter Szor (Symantec), Miles Tracy (U.S. Federal Reserve System), and Lenny Zeltser (Gemini Systems LLC), as well as representatives from the General Accounting Office, and for their particularly valuable comments and suggestions.

Begins one calendar year following the start date of Phase 2. In addition to Phase 1 and 2 requirements, DoD intends to include the requirement for CMMC Status of Level 2 (C3PAO) for all applicable DoD solicitations and contracts as a condition of contract award and as a condition to exercise an option period on a contract awarded after the effective date. DoD intends to include the requirement for CMMC Status of Level 3 (DIBCAC) for all applicable DoD solicitations and contracts as a condition of contract award. DoD may, at its discretion, delay the inclusion of requirement for CMMC Status of Level 3 (DIBCAC) to an option period instead of as a condition of contract award.

(4) Phase 4, full implementation. Begins one calendar year following the start date of Phase 3. DoD will include CMMC Program requirements in all applicable DoD solicitations and contracts including option periods on contracts awarded prior to the beginning of Phase 4.

§ 170.4 Acronyms and definitions. (a) Acronyms. Unless otherwise noted, the following acronyms and their terms are for the purposes of this part. approves any materials that are incorporated by reference (as detailed in the Office of the Federal Register's Incorporation By Reference (IBR) Handbook, June 2023). Materials that are incorporated by reference in this rule are reasonably available. Information on how to access the documents is detailed in § 170.2. Materials that are incorporated by reference in this rule are from the NIST (see § 170.2(a)), the Committee on National Security Systems (see § 170.2(b)), and the International Organization for Standardization/International Electrotechnical Commission (ISO/IEC) (see § 170.2(c)) which may require payment of a fee. Note: While the ISO/IEC standards are issued jointly, they are available from the ISO Secretariat (see § 170.2(c)). The American National Standards Institute (ANSI) IBR Portal provides access to standards that have been incorporated by reference in the U.S. Code of Federal Regulations at <https://ibr.ansi.org>. These standards incorporated by the U.S. government in rulemakings are offered at no cost in ·read only· format and are presented for online reading. There are no print or download options. All users will be required to install the FileOpen plug-in and accept an online end user license agreement prior to accessing

any standards. The materials that are incorporated by reference are summarized below. (a) Federal Information Processing Standard (FIPS) Publication (PUB) 200 (FIPS PUB 200), titled "Minimum Security Requirements for Federal Information and Information Systems" is the second of two security standards mandated by the Federal Information Security Management Act (FISMA). It specifies minimum security requirements for information and information systems supporting the executive agencies of the federal government and a risk-based process for selecting the security controls necessary to satisfy the minimum security requirements. This standard promotes the development, implementation, and operation of more secure information systems within the federal government by establishing minimum levels of due diligence for information security and facilitating a more consistent, comparable, and repeatable approach for selecting and specifying security controls for information systems that meet minimum security requirements. This document is incorporated by reference as a source for definitions.

to the extent such provisions have been identified and an exemption claimed for the original record and the purposes underlying the exemption for the original record still pertain to the record which is now contained in this system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided the President and others are not compromised, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, to preserve the confidentiality and integrity of Federal testing materials, and to safeguard evaluation materials used for military promotions when furnished by a confidential source. The exemption rule for the original records will identify the specific reasons why the records are exempt from specific provisions of 5 U.S.C. 552a . (8) System identifier and name. LDIA 0010, Information Requests-Freedom of Information Act (FOIA) and Privacy Act. (i) Exemption. During the course of information requests-FOIA and Privacy Act actions, exempt records/material from other systems of records may become part of this system of records. For such records/material, DIA hereby claims the same exemptions as is claimed for the systems from which such records/material are derived. (ii) Authority. 5 U.S.C. 552a(k)(2) through (k)(7) . (iii) Reasons. Records in a system of records are only exempted from pertinent provisions of 5 U.S.C. 552a to the extent such provisions are identified and an exemption claimed. In general, exemptions claimed protect properly classified information relating to national defense and foreign policy; avoid interference during the conduct of criminal, civil, or administrative actions or investigations; ensure protective services provided the President and others are not compromised; protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations; preserve the confidentiality and integrity of Federal testing materials; and safeguard evaluation materials used for military promotions when furnished by a confidential source. The exemption rule(s) for the systems of records from which the records/materials was derived will identify the specific reasons why the records/materials are exempt from provisions of 5 U.S.C. 552a . (9) System identifier and name. LDIA 12-0002, Privacy and Civil Liberties Case Management System. (i) Exemption. Any portion of this record system which falls within the provisions of 5 U.S.C. 552a(k)(2) and (k)(5) may be exempt from the following subsections of 5 U.S.C. 552a : (c)(3), (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5) . (iii) Reasons.

(Comment 188) Several comments address the costs of records retention. Several comments suggest that records are often stored off site or at corporate headquarters, with a nonzero cost for retrieval. Another comment recommends that we review our estimate of records retention costs of zero. The comment states that firms that handle products not covered by the juice HACCP regulation (part 120) may not have a records retention strategy and may have to implement a new strategy for records retention and recovery. Several comments express uncertainty with regard to the appropriate records retention time of either 1 year or 2 years for the products that they handle. These comments suggest definitions of "perishable" that would be more consistent with the terminology used in the trade, which is different from the definition in the proposed rule. Recommended records retention times ranged from a low of 6 months for perishable foods, up to 2 years for other foods. (Response) In the PRIA, we used information from preliminary outreach to tentatively conclude that requirements for records retention of 1 year for perishable products, and 2 years for all other foods were consistent with current industry norms. The respondents to the outreach were not necessarily subject to the recordkeeping requirement of the juice HACCP rule, and we assume that the understanding of the term "perishables" by the respondents to that outreach was based on the conventional use of the

term, rather than the definition of the term used in the PRIA. In response to comments, the record retention requirements for nontransporters in the final rule now provide: (1) 6 months for food for which a significant risk of spoilage or significant loss of value occurs within (printed page 71635) 60 days under normal shipping and storage conditions for that food; (2) 1 year for food for which a significant risk of spoilage or significant loss of value occurs within 61 days to 6 months under normal shipping and storage conditions for that food; and (3) 2 years for food for which a significant risk of spoilage or significant loss of value occurs greater than 6 months under normal shipping and storage conditions for that food. (Comment 189) One comment suggests that the estimates of zero storage costs from records retention are too low. The comment estimates that offsite storage and recovery costs range between \$2.50 and \$3.50 per cubic foot per year.

3.6.1 | Continuous Risk Monitoring... 3.6.1 Continuous Risk Monitoring Because cybersecurity risks and their impacts on other risks frequently change, enterprise risk conditions should be continually monitored to ensure that they remain within acceptable levels. 3.6.1 describes the Check element, where the practitioner determines whether the intended activities accomplished objectives and to what extent.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 204, 212, and 252 RIN 0750-AH02 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Final rule. SUMMARY: DoD is issuing a final rule amending the Defense Federal Acquisition Regulation Supplement (DFARS) to establish a standard procedure for offerors to propose an alternative line item structure that reflects the offeror's business practices for selling and billing commercial items and initial provisioning spares for weapon systems DATES: Effective Date: September 20, 2011. FOR FURTHER INFORMATION CONTACT: Mr. Julian E. Thrash, 703-602-0310. SUPPLEMENTARY INFORMATION: I. Background DoD published a proposed rule in the Federal Register at 76 FR 21847 on April 19, 2011, to add DFARS language that provides offerors the opportunity to propose an alternative line item structure in solicitations for commercial items and initial provisioning spares. This DFARS change will allow offerors to provide information about their products that may not have been known to the Government prior to issuance of the solicitation. No public comments were received regarding the proposed rule. DoD identified the need to propose an alternative line item structure during process reviews and working group sessions that assessed destination-acceptance procedures. The process reviews performed by DoD cross-service working groups, which were chartered by the Defense Finance and Accounting System, examined issues causing problems in the receipt and acceptance phase for contract deliverables and payments. This group determined that the level of detail in the requirements description and line item structure is not always sufficient for delivery, payment, and subsequent inventory management of the items delivered. For example, the contract line item may be for a desktop computer, but the actual items delivered, invoiced, and inventoried may reflect a separate monitor, keyboard, and central processing unit. The resultant misalignment of transaction detail (i.e., contract line item, invoiced unit, delivery and inventory unit) is the cause of failures in the electronic processes of the DoD's business enterprise requiring manual intervention with potential delays in contractor payment.

3.1.3. 3.1.3 Review Management Procedures and Controls-Program Assessment The Contractor shall examine the management procedures that support security.

. FDA estimates that there are approximately 115,000 intrastate carriers, and based on DOT data, almost one million commercial drivers report intrastate travel. In reviewing the truck tonnage by commodity, approximately 12 percent of the intrastate shipments are of FDA-regulated food products. The average distance these products are shipped is 231 miles, which means many shipments are intrastate, especially in the larger western states. For some foods, distribution may be limited primarily to intrastate transportation, depending on the time of year and state. Many businesses have their own delivery trucks that are used intrastate, several use employee vehicles for deliveries, and many rent vehicles to deliver product. These vehicles are used to deliver all types of food products-refrigerated, cooked, as well as fresh food and produce, and grocery items. Some local firms pick up their own merchandise from warehouse facilities to stock their own locations.

Many of these "warehouses" (commonly referred to as "bin warehouses") may receive product via interstate transporter and subsequently deliver to a variety of intrastate retail customers via many different intrastate means. Data on the volume of foods that move in intrastate commerce are maintained by individual state Departments of Agriculture and by DOT. For example, from CA, LA, TX alone, DOT reports over 12 percent of intrastate truck tonnage is FDA-regulated products. Past traceback investigations provide examples of the need to regulate intrastate transport. For example, in 2003, there were two produce-associated outbreaks that occurred in CA from intrastate shipments. There were also two *Salmonella enteritidis* outbreaks in WI associated with intrastate shipments of eggs. Other foods, such as pasteurized milk, nearly all raw products, seafood, and sprouts, may be shipped either intrastate or interstate depending on the production or processing site. Most seafood consumed in FL is transported only intrastate, but in OK, most seafood is transported interstate. In 2002, there was an outbreak in NJ and FL linked to seafood. Intrastate records assisted us in pinpointing the portion of the Indian River, FL that was causing the problem. In reviewing egg tracebacks from 1996 to 2003, 35 percent of the tracebacks that resulted in farm investigations were intrastate. This past summer, the state of Oregon (OR) was able to stop a sprout-associated outbreak from becoming a serious one by tracing back to a WA sprouter just over the border from OR after some initial cases but before the *Salmonella* serotype had been identified. The sprouts were recalled. If the sprouter had been located in OR so that the sprouts were not transported interstate, it would have been problematic to a traceback investigation for FDA to be limited to records only from interstate transporters.

(C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsections (e)(4)(G) and (H) because this system of records is compiled for investigative purposes and is exempt from the access provisions of subsections (d) and (f). (E) From subsection (e)(4)(I) because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. (24) System identifier and name. F036 AETC X, College Scholarship Program. (i) Exemption. Investigatory material compiled solely for the purpose of determining suitability but only to the extent that disclosure would reveal the (printed page 14744) identity of a confidential source. Therefore, portions of this system may be exempt pursuant to 5 U.S.C. 552a(k) (5) from the following subsections of 5 U.S.C. 552a(c)(3) , (d), and (e)(1). (ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons. (A) From subsection (c)(3) and (d) and when access to accounting disclosures and access to or amendment of records would cause the identity of a confidential sources to be revealed. Disclosure of the source's identity not only will result in the Department breaching the promise of confidentiality made to the source but it will impair the Department's future ability to compile investigatory material for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, Federal contracts, or access to classified information. Unless sources can be assured that a promise of confidentiality will be honored, they will be less likely to provide information considered essential to the Department in making the required determinations. (B) From (e)(1) because in the collection of information for investigatory purposes, it is not always possible to determine the relevance and necessity of particular information in the early stages of the investigation. In some cases, it is only after the information is evaluated in light of other information that its relevance and necessity becomes clear. Such information permits more informed decision-making by the Department when making required suitability, eligibility, and qualification determinations. (25) System identifier and name. F032 AFCESA C, Civil Engineer System-Explosive Ordnance Records. (i) Exemption. Records maintained in connection with providing protective services to the President and other individuals under 18 U.S.C. 3056 , may be exempt pursuant to 5 U.S.C. 552a(k)(3) may be exempt from the following subsections of 5 U.S.C. 552a(c)(3)

10. Estimate of the Time Required Before Preventive Action We estimated the time required before taking preventive action using FDA outbreak investigation information. We estimated the time required for a preventive action as the time that elapsed between the onset of the first reported illness and the first action taken by FDA or a commercial or state entity. In 11 of 26 traceback investigations considered from 2000 to 2003, an average of 78 days had elapsed between the time of the onset of the first illness in the outbreak and any initial preventive measure. The estimate of the time required for a preventive action may be overstated because for those investigations that

had entries reporting an initial action, but did not report a specific date of the action, we used the information entry date to approximate the date of the initial action. The information entry date is the date on which the initial action is recorded by FDA. Consequently, this procedure likely overestimates the time to preventive action because the information entry date is later than the date of the initial action it approximates, and in some cases may be significantly later than that date. Moreover, many investigations do not involve any preventive action that would limit the magnitude of the outbreak, because either the investigation lasts longer than the shelf life of the implicated food product (so that there is no longer any implicated food in circulation), or the implicated source of the outbreak is determined to be an isolated event with no possible preventive action that would limit the size of the outbreak. Because information from such observations is not used in the analysis, the resulting estimate of the investigation duration is likely to be shorter than what would otherwise be obtained. Based on the outbreak data used to create figure 2 of this document entitled 'Cumulative Distribution of the Fraction of Total Reported Illnesses by Outbreak Duration,' we estimate that between 15 and 18 percent of all illnesses were from outbreaks that lasted more than 78 days. This implies that, with an average of 2,081 reported illnesses per year, the faster tracebacks could potentially prevent up to a maximum of 312 to 374 (reported) illnesses per year. The average duration of outbreaks that last longer than 78 days is approximately 121 days, for an average net excess of 43 days (121 days minus 78 days). By dividing the maximum number of known illnesses per year, by the average duration of outbreaks that persist beyond 78 days, we estimate a maximum daily average of 8 to 9 illnesses that occur each day after the 78 day threshold.

to the extent such provisions have been identified and an exemption claimed for the original record, and the purposes underlying the exemption for the original record still pertain to the record which is now contained in this system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided the President and others are not compromised, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, and to preserve the confidentiality and integrity of Federal evaluation materials. The exemption rule for the original records will identify the specific reasons why the records are exempt from specific provisions of 5 U.S.C. 552a . (21) System identifier and name. F033 AF B, Privacy Act Request Files. (i) Exemption. During the processing of a Privacy Act request, exempt materials from other systems of records may in turn become part of the case record in this system. To the extent that copies of exempt records from those 'other' systems of records are entered into this system, the Department of the Air Force hereby claims the same exemptions for the records from those 'other' systems that are entered into this system, as claimed for the original primary system of which they are a part. (ii) Authority. 5 U.S.C. 552a(j)(2) , (k)(1), (k)(2), (k)(3), (k)(4), (k)(5), (k)(6), and (k)(7). (iii) Reasons. Records are only exempt from pertinent provisions of 5 U.S.C. 552a to the extent such provisions have been identified and an exemption claimed for the original record, and the purposes underlying the exemption for the original record still pertain to the record which is now contained in this (printed page 14743) system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided the President and others are not compromised, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, and to preserve the confidentiality and integrity of Federal evaluation materials. The exemption rule for the original records will identify the specific reasons why the records are exempt from specific provisions of 5 U.S.C. 552a . (22) System identifier and name. F051 AFJA E, Judge Advocate General's Professional Conduct Files. (i) Exemption. Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2)

As with all of DoD programs, the Department intends to effectively oversee the CMMC Program and take the appropriate actions needed to manage its effective implementation. The phased implementation

plan described in § 170.3(e) was extended by six months and is intended to address ramp-up issues, provide time to train the necessary number of assessors, and allow companies the time needed to understand and implement CMMC requirements. **Small Business Entities Impacted** This rule will impact small businesses that do business with the Department of Defense, except those competing on contracts or orders that are exclusively for COTS items or when receiving contracts or orders valued at or below the micro-purchase threshold. According to the Federal Procurement Data System (FPDS) there is an average of 29,260 unique small business contractors: FY 2019 (31,189), FY 2020 (29,166) and FY 2021 (27,427). **Cost Assumptions and Analysis for CMMC** Complete details on CMMC requirements and associated costs, savings, and benefits of this rule are provided in the Regulatory Impact Analysis referenced in the preamble. Key Components of the model are described in §§ 170.14 through 170.24. (a) **Assumptions for the updated CMMC Program Cost Analysis** In estimating the public cost for a small DIB company to achieve CMMC compliance or certification at each CMMC level, DoD considered non-recurring engineering costs, recurring engineering costs, assessment costs, and affirmation costs for each CMMC Level. [62] These costs include labor and consulting. Estimates include size and complexity assumptions to account for organizational differences and how it handles Information Technology (IT) and cybersecurity: small entities have a less complex, less expansive operating environment and Information Technology (IT)/Cybersecurity infrastructure compared to larger DIB companies. small entities outsource IT and cybersecurity to an External Service Provider (ESP) entities (large or small) pursuing CMMC Level 2 self-assessment will seek consulting or implementation assistance from an ESP to either help them prepare for the assessment technically or participate in the assessment with the C3PAOs. Estimates do not include implementation (Non-recurring Engineering Costs (NRE)) or maintenance costs (Recurring Engineering (RE)) for requirements prescribed in current regulations. For CMMC Levels 1 and 2, cost estimates are based upon assessment, reporting and affirmation activities which a contractor will take to validate conformance with existing cybersecurity requirements from the FAR clause 52.204-21 (effective June 15, 2016) to protect FCI, and the DFARS clause 252.204-7012 which required contractor implementation of NIST SP 800-171 not later than December 31, 2017, to protect CUI. As such, costs estimates are not included for an entity to implement security requirements, maintain existing security requirements, or remediate a Plan of Action for unimplemented requirements.

, as implemented by DOD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1) . (B) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, military service, Federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (C) Portions of this system of records are exempt from the following subsections of the Privacy Act: (c)(3), (d), (e)(1), (e)(4) (G) through (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(1) and (k)(5) . (iii) Reasons. (A) Exempted portions of this system contain information that has been properly classified under E.O. 12356 , and that is required to be kept secret in the interest of national defense or foreign policy. (B) Exempted portions of this system also contain information considered relevant and necessary to make a determination as to qualifications, eligibility, or suitability for access to classified information and was obtained by providing an express or implied assurance to the source that his or her identity would not be revealed to the subject of the record. (7) System identifier and name. N04060-1, Navy and Marine Corps Exchange Sales and Security Files. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (B) Portions of this system of records are exempt from the following subsections of the Privacy Act: (c)(3), (d), (e)(4)(G) through (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) . (iii) Reasons. Granting individuals access to information collected and maintained by these activities relating to the enforcement of criminal laws could interfere with orderly investigations, with orderly administration of justice, and possibly enable suspects to avoid detection or apprehension. Disclosure of this information could result in the concealment, destruction, or fabrication of evidence, and could also reveal and render ineffectual investigative techniques, sources, and methods used by these activities. (8) [Reserved] (9) System identifier and name. N05041-1, Inspector General (IG) Records. (i) Exemption. (A) Information specifically authorized to be classified under E.O. 12958 , as implemented by DOD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1) . (B) Investigatory material compiled for law enforcement purposes may be exempt

pursuant to 5 U.S.C. 552a(k)(2)

means assets that process, store, or transmit FCI. FCI Assets are part of the Level 1 CMMC Assessment Scope and are assessed against all CMMC Level 1 requirements. (CMMC-custom term) Government Furnished Equipment (GFE) has the same meaning as government-furnished property as defined in 48 CFR 45.101. Industrial Control Systems (ICS) means a general term that encompasses several types of control systems, including supervisory control and data acquisition (SCADA) systems, distributed control systems (DCS), and other control system configurations such as Programmable Logic Controllers (PLC) often found in the industrial sectors and critical infrastructures. An ICS consists of combinations of control components (e.g., electrical, mechanical, hydraulic, pneumatic) that act together to achieve an industrial objective (e.g., manufacturing, transportation of matter or energy), as defined in NIST SP 800-82 R2 (incorporated by reference, see § 170.2). Information System (IS) is defined in NIST SP 800-171 Rev 2 (incorporated by reference, see § 170.2). Internet of Things (IoT) means the network of devices that contain the (printed page 89122) hardware, software, firmware, and actuators which allow the devices to connect, interact, and freely exchange data and information, as defined in NIST SP 800-172A (incorporated by reference, see § 170.2). Operational Technology (OT) means programmable systems or devices that interact with the physical environment (or manage devices that interact with the physical environment). These systems or devices detect or cause a direct change through the monitoring or control of devices, processes, and events. Examples include industrial control systems, building management systems, fire control systems, and physical access control mechanisms, as defined in NIST SP 800-160v2 Rev 1 (incorporated by reference, see § 170.2). Organization-Defined means as determined by the OSA being assessed except as defined in the case of Organization-Defined Parameter (ODP). (CMMC-custom term) Organization-Defined Parameter (ODP) means selected enhanced security requirements contain selection and assignment operations to give organizations flexibility in defining variable parts of those requirements, as defined in NIST SP 800-172A (incorporated by reference, see § 170.2). Note 1 to ODP: For CMMC Level 3, the organization defining the parameters is the DoD. Organization Seeking Assessment (OSA) means the entity seeking to conduct, obtain, or maintain a CMMC assessment for a given information system at a particular CMMC Level. The term OSA includes all Organizations Seeking Certification (OSCs). (CMMC-custom term) Organization Seeking Certification (OSC) means the entity seeking to contract, obtain, or maintain CMMC certification for a given information system at a particular CMMC Level. An OSC is also an OSA. (CMMC-custom term) Out-of-Scope Assets

and maintained under all negotiated arrangements. FDA assumes that current business practices are the low-cost arrangement for the establishment and maintenance of records and does not revise its estimate of recordkeeping costs to account for higher coordination costs between transporters and nontransporters. (Comment 208) Some comments state that FDA's estimated cost per facility in the public warehousing sector is likely to be incorrect because of the apparent assumption that costs incurred would be similar for both a public warehouse and a wholesaler. The comments argue that, because wholesalers own a product, they are more knowledgeable about its contents and packaging than are warehouse facilities. The comment notes that a warehouse is a third party provider of warehousing, storage, and other value added services; does not have direct knowledge of where a product originates; and may not have full knowledge of the contents and packaging of a product, or of the product's next destination. Another comment states that the information asked for in the proposal is reasonable, but that this information will be difficult, costly, or impossible to obtain for public warehouse facilities. (Response) FDA acknowledges that warehouse facilities and wholesalers perform different functions. FDA has accounted for the differences in its cost estimates. The NAICS definition of the wholesale trade includes, "selling merchandise, generally without transformation to other business". The definition also characterizes wholesalers as normally operating from a warehouse or office (Ref. 27). In contrast, the NAICS defines the warehousing and storage sector as providing facilities to store goods but not sell the goods that they store. In addition, warehouse facilities may also provide logistical services for the goods that they store (Ref. 27). Although the warehouse and wholesaler functions are clearly different, FDA assumes that both kinds of facilities would have records giving an immediate previous source and an immediate subsequent recipient of the product. Because warehouse facilities do not take ownership of the products that they handle, they may not have specific information about the products and their packaging.

CMMC self-assessments and C3PAO assessments differ in several key ways: **Self-Assessment (Level 1

and Level 2 option)**: - Conducted internally by the organization - Affirmed by a senior official (CEO, CIO, or equivalent) - Lower cost (internal resources only) - Required for CMMC Level 1 and available as an option for some Level 2 contracts - Results entered into SPRS **C3PAO Certification Assessment (Level 2)**: - Conducted by an authorized C3PAO (Cyber AB-accredited) - Independent third-party verification - Higher cost (\$30K-\$150K+) - Required for Level 2 contracts specifying C3PAO assessment (Phase 2, November 2026) - Results in formal CMMC certification (valid 3 years) The contract will specify which type of assessment is required. During Phase 1 (current), most contracts accept self-assessments. Phase 2 will introduce C3PAO certification requirements.

The Department of Health and Human Services (HHS or Department) has examined the effects of this proposed rule under Executive Order (E.O.) 12866, Regulatory Planning and Review, [931] E.O. 13563 , Improving Regulation and Regulatory Review, [932] E.O. 14094 , Modernizing Regulatory Review, [933] the Regulatory Flexibility Act [934] (RFA), the Unfunded Mandates Reform Act of 1995 [935] (UMRA), and E.O. 13132 on Federalism. [936] E.O.s 12866 and 13563 direct the Department to assess all costs and benefits of available regulatory alternatives and, when regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive effects; and equity). The proposed rule meets the criteria as significant under section 3(f)(1) of E.O. 12866 , as amended by E.O. 14094 . The RFA requires us to analyze regulatory options that would minimize any significant effect of a rule on small entities. As discussed in greater detail below, this analysis concludes, and the Secretary certifies, that the notice of proposed rulemaking (NPRM), if adopted, would not result in a significant economic effect on a substantial number of small entities. The UMRA (section 202(a)) generally requires us to prepare a written statement, which includes an assessment of anticipated costs and benefits, before proposing any rule that includes any Federal mandate that may result in the expenditure by State, local, and Tribal governments, in the aggregate, or by the private sector, of \$100,000,000 or more (adjusted annually for inflation) in any 1 year. [937] The current threshold after adjustment for inflation is \$183 million, using the most current (2024) Implicit Price Deflator for the Gross Domestic Product. UMRA does not address the total cost of a rule. Rather, it addresses certain categories of cost, mainly Federal mandate costs resulting from imposing enforceable duties on State, local, or Tribal governments or the private sector; or increasing the stringency of conditions in, or decreasing the funding of, State, local, or Tribal governments under entitlement programs. This proposed rule, if adopted, would impose mandates that would result in the expenditure by State, local, and Tribal governments, in the aggregate, or by the private sector, of more than \$183 million in any one year. The impact analysis in this proposed rule addresses such effects both qualitatively and quantitatively. Each covered entity and business associate (collectively, regulated entity), including government entities that meet the definition of covered entity (e.g.,

(D) From subsection (e)(1) because in the course of criminal investigations, information is often obtained concerning the violation of laws or civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this information be retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought. (E) From subsection (e)(2) because in a criminal or other law enforcement investigation, the requirement that information be collected to the greatest extent possible from the subject individual would alert the subject as to the nature or existence of the investigation and thereby present a serious impediment to effective law enforcement. (F) From subsection (e)(3) because the requirement that individuals supplying information be provided with a form stating the requirements of subsection (e)(3) would constitute a serious impediment to law enforcement in that it could compromise the existence of a confidential investigation, reveal the identity of confidential sources of information and endanger the life and physical safety of confidential informants. (G) From subsections (e)(4)(G) and (e)(4)(H) because portions of this system of records have been exempted from access provisions of subsection (d), making these subsections not applicable. (H) From subsections (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (I) From subsection (e)(5) because the requirement that records be maintained with attention to accuracy, relevance, timeliness, and completeness would unfairly hamper the investigative process. It is the nature of law enforcement for investigations to uncover the commission of illegal acts at diverse stages. It is frequently impossible to determine

initially what information is accurate, relevant, timely, and least of all complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light. (J) From subsection (e)(8) because the notice requirements of this provision could present a serious impediment to criminal law enforcement by revealing investigative techniques, procedures, and the existence of confidential investigations. (K) From subsection (f) because portions of this system of records have been exempted from the access provisions of subsection (d). (L) From subsection (g) because portions of this system of records are compiled for law enforcement purposes and have been exempted from the access provisions of subsections (d) and (f). (17) System identifier and name. A0195-2c USACIDC DoD, DoD Criminal Investigation Task Force (CITF) Files. (i) Exemption.

a. Marking and Identifying CUI Comment: Multiple commenters asked for clarification regarding definition, marking, and identification of CUI as related to CMMC requirements and DFARS clause 252.204-7021. One commenter asked if the definition of DoD CUI applies to the CUI required to be safeguarded under the CMMC clause. Another asked if DFARS clause 252.204-7021 includes information that requires protection under DFARS clause 252.204-7012. One commenter requested that the Department confirm that, under CMMC, contractors will only be responsible for protecting CUI that is clearly marked upon receipt from the Department and created by contractors. Response: If the contract includes a CMMC Level requirement, contractors will be required to protect FCI and CUI, as applicable, through fulfillment of the designated CMMC Level security requirements. CMMC does not in any way change the DoD requirements regarding the definition, marking, and protection of CUI. If DFARS clause 252.204-7012 applies, contractors are required to safeguard covered defense information in accordance with the terms and conditions of the clause and contract, which includes information developed in support of the contract. CMMC does not change these requirements. b. Relationship of FCI and CUI to the CMMC Requirements Comment: One commenter suggested that the inclusion of FCI in CMMC needs significant clarification. Others asked if FCI references within the CMMC Model [1.0] and nonpublic DoD information references in Department of (printed page 89069) Defense Instruction (DoDI) 8582.01 [18] are the same type of information, and if DoDI 8582.01 is the definitive DoD policy for FCI and DoD standards regarding the requirements under FAR clause 52.204-21. Response: The CMMC Program requirements for Level 1 will apply when the contract effort requires contractors to process, store, or transmit FCI on its unclassified information system. If CUI is processed, stored, or transmitted on a contractor information system, a higher level of CMMC compliance or certification is required. The CMMC Level required to protect CUI (i.e., CMMC Level 2 Self-Assessment as described in § 170.16, CMMC Level 2 Certification Assessment as described in § 170.17, or CMMC Level 3 Certification Assessment as described in § 170.18) is determined by the Department based upon the sensitivity of the CUI and will be identified in the solicitation. The CMMC Program uses the definitions of FCI from FAR 4.1901 and CUI from 32 CFR 2002

Many different types of people use ICAT for a variety of purposes. System administrators and computer security officers use ICAT to identify the known vulnerabilities (and patch information) associated with the software on critical systems. Law enforcement can use ICAT in forensics activities to determine the set of possible vulnerabilities that a hacker might have used to penetrate a system. Computer security researchers use ICAT to identify sets of vulnerabilities that have particular characteristics of interest. Auditors can use ICAT to check to see if particular vulnerabilities have been patched in audited systems.

Control PD-200901022: nal structure and implementation detail of the assessment object. This type of testing is conducted using a functional specification for mechanisms and a high-level process description for activities. Basic testing provides a level of understanding of the security safeguards necessary for determining whether the safeguards are implemented and free of obvious errors. | | | Focused | Test methodology (also known as gray box testing) that assumes some knowledge of the internal structure and implementation detail of the assessment object. This type of testing is conducted using a functional specification and limited system architectural information (e.g., high-level design) for mechanisms and a high-level process description and high-level description of integration into the operational environment for activities. Focused testing provides a level of understanding of the security safeguards necessary for determining whether the safeguards are implemented and free of obvious errors and whether there are increased grounds for confidence that the safeguards are implemented correctly and operating as intended .

(iii) Some access requirements for RD and FRD exceed the requirements for NSI. Due to the unique

national security implications of RD and FRD, and to facilitate maintaining consistency of codified requirement, they are not repeated in the baseline of this rule, but may be applied through specific contract requirements. (iv) When RD is transclassified as TFNI, it is safeguarded as NSI. Such information will be labeled as TFNI. The label TFNI will be included on (printed page 83361) documents to indicate it is exempt from automatic declassification as specified in 10 CFR part 1045 , the AEA, E.O. 13526 , and 32 CFR part 2001 . (2) Unauthorized disclosures. Contractors will report all unauthorized disclosures involving RD, FRD and TFNI information to the CSA. (3) International requirements. The AEA provides for a program of international cooperation to promote common defense and security and to make available to cooperating nations the benefits of peaceful applications of atomic energy as widely as expanding technology and considerations of the common defense and security will permit. (i) Information controlled in accordance with the AEA, RD, and FRD may be shared with another nation only under the terms of an agreement for cooperation. The disclosure by a contractor of RD and FRD will not be permitted until an agreement is signed by the United States and participating governments, and disclosure guidance and security arrangements are established. (ii) RD and FRD will not be transmitted to a foreign national or regional defense organization unless such action is approved and undertaken under an agreement for cooperation between the United States and the cooperating entity and supporting statutory determinations, as prescribed in the AEA. (4) Personnel security clearance and access. Only the DOE, the NRC, the DoD, and the National Aeronautics and Space Agency can grant access to RD and FRD that is under their cognizance. Access to RD and FRD must be granted in accordance with the AEA. Baseline requirements for access to RD and FRD are codified in specific DoD, DOE, NRC, and the National Aeronautics and Space Agency directives and regulations. In addition, need-to-know and other restrictions on access apply. (5) Classification and declassification. (i) All persons with access to RD and FRD must receive initial and periodic refresher training as required under §.1045.120 10 CFR. The training must include the following information: (A) What information is potentially RD and FRD. (B) Matter that potentially contains RD or FRD must be reviewed by an RD derivative classifier to determine whether it is RD or FRD. (C) The DOE must review matter that potentially contains RD or TFNI for public release and DOE or DoD must review matter that potentially contains FRD for public release. (D) RD derivative classification authority is required to classify or upgrade matter containing RD or FRD, or to downgrade the level of matter containing RD or FRD.

(iii) A routine use applies. Another major exception to the ·no disclosure without consent· rule is the routine use exception. The Privacy Act allows federal agencies to publish routine use exceptions to the Privacy Act. Some routine uses are Army specific, DOD specific, and Governmentwide. Routine uses exceptions are listed in the Privacy Act system of records notice(s) applicable to the Privacy Act records in question. The Army and other agencies' system of records notices may be accessed at the Defense Privacy Office's Web site <http://www.defenselink.mil/privacy> . (2) The approved twelve exceptions to the Privacy Act ·no disclosure without consent· rule are listed at appendix C of this part. (b) Disclosing records to other DOD components and to federal agencies outside the DOD. (1) The twelve Privacy Act exceptions referred to in appendix C of this part are available to other DOD components and to federal agencies outside the DOD as exceptions to the Privacy Act's ·no disclosure without consent· rule, with the exception of the FOIA exception. The FOIA is not an appropriate mechanism for providing information to other DOD components and to federal agencies outside the DOD. (2) A widely used exception to requests for information from local and state government agencies and federal agencies not within the DOD is the routine use exception to the Privacy Act. (3) The most widely used exception to requests for information from other DOD components is the ·intra-agency need to know· exception to the Privacy Act. Officers and employees of the DOD who have an official need for the records in the performance of their official duties are entitled to Privacy Act protected information. Rank, position, or title alone does not authorize access to personal information about others. An official need for the information must exist before disclosure. (4) For the purposes of disclosure and disclosure accounting, the Department of Defense (DOD) is considered a single agency. (c) Disclosures under AR 25-55, the Freedom of Information Act (FOIA) Program. (1) Despite Privacy Act protections, all records must be disclosed if the Freedom of Information Act (FOIA) requires their release. The FOIA requires release unless the information is exempted by one or more of the nine FOIA exemptions. (2) Required release under the FOIA. The following are examples of personal information that is generally not exempt from the FOIA; therefore, it must be released to the public, unless covered by paragraphs (d)(2) and (d)(3) of this section. The following list is not all inclusive: (i) Military Personnel· (A) Rank, date of rank, active duty entry date, basic pay entry date, and gross pay (including base pay, special pay, and

all allowances except Basic Allowance for Housing); (B) Present and past duty assignments, future stateside assignments; (C) Office/unit name, duties address and telephone number (DOD policy may require withholding of this information in certain circumstances);

· Communications 24. Which of the following topics have been addressed by your security awareness program via training courses, events, or other communications in the past 1-2 years? Check all that apply. · Communications and marketing

Section 170.12 addresses the roles and responsibilities of a CMMC Provisional Instructor (PI) and CMMC Certified Instructor (CCI) to teach CMMC assessor candidates. Candidate PIs and CCIs are trained and tested per the requirements set forth in § 170.12(c). Section 170.12(c) also provides candidate PIs and CCIs with the requirements to obtain and maintain designation or certification (as applicable), compliance with Accreditation Body policies, work activity exclusions, confidentiality (printed page 83101) expectations, non-disclosure clause, non-public training related information, forbidden consulting services, and reporting requirements. Section 170.13-CMMC Certified Professional (CCP) Section 170.13 addresses the roles and responsibilities of a CMMC Certified Professional (CCP) required to provide advice, consulting, and recommendations to clients. The CAICO trains and tests candidate CCPs per the requirements set forth in § 170.13(b) with CCP certification issued upon successful completion. A CCP can participate on CMMC Level 2 certification assessments with CCA oversight, however CCAs are responsible for making final assessment determinations for a CMMC Status of Conditional or Final Level 2 (C3PAO). A list of CCP requirements is provided for obtaining and maintaining certification, compliance with Accreditation Body policies, completion of a Tier 3 background investigation or equivalent, sharing assessment specific information, and reporting requirements. Section 170.14-CMMC Model Section 170.14 addresses the structure, security requirement contents, organization, sourcing, and numbering of the security requirements that comprise the CMMC Model. It also provides an overview of the assessment process. The CMMC Model consists of three (3) levels, each containing security requirements taken directly from existing regulations and guidelines. Firstly, § 170.14(2) defines CMMC Level 1 as the 15 security requirements listed in the FAR clause 52.204-21(b)(1). Secondly, § 170.14(3) defines CMMC Level 2 as the 110 security requirements from the NIST SP 800-171 R2. Lastly, § 170.14(4) defines CMMC Level 3 as 24 selected security requirements from the NIST SP 800-172 Feb2021. The CMMC security requirements are organized into domains following the approach taken in NIST SP 800-171 R2. The numbering of the CMMC security requirements, addressed in § 170.14(c)(1), is of the form DD.L#-REQ where the 'DD' is the two-letter domain abbreviation, the 'L#' is the CMMC Level, and the 'REQ' is based directly on the numbering in the source. Assessment criteria for these security requirements, as described in § 170.14(d), is based on security requirement assessment guidance provided in NIST SP 800-171A Jun2018 and NIST SP 800-172A Mar2022. Section 170.15-CMMC Level 1 Self-Assessment and Affirmation Requirements

ries in batches instead of on an ongoing basis. 4 - GLYPH<c=31,font=/APONEK+Webdings> Remote Access Software. Remote access is often granted and secured through virtual private networking (VPN). VPN systems typically log successful and failed login attempts, as well as the dates and times each user connected and disconnected, and the amount of data sent and received in each user session. VPN systems that support granular access control, such as many Secure Sockets Layer (SSL) VPNs, may log detailed information about the use of resources. -

GLYPH<c=31,font=/APONEK+Webdings> Web Proxies. Web proxies are intermediate hosts through which Web sites are accessed. Web proxies make Web page requests on behalf of users, and they cache copies of retrieved Web pages to make additional accesses to those pages more efficient. Web proxies can also be used to restrict Web access and to add a layer of protection between Web clients and Web servers. Web proxies often keep a record of all URLs accessed through them. -

GLYPH<c=31,font=/APONEK+Webdings> Vulnerability Management Software. Vulnerability management software, which includes patch management software and vulnerability assessment software, typically logs the patch installation history and vulnerability status of each host, which includes known vulnerabilities and missing software updates. 5 Vulnerability management software may also record additional information about hosts' configurations. Vulnerability management software typically runs occasionally, not continuously, and is likely to generate large batches of log entries. -

GLYPH<c=31,font=/APONEK+Webdings> Authentication Servers. Authentication servers, including directory servers and single sign-on servers, typically log each authentication attempt, including its origin, username, success or failure, and date and time.

(ix) Review, if applicable, ongoing Computer Matching Agreements. The Defense Data Integrity Board approves Computer Matching Agreements for 18 months, with an option to renew for an additional year. This additional review will ensure that the requirements of the Privacy Act, Office of Management and Budget guidance, local regulations, and the requirements contained in the Matching Agreements themselves have been met. (7) All DA personnel will-

- (i) Take appropriate actions to ensure personal information contained in a Privacy Act system of records is protected so that the security and confidentiality of the information is preserved;
- (ii) Not disclose any personal information contained in a Privacy Act system of records except as authorized by 5 U.S.C. 552a, DOD 5400.11-R, or other applicable laws. Personnel willfully making a prohibited disclosure are subject to possible criminal penalties and/or administrative sanctions; and
- (iii) Report any unauthorized disclosures or unauthorized maintenance of new Privacy Act systems of records to the applicable activity's Privacy Act Official.

(8) Heads of Joint Service agencies or commands for which the Army is the Executive Agent or the Army otherwise provides fiscal, logistical, or administrative support, will adhere to the policies and procedures in this part. (9) Commander, Army and Air Force Exchange Service, will supervise and execute the Privacy Program within that command pursuant to this part. (10) Overall Government-wide responsibility for implementation of the Privacy Act is the Office of Management and Budget. The Department of Defense is responsible for implementation of the Act within the armed services. The Privacy Act also assigns specific Government-wide responsibilities to the Office of Personnel Management and the General Services Administration. (11) Government-wide Privacy Act systems of records notices are available at <http://www.defenselink.mil/privacy>.

(e) Legal Authority. (1) Title 5, United States Code, Section 552a, as amended, The Privacy Act of 1974. (2) Title 5, United States Code, Section 552, The Freedom of Information Act (FOIA). (3) Office of Personnel Management, Federal Personnel Manual (5 CFR parts 293, 294, 297, and 7351). (4) OMB Circular No. A-130, Management of Federal Information Resources, Revised, August 2003. (5) DOD Directive 5400.11, Department of Defense Privacy Program, November 16, 2004. (6) DOD Regulation 5400.11-R, Department of Defense Privacy Program, August 1983. (7) Title 10, United States Code, Section 3013, Secretary of the Army. (8) Executive Order No. 9397, Numbering System for Federal Accounts Relating to Individual Persons, November 30, 1943. (9) Public Law 100-503, the Computer Matching and Privacy Act of 1974. (10) Public Law 107-347, Section 208, Electronic Government (E-Gov) Act of 2002. (11) DOD Regulation 6025.18-R, DOD Health Information Privacy Regulation, January 24, 2003. § 505.2 General provisions. (a) Individual privacy rights policy

) govern the agency's ability to disclose information to the public. For example, section 301 of the FD&C Act prohibits any person from using to his own advantage or revealing, other than to the Secretary or other officers or employees of the Department, or to the courts, any information acquired under authority of section 414 and 704 concerning any method or process which as a trade secret is entitled to protection. Furthermore, the records provisions in the Bioterrorism Act recognize that FDA may obtain trade secret or confidential information and direct the Secretary to take appropriate measures to ensure that there are in effect effective procedures to prevent the unauthorized disclosure of [such information]. (21 U.S.C. 414(c)). FDA is planning to reemphasize (printed page 71591) in instructions to FDA personnel the importance of current protections and legal requirements against the unauthorized disclosure of any trade secret or confidential information that is obtained. Therefore, FDA disagrees that a manufacturer would be harmed by disclosing ingredient information to FDA. Moreover, the FD&C Act currently requires manufacturers to disclose the ingredients they use to the public on food labels. One comment notes that section 403(i)(2) of the FD&C Act excludes spices, flavorings, and some colors from the label requirement. The exemption in section 403(i)(2) of the FD&C Act from disclosing specific spices, flavorings, and colors to the public on the label does not prohibit FDA from obtaining this information under the Bioterrorism Act. As previously discussed, if this information is legally protected from public disclosure, FDA will not release it to the public.

(iv) Statements, written or audio, of contractor employees describing what they witnessed or experienced in connection with the contractor's performance of the contract. Government data means any information (including metadata), document, media, or machine-readable material regardless of physical form or characteristics that is created or obtained by the Government, or a contractor on behalf of the Government, in the course of official Government business. Government-related data means any information, document, media, or machine-readable material regardless of physical form or characteristics that is created or obtained by a contractor through the storage, processing, or communication of Government data. Government-related data does not include-

- (1) A contractor's business records (e.g., financial records, legal records) that do not incorporate Government

data; or (2) Data such as operating procedures, software coding or algorithms that are not primarily applied to the Government data. Information means any communication or representation of knowledge, such as facts, data, or opinions in any medium or form, including textual, numerical, graphic, cartographic, narrative, electronic, or audiovisual forms (see Office of Management and Budget (OMB) Circular No. A-130, Managing Information as a Strategic Resource). Information and communications technology (ICT) means information technology and other equipment, systems, technologies, or processes, for which the principal function is the creation, manipulation, storage, display, receipt, or transmission of electronic data and information, as well as any associated content. Examples of ICT include but are not limited to the following: computers and peripheral equipment; information kiosks and transaction machines; telecommunications equipment; telecommunications services; customer premises equipment; multifunction office machines; computer software; applications; websites; electronic media; electronic documents; Internet of Things (IoT) devices; and operational technology. Information system means a discrete set of information resources organized for the collection, processing, maintenance, use, sharing, dissemination, or disposition of information (44 U.S.C. 3502(8)). Information resources as used in this definition, includes any ICT. Media means physical devices or writing surfaces including, but not limited to, magnetic tapes, optical disks, magnetic disks, large-scale integration memory chips, and printouts onto which information is recorded, stored, or printed within an information system (NIST SP 800-53). (b) Applicability. The requirements of this clause shall only apply to aspects of a Federal information system (FIS) that involve cloud computing services. (c) Cloud computing security requirements.

3.3.5 | Encryption and Integrity Protection... 3.3.5 Encryption and Integrity Protection SSL VPNs use the underlying SSL protocol to protect the confidentiality of data using encryption and to provide data integrity (ensuring that the data has not been modified).

A new solicitation provision at FAR 52.204-WW, Notice of Controlled Unclassified Information Requirements, is prescribed for use in solicitations that contain the new clause at FAR 52.204-XX or the new clause at FAR 52.204-YY. This provision provides a notice to offerors that agencies will provide agency procedures on handling CUI during the solicitation phase if handling CUI is necessary to prepare an offer. The notice also advises offerors that contractor bid or proposal information, proprietary business information, or contractor-attributable information must be properly marked to ensure adequate protection of their information. The provision also advises offerors that they should notify the contracting officer if there appears to be unmarked or mismarked CUI or an incident related to CUI handled by the offeror during the solicitation phase. When the contract does not identify CUI, the new contract clause at FAR 52.204-YY, Identifying and Reporting Information That Is Potentially Controlled Unclassified Information, is used in lieu of the CUI clause. Similar to the solicitation provision, this clause requires the contractor to notify the Government if there appears to be unmarked or mismarked CUI or a suspected CUI incident related to information handled by the contractor in performance of the contract. This clause requires the contractor to properly mark proprietary business information or contractor-attributable information to ensure adequate protection. The new solicitation provision and the new contract clauses all forbid an offeror or contractor from using Government-provided information for its own purposes, whether or not the information is marked as CUI, unless the information is in the public domain, or unless the information is lawfully made available to the offeror or contractor by someone other than the Government. B. Benefits 1. Uniform Cybersecurity Hygiene Baseline Establishing uniform requirements for how the acquisition workforce and Federal contractors manage CUI will significantly improve the Government and Federal contractors' ability to protect Federal information and information systems from criminals and our adversaries. Absent the uniform approach proposed in this rule, agencies will continue to employ ad hoc, agency-specific policies to manage this information, an approach that can cause agencies to mark and handle information inconsistently and inefficiently. While waivers may be applied in some circumstances, this rule is intended to establish a Governmentwide baseline that will lead to more effective implementation of protections for this sensitive information by the acquisition workforce and contractors. More effective implementation of requirements for identifying and marking CUI will reduce scenarios in which contractors may not realize the information that they are handling is sensitive information that must be safeguarded. 2. Protection From Potential Financial Impacts of CUI Incidents

(A) From subsection (c)(3) because the release of accounting of disclosure would inform a subject that he or she is under investigation. This information would provide considerable advantage to the

subject in providing him or her with knowledge concerning the nature of the investigation and the coordinated investigative efforts and techniques employed by the cooperating agencies. This would greatly impede OIG's criminal law enforcement. (B) From subsection (c)(4) and (d), because notification would alert a subject to the fact that an open investigation on that individual is taking place, and might weaken the on-going investigation, reveal investigatory techniques, and place confidential informants in jeopardy. (C) From subsection (e)(1) because the nature of the criminal and/or civil investigative function creates unique problems in prescribing a specific parameter in a particular case with respect to what information is relevant or necessary. Also, due to OIG's close liaison and working relationships with other Federal, state, local and foreign country law enforcement agencies, information may be received which may relate to a case under the investigative jurisdiction of another agency. The maintenance of this information may be necessary to provide leads for appropriate law enforcement purposes and to establish patterns of activity which may relate to the jurisdiction of other cooperating agencies. (D) From subsection (e)(2) because collecting information to the fullest extent possible directly from the subject individual may or may not be practical in a criminal and/or civil investigation. (E) From subsection (e)(3) because supplying an individual with a form containing a Privacy Act Statement would tend to inhibit cooperation by many individuals involved in a criminal and/or civil investigation. The effect would be somewhat adverse to established investigative methods and techniques. (printed page 14800) (F) From subsection (e)(4) (G) through (I) because this system of records is exempt from the access provisions of subsection (d). (G) From subsection (e)(5) because the requirement that records be maintained with attention to accuracy, relevance, timeliness, and completeness would unfairly hamper the investigative process. It is the nature of law enforcement for investigations to uncover the commission of illegal acts at diverse stages. It is frequently impossible to determine initially what information is accurate, relevant, timely, and least of all complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light. (H) From subsection (e)(8) because the notice requirements of this provision could present a serious impediment to law enforcement by revealing investigative techniques, procedures, and existence of confidential investigations.

ngle sign-on; and - Privacy technologies, including a privacy framework, privacy reference architecture, privacy infrastructure, anonymity and credentials, and specific privacy-enhancing technologies. In the past year, NIST continued to support the EAC in finalizing changes to the Voluntary Voting System Guidelines (VVSg) 1.1. These changes sought to improve the auditability of voting systems, provide greater software integrity protections, expand and improve access-control requirements, and help ensure that cryptographic security mechanisms are implemented properly. The EAC approved these updates to the VVSg in March 2015. In addition, NIST completed a set of draft test assertions for the security requirements in the VVSg. This included test assertions in the

As an example computing how compressed preliminary investigation and decision making times affect the benefits from faster tracebacks, we estimate the duration of the preliminary and decision making parts of the outbreak investigation to currently be approximately 55 days (i.e., the difference between 78 days for an initial preventive action and 33 days for the traceback investigation). If we assume a 50 percent reduction in the times for the preliminary and decision making components of an outbreak investigation, then a 10-day reduction in traceback times would result in preventive measures taken after approximately 56 days (28 days, rounding up, for the preliminary and decision making investigations plus 28 days for a traceback investigation) compared with the current 78 day duration. For a 75 percent reduction in the duration of the initial parts of an outbreak investigation, a 10-day reduction in traceback times would result in preventive measures being taken after approximately 42 days (14 days for preliminary and decision making investigations plus 28 days for a traceback investigation) compared with the current 78 days. b. Records retention requirements of 6 months, 12 months, and 24 months based on three NIST definitions . Many comments suggested that product shelf lives as defined by the NIST should determine which product records would be subject to retention requirements of 6 months, 12 months, and 24 months. We estimate a negligible reduction in costs (which we estimate to be zero) and benefits associated with reducing retention times in the final rule. The provision specifying the shorter retention requirements of 6 months, 12 months, and 24 months may result in the destruction of records earlier than would be the case for the longer retention requirements. While we estimate the reduction in benefits from the reduced retention times to be negligible, we explain the logic behind the perverse incentive for the early destruction of records, and its potential impact on traceback performance. The benefits from the records access requirements cannot be realized without the records retention requirements. If

records no longer exist, there is nothing for FDA to access.

When a Government Contracting Activity (GCA), an element of an agency that has authority regarding acquisition or grant functions, awards a contract that has been determined to require access to classified information, the contract is considered to be a classified contract. The GCA checks with its applicable CSA to determine if the awarded legal entity already has an entity eligibility determination (also referred to as a facility security clearance (FCL)). GCAs will ordinarily include enough lead-time in the acquisition cycle to accomplish all required security actions. In many instances, advanced planning can ensure that access to classified information will not be required in the pre-award process. This would preclude processing an entire bidder list for FCLs. When access to classified information is not a factor in the pre-award phase, but will be required for contract performance, only the successful bidder or offeror will be processed for an FCL. Before an entity can have access to classified information during its contract performance, it must have an FCL. If the legal entity does not already have an FCL when awarded a classified contract, a GCA must sponsor the entity for an FCL. Or, an entity already part of the NISP (i.e., a prime contractor) may sponsor another entity in order to subcontract part of its classified business. To sponsor an entity, the GCA or prime contractor puts in a request, often referred to as a sponsorship letter, to the appropriate CSA for the entity to access classified information in connection with a legitimate government requirement, which may include a foreign government requirement. With an approved FCL, an entity is then eligible for access to information classified at the level of the FCL (i.e., TOP SECRET, SECRET or CONFIDENTIAL) when competing for a classified contract. Among other requirements, an entity must have sponsorship based on a valid government requirement for access to classified information. The USG agency sponsoring an entity for an FCL must include the applicable security requirements clause or equivalent in the contract (e.g., for DoD this is the Federal Acquisition Regulation (FAR) 52.204-2 Security Requirements, or the terms and conditions of a grant award under 2 CFR part 200.210) to require compliance with the NISPOM. A GCA provides the security requirements for a classified contract in a contract security classification specification as part of the contract. For DoD, the DD form 254, Department of Defense Contract Security Classification Specification, OMB Control number 0704-0567, is part of the classified contract and provides the contractor (or a subcontractor) with security requirements and the classification (printed page 83302) guidance necessary to execute a specific classified contract. See <https://www.esd.whs.mil/Portals/54/Documents/DD/forms/dd/dd0254.pdf> and available at <https://www.dcsa.mil/is/nccs/>.

194. Where an application developer meets the HIPAA Rules' definition of health care provider and engages in standard electronic transactions, such as billing an insurance company for its services, it is a covered entity for the purposes of the HIPAA Rules, including the Security Rule. Where an application developer is not regulated under the HIPAA Rules, other Federal laws may apply to the application developer or the application, such as the FTC Act. See, e.g., FTC Act (codified at 15 U.S.C. 41-58). Back to Citation 195. See, e.g., Kea Turner, et al., Sharing patient-generated data with healthcare providers: findings from a 2019 national survey, Journal of the American Medical Informatics Association, p. 371-376 (Nov. 12, 2020), <https://doi.org/10.1093/jamia/ocaa272> ; Accenture Federal Services, Conceptualizing a Data Infrastructure for the Capture, Use, and Sharing of Patient-Generated Health Data in Care Delivery and Research through 2024, The Office of the National Coordinator for Health Information Technology, U.S. Department of Health and Human Services, p. 5 (Jan. 2018), https://www.healthit.gov/sites/default/files/onc_pghd_final_white_paper.pdf ; see also Jolaade Kalinowski, et al., Smart device ownership and use of social media, wearable trackers, and health apps among Black women with hypertension in the United States, JMIR Cardio (pre-print), <https://preprints.jmir.org/preprint/59243> . (iii) A statement that the information being denied does not contain meaningful portions that are reasonably segregable in the case of appeals for total denial of records. (iv) The requester's right to judicial review. (g) Consultation. (1) Final denial of access involving issues not previously resolved or that the DoD Component knows to be inconsistent with rulings of other DoD Components ordinarily should not be made before consultation with the DoD Office of the General Counsel. (2) Tentative decisions to deny records that raise new or significant legal issues of potential significance to other Government agencies shall be discussed with the DoD Office of the General Counsel. § 286.21 Judicial actions. (a) General. (1) This paragraph states current legal and procedural rules for the convenience of the reader. The statements of rules do not create rights or remedies not otherwise available, nor do they bind the Department of Defense to particular judicial interpretations or procedures. (2) A requester may seek an order from a U.S. District Court to compel release of a record after administrative remedies have been exhausted; i.e., when the requester has filed an administrative appeal from the denied access to a record by the Head of the DoD Component or an appellate designee, or when the DoD Component has failed to respond within the time limits prescribed by the FOIA and in this part. (b) Venue. The requester may bring suit in the U.S. District Court in the district in which the requester resides, the district where the requester's place of business is located, the district in which the record is located, or the District of Columbia. (c) Burden of proof. The burden of proof is on the DoD Component to justify its refusal to provide a record. The court shall evaluate the case de novo (anew) and may elect to examine any requested record in camera (in private) to determine whether the denial was justified. (d) Actions by the court. (1) The U.S. District Court for the District of Columbia has ruled that, when the DoD Component has failed to make a determination within the statutory time limits but can demonstrate due diligence in exceptional circumstances, to include negotiating with the requester to modify the scope of their request, the court may retain jurisdiction and allow the Component additional time to complete its review of the records (Department of Justice FOIA Update Web site). The Component must request that the Court retain jurisdiction by seeking an Open America stay (Department of Justice FOIA Update Web site). (2) If the Court determines that the plaintiff substantially prevails, it may require the United States to pay reasonable attorney fees and other litigation costs.

Although this regulation is costly, we do not expect it to substantially affect national productivity, growth, jobs, or full employment. The total costs will be small relative to the economy, and will be offset by benefits. The improved ability to respond to, and contain, serious adverse health consequences means less illness and fewer sick days taken by employees, and lower adjustment costs by firms that would otherwise need to hire replacement employees. Exports This rule requires additional records to be kept throughout the production and distribution chain for food. The additional recordkeeping costs will increase the total costs of production and distribution for all of the regulated products, including products sold within the United States and across national borders. These increased costs will be largely passed on to consumers in the form of higher prices, which will tend to reduce the quantity demanded of the regulated products. The increased prices of United States exports could reduce the quantity of United States exports demanded, particularly in comparison with exports from countries that do not implement similar recordkeeping regulations. We expect this effect to be insignificant, because under the final rule, the increases in the price of United States exports (and resulting decreases in quantity demanded) will be quite small. VII. SBREFA SBREFA (Public Law 104-121) defines a major rule for the purpose of congressional review as having caused or being likely to cause one or more of the following: an annual effect on the economy of \$100 million or more; a major increase in costs or prices; significant adverse effects on competition, employment, productivity, or innovation; or significant adverse effects on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets. In accordance with SBREFA, OMB has determined that this final rule is a major rule for the purpose of congressional review. (printed page 71649) VIII. Paperwork Reduction Act of 1995 This final rule contains information collection

requirements that are subject to review by OMB under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501-3520). The title, description, and respondent description of the information collection requirement are shown below with an estimate of the annual recordkeeping burden. Included in the estimate is the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing each collection of information. Title : Establishment and Maintenance of Records Description

The Department of Defense (DoD) requires defense contractors to protect sensitive unclassified information in accordance with requirements for FCI and CUI. To verify contractor and subcontractor implementation of DoD's cybersecurity information protection requirements, the Department developed the Cybersecurity Maturity Model Certification (CMMC) Program as a means of assessing and verifying adequate protection of contractor information systems that process, store, or transmit either FCI or CUI. The CMMC Program is intended to: (1) align cybersecurity requirements to the sensitivity of unclassified information to be protected, (2) add a self-assessment element to affirm implementation of applicable cybersecurity requirements, (3) add a certification element to verify implementation of cybersecurity requirements, and (4) add an affirmation to attest to continued compliance with assessed requirements. As part of the program, DoD also intends to provide supporting resources and training to the DIB, to help support companies who are working to achieve the required CMMC level. The CMMC Program provides for assessment at three levels, starting with basic safeguarding of FCI at CMMC Level 1, moving to the broad protection of CUI at CMMC Level 2, and culminating with higher-level protection of CUI against risk from Advanced Persistent Threats (APTs) at CMMC Level 3. The CMMC Program addresses DoD's need to protect its sensitive unclassified information during the acquisition and sustainment of products and services from the DIB. This effort is instrumental in establishing cybersecurity as a foundation for DoD acquisitions. Although DoD contract requirements to provide adequate security for covered defense information (reflected in DFARS clause 252.204-7012) predate CMMC by many years, a certification requirement for the handling of CUI to (printed page 89078) assess a contractor or subcontractor's implementation of those required information security controls is new with the CMMC Program. The theft of intellectual property and sensitive information from all U.S. industrial sectors from malicious cyber activity threatens economic security and national security. The Council of Economic Advisers estimates that malicious cyber activity cost the U.S. economy between \$57 billion and \$109 billion in 2016. [19] The Center for Strategic and International Studies estimates that the total global cost of cybercrime was as high as \$600 billion in 2017. [20] Malicious cyber actors have targeted and continue to target defense contractors and the DoD supply chain. These attacks not only focus on the large prime contractors, but also target subcontractors that make up the lower tiers of the DoD supply chain. Many of these subcontractors are small entities that provide critical support and innovation. Overall, the DIB sector consists of over 220,000 companies [21]

the privacy and security certification framework for Health IT Modules. Section 170.550(h) identifies a mandatory minimum set of the certification criteria that ONC ACBs must ensure are also included as part of specific Health IT Modules that are presented for certification. For example, to meet the '[s]tandardized API for patient and population services' certification criterion, the ONC Health IT Certification Program requires that a Health IT Module presented for testing and certification must demonstrate the ability to establish a secure and trusted connection with an application requesting data for patients. Contractors will appoint security officials who are U.S. citizens, unless the provisions of § 117.11(e)(1)(iii) apply for the SMO and ITPSO. * * * * (h) * * * (1) * * * (i) Review cycle. The CSA will determine the scope and frequency of security reviews, which may be increased or decreased consistent with risk management principles. Security reviews may be conducted not more often than once every 12 months unless special circumstances exist, to include addressing security vulnerabilities found during a previous security review. (ii) * * * (A) The CSA will generally provide notice to the contractor of a forthcoming review, but may also conduct unannounced reviews at its discretion, e.g., if there is possible imminent loss or compromise of classified information. The CSA security review may subject contractor employees and all areas and receptacles under the control of the contractor to examination. * * * * 5. Amend § 117.8 by revising paragraphs (a)(2)(ii), (c)(7)(iii)(B), and (c)(14) to read as follows: § 117.8 Reporting requirements. (a) * * * (2) * * * (ii) Provide requested information to enable the CSA to ascertain whether classified information is adequately protected in accordance with this rule. * * * * (c) * * * (7) * * * (iii) * * * (B) Whether they have been excluded from access to classified information in accordance with § 117.7(c)(2). * * * * (14) Reporting by subcontractor. Subcontractors will also notify their prime contractors if they make any reports to their CSA that affect the status of the entity eligibility determination (e.g., FCL), may indicate an employee poses as an insider threat, affect the proper safeguarding of classified information, or indicate classified information has been lost or compromised. * * * * 6. Amend § 117.9 by: a. Revising paragraph (f); and b. Redesignating paragraphs (h)(i) and (h)(ii) as paragraphs (h)(1) and (h)(2). The revision reads as follows: § 117.9 Entity eligibility determination for access to classified information. * * * * (f) Exclusion procedures. If a CSA determines that certain KMP can be excluded from access to classified information, the contractor will follow the procedures in accordance with § 117.7(c)(2). * * * * 7. Amend § 117.11 by: a. In paragraph (d)(2)(iii)(B)(4), removing the words SCI, RD, or COMSEC and adding in their place the words proscribed information; and b. Revising paragraph (h)(4). The revision reads as follows: § 117.11 Foreign Ownership, Control, or Influence (FOCI). * * * * (h) * * * (4) Facilities location plan.

The Department proposes a new implementation specification for criticality analysis at proposed 45 CFR 164.308(a)(13)(ii)(A) . This would require a regulated entity to perform and document an assessment of the relative criticality of its relevant electronic information systems and technology assets in its relevant electronic information systems. The proposal would not limit this analysis to electronic information systems that create, receive, maintain, or transmit ePHI because other electronic information systems and/or technology assets may be crucial to ensuring the confidentiality, integrity, or availability of ePHI, providing patient care, and supporting other business needs. A prioritized list of specific relevant electronic information systems and technology assets in those electronic information systems would help a regulated entity to determine their criticality and the order of restoration. [610] Under this proposal, the implementation specification for establishing and implementing a data backup plan would be redesignated as proposed 45 CFR 164.308(a)(13)(ii)(B) and renamed Data backups. It would also be modified to clarify that the procedures to create and maintain exact retrievable copies of ePHI must be in writing, and to also require such procedures to include verifying that the ePHI has been copied accurately. For example, the ability to access ePHI from a remote location in the event of a total failure should be reflected in the procedures specified for data backups. The proposed implementation specification for backing up information systems at proposed paragraph (a)(13)(ii)(C) would require a regulated entity to establish and implement written procedures to create and maintain backups of its relevant electronic information systems, including verifying the success of such backups. Establishing such procedures would ensure that the ePHI in relevant electronic information systems is both protected and available. Additionally, the Department proposes to redesignate the implementation

specification for disaster recovering planning as paragraph (a)(13)(ii)(D). We propose to clarify that a regulated entity would be required to establish (and implement as needed) written procedures to restore both its critical relevant electronic information systems and data within 72 hours of the loss, and to restore the loss of other relevant electronic information systems and data in accordance with its criticality analysis. [611] The Department proposes to clarify the implementation specification for emergency mode operation planning, redesignated as proposed 45 CFR 164.308(a)(13)(ii)(E)

Analysis of Environmental Impact X. Federalism XI. References I. Background and Legal Authority The events of September 11, 2001, have highlighted the need to enhance the security of the infrastructure of the United States, including the food supply. Congress responded by enacting the Bioterrorism Act (Public Law 107-188), which was signed into law on June 12, 2002. The Bioterrorism Act includes a provision in title III (Protecting Safety and Security of Food and Drug Supply), subtitle A·Protection of Food Supply, section 306, which amends the Federal Food, Drug, and Cosmetic Act (the FD&C Act) by adding section 414, Maintenance and Inspection of Records (21 U.S.C. 350c). (In the regulation itself, which is codified in title 21 of the Code of Federal Regulations

(i) The individuals shall be advised of what specific data was involved. It is insufficient to simply state that personal information has been lost. Where names, social security numbers, and dates of birth are involved, it is critical that the individual be advised that these data elements potentially have been compromised. (ii) The individual shall be informed of the facts and circumstances surrounding the loss, theft, or compromise. The description of the loss should be sufficiently detailed so that the individual clearly understands how the compromise occurred. (iii) The individual shall be informed of what protective actions the Component is taking or the individual can take to mitigate against potential future harm. The Component should refer the individual to the Federal Trade Commission's public Web site on identity theft at http://www.consumer.gov/idtheft/con_steps.htm . The site provides valuable information as to what steps individuals can take to protect themselves if their identities potentially have been or are stolen. (iv) A sample notification letter is at Appendix B. (b) The notification shall be made whether or not the personal information is contained in a system of records (See § 310.10(a)). Subpart C·Collecting Personal Information § 310.15 General considerations. (a) Collect directly from the individual. Collect to the greatest extent practicable personal information directly from the individual to whom it pertains if the information may result in adverse determination about an individual's rights, privileges, or benefits under any Federal program. (b) Collecting social security numbers (SSNs). (1) It is unlawful for any Federal, State, or local governmental agency to deny an individual any right, benefit, or privilege provided by law because the individual refuses to provide his or her SSN. However, if a Federal statute requires the SSN be furnished or if the SSN

is furnished to a DoD Component maintaining a system of records in existence that was established and in operation before January 1, 1975, and the SSN was required under a statute or regulation adopted prior to this date for purposes of verifying the identity of an individual, this restriction does not apply. (2) When an individual is requested to provide his or her SSN, he or she must be told: (i) What uses will be made of the SSN; (ii) The statute, regulation, or rule authorizing the solicitation of the SSN; and (iii) Whether providing the SSN is voluntary or mandatory. (3) Include in any systems notice for any system of records that contains SSNs a statement indicating the authority for maintaining the SSN. (4) E.O. 9397, "Numbering System for Federal Accounts Relating to Individual Persons", November 30, 1943, authorizes solicitation and use of SSNs as a numerical identifier for Federal personnel that are identified in most Federal record systems. However, it does not constitute authority for mandatory disclosure of the SSN.

Additionally, as discussed above, the Department proposes to remove the distinction between required and addressable implementation specifications and make all implementation specifications required, with specific, limited exceptions. Also as discussed above, we propose to modify certain standards and implementation specifications to clarify that the technical safeguards apply to ensure the confidentiality, integrity, and availability of ePHI, which requires a regulated entity to implement the technical safeguards in or on all relevant electronic information systems. These proposals are discussed in greater detail below.

b. Section 164.312(a)(1) Standard: Access Control The Department proposes to clarify the standard for access control at 45 CFR 164.312(a)(1) by requiring a regulated entity to deploy technical controls in relevant electronic information systems to allow access only to those users and technology assets that have been granted access rights. This proposed modification would ensure that a regulated entity deploys technical controls, rather than solely ensuring that it implements technical policies and procedures, consistent with our proposals to define "deploy" and "implement." [695] Thus, the proposal would clarify that a regulated entity is not expected to merely establish a policy and procedure, but must also put into place, ensure the operation of, and verify the continued operation of, technical controls for access to its relevant electronic information systems such that the failure to have such technical control in operation throughout its enterprise would be a violation of the new proposed standard. Additionally, the Department's proposal would clarify that access controls would apply to persons with authorized access and to technology assets. Access controls are one of the key mechanisms by which a regulated entity protects ePHI. Such technical controls ensure that access to the regulated entity's electronic information systems is limited to only users and technology assets that have been granted access rights under the policies and procedures adopted in accordance with the standard for information access management under 45 CFR 164.308. [696] The Security Rule does not identify a specific type of access control method or technology to deploy, nor are we proposing to do so in this rule. [697] As discussed above, access rights should be role-based and the technical controls should assist the regulated entity in implementing such policies and procedures. For example, workforce members responsible for monitoring and administering a regulated entity's relevant electronic information systems, such as someone responsible for cybersecurity or providing technical support to users, must only have access to ePHI and to the regulated entity's relevant electronic information systems as appropriate for their role and job function. We also propose at 45 CFR 164.312(a)(1) to add a paragraph heading to clarify the organization of the regulatory text.

(2) An adequate description of the type of food released, to include brand name and specific variety (e.g., brand x cheddar cheese, not just cheese; or romaine lettuce, not just lettuce); (3) The date you released the food; (4) For persons who manufacture, process, or pack food, the lot or code number or other identifier of the food (to the extent this information exists); (5) The quantity and how the food is packaged (e.g., 6 count bunches, 25 lb carton, 12 oz bottle, 100 gal tank); (6) The name of the firm, address, telephone number, and, if available, the fax number and e-mail address of the transporter immediate subsequent recipient (the transporter who transported the food from you); and (b) Your records must include information reasonably available to you to identify the specific source of each ingredient used to make every lot of finished product. Requirements for Transporters to Establish and Maintain Records §1.352 What information must transporters establish and maintain? If you are a transporter, you must establish and maintain the following (printed page 71654) records for each food you transport in the United States. You may fulfill this requirement by either: (a) Establishing and maintaining the following records: (1) Names of the transporter's immediate previous source and transporter's immediate subsequent recipient; (2) Origin and destination points; (3) Date shipment received and date released; (4) Number of packages; (5) Description of freight; (6) Route of movement during the time you transported the

food; and (7) Transfer point(s) through which shipment moved; or (b) Establishing and maintaining records containing the following information currently required by the Department of Transportation's Federal Motor Carrier Safety Administration (of roadway interstate transporters (49 CFR 373.101 and 373.103) as of December 9, 2004: (1) Names of consignor and consignee; (2) Origin and destination points; (3) Date of shipment; (4) Number of packages; (5) Description of freight; (6) Route of movement and name of each carrier participating in the transportation; and (7) Transfer points through which shipment moved; or (c) Establishing and maintaining records containing the following information currently required by the Department of Transportation's Surface Transportation Board of rail and water interstate transporters (49 CFR 1035.1 and 1035.2) as of December 9, 2004: (1) Date received; (2) Received from; (3) Consigned to; (4) Destination; (5) State of; (6) County of; (7) Route; (8) Delivering carrier; (9) Car initial; (10) Car no; (11) Trailer initials/number; (12) Container initials/number; (13) No. packages; and (14) Description of articles; or (d) Establishing and maintaining records containing the following information currently required by the Warsaw Convention of international air transporters on air waybills: (1) Shipper's name and address; (2) Consignee's name and address; (3) Customs reference/status; (4) Airport of departure and destination; (5) First carrier; and

The Department considered proposing an exception to the MFA authentication requirement that would permit regulated entities in the future to adopt other technologies, in lieu of MFA, that might offer a more secure method of authenticating user identity. [997] Based on discussions with cybersecurity experts, the Department believes that MFA is likely to remain the most secure method for authenticating user identity in future years. It may take different forms, but it will still, at its core, meet the definition of MFA proposed in this NPRM for the foreseeable future. [998] While the Department acknowledges that technology will continue to evolve, we are unable to predict when and whether future technology will address identity verification and exceed the level of protection offered by MFA. This uncertainty renders us unable to articulate requirements specific enough to justify a purposeful exception. Because of the uncertainty surrounding new technologies, we are also unable to estimate costs of adopting this alternative. Our current view is that proposing and codifying such an exception would be premature, but we will revisit the proposed specific requirement for MFA, if adopted, and reconsider the need for an exception should a more secure technology emerge.

Transition for Business Associates and Group Health Plans The Department considered requiring regulated entities to comply with all of the proposals in this NPRM by the compliance date, rather than proposing transition provisions for existing business associate agreements or other contractual arrangements. Had the Department taken that approach, we would have proposed that regulated entities update all existing business associate agreements by the proposed compliance date to comply with all applicable proposed requirements in this NPRM. While the Department believes that many of the proposals in this NPRM are consistent with the Security Rule as it currently exists, we are also concerned that too many regulated entities are not currently compliant with the Security Rule. Given the demonstrable increase in breaches, we believe that it is more important for regulated entities to first improve their cybersecurity posture by coming into compliance with all applicable proposed requirements in this NPRM, if adopted. Upon doing so, the Department anticipates that regulated entities will be better positioned to evaluate their contractual needs and to modify existing business associate agreements. For this reason, the Department has proposed the transition provisions in proposed 45 CFR 164.318

(A) From subsections (c)(3) and (d) when access to accounting disclosure and access to or amendment of records would cause the identity of a confidential source to be revealed. Disclosure of the source's identity not only will result in the Department breaching the promise of confidentiality made to the source but it will impair the Department's future ability to compile investigatory material for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, Federal contracts, or access to classified information. Unless sources can be assured that a promise of confidentiality will be honored, they will be less likely to provide information considered essential to the Department in making the required determinations. (B) From subsection (e)(1) because in the collection of information for investigatory purposes, it is not always possible to determine the relevance and necessity of particular information in the early stages of the investigation. It is only after the information is evaluated in light of other information that its relevance and necessity becomes clear. Such information permits more informed decision-making by the Department when making required suitability, eligibility, and qualification determinations. (19) System identifier and name. DA&M 01, Civil Liberties Program Case Management System. (i) Exemption. Records contained in this System of Records may be exempted from the

requirements of subsections (c)(3); (d)(1), (2), (3), and (4); (e)(1) and (e)(4)(G), (H), and (I); and (f) of the Privacy Act pursuant to 5 U.S.C. 552a(k)(1). Records may be exempted from these subsections or, additionally, from the requirements of subsections (c)(4); (e)(2), (3), and (8) of the Privacy Act of 1974 consistent with any exemptions claimed under 5 U.S.C. 552a (j)(2) or (k)(1), (k)(2), or (k)(5) by the originator of the record, provided the reason for the exemption remains valid and necessary. An exemption rule for this system has been promulgated in accordance with the requirements of 5 U.S.C. 553(b)(1), (2), and (3), (c) and (e) and is published at 32 CFR part 311. (ii) Authority. 5 U.S.C. 552a (j)(2), (k)(1), (k)(2), or (k)(5). (iii) Reasons. (A) From subsections (c)(3) (accounting of disclosures) because an accounting of disclosures from records concerning the record subject would specifically reveal an intelligence or investigative interest on the part of the Department of Defense and could result in release of properly classified national security or foreign policy information.

Controlled Unclassified Information (CUI) is information the Government creates or possesses, or that an entity creates or possesses for or on behalf of the Government, that a law, regulation, or Government-wide policy requires or permits an agency to handle using safeguarding or dissemination controls. CUI is not classified information but requires protection beyond what is provided to general public information. CUI is governed by 32 CFR Part 2002 and the ISOO CUI Registry, which lists 125 categories across 20 index groupings. In the defense context, CUI is the primary category of information that CMMC is designed to protect. Examples of CUI in the DIB include: technical data, export-controlled information, proprietary business information provided by the government, vulnerability assessments, and personally identifiable information (PII) in government contracts.

d. Whether there should be exceptions to any of the proposed or existing technical safeguards or related implementation specifications, in addition to those proposed for encryption and decryption and MFA. For example, are there any proposed or existing standards or implementation specifications with which small or rural regulated entities would have substantial difficulty complying? If so, please explain the type of regulated entities that would be adversely affected by the requirement, the nature of the compliance difficulty, and any alternative or compensating measures that such entities are implementing now or could implement in the event of such requirement to address the risk to ePHI posed by the specific standard or implementation specification. e. Whether the exceptions the Department has proposed to the standard for encryption or decryption are appropriate. If not, please explain. f. Data about the frequency and number of requests regulated entities receive pursuant to the individual right of access at 45 CFR 164.524 where an individual requests that the regulated entity transmit to the individual or a third party a copy of the individual's ePHI via unencrypted email or other unencrypted messaging technologies. Please confirm that these are requests made pursuant to the individual right of access, rather than other types of communications, such as appointment reminders or requests made pursuant to a valid authorization. g. Whether the Department should provide any additional exceptions to standard for encryption or decryption. If so, please explain. h. Whether there are additional criteria or parameters for encryption that regulated entities would find helpful. If yes, please explain and provide examples. i. Whether the Department should require review of compensating controls implemented to comply with an exception to the encryption and decryption standard more frequently than once every 12 months where there are no environmental or operational changes. j. With respect to the exception to the standard for encryption and decryption for certain requests made pursuant to the individual right of access, whether there are forms and formats the Department should include or exclude from the exception (e.g., portable document format (PDF)). If so, please explain. k. Resources that regulated entities have identified to help inform individuals about the risks associated with the unencrypted transmission of ePHI, and whether the Department should compile and publish a list of such resources. l. Whether the Department should define in regulation or guidance what constitutes a prevailing cryptographic standard. If so, please explain. m. Whether the Department should specify the deployment of a particular form or manner of encryption, such as the use of particular algorithms, protocols, or compliance standards. If so, please explain.

(3) Board members, who have denial authority, may not vote on a matter upon which they took Denial Authority action. However, an individual who took Denial Authority action, or his or her representative, may serve as a non-voting member when the Board considers matters in the Denial Authority's area of functional specialization. (4) The Board may seek additional information, including the requester's official personnel file, if relevant and necessary to decide the appeal. (5) If the Board determines that an amendment is warranted (the record is inaccurate as a matter of

fact rather than judgment, irrelevant, untimely, or incomplete) it will amend the record and notify the requester, the Denial Authority, the custodian of the record, and any prior recipients of the record, of the amendment. (6) If the Board determines that amendment is unwarranted, they will:

- (i) Obtain the General Counsel's concurrence in writing;
- (ii) Respond to the requester with the reasons for denial; and
- (iii) Inform the requester of the right to file a Statement of Disagreement with the Board's action and to seek judicial review of the Army's refusal to amend. A Statement of Disagreement must be received by the system manager within 120 days and it will be made an integral part of the pertinent record. Anyone who may have access to, use of, or need to disclose information from the record will be aware that the record was disputed. The disclosing authority may include a brief summary of the Board's reasons for not amending the disputed record.

(7) It is inappropriate for the Privacy Act Review Board to consider any record which is exempt from the amendment provision of the Privacy Act. § 505.7 Disclosure of personal information to other agencies and third parties. (a) Disclosing records to third parties. (1) DA is prohibited from disclosing a record from a Privacy Act system of records to any person or agency without the prior written consent of the subject of the record, except when:

- (i) Pursuant to the twelve Privacy Act exceptions. The twelve exceptions to the 'no disclosure without consent' rule are those exceptions which permit the release of personal information without the individual's/subject's consent (See appendix C of this part).
- (ii) The FOIA requires the release of the record. One of the twelve exceptions to Privacy Act is the FOIA Exception. If the FOIA requires the release of information, the information must be released. The Privacy Act can not prevent release to a third party if the FOIA requires release. However, information must not be discretionarily released under the FOIA if the information is subject to the Privacy Act's 'no disclosure without consent' rule.

(1) The release of home addresses and home telephone numbers normally is prohibited. This release is normally considered a clearly 'unwarranted invasion' of personal privacy and is exempt from mandatory release under the FOIA. However, home addresses and home telephone numbers may still be released if:

- (i) The individual has indicated previously in writing that he or she has no objection to the release;
- (ii) The source of the information to be released is a public document such as commercial telephone directory or other public listing;
- (iii) The release is required by Federal statute (for example, pursuant to federally funded state programs to locate parents who have defaulted on child support payments) (See 42 U.S.C. 653); or
- (iv) The releasing of information is pursuant to the routine use exception or the 'intra-agency need to know' exception to the Privacy Act.

(2) A request for a home address or telephone number may be referred to the last known address of the individual for a direct reply by the individual to the requester. In such cases, the requester shall be notified of the referral. (3) Do not sell or rent lists of individual names and addresses unless such action is specifically authorized by the appropriate authority. (f) Emergency Recall Rosters. (1) The release of emergency recall rosters normally is prohibited. Their release is normally considered a clearly 'unwarranted invasion' of personal privacy and is exempt from mandatory release under the FOIA. Emergency recall rosters should only be shared with those who have an 'official need to know' the information, and they should be marked 'For Official Use Only' (See AR 25-55). (2) Do not include a person's SSN on an emergency recall roster or their spouse's name. (3) Commanders and supervisors should give consideration to those individuals with unlisted phone numbers. Commanders and supervisors should consider limiting access to an unlisted number within the unit. (g) Social Rosters. (1) Before including personal information such as a spouse's name, home addresses, home phone numbers, and similar information on social rosters or social directories, which will be shared with individuals, always ask for the individual's written consent. Without their written consent, do not include this information. (2) Collection of this information will require a Privacy Act Statement which clearly tells the individual what information is being solicited, the purpose, to whom the disclosure of the information is made, and whether collection of the information is voluntary or mandatory. (h) Disclosure of personal information on group orders. (1) Personal information will not be posted on group orders so that everyone on the orders can view it. Such a disclosure of personal information violates the Privacy Act and this part. (2) The following are some examples of personal information that should not be contained in group orders. The following list is not all inclusive:

- (i) Complete SSN;

means the senior level representative from within each Organization Seeking Assessment (OSA) who is responsible for ensuring the OSA's compliance with the CMMC Program requirements and has the authority to affirm the OSA's continuing compliance with the specified security requirements for their respective organizations. (CMMC-custom term) Assessment means the testing or evaluation of security controls to determine the extent to which the controls are implemented correctly, operating

as intended, and producing the desired outcome with respect to meeting the security requirements for an information system or organization, as defined in §§ 170.15 through 170.18. (CMMC-custom term)

(i) Level 1 self-assessment is the term for the activity performed by an OSA to evaluate its own information system when seeking a CMMC Status of Level 1 (Self). (ii) Level 2 self-assessment is the term for the activity performed by an OSA to evaluate its own information system when seeking a CMMC Status of Level 2 (Self). (iii) Level 2 certification assessment is the term for the activity performed by a C3PAO to evaluate the information system of an OSC when seeking a CMMC Status of Level 2 (C3PAO). (iv) Level 3 certification assessment is the term for the activity performed by the DCMA DIBCAC to evaluate the information system of an OSC when seeking a CMMC Status of Level 3 (DIBCAC). (v) POA&M closeout self-assessment is the term for the activity performed by an OSA to evaluate only the NOT MET requirements that were identified with POA&M during the initial assessment, when seeking a CMMC Status of Final Level 2 (Self). (vi) POA&M closeout certification assessment is the term for the activity performed by a C3PAO or DCMA DIBCAC to evaluate only the NOT MET requirements that were identified with POA&M during the initial assessment, when seeking a CMMC Status of Final Level 2 (C3PAO) or Final Level 3 (DIBCAC) respectively. Assessment Findings Report means the final written assessment results by the third-party or government assessment team. The Assessment Findings Report is submitted to the OSC and to the DoD via CMMC eMASS. (CMMC-custom term) Assessment objective means a set of determination statements that, taken together, expresses the desired outcome for the assessment of a security requirement. Successful implementation of the corresponding CMMC security requirement requires meeting all applicable assessment objectives defined in NIST SP 800-171A Jun2018 (incorporated by reference, see § 170.2) or NIST SP 800-172A Mar2022 (incorporated by reference, see § 170.2). (CMMC-custom term) Assessment Team means participants in the Level 2 certification assessment (CMMC Certified Assessors and CMMC Certified Professionals) or the Level 3 certification assessment (DCMA DIBCAC assessors). This does not include the OSC participants preparing for or participating in the assessment. (CMMC-custom term) Asset means an item of value to stakeholders. An asset may be tangible (e.g.,

There is no CMMC 2.0 Level 4. CMMC 2.0 defines three levels: - Level 1: 15 FAR 52.204-21 basic safeguarding requirements - Level 2: 110 NIST SP 800-171 security requirements - Level 3: NIST SP 800-172 enhanced security requirements The original CMMC 1.0 had five levels (1-5), but CMMC 2.0 consolidated these into three. If you need the highest level of protection under CMMC, that is Level 3.

<https://eportal.nspa.nato.int/Codification/CageTool/home> . As specified in §§ 170.15 and 170.16, SPRS inputs include the industry CAGE codes(s) associated with the information system(s) addressed by the CMMC Assessment Scope. For each new information system used to support a DoD contract with FCI or CUI, a new SPRS entry is required. If the contractor or subcontractor will use an information system associated with a CAGE code already recorded in SPRS then a new entry is not required. 3. Assessors and Certificates Comment: One commenter asked if an assessor is prohibited from interacting with OSA IT tools such as MS Office 365 or cloud based GRC tools. One commenter requested the CMMC rule require C3PAOs to clearly indicate the CMMC Assessment Scope on the CMMC Certificate of CMMC Status, to include CAGE codes, that could be shared with trusted partners. Response: The rule text in § 170.11(b)(7) does not prohibit collecting assessment evidence within the OSC environment using the OSC's IT. This section applies only to IT used (printed page 83135) by the assessors to process, store, or transmit assessment-related information once it leaves the OSC environment. The rule has been modified to list the minimum required information to be included on the Certificate of CMMC Status, including CAGE code. h. Reassessment Comment: Some commenters interpreted the end of a CMMC assessment validity period (and need for new assessment) as having the same significance or meaning as a 'reassessment', which the rule describes as potentially necessary only in rare circumstances when cybersecurity risks, threats, or awareness have changed. Another commenter asked for examples of circumstances that might prompt a re-assessment and description of the process for completing one. Four commenters expressed concern that re-assessments might be frequent, costly, and time-consuming. These commenters sought confirmation that relatively common system maintenance activities would not require a new assessment or prevent annual affirmation. One commenter questioned the rationale for differences between validity periods for CMMC Level 1 versus Levels 2 and 3 assessment and recommended standardization on either a 1-year or 3-year frequency for all levels. Other commenters asserted that annual affirmations would drive a need for annual assessments at levels 2 or 3 and requested deletion of the affirmation requirement. One commenter asked whether system changes within an assessment scope would require notification to the contracting agency. Another asked for guidance on remediation of POA&M items and asked whether

systems that fall out of compliance must be identified to the contracting agency. Response:

Evaluation material used to determine potential for promotion in the Military Services may be exempt pursuant to 5 U.S.C. 552a(k)(7), but only to the extent that the disclosure of such material would reveal the identity of a confidential source. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(7) from the following subsections of 5 U.S.C. 552a(c)(3), (d), (e)(4)(G), (H), and (I); and (f). (ii) Authority. 5 U.S.C. 552a(k)(7). (iii) Reasons. To protect the integrity of information used in the Reserve Initial Brigadier General Screening Board, the release of which would compromise the selection process. (8) System identification and name. F036 AF PC O, General Officer Personnel Data System. (i) Exemption. Evaluation material used to determine potential for promotion in the Military Services may be exempt pursuant to 5 U.S.C. 552a(k)(7), but only to the extent that the disclosure of such material would reveal the identity of a confidential source. Therefore, portions of this system of records (Air Force General Officer Promotion and Effectiveness Reports with close out dates on or before January 31, 1991) may be exempt pursuant to 5 U.S.C. 552a(k)(7) may be exempt from following subsections of 5 U.S.C. 552a(c)(3), (d), (e)(4)(H), and (f). (ii) Authority. 5 U.S.C. 552a(k)(7). (iii) Reasons. (A) From subsection (c)(3) because making the disclosure accounting available to the individual may compromise express promises of confidentiality by revealing details about the report and identify other record sources, which may result in circumvention of the access exemption. (B) From subsection (d) because individual disclosure compromises express promises of confidentiality conferred to protect the integrity of the promotion rating system. (C) From subsection (e)(4)(H) because of and to the extent that portions of this record system are exempt from the individual access provisions of subsection (d). (D) From subsection (f) because of and to the extent that portions of this record system are exempt from the individual access provisions of subsection (d). (9) System identifier and name. F036 AFPC K, Historical Airman Promotion Master Test File. (i) Exemption. Testing or examination material used solely to determine individual qualifications for appointment or promotion in the federal or military service, if the disclosure would compromise the objectivity or fairness of the test or examination process may be exempt pursuant to 5 U.S.C. 552a(k)(6), if the disclosure would compromise the objectivity or fairness of the test or examination process. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(6) from the following subsections of 5 U.S.C. 552a(c)(3), (d), (e)(4)(G), (H), and (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(6). (iii) Reasons. To protect the integrity, objectivity, and equity of the promotion testing system by keeping test questions and answers in confidence. (iv) [Reserved] (10) System identifier and name.

All cleared employees must submit foreign travel reports and receive any pre-travel briefings or post travel briefings from the FSO-based on threat according to this rule, SEAD 3 and CSA-provided guidance for unique mission requirements. It is estimated that the number of foreign travel reports submitted annually will be 483,681 to comply with this rule. That estimate is based on analysis of calendar year 2019 unofficial foreign travel reported by DoD civilians and military in the DoD Aircraft and Personnel Automated Clearance System (APACS), a web-based tool for the creation, submission and approval of aircraft diplomatic clearances and personnel travel clearances (i.e. Country, Theater and Special Area, as applicable with individual DoD Foreign Clearance Guide (FCG), <https://www.fcg.pentagon.mil> country pages) designed to aid USG travelers on official government and unofficial (i.e., leave) travel. For calendar year 2019, there were 126,131 travelers and 113,214 travel requests submitted into APACS. APACS requirements are published on the DoD Foreign Clearance Guide (FCG), <https://www.fcg.pentagon.mil>. Thus an annual estimate of .89 expected foreign travel trips by traveler (113,214 divided by 126,131). In the small business analysis, there were a total of 18,242 cleared employees in the 658 small entities sampled and 63,598 cleared employees in the remaining 356 non-small businesses. Of the total cleared employees in the small business analysis (as reported in the National Industrial Security System), approximately 22.3% were at small entities and 77.7% were at non-small businesses. Known number of new travelers expected to be effected by this rule is 543,462 SECRET cleared contractor personnel under DoD security cognizance and the estimated trips at .89 per traveler is $(543,462 \times .89 = 483,681 \text{ estimated trips})$. Assuming the ratio for those employees reporting foreign travel into APACS is the same as SECRET cleared employees would report, of the estimated 483,681 foreign trips by SECRET cleared employees, it can be estimated that approximately 107,812 (22.3% of 483,681) will be taken by contractors at small entities, and 375,869 (77.7% of 483,681) by contractors at non-small businesses. It is estimated that it will take a half an hour for a SECRET cleared employee to report foreign travel in 2021 and in each of the following years up to year 20 to report foreign travel and receive any pre-

travel or post-travel briefings. The estimated average labor rate for a SECRET cleared employee to report foreign travel is the equivalent of a GS11 step 5. These assumptions imply costs of \$16.81 million in each year one through 20. e. Fewer contract performance delays by the small number of U.S. contractors with NTIB ownership operating under an SSA. Section 842 of Public Law 115-232

(5) To find out if an exemption is available for a particular record, refer to the applicable system of records notices. System of records notices will state which exemptions apply to a particular type of record. System of records notices that are applicable to the Army are contained in DA Pam 25-51 (available at the Army Publishing Directorate Web site <http://www.usapa.army.mil/>), the Defense Privacy Office's Web site <http://www.defenselink.mil/privacy/>), or in this section). Some of the system of records notices apply only to the Army and the DOD and some notices are applicable government-wide. (6) Descriptions of current exemptions are listed in detail at appendix C of this part. (b) Exemption procedures. (1) For the General and Specific exemptions to be applicable to the Army, the Secretary of (printed page 46065) the Army must promulgate exemption rules to implement them. This requirement is not applicable to the one Special exemption which is self-executing. Once an exemption is made applicable to the Army through the exemption rules, it will be listed in the applicable system of records notices to give notice of which specific types of records the exemption applies to. When a system manager seeks to have an exemption applied to a certain Privacy Act system of records that is not currently provided for by an existing system of records notice, the following information will be furnished to the DA FOIA/P Office: (i) Applicable system of records notice; (ii) Exemption sought; and (iii) Justification. (2) After appropriate staffing and approval by the Secretary of the Army and the Defense Privacy Office, it will be published in the Federal Register as a proposed rule, followed by a final rule 60 days later. No exemption may be invoked until these steps have been completed. § 505.11 Federal Register publishing requirements. (a) The Federal Register . There are three types of documents relating to the Privacy Act Program that must be published in the Federal Register . They are the DA Privacy

Program policy and procedures (AR 340-21), the DA exemption rules, and Privacy Act system of records notices. (b) Rulemaking procedures. (1) DA Privacy Program procedures and exemption rules are subject to the formal rulemaking process. (2) Privacy Act system of records notices are not subject to formal rulemaking and are published in the Federal Register as Notices, not Rules. (3) The Privacy Program procedures and exemption rules are incorporated into the Code of Federal Regulations (CFR). Privacy Act system of records notices are not published in the CFR. §505.12 Privacy Act enforcement actions. (a) Judicial Sanctions. The Act has both civil remedies and criminal penalties for violations of its provisions. (1) Civil remedies. The DA is subject to civil remedies for violations of the Privacy Act. In addition to specific remedial actions, 5 U.S.C. 552a(g) may provide for the payment of damages, court costs, and attorney's fees. (2) Criminal penalties.

(i) Incorporate appropriate security requirement clauses in a classified contract, IFB, RFP, RFQ, or all solicitations leading to a classified contract. (ii) Provide the contractor with the security classification guidance needed during performance of the contract. (iii) Provide this guidance to the contractor in the contract security classification specification, or equivalent. (2) The contract security classification specification, or equivalent, must identify the specific elements of classified information involved in the contract that require security protection. (3) At the discretion of the CSA, contractors may, to the extent possible, advise and assist in the development and any updates to or any revisions to the contract security classification specification, or equivalent. (4) The contractor will comply with all aspects of the classification guidance. (i) Users of classification guides are encouraged to notify the originator of the guide when they acquire information that suggests the need for change in the instructions contained in the guide. (ii) Classification guidance is the exclusive responsibility of the GCA, and the final determination of the appropriate classification for the information rests with that activity. The contract security classification specification, or equivalent, is a contractual specification necessary for the performance of a classified contract. Challenges to classification status are in paragraph (e) in this section. (iii) If the contractor receives a classified contract without a contract security classification specification, or equivalent, the contractor will notify the GCA. If the GCA does not respond with the appropriate contract security classification specification, or equivalent, the contractor will notify the CSA. (5) Upon completion of a classified contract, the contractor must return all USG provided or deliverable information to the custody of the USG. (i) If the GCA does not advise to the contrary, the contractor may retain (printed page 83337) copies of the USG material for a period of two years following the completion of the contract. The contract security classification specification, or equivalent, will continue in effect for this two-year period. (ii) If the GCA determines the contractor has a continuing need for the copies of the USG material beyond the two-year period, the GCA will issue a final contract security classification specification, or equivalent, for the classified contract and will include disposition instructions for the copies. (e) Challenges to classification status. (1) The contractor will address challenges to classification status with the GCA and request remedy when: (i) Information is classified improperly or unnecessarily. (ii) Current security considerations justify downgrading to a lower classification level or upgrading to a higher classification level. (iii) Security classification guidance is not provided, improper or inadequate.

The definition of ·farm· now states that washing, trimming of outer leaves, and cooling produce are part of harvesting. The definition of ·farm· now includes facilities that pack or hold food, provided that all food used in such activities is grown, raised, or consumed on that farm or another farm under the same ownership. ·Holding· has been defined and means ·storage of food.· Holding facilities include warehouses, cold storage facilities, storage silos, grain elevators, and liquid storage tanks. ·Packaging· has been defined and means ·the outer packaging of food that bears the label and does not contact the food. Packaging does not include food contact substances as they are defined in section 409(h)(6) of the FD&C Act (21 U.S.C. 348(h)(6)).· Recipe has been defined to mean the formula, including ingredients, quantities, and instructions, necessary to manufacture a food product. Because a recipe must have all three elements, a list of the ingredients used to manufacture a product without quantity information and manufacturing instructions is not a recipe. The partial exclusion for retail food establishments has been replaced with a partial exclusion for persons who distribute food directly to consumers. Persons who distribute food directly to consumers are excluded from establishing and maintaining records required by §.1.345 to identify the nontransporter and transporter immediate subsequent recipients as to those transactions. Persons who distribute food to businesses must establish and maintain records to identify the nontransporter and

transporter immediate subsequent recipients to the extent that information is reasonably available, for example when the purchaser has an established commercial account. The exclusion for retail facilities that are located in the same general physical location as a farm has been replaced with an exclusion for all retail food establishments that employ 10 or fewer full-time equivalent employees. An exclusion has been added for nonprofit food establishments. ·Nonprofit food establishment· has been defined and means: * * * a charitable entity that prepares or serves food directly to the consumer or otherwise provides food or meals for consumption by humans or animals in the United States. The term includes central food banks, soup kitchens, and nonprofit food delivery services. To be considered a nonprofit food establishment, the establishment must meet the terms of section 501(c)(3) of the U.S. Internal Revenue Code (26 U.S.C. 501(c)(3)). The requirement to record a ·responsible individual· when identifying the immediate previous source, immediate subsequent recipient, and transporters has been deleted. The requirement to record ·lot or code number or other identifier· has been deleted for all covered entities, except persons who manufacture, process, or pack food. The definition of perishable food has been deleted.

One commenter misunderstood the meaning of 'maintained' with respect to the Level 1, 2, and 3 provisions. An operational plan of action can be created without risk to the certification validity period. If a security event generates risk for the protection of FCI or CUI, the associated security requirements should be readdressed expeditiously. If one or more of the requirements can't be remediated, the OSA should create an operational plan of action and resolve it in a time frame that continues to provide protection to FCI or CUI. The Accreditation Body must have its own appeals process, as required under ISO/IEC 17011:2017(E). Each C3PAO is required to have an appeals process which involves elevation to the CMMC Accreditation Body for resolution. The appeals process is derived from and consistent with ISO/IEC 17020:2012(E) and ISO/IEC 17011:2017(E). The appeals process is addressed in §§·170.7(b), 170.8(b)(16), and 170.9(b)(13), (19), and (20). An OSC, the CMMC AB, or a C3PAO may appeal the outcome of its DCMA DIBCAC conducted assessment within 21 days of the assessment by submitting a written basis for appeal that include the requirements in question for DCMA DIBCAC consideration. An OSC, the CMMC AB, or a C3PAO should visit www.dcma.mil/DIBCAC to obtain the latest for contact information for submitting appeals. A DCMA DIBCAC Quality Assurance Review Team will respond to acknowledge receipt of the appeal and may request additional supporting documentation. By defining the requirements in this rule to become a C3PAO, and defining a scoring methodology, the DoD is providing the authority and guidance necessary for C3PAOs to conduct assessments. The CMMC Accreditation Body will administer the CMMC Ecosystem. The DoD will not assume the workload of directly managing the CMMC ecosystem or the other alternatives suggested. DoD declines to give the PMO responsibility to render the final decision on all CMMC Level 2 assessment appeals as this role is properly aligned to the CMMC Accreditation Body. The CMMC AB is under contract with the Department of Defense to execute defined roles and responsibilities for the DoD CMMC Program as outlined in §·170.8. The specified CMMC AB requirements were selected and approved by the DoD. They include Conflict of Interest, Code of Professional Conduct, and Ethics policies as set forth in the DoD contract. For ISO/IEC 17020:2012(E) and ISO/IEC 17011:2017(E) compliance, an appeals process is required. CMMC-specific requirements for appeals are addressed in §§·170.8(b)(16) and 170.9(b)(13), (19), and (20). The DoD expects the process to be managed efficiently, however setting a specific timeline is not appropriate as the time may vary based on the complexity of the issue. Responsibility for final appeals determination rests with the CMMC AB. The DoD declines to mandate that the CMMC AB consult with the CMMC PMO or DIBCAC prior to rendering a decision. The CMMC PMO will serve in the oversight role for the entire CMMC program.

This final rule includes additional amendments in response to industry feedback on the proposed rule, which are described in section II.A. of this preamble. In particular, one of the amendments provides alternative forms of security, in lieu of the requirements of paragraph (f) of the clause at FAR 52.232-32. The amendment to the rule will facilitate the use of performance-based payments by contractors that may not have accounting systems designed for FAR part 15 cost-reimbursement work, and contractors without job-cost accounting systems that can associate work in progress with a specific contract. One company expressed (printed page 19687) support for this specific amendment at an E.O. 12866 meeting on the final rule. DoD has performed a regulatory cost analysis on this rule. The following is a summary of the estimated public cost savings and Government costs in millions calculated in perpetuity in 2016 dollars at a 7-percent discount rate:

Summary	Public	Government	Total	Present Value	Annualized Costs
·3.778	·1.914	·1.864	Annualized Value Costs (as of 2016 if Year 1 is 2020)	·2.882	·1.460

·1.422 To access the complete Regulatory Cost Analysis, go to the Federal eRulemaking Portal at www.regulations.gov, search for DFARS Case 2019-D002, click Open Docket, and view Supporting Documents. V. Executive Orders 12866 and 13563 Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is a significant regulatory action and, therefore, was subject to review under section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804. VI. Executive Order 13771 This rule is an E.O. 13771, Reducing Regulation and Controlling Regulatory Costs, deregulatory action. We estimate that this rule generates \$1.4 million in annualized cost savings, discounted at 7 percent relative to year 2016, over a perpetual time horizon. Details on the estimated cost savings can be found in section IV. of this preamble. VII. Regulatory Flexibility Act A final regulatory flexibility analysis (FRFA) has been prepared consistent with the Regulatory Flexibility Act, 5 U.S.C. 601, et seq. The FRFA is summarized as follows: This rule implements section 831 the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2017, which amends 10 U.S.C. 2307

CIS Safeguard 6.6 Establish and Maintain an Inventory of Authentication and Authorization Systems Establish and maintain an inventory of the enterprise's authentication and authorization systems, including those hosted on-site or at a remote service provider. Review and update the inventory, at a minimum, annually, or more frequently. Implementation Groups: 2,3 Asset Type: users Security Function: identify Parent Control: Access Control Management

To control access to DOD information, information based systems and facilities by authenticating the identity of a person using a measurable physical characteristic(s). This computer system uses

software programs to create biometrics templates and summary statistics, which are used for purposes such as assessing system performance or identifying problem areas. (iii) Routine Use(s): None. The DOD Blanket Routine Uses set forth at the beginning of the Army's Compilations of System of Records Notices applies to this system. (iv) Disclosure: Voluntary; however, failure to provide the requested information may result in denial of access to DOD information based systems and/or DOD facilities. (2) [Reserved]. (printed page 24510) Appendix D to Part 505-Exemptions; Exceptions; and DOD Blanket Routine Uses (a) Special Exemption. 5 U.S.C. 552a(d)(5) Denies individual access to any information compiled in reasonable anticipation of civil action or proceeding. (b) General and Specific Exemptions. The Secretary of the Army may exempt Army systems of records from certain requirements of the Privacy Act. The two kinds of exemptions that require Secretary of the Army enactment are General and Specific exemptions. The Army system of records notices for a particular type of record will state whether the Secretary of the Army has authorized a particular General and Specific exemption to a certain type of record. The Army system of records notices are published in DA Pam 25-51 and on the Defense Privacy Office's Web site <http://www.defenselink.mil/privacy/>. (c) Twelve Exceptions to the No Disclosure without Consent rule of the Privacy Act. (1) 5 U.S.C. 552a(b)(1) To DOD officers and employees who have a need for the record in the performance of their official duties. This is the official need to know concept. (2) 5 U.S.C. 552a(b)(2) FOIA requires release of the information. (3) 5 U.S.C. 552a(b)(3) the Routine Use Exception. The Routine Use must be published in the Federal Register and the purpose of the disclosure must be compatible with the purpose for the published Routine Use. The applicable Routine Uses for a particular record will be listed in the applicable Army Systems Notice. (4) 5 U.S.C. 552a(b)(4) To the Bureau of the Census to plan or carry out a census or survey, or related activity pursuant to Title 13 of the U.S. Code. (5) 5 U.S.C. 552a(b)(5) To a recipient who has provided DA or DOD with advance adequate written assurance that the record will be used solely as a statistical research or reporting record, and the record is to be transferred in a form that is not individually identifiable. (6) 5 U.S.C. 552a(b)(6)

- Risk Assessments - Application Certification / Recertification - Functional Security Requirements
 - Security Specifications - Security Design Reviews - System Tests - Certification / Recertification
 - Personnel Screening - Access Control & Accountability - Compliance Assurance - Contingency Planning - Disaster Recovery - Operations Continuity - Approval of Methodologies - b. Certifying Requirements . Procedures must be established for defining functional security requirements, developing technical security specifications, conducting security design reviews and system tests, certifying and recertifying computer applications processing sensitive or mission-critical information at appropriate phases of the system life cycle, and approving technical security specifications for the acquisition of computing resources or related services. (See paragraph 305 for minimum functional security requirements and certification procedures . - c. Personnel Screening . Personnel who participate in managing, designing, developing, operating, or maintaining computer applications processing sensitive or mission-critical information, or who access automated sensitive or missioncritical information, must be appropriately screened to a level commensurate with the sensitivity, criticality, or value of the information to be accessed or handled and the risk and magnitude of loss or harm that could be caused by the individual. Federal personnel are to be screened in accordance with the Federal Personnel Manual, Section 732. Guidance on screening non-Federal personnel is presented in paragraph 306. - d. Access Protection and Accountability . Appropriate protective measures must be established, to the extent economically and technically feasible, for maintaining personal accountability of individual users granted access to sensitive or mission-critical information and for ensuring that they have access to no more information than they are authorized to access. - e. Compliance Assurance .

Documentation review determines if the technical aspects of policies and procedures are current and comprehensive. These documents provide the foundation for an organization's security posture, but are often overlooked during technical assessments. Security groups within the organization should provide assessors with appropriate documentation to ensure a comprehensive review. Documents to review for technical accuracy and completeness include security policies, architectures, and requirements; standard operating procedures; system security plans and authorization agreements; memoranda of understanding and agreement for system interconnections; and incident response plans. Although port scanners identify active hosts, operating systems, ports, services, and applications, they do not identify vulnerabilities. Additional investigation is needed to confirm the presence of insecure protocols (e.g., Trivial File Transfer Protocol [TFTP], telnet), malware, unauthorized applications, and vulnerable services. To identify vulnerable services, the assessor compares

identified version numbers of services with a list of known vulnerable versions, or perform automated vulnerability scanning as discussed in Section 4.3. With port scanners, the scanning process is highly automated but interpretation of the scanned data is not. The plan should also address the logistical details of the engagement-including the hours of operation for assessors; the clearance or background check level required; a call plan with current contact information, network and security operations centers, and the organization's main point of contact for the assessment; the physical location where assessment activities will originate; and the equipment and tools that will be used to conduct the assessment. Any requirements to inform parent organizations, law enforcement, and a computer incident response team (CIRT) should be identified in the assessment plan.

From the NIST SP 800-172 Rev 3 Final Public Draft: Take the following actions when unauthorized or misconfigured components are detected: [Selection (one or more): disable network access by such components; isolate the components; notify [Assignment: organization-defined personnel or roles]]. NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 DISCUSSION 925

- I. All data sources and computing services are considered resources. An enterprise relies on different resources to perform its mission: mobile devices, data stores, compute resources (including virtual), remote sensors/actuators, etc. All these components are resources and need to be considered in a ZTA. Some components (e.g., IoT sensors) may not be able to support some solutions such as configuration agents, application sandboxing, etc. so compensating technologies or alternative mitigations may be needed. If the resource lacks certain security capabilities, the enterprise may need to add a PEP component to provide that functionality. - II. The enterprise monitors and measures the integrity and security posture of all owned and associated resources. This tenet deals with the aspects of cyber hygiene for both enterprise-owned resources and those that may not be owned, but used in an enterprise workflow such as configuration, patching, application loading, etc. The state of resources should be monitored, and appropriate action taken when new information such as a new vulnerability or attack is reported or observed. The confidentiality and integrity of data on the resource should be protected. This requires enterprise admins to know how resources are configured, maintained, and monitored. - III. Access to resources is determined by dynamic policy-including the observable state of client identity, application/service, and the requesting asset-and may include other behavioral and environmental attributes. In zero trust, the default behavior for all resources is to deny all connections and only accept connections that are explicitly allowed by policy. Those authorized to access the resource must still authenticate themselves and prove they meet the enterprise policy to be granted the session. This may include meeting requirements such as client software versions, patch level, geolocation, historical request patterns, etc.

HIPAA Security Rule section 164.308 (Administrative Safeguards) addresses security management process. Covered entities and business associates must implement appropriate safeguards to protect electronic protected health information (ePHI). For security management process, organizations should: 1. Establish and document policies specific to security management process 2. Implement technical and procedural controls 3. Train workforce members on their responsibilities 4. Conduct periodic risk assessments addressing security management process 5. Maintain documentation of compliance efforts Under 45 CFR 164.308, this is a administrative safeguards requirement that applies to all covered entities and business associates that create, receive, maintain, or transmit ePHI.

the round key is a block that is usually represented as a sequence of four words (i.e., 16 bytes). An expansion routine, denoted by KEYEXPANSION(), takes the block cipher key as input and generates the round keys as output. In particular, the input to KEYEXPANSION() is represented as an array of words, denoted by key , and the output is an expanded array of words, denoted by w , called the key schedule.

packages, we first estimate the number of facilities that engage in only intrastate food transportation. Then, we adjust this number to account for domestic air cargo carriers of food shipments and carriers of low-value food packages. Additional records maintenance costs incurred by interstate carriers of intrastate shipments are estimated to be zero since it is unlikely that a transportation establishment would use two sets of recordkeeping practices. To determine the number

of intrastate carriers subject to this final rule but not subject to FMCSA requirements, we take a weighted average of the ratios of local to total general freight trucking in the CBP data under NAICS code 4841, and the local to total specialized freight trucking in the County Business Pattern data under NAICS code 4842. Weights are applied to reflect the importance of local specialized and local general freight in all local trucking to estimate the overall number of intrastate carriers. This computation estimates that 50 percent of all freight carrying trucks are intrastate carriers. Consequently, we assume that 50 percent of all transportation facilities are not already subject to recordkeeping requirements under FMCSA, and will incur the full records redesign and additional records maintenance costs of this regulation. The total number of domestic air cargo carriers of food packages is estimated from NAICS code 481112 in the CBP and NES data which was used for estimating the total number of transporters in the PRIA. Since not all of the carriers reported under NAICS code 481112 transport food items, we used a factor of 50 percent to scale data from the CBP and the NES to estimate the number of air cargo carriers that have a significant portion of their business transporting food items. The resulting estimate of the number of air cargo carrier facilities that transport food items is approximately 1,825 or 0.078 percent of the total number of transporters. These facilities will incur records redesign costs and additional records maintenance costs, in addition to learning costs as a result of this final rule. The number of carriers of low-value food items is estimated using the number of couriers under NAICS code number 49211, which was not included in the PRIA. According to the U.S. Census Bureau, this NAICS includes establishments primarily engaged in providing air, surface, or combined courier delivery services. From the CBP and NES statistics there are approximately 141,931 establishments engaged in courier services. Since this includes courier services that use both air and surface transportation, we reduce this number by 50 percent, under the assumption that only establishments engaged in surface courier services are likely to carry food items, resulting in an estimate of 70,965 surface courier facilities.

(1) A consultant will not access classified information off the premises of the using (hiring) contractor except in connection with authorized classified visits. (2) A contractor may only assign a consultant outside the United States with responsibilities requiring access to classified information when: (i) The consultant agreement between the contractor and consultant includes: (A) Identification of the contract, license, or agreement that requires access to classified information, the level of classified information that is required, and access to FGI by the consultant while assigned outside the United States. (B) A formal agreement that prohibits the consultant from disclosing any classified information related to the contract, license, or agreement as required in paragraph (m)(i)(A) of this section to any party other than the USG or foreign government with which the consultant is meeting, and who possesses the requisite clearance and need to know. (ii) The consultant and the using contractor will jointly execute the consultant agreement setting forth respective security responsibilities. The contractor will retain an original signed copy of the agreement and will ensure its availability if requested by the CSA. (iii) The contractor, in consultation with the applicable CSA as appropriate, will determine what threat

briefing(s) the consultant should receive before the assignment, and conduct those briefings as part of the consultant's pre-assignment and recurring security training. (iv) The contractor provides notice of any changes to the consultant agreement to the applicable CSA during assessments or upon CSA request. (3) The using contractor will be the consumer of the consultant services as set forth in the consultant agreement. (4) For security administration purposes, a consultant will be considered an employee of the using contractor for compliance with this rule. (5) Consultants to GCAs are not under the purview of the NISP and will be processed for determination of eligibility by the GCA in accordance with GCA procedures. § 117.11 Foreign Ownership, Control, or Influence (FOCI). (a) General. Foreign investment can play an important role in maintaining the vitality of the U.S. industrial base. Therefore, it is the intent of the USG to allow foreign investment consistent with the national security interests of the United States. The following FOCI (printed page 83331) procedures for cleared U.S. entities are intended to mitigate the risks associated with FOCI by ensuring that foreign firms cannot undermine U.S. security to gain unauthorized access to classified information. (1) The CSA will consider a U.S. entity to be under FOCI when: (i) A foreign interest has the power to direct or decide issues affecting the entity's management or operations in a manner that could either: (A) Result in unauthorized access to classified information; or (B) Adversely affect performance of a classified contract or agreement.

t the Transmission Control Protocol/Internet Protocol (TCP/IP) layers that each is able to examine. TCP/IP communications are composed of four layers that work together to transfer data between hosts. When a user wants to transfer data across networks, the data is passed from the highest layer through intermediate layers to the lowest layer, with each layer adding more information. The lowest layer sends the accumulated data through the physical network, with the data then passed upwards through the layers to its destination. Simply put, the data produced by a layer is encapsulated in a larger container by the layer below it. The four TCP/IP layers, from highest to lowest, are shown in Figure 2-1.

According to Guide to Attribute Based Access Control (ABAC) Definition and Considerations, Executive Summary: (subject and object), operations, and the environment relevant to a request. ABAC systems are capable of enforcing both Discretionary Access Control (DAC) and Mandatory Access Control (MAC) concepts. ABAC enables precise access control, which allows for a higher number of discrete inputs into an access control decision, providing a bigger set of possible combinations of those variables to reflect a larger and more definitive set of possible rules to express policies. The access control policies that can be implemented in ABAC are limited only by the computational language and the richness of the available attributes. This flexibility enables the greatest breadth of subjects to access the greatest breadth of objects without specifying individual relationships between each subject and each object. For example, a subject is assigned a set of subject attributes upon employment (e.g., Nancy Smith is a Nurse Practitioner in the Cardiology Department). An object is assigned its object attributes upon creation (e.g., a folder with Medical Records of Heart Patients) . Objects may receive their attributes either directly from the creator or as a result of automated scanning tools. The administrator or owner of an object creates an access control rule using attributes of subjects and objects to govern the set of allowable capabilities (e.g., all Nurse Practitioners in the Cardiology Department can View the Medical Records of Heart Patients). Under ABAC, access decisions can change between requests by simply changing attribute values, without the need to change the subject/object relationships defining underlying rule sets. This provides a more dynamic access control management capability and limits long-term maintenance requirements of object protections. Further, ABAC enables object owners or administrators to apply access control policy without prior knowledge of the specific subject and for an unlimited number of subjects that might require access.

The Secure Data Network System (SDNS) project, initiated by the National Security Agency in 1986, produced a computer network security architecture within the framework of the International Organization for Standardization (ISO) reference model for Open Systems Interconnection (OSI). The security protocol at layer 4 (SP4) is one element of the SDNS architecture used to provide security services at the Transport Layer of the OSI reference model. This report specifies the Protocol Implementation Conformance Statement (PICS) proforma for SP4. When the PICS proforma is completed for an SP4 implementation, it provides a clear and concise statement of capabilities, useful in a variety of situations to those involved in the production, testing, supply, procurement, and application of the implementation. The Secure Data Network System (SDNS) project, initiated by the National Security Agency in 1986, produced a computer network security architecture within the

framework of the International Organization for Standardization (ISO) reference model for Open Systems Interconnection (OSI) . The security protocol at layer 4 (SP4) is one element of the SDNS architecture used to provide security services at the Transport Layer of the OSI reference model. This report specifies the Protocol Implementation Conformance Statement (PICS) proforma for SP4. When the PICS proforma is completed for an SP4 implementation, it provides a clear and concise statement of capabilities, useful in a variety of situations to those involved in the production, testing, supply, procurement, and application of the implementation.

CM.L2-3.4.5 · Access Restrictions for Change CMMC Assessment Guide · Level 2 | Version 2.13 101
DISCUSSION [NIST SP 800-171 REV. 2]89 Any changes to the hardware, software, or firmware components of systems can potentially have significant effects on the overall security of the systems . Therefore, organizations permit only qualified and authorized individuals to access systems for purposes of initiating changes, including upgrades and modifications . Access restrictions for change also include software libraries . Access restrictions include physical and logical access control requirements, workflow automation, media libraries, abstract layers (e.g., changes implemented into external interfaces rather than directly into systems), and change windows (e.g., changes occur only during certain specified times) . In addition to security concerns, commonly-accepted due diligence for configuration management includes access restrictions as an essential part in ensuring the ability to effectively manage the configuration. NIST SP 800-128 provides guidance on configuration change control. FURTHER DISCUSSION Define, identify, and document qualified individuals authorized to make physical and logical changes to the organization's hardware, software, software libraries , or firmware components. Control of configuration management activities may involve: · physical access control that prohibits unauthorized users from gaining physical access to an asset (e.g., requiring a special key card to enter a server room); · logical access control that prevents unauthorized users from logging onto a system to make configuration changes (e.g., requiring specific credentials for modifying configuration settings, patching software, or updating software libraries); · workflow automation in which configuration management workflow rules define human tasks and data or files are routed between people authorized to do configuration management based on pre-defined business rules (e.g., passing an electronic form to a manager requesting approval of configuration change made by an authorized employee); · an abstraction layer for configuration management that requires changes be made from an external system through constrained interface (e.g., software updates can only be made from a patch management system with a specific IP address); and · utilization of a configuration management change window (e.g., software updates are only allowed between 8:00 AM and 10:00 AM or between 6:00 PM and 8:00 PM). Example Your datacenter requires expanded storage capacity in a server. The change has been approved, and security is planning to allow an external technician to access the building at a specific date and time under the supervision of a manager [a,b,c,d]. A system administrator creates a temporary privileged account that can be used to log into the server's operating system and update storage settings [e,f,g]. On the appointed day , the technician is escorted 89 NIST SP 800-171 Rev. 2, p. 22.

From the NIST SP 800-172 Rev 3 Final Public Draft: PROTECTION STRATEGY PRA, DLO ADVERSARY EFFECTS Preclude (Preempt), Impede (Exert), Expose (Detect) NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 REFERENCES 2189

s of computing platforms, including general purpose computing systems, cyber-physical systems, cloud systems, mobile systems, industrial control systems, and Internet of Things (IoT) devices. Safeguarding measures include both security and privacy controls to protect the critical and essential operations and assets of organizations and the privacy of individuals. The objective is to make the systems we depend on more penetration resistant to attacks, limit the damage from those attacks when they occur, and make the systems resilient, survivable, and protective of individuals' privacy.

The CTR\DRBG\Update function updates the internal state of the CTR\DRBG using the provided_data . The values for blocklen , keylen and seedlen are provided in Table 3 of Section 10.2.1. The value of ctr_len is known by an implementation. The block cipher operation in step 2.2 of the CTR\DRBG\UPDATE process uses the selected block cipher algorithm. The specification of Block_Encrypt is discussed in Section 10.3.3. For this DRBG mechanism, there are two cases for the processing. For each case, let CTR\DRBG\Update be the function specified in Section 10.2.1.2, and let Block_Encrypt be the function specified in Section 10.3.3. The seed length (seedlen) and the

value of `reseed_interval` are provided in Table 3 of Section 10.2.1. The value of `ctr_len` is known by an implementation. Derivation functions are internal functions that are used during DRBG instantiation and reseeding to either derive internal state values or to distribute entropy throughout a bitstring. Two methods are provided. One method is based on the use of hash functions (see Section 10.3.1), and the other method is based on the use of block cipher algorithms (see Section 10.3.2). The block cipher derivation function specified in Section 10.3.2 uses a BCC function and a `Block_Encrypt` call that are discussed in Section 10.3.3.

(v) If the record or information was submitted on a strictly voluntary basis, absent any exercised authority that prescribes criteria for submission, and it is absolutely clear that the record or information would customarily not be released to the public the submitter need not be notified. The Component shall withhold this information under Exemption 4. (2) The coordination provisions of this paragraph apply to the release of responsive information received from multi-national organizations, such as the North Atlantic Treaty Organization (NATO), United Nations Commands, the North American Aerospace Defense Command (NORAD), the Inter-American Defense Board, foreign governments, or international organizations (e.g., the International Committee of the Red Cross). (i) Coordination with foreign governments under the provisions of this paragraph may be made through the Department of State, the specific foreign embassy, or any other coordination channel the Component has established. OFOI has established a coordination channel with the United Kingdom Ministry of Defence (MOD). If the DoD Component has MOD-originated information within its files, it shall be forwarded to OFOI, which shall coordinate with the MOD for release. The MOD release recommendation will be forwarded by OFOI back to the Component for direct response to the requester. Coordination with most international organizations may be made directly with those organizations. However, for NORAD coordination the Components shall refer the documents to the FOIA Office at the United States Northern Command, which will consult with NORAD. (ii) If an international organization or foreign government asks the Department of Defense to withhold classified information originated by the multi-national organization or foreign government, it will be withheld under the provisions of Exemption 1. (iii) If the DoD Component is asked to withhold sensitive unclassified information originated by the multi-national organization or foreign government, then the Component will withhold it under the provisions of Exemption 3, and shall reference the relevant statute as 10 U.S.C. 130c. To qualify for withholding under this statute, the Component IDA must make the three following determinations concerning the requested foreign information: (A) The information was provided by or produced in cooperation with a foreign government or international organization. (B) The information is withheld from public disclosure by the foreign government or international organization (the foreign government or international organization should make this representation in writing). (C) Any of the following three conditions are met: (1) The foreign government or international organization requests in writing that the information be withheld. (2) The foreign government or international organization provides the information to the U.S. Government on the condition that it not be released to the public. (3

CUI handling is governed by 32 CFR Part 2002 and the ISOO CUI Marking Handbook (Version 1.1). Organizations must implement NIST SP 800-171 controls to protect CUI and follow marking requirements: - Banner markings (CUI designation at top and bottom of pages/documents) - Portion markings (optional, marking individual sections with (CUI)) - Dissemination controls where applicable - Proper handling, storage, and destruction procedures For specific marking guidance, consult the ISOO CUI Marking Handbook and your organization's CUI handling procedures. Under DFARS 252.204-7012, any incident involving potential CUI compromise must be reported to DC3 within 72 hours.

8 (also known as the Common Criteria) provides functionality and assurance requirements for developers of information systems and information system components (i.e., information technology products). Since many of the technical security controls defined in Appendix F are implemented in hardware, software, and firmware components of information systems, organizations can obtain significant benefit from the acquisition and employment of information technology products evaluated against the requirements of ISO/IEC 15408. The use of such products can provide evidence that certain security controls are implemented correctly, operating as intended, and producing the desired effect in satisfying stated security requirements.

- FIPS 140-2, Security Requirements for Cryptographic Modules - FIPS 197, Advanced Encryption Standard (AES) - FIPS 199, Standards for Security Categorization of Federal Information and

Information Systems - FIPS 201-2, Personal Identity Verification (PIV) of Federal Employees and Contractors - SP 800-12 Rev. 1, An Introduction to Information Security - Draft SP 800-16 Rev. 1, A Role-Based Model for Federal Information Technology/Cybersecurity Training - SP 800-18 Rev. 1, Guide for Developing Security Plans for Federal Information Systems - SP 800-30 Rev. 1, Guide for Conducting Risk Assessments - SP 800-34 Rev. 1, Contingency Planning Guide for Federal Information Systems - SP 800-39, Managing Information Security Risk: Organization, Mission, and Information System View - SP 800-40 Rev. 3, Guide to Enterprise Patch Management Technologies Advanced Encryption Standard - [1] NIST Special Publication (SP) 800-125, Guide to Security for Full Virtualization Technologies, National Institute of Standards and Technology, Gaithersburg, Maryland, January 2011, 35pp. <https://doi.org/10.6028/NIST.SP.800-125>.

- o management procedures and controls; - o physical, data, operating system, application software, personnel, and network security; and - o disaster recovery. The Contractor shall examine the management procedures that support security. This includes a study of the organization chart, the authorities and responsibilities, and the separation of functions. The Contractor shall also provide a list of management controls to be reviewed in each area (general, physical, data, and system and application software). This list shall, at a minimum, include: ## Task 3 -Review Physical Security

Comment: Obligations of non-PSC prime contractors Response: The definition of covered contract has been reworded to cover contracts for the performance of services and/or the delivery of supplies. Comment: IFR applicability to contingency operations in the U.S. and distinction between combat operations and contingency operations Response: The Rule does not apply to operations within the United States. We have clarified this in the definition of covered contract. Comment: Applicability to foreign actors Response: When applicable conditions are met, the Rule covers all companies and personnel providing private security functions, regardless of the country of registration of the company or national origin of its employees. We believe that this is already made clear by sections 159.2 (b)(1) and (2) which state the policy prescription. The Rule applies to government entities and prescribes policies for the oversight and management of PSCs and PSC personnel. The clause in section 159.2 (2)(a)(2) starting with specifically describes the conditions under which this part would apply beyond DoD, to DoS and other Federal agencies. The acquisition regulations, rather than this rule, will serve as the implementing mechanisms for PSC companies. Comment: Further define intelligence operations Response: This language implements Section 862 (d) of the FY 2008 NDAA. Comment: Active non-lethal countermeasure would benefit from a clear definition and examples Response: The following clarification has been added to the Rule: Active non-lethal systems include laser optical distracters, acoustic hailing devices, electro-muscular TASER guns, blunt-trauma devices like rubber balls and sponge grenades, and a variety of riot-control agents and delivery systems. Comment: Definition of Contingency Operation is a slight variation of the definition of contingency operation in FAR 2.101 Response: The definition in the Rule has been updated; it is taken verbatim from U.S. Code Title 10, 101(a)(13). Comment: Definition of Covered Contract excludes temporary arrangements outside of DoD for private security functions when contracted for by a non-DoD contractor or a grantee Response: The genesis for this provision was a USAID concern that development projects undertaken by USAID may engage local personnel as security on an ad hoc basis, and that such arrangements should be excluded from complying with the requirements of this regulation. These arrangements cannot realistically be regulated in the same manner as traditional contracts.

(F) Consistent with the legislative purpose of the Privacy Act of 1974, the NRO will grant access to nonexempt material in the records being maintained. Disclosure will be governed by NRO's Privacy Regulation, but will be limited to the extent that the identity of confidential sources will not be compromised; subjects of an investigation of an actual or potential criminal or civil violation will not be alerted to the investigation; the physical safety of witnesses, informants and law enforcement personnel will not be endangered; the privacy of third parties will not be violated; and that the disclosure would not otherwise impede effective law enforcement. Whenever possible, information of the above nature will be deleted from the requested documents and the balance made available. The controlling principle behind this limited access is to allow disclosures except those indicated in this paragraph. The decisions to release information from these systems will be made on a case-by-case basis. (6) System identifier and name. NRO-21, Personnel Security Files. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as

a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (B) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (C) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(2) and/or (k)(5) from the following subsections of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (H) and (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5) . (iii) Reasons. (A) From subsection (c)(3) because to grant access to the accounting for each disclosure as required by the Privacy Act, including the date, nature, and purpose of each disclosure and the identity of the recipient, could alert the subject to the existence of the investigation or prosecutable interest by the NRO or other agencies. This could seriously compromise case preparation by prematurely revealing its existence and nature; compromise or interfere with witnesses or make witnesses reluctant to cooperate; and lead to suppression, alteration, or destruction of evidence. (printed page 14790)

3.1.4 | Backdoors and Unpatched Vulnerabilities ... 3.1.4 Backdoors and Unpatched Vulnerabilities
Backdoors and unpatched vulnerabilities could be used either directly or indirectly to bypass other security controls.

Seagate continues to develop a risk-resilient culture within their own organization and throughout their supply chain. Through investments in supply chain-oriented risk metrics and new PSO team tool development, the company aims to remain a leader in the C-SCRM space and continue to provide actionable insight for supply chain interdependencies.

Use of the definition of ‘food’ in section 201(f) of the FD&C Act is consistent with the language of section 306 of the Bioterrorism Act. Section 306 does not contain language qualifying the meaning of food. Furthermore, section 414(b) of the FD&C Act authorizes the Secretary to require certain records to identify the immediate previous sources and recipients of ‘food, including its packaging.’ In addition, section 306(b) of the Bioterrorism Act amended section 704(a) of the FD&C Act, governing factory inspections, to provide that in the case of persons engaging in covered activities with regard to ‘foods, the inspection shall extend to all records and other information described in section 414* * *’. The inspection referenced in section 306(b) of the Bioterrorism Act is one of ‘any factory, warehouse or establishment in which [food] is manufactured, processed, packed or held* * *’. FDA’s longstanding interpretation is that ‘food’ in section 704 of the FD&C Act has the same meaning as in section 201(f) of the FD&C Act. Use of the definition of ‘food’ in section 201(f) of the FD&C Act is also consistent with other sections of the Bioterrorism Act. Section 414(a) of the FD&C Act refers to an article of food that is ‘adulterated.’ ‘Adulterated’ is defined in section 402 of the FD&C Act (21 U.S.C. 342), and ‘food’ in that section has the meaning provided in section 201(f) of the FD&C Act. See, e.g., *Natick Paperboard Corp. v. Weinberger* , 525 F.2d 1103 (1st Cir. 1975). Furthermore, using the definition of ‘food’ in section 201(f) of the FD&C Act for section 306 is consistent with the interpretation of ‘food’ in section 303 of the Bioterrorism Act, providing for administrative detention. When the Secretary has a reasonable belief that an article of food is adulterated and presents a threat of serious adverse health consequences or death to humans or animals, FDA may need to administratively detain the food under section 303 of the Bioterrorism Act and access relevant records under section 306 of the Bioterrorism Act. FDA is therefore retaining its interpretation of ‘food’ in section 306 of the Bioterrorism Act to mean ‘food’ as defined in section 201(f) of the FD&C Act. Food subject to section 306 of the Bioterrorism Act thus includes, but is not limited to, fruits, vegetables, fish, dairy products, eggs, raw agricultural commodities for use as food or components of food, animal feed (including pet food), food and feed ingredients and additives (including substances that migrate into food from food packaging and other articles that contact food, dietary supplements and dietary ingredients), infant formula, beverages (including alcoholic beverages and bottled water), live food animals (such as hogs and elk), bakery goods, snack foods, candy, and canned foods.

The general methodology used to estimate security costs incurred by contractor cleared facilities with approved storage of classified information is based on the costs incurred by respondent contractors for the protection of classified information. The methodology captures the most significant portion of industry’s costs, which is labor. Security labor in the survey is defined as personnel whose positions exist to support operations and staff in the implementation of government

security requirements for the protection of classified information. Guards who are required as supplemental controls are included in security labor. The respondent contractors are requested to compile their cleared facility's current annual security labor cost in burdened, current year dollars with the most recent data being from the 2017 survey. The labor cost, when identified as an estimated percent of each contractor's total security costs, enables the respondent contractors to calculate their total security costs. Information collected is compiled to create an aggregate estimated cost of NISP classification-related activities. Only the aggregate data is reported. The full enterprise industrial security total baseline cost in the December 21, 2020, rule was estimated to not exceed \$1.486 billion for fiscal year 2017. Based on the data collected from the survey, we can be 95% confident the true 2017 total NISP security cost for contractor facilities with approved classified storage is less than \$1.486 billion. Public Cost Analysis of the Changes to the Baseline From This Rule

1. Cost Analysis. Throughout, labor rates are adjusted upward by 100% to account for overhead and benefits. The following areas, 1.a and 1.b, were re-evaluated for cost based on the public comment.

a. Train all cleared employees on requirements to submit foreign travel reports. We determined that the estimate of cleared contractor personnel who would be required to be trained should also include TOP SECRET cleared employees rather than just SECRET cleared employees as indicated in the original rule. The FSO at each entity (small or large) must ensure that its cleared employees are trained on the requirements. Such training by the FSO is estimated to take one hour in 2021 and a half an hour in each of the following years up to the 20th year. Using the published Office of Personnel Management GS salary schedule for FY20, the estimated labor rate for an FSO of a small business entity firm is the equivalent of a GS11 step 5 and for an FSO of a large business entity is the equivalent of a GS13, step 5. These assumptions imply total costs of \$0.99 million in 2021 as year one; and, \$0.49 million each year from year two through the 20th year. These estimates have not changed from the original baseline.

Van Wyk, who reviewed drafts of this document. Additionally, the authors would like to thank Mr. Art Friedman (NSA) and Mr. Paul Jacob (Booz Allen Hamilton, Linthicum, MD) for initiating this effort. The authors also gratefully acknowledge and appreciate the comments and contributions made by government agencies, private organizations, and individuals in providing direction and assistance in the development of this document.

Multi-Regional HIEs connect multiple Regional HIEs. They may cross state lines or other physical boundaries. They are usually EHR-based. Since they connect multiple Regional HIEs, they will likely have a federated technical architecture. For Multi-Regional HIEs, conflicts of laws may require complex solutions. not, for example, be obliged to disclose health information about mental or physical abuse to the patient's possible abuser. As this measure allows the patient even more protection than HIPAA explicitly allows, it is 'more stringent' and should be followed.

promoting declassification and public access to information as soon as national security considerations permit. ISOO issues implementing directives and produces an annual report to the President on the NISP. E.O. 12829 also established the National Industrial Security Program Policy Advisory Committee (NISPPAC), a federal advisory committee comprised of both Government and industry representatives, which is responsible for recommending changes in industrial security policy. The NISPPAC, chaired by the Director of the ISOO, also advises ISOO on all issues concerning the policies of the NISP, including recommended changes to those policies, and serves as a forum to discuss policy issues in dispute. The NISPPAC industry members represent all types and sizes of NISP cleared entities, whose scope of operations range from a one person entity, having a single classified contract to some of the largest U.S. entities, having numerous classified contracts. All NISPPAC industry members have expertise comprising the primary functions of an industrial security program, to include information, personnel, physical, and information system security. Five USG executive branch agencies·DoD, DOE, the Nuclear Regulatory Commission (NRC), the Office of the Director of National Intelligence (ODNI), and the Department of Homeland Security (DHS)·have been designated as Cognizant Security Agencies (CSAs) and have specific responsibilities within the NISP. For DoD, the Defense Counterintelligence and Security Agency (DCSA) is the Cognizant (printed page 83301) Security Office (CSO) for DoD Components and non-DoD agencies where an industrial security agreement is in place. DCSA, as the DoD CSO, DOE, and NRC each has the following responsibilities: Administers the NISP. provides security oversight. conducts security review actions. provides security education and training. provides supplementary procedures for unique mission requirements (e.g. DoD publishes industrial security letters (ISLs), which provide DoD-specific guidance and clarification on NISP policies and supplementary procedures to its unique CSO

mission requirements (available at: <https://www.dcsa.mil/mc/ctp/tools/>). assesses, authorizes and oversees contractor information systems used to process classified information. makes temporary national security eligibility determinations pursuant to SEAD 8, Temporary Eligibility (available at: https://www.dni.gov/files/NCSC/documents/Regulations/SEAD-8_Temporary_Eligibility_U.pdf), for contractor personnel who require access to classified information. DHS receives NISP industrial security services from DoD due to its industrial security services agreement and also has the following responsibilities: Prescribes procedures for the portions of this rule that pertain to the CCIPP. retains authority over access to information under the CCIPP. inspects and monitors contractor, licensee, certificate holder, and grantee programs and facilities that involve access to CCIPP.

Attribute Considerations for Access Control Systems ## Attribute Considerations for Access Control Systems This document provides federal agencies with a guide for implementing attributes in access control systems. Attributes enable a logical access control methodology where authorization to perform a set of operations is determined by evaluating attributes associated with the subject, object, requested operations, and, in some cases, environment conditions against policy, rules, or relationships that describe the allowable operations for a given set of attributes. This document outlines factors which influence attributes that an authoritative body must address when standardizing an attribute system and proposes some notional implementation suggestions for consideration.

(6) Not be under FOCI to such a degree that a favorable entity eligibility determination for access to classified information would be inconsistent with the national interest, in the judgment of the CSA. (7) Maintain sufficient authorized and cleared employees to manage and implement the requirements of this rule in accordance with CSA guidance. (8) Not pose an unacceptable risk to national security interests, in the judgment of the CSA. (9) Meet all requirements governing access to classified information established by the CSA or the relevant authorizing law, regulation, or government-wide policy. (d) Processing the entity eligibility determination. The CSA will assess the entity's eligibility for access to classified information based on its business structure. (1) At a minimum, the entity will: (i) Provide CSA-requested documentation within timelines established by the CSA. (ii) Have and identify the SMO. (iii) Appoint a U.S. citizen employee as the FSO. (iv) Appoint a U.S. citizen employee as the ITPSO. (v) Submit requests for personnel security investigations for the SMO, FSO, ITPSO, and those other KMP identified by the CSA as requiring eligibility for access to classified information in connection with the entity eligibility. (2) If the entity is under FOCI with a special security agreement (SSA) as the proposed method of FOCI mitigation, and the GCA requires the entity to have access to proscribed information, the CSA must consider the measures listed in § 117.11(d) as part of the entity eligibility determination. (e) Other personnel eligibility determinations concurrent with the entity eligibility determination. (1) Contractors may designate employees who require access to classified information during the negotiation of a contract or the preparation of a bid or quotation pertaining to a prime contract or a subcontract. These designated employees will be processed for a determination of eligibility for access to classified information (i.e., PCL eligibility) concurrent with entity's entity eligibility determination. (2) The entity eligibility determination is not dependent on the PCL eligibility for access to classified information by such employees, provided none of these employees are among those listed in paragraph (c)(5) of this section. Even so, the employees will not be granted access to classified information until both a favorable entity eligibility determination and PCL eligibility has been granted. (f) Exclusion procedures. If a CSA determines that certain KMP can be excluded from access to classified information, the contractor will follow the procedures in accordance with § 117.7(b)(5)(ii). (g) Temporary exclusions. As a result of a changed condition, the SMO or other KMP who require eligibility for access to classified information in connection with the facility entity eligibility determination may be temporarily excluded from access to classified information while in the process of a PCL eligibility determination provided:

(3) The CSA will promptly advise the parties in a transaction under CFIUS review that would require FOCI negation or mitigation measures if consummated, to submit to the CSA a plan to negate or mitigate FOCI. If it appears that an agreement cannot be reached on material terms of a FOCI action plan, or if the U.S. person that is a party, or in applicable cases, a subject of the proposed transaction fails to comply with the FOCI reporting requirements of this rule, the CSA may recommend a full investigation of the transaction by the CFIUS to determine the effects on national security.

§-117.12 Security training and briefings. (a) General. Contractors will provide all cleared employees with security training and briefings commensurate with their involvement with classified information. (b) Training materials. Contractors may obtain security, threat awareness, and other education and training information and material from their CSA or other sources. (c) Government provided briefings. The CSA is responsible for providing initial security briefings to the FSO and for ensuring other briefings required for special categories of information are provided to the FSO. (d) FSO training. Contractors will ensure the FSO and others performing security duties complete training considered appropriate by the CSA. Training requirements will be based on the contractor's involvement with classified information. Training may include an FSO orientation course, and for FSOs at contractor locations with a classified information safeguarding capability, an FSO program management course. Contractor FSOs will complete training within six months of appointment to the position of FSO. When determined by the applicable CSA, contractor FSOs must complete an FSO program management course within six months of the CSA approval to store classified information at the contractor. (e) Initial security briefings. Prior to being granted access to classified information, contractors will provide employees with an initial security briefing that includes: (1) Threat awareness, including insider threat awareness in accordance with paragraph (g) in this section. (2) Counterintelligence (CI) awareness. (3) Overview of the information security classification system. (4) Reporting obligations and requirements, including insider threat. (5) Cybersecurity training for all authorized information system users in accordance with CSA-provided guidance pursuant to §-117.18(a)(1) and (a)(2). (6) Security procedures and duties applicable to the employee's position requirements (e.g. marking and safeguarding of classified information) and criminal, civil, or administrative consequences that may result from the unauthorized disclosure of classified information, even though the individual has not yet signed an NDA. (f) CUI training. While outside the requirements of the NISPOM, when a classified contract includes provisions for CUI training, contractors will comply with those contract requirements. (g) Insider threat training.

The DIB CS/IA program collects Point of Contact (POC) information from DIB participants. POC information is needed to facilitate communication between DoD and DIB participants, as well as prospective participants. The POC information includes the names, security clearance information, citizenship, work addresses, including division/group, work email addresses and work telephone numbers of company-identified representatives. DIB POCs include the Chief Executive Officer (CEO), Chief Information Officer (CIO), Chief Information Security Officer (CISO), General Counsel, the Chief Privacy Officer, and the Corporate Security Officer (CSO) or Facility Security Officer (FSO), or their equivalents. DIB participants also provide POC information for personnel responsible for the implementation and execution of the DIB CS/IA program within their company including designated personnel authorized to report incidents and any policy, administrative, or technical personnel identified to interact with DOD in the operational implementation of the program. Affected Public: Business or other for-profit and not-for-profit institutions participating in the voluntary DIB CS/IA program. Frequency: On occasion. Respondent's Obligation: Voluntary. (b) Title: DIB Cyber Security/Information Assurance Cyber Incident Reporting. Type of Request: New. Phased expansion of DIB CS/IA Number of Participants increases to 750 over three years. Projected Responses per Participant: 5. Annual Responses: Year 1 responses are 1,250. Year 2 responses are 2,500. Year 3 responses are 3,750. Average Burden per Response: 7 hours (this includes searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information). Annual Burden Hours: Year 1 burden hours are 8,750 hours. Year 2 burden hours are 17,500 hours. Year 3 burden hours are 26,250 hours. Needs and Uses: The collection of this information is necessary to enhance and supplement DIB participants' information security capabilities to safeguard DoD information that resides on, or transits, DIB unclassified (printed page 27618) information systems. The requested information supports the information assurance objectives, cyber threat information sharing, and incident reporting between DoD and the DIB participants. In most cases, DIB participants report incidents using a DIB CS/IA standardized Incident Collection Form (ICF). In some cases, a company may elect to report the incident without using the ICF; and companies may report incidents through a variety of communications channels, including email, fax, or by phone, if necessary. Affected Public: Business or other for-profit and not-for-profit institutions participating in the DIB CS/IA program. Frequency: On occasion. Respondent's Obligation: Voluntary. OMB Desk Officer:

would apply to a technology asset currently used by a regulated entity that does not support encryption according to prevailing cryptographic standards. Because the requirements for encryption under the Security Rule today are addressable, a regulated entity may be in compliance with the

encryption requirement without actual encryption of ePHI if encryption is not reasonable and appropriate, provided that the entity meets certain conditions. Additionally, technology assets in use today may rely on cryptographic standards that are no longer accepted industry practice. The Department recognizes that it may take some time for a regulated entity to adopt compliant technology assets. Thus, we propose this exception for such technology assets that do not support encryption consistent with prevailing cryptographic standards in limited circumstances. Specifically, to meet this exception, a regulated entity would be required to establish a written plan to migrate ePHI to technology assets that support encryption consistent with prevailing cryptographic standards and to implement such plan. The regulated entity would be required to establish and implement the written plan within (printed page 969) a reasonable and appropriate period of time. For example, it would not be reasonable or appropriate for a regulated entity to establish a plan to migrate ePHI on a single flash drive within 30 days and not complete migration of that ePHI for a period of a year because migrating ePHI from a flash drive to a more secure medium is a simple and quick process that the regulated entity already determined could be completed within 30 days. Thus, a year would be an unreasonably long period to leave ePHI insufficiently encrypted, particularly after a need to migrate the ePHI has been established. In such circumstances, the regulated entity would not be complying with the requirements of this proposed exception. The second proposed exception at proposed 45 CFR 164.312(b)(3)(ii) would be available for ePHI transmitted in response to an individual request, pursuant to 45 CFR 164.524 , to receive their ePHI in an unencrypted manner. Unencrypted manners for an individual to receive their ePHI may include some types of text messaging, instant messaging, and other applications on a smartphone or another computing device that are capable of making an access request and receiving ePHI. [735] This exception for individual access requests under 45 CFR 164.524 would not apply when the individual would receive their ePHI using technology controlled by the regulated entity, such as a patient portal [736] or other technology for the transmission of ePHI (e.g., API technology). [737] Such email or messaging technologies are considered to be among a covered entity's technology assets because they are components of a covered entity's relevant electronic information systems, and the requirement to encrypt ePHI would apply.

Further, some comments assert that the regulations are directed toward enabling the Government to trace a product, rather than ensuring that companies are able to trace the product through all the links in the chain of custody of a food ingredient or product. The comments state that the intent of the Bioterrorism Act was to ensure the existence of a system that fully engages the institutional knowledge and logical procedures that already enable the companies responsible for the production and distribution of food to maintain an orderly and efficient nationwide supply chain and that also currently make it possible to effect rapid recalls when necessary. The comments state that the proposed regulations fail to capitalize on the efficiencies of time and resources available through effective public/private coordination, exemplified by the efforts that currently support effective recalls. (Response) FDA recognizes that some of the food industry currently has existing records that may satisfy all or part of these regulations; however, not all of the food industry is currently able to conduct such traceback investigations. Notwithstanding the ability of some of the food industry to conduct such investigations, Congress authorized FDA through the Bioterrorism Act to issue regulations requiring the establishment and maintenance of records by persons who manufacture, process, pack, transport, distribute, receive, hold or import food to enable FDA to identify the immediate previous sources and immediate subsequent recipients of food, including its packaging, to address credible threats of serious adverse health consequences or death to humans or animals. FDA believes the information required to be established and maintained in records in these regulations is necessary to enable FDA to conduct an efficient and effective tracing investigation, independent of what the food industry may be able to do. FDA reiterates that it is not dictating the form or type of system to be used to satisfy these requirements in these regulations. If the food industry already keeps all of the information required by this final rule, then existing records can be used to comply with this final rule. Further, FDA anticipates working closely with the food industry in any tracing investigation.

This rule will apply to small businesses that are awarded Government contracts, other than those that receive awards exclusively for COTS items. According to award data in the Federal Procurement Data System (FPDS) for fiscal years (FY) 2021 through FY 2023, on average per year the Government awards contracts and orders for supplies and services (excluding those for supplies purchased using commercial item procedures) to 67,547 unique contractors, of which 44,152 (65 percent) are small businesses. When an SF XXX is incorporated in the contract and identifies CUI that will be involved

in the contract, the contractor will be subject to the new FAR clause at FAR 52.204-XX and more robust compliance requirements for safeguarding the CUI. Per the FPDS data, of the contractors that receive covered awards each year, approximately 37,933 are non-defense contractors and 29,614 are defense contractors, or contractors that do business with both civilian agencies and DoD. Based on consultation with subject matter experts, it is assumed that 18 percent of non-defense contractors (6,828) and 28 percent of defense contractors (8,292), or 15,120 total contractors, may receive awards each year that include an SF XXX listing CUI and the associated safeguarding requirements. It is further assumed that the ratio of subcontractors to prime contractors that handle CUI is 0.5:1, or 7,560 total subcontractors. Therefore, each year, an estimated 22,680 contractors and subcontractors, of which 15,809 (70 percent) are estimated to be small businesses, will be required to safeguard CUI in performance of a contract, pursuant to the new clause at FAR 52.204-XX and the instructions provided on an SF XXX. These small entities may be impacted by the various compliance requirements in the clause, depending on the type of CUI required to be handled under the contract or subcontract, the way in which the information will be handled, and whether those small businesses have already been safeguarding sensitive Government information under other contract provisions. The new FAR clause at 52.204-XX is modeled after the existing clause at DFARS 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting, the most recent version of which has been in effect since 2017 (the clause has been in effect since 2013, and the NIST SP 800-171 requirements were added in 2015). As such, small businesses that do business with DoD and handle CUI in performance of their contracts are already subject to requirements equivalent to the new FAR clause and provision. In addition, small businesses that do business with other agencies that have included similar or overlapping safeguarding requirements under agency-specific contract terms may already be in partial or substantial compliance with the clause requirements. The following specific compliance requirements will apply to all Federal offerors, contractors, and subcontractors: Review and Distribute the SF XXX.

CIS Control 4 · Secure Configuration of Enterprise Assets and Software Establish and maintain the secure configuration of enterprise assets (end-user devices, including portable and mobile; network devices; non-computing/IoT devices; and servers) and software (operating systems and applications). As delivered from manufacturers and resellers, the default configurations for enterprise assets and software are normally geared towards ease-of-deployment and ease-of-use rather than security. Basic controls, open services and ports, default accounts or passwords, pre-configured Domain Name System (DNS) settings, older (vulnerable) protocols, and pre-installation of unnecessary software can all be exploitable if left in their default state. Further, these security configuration updates need to be managed and maintained over the life cycle of enterprise assets and software. Configuration updates need to be tracked and approved through configuration management workflow process to maintain a record that can be reviewed for compliance, leveraged for incident response, and to support audits. This CIS Control is important to on-premises devices, as well as remote devices, network devices, and cloud environments. Service providers play a key role in modern infrastructures, especially for smaller enterprises. They often are not set up by default in the most secure configuration to provide flexibility for their customers to apply their own security policies. Therefore, the presence of default accounts or passwords, excessive access, or unnecessary services are common in default configurations. These could introduce weaknesses that are under the responsibility of the enterprise that is using the software, rather than the service provider. This extends to ongoing management and updates, as some Platform as a Service (PaaS) only extend to the operating system, so patching and updating hosted applications are under the responsibility of the enterprise. Even after a strong initial configuration is developed and applied, it must be continually managed to avoid degrading security as software is updated or patched, new security vulnerabilities are reported, and configurations are tweaked, to allow the installation of new software or to support new operational requirements.

additional information collection requirements to the paperwork burden previously approved under the Office of Management and Budget (OMB) Control Number 0704-0567, entitled "Department of Defense Contract Security Classification Specification". The rule addresses use of CAGE codes on the DD Form 254, however, it does not impact information collection requirements concerning the CAGE code, OMB Control Number 9000-0185, Commercial and Government Entity Code. List of Subjects in 48 CFR Parts 1, 2, 4, 52, and 53 Government procurement William F. Clark, Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy. Therefore, DoD, GSA, and NASA amend 48 CFR parts 1, 2, 4, 52, and 53 as set forth below: 1. The authority citation for 48 CFR parts 1, 2, 4, 52, and 53

continues to read as follows: Authority: 40 U.S.C. 121(c) ; 10 U.S.C. chapter 137 ; and 51 U.S.C. 20113 . PART 1-FEDERAL ACQUISITION REGULATIONS SYSTEM 2. In section 1.106 amend the table following by adding an entry for ·DD Form 254· at the end of the table to read as follows: 1.106 OMB approval under the Paperwork Reduction Act. FAR segment OMB control No. *.....* DD Form 254 0706-0567 PART 2-DEFINITIONS OF WORDS AND TERMS 3. In section 2.101, amend paragraph (b) by adding in alphabetical order the defined term ·Commercial and Government Entity (CAGE) code· to read as follows: 2.101 Definitions. * * * * * Commercial and Government Entity (CAGE) code means· (1) An identifier assigned to entities located in the United States or its outlying areas by the Defense Logistics Agency (DLA) Commercial and Government Entity (CAGE) Branch to identify a commercial or government entity by unique location; or (2) An identifier assigned by a member of the North Atlantic Treaty Organization (NATO) or by the NATO Support and Procurement Agency (NSPA) to entities located outside the United States and its outlying areas that the DLA Commercial and Government Entity (CAGE) Branch records and maintains in the CAGE master file. This type of code is known as a NATO CAGE (NCAGE) code. * * * * * PART 4-ADMINISTRATIVE AND INFORMATION MATTERS 4. Amend section 4.402 by· a. Removing from paragraph (b) introductory text ·and the Director of Central Intelligence,· and adding ·the Director of National Intelligence, and the Secretary of Homeland Security· in its place; b. Removing from paragraph (b)(2) ·Industrial Security Regulation (DOD 5220.22-R)· and adding ·DoD Manual 5220.22, Volume 2, ·National Industrial Security Program: Industrial Security Procedures for Government Activities...· in its place; and c. Redesignating paragraph (d) as (e), and adding a new paragraph (d) to read as follows: 4.402 General. * * * * *

). The guidance represents the Agency's current thinking on medical device classification product codes. It does not create or confer any rights for or on any person and does not operate to bind FDA or the public. An alternative approach may be used if such approach satisfies the requirements of the applicable statute and regulations. III. Electronic Access Persons interested in obtaining a copy of the guidance may do so by using the Internet. A search capability for all CDRH guidance documents is available at <http://www.fda.gov/MedicalDevices/DeviceRegulationandGuidance/GuidanceDocuments/default.htm> . Guidance documents are also available at <http://www.regulations.gov> or from CBER at <http://www.fda.gov/BiologicsBloodVaccines/GuidanceComplianceRegulatoryInformation/default.htm> . To receive ·Medical Device Classification Product Codes,· you may either send an email request to dsmica@fda.hhs.gov to receive an electronic copy of the document or send a fax request to 301-847-8149 to receive a hard copy. Please use the document number 1774 to identify the guidance you are requesting. IV. Paperwork Reduction Act of 1995 This guidance refers to previously approved collections of information found in FDA regulations. These collections of information are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501-3520). The collections of information in 21 CFR part 803, subpart A through E , have been approved under OMB control number 0910-0437; the collections of information in 21 CFR part 807, subpart E , have been approved under OMB control number 0910-0120; and the (printed page 21613) collections of information under 21 CFR part 814 have been approved under OMB control number 0910-0231. V. Comments Interested persons may submit either electronic comments regarding this document to <http://www.regulations.gov> or written comments to the Division of Dockets Management (see ADDRESSES). It is only necessary to send one set of comments. Identify comments with the docket number found in brackets in the heading of this document. Received comments may be seen in the Division of Dockets Management between 9 a.m. and 4 p.m., Monday through Friday, and will be posted to the docket at <http://www.regulations.gov> . Dated: April 5, 2013. Leslie Kux, Assistant Commissioner for Policy. [FR Doc. 2013-08442 Filed 4-10-13; 8:45 am] BILLING CODE 4160-01-P

Guidelines for the Authorization of Personal Identity Verification Card Issuers (PCI) and Derived PIV Credential Issuers (DPCI) ## Guidelines for the Authorization of Personal Identity Verification Card Issuers (PCI) and Derived PIV Credential Issuers (DPCI) The purpose of this Special Publication is to provide appropriate and useful guidelines for assessing the reliability of issuers of Personal Identity Verification (PIV) Cards and Derived PIV Credentials. These issuers store personal information and issue credentials based on Office of Management and Budget (OMB) policies and on the standards published in response to Homeland Security Presidential Directive 12 (HSPD-12) and therefore are the primary target of the assessment and authorization under this guideline. The reliability of an issuer is of utmost importance when one organization (e.g., a federal agency) is required to trust the identity credentials of individuals that were created and issued by another

federal agency. This trust will only exist if organizations relying on the credentials issued by a given organization have the necessary level of assurance that the reliability of the issuing organization has been established through a formal authorization process.

3.4.1 Examples of Sub-Capabilities (from HWAM)... 3.4.1 Examples of Sub-Capabilities (from HWAM) As described in Table 4: Tracing the HWAM Capability to Blocking Attack Steps, HWAM provides a high-level ability to block or delay attack steps related to the exploitation of hardware devices.

3.4.1 Password Authentication... 3.4.1 Password Authentication There are two kinds of password authentication mechanisms in SSH: basic password authentication and keyboard-interactive authentication.

This rule establishes requirements for the conduct of assessments, as well as the requirements for handling of disputes, to include an appeals process. In the roles established by this rule, C3PAOs and the CMMC AB execute program requirements as codified in the 32 CFR part 170 CMMC Program rule, with appropriate DoD oversight. For ISO/IEC 17020:2012(E) and ISO/IEC 17011:2017(E) compliance, an appeals process is required. Appeals are addressed in §§ 170.8(b)(16) and 170.9(b)(9), (14), (20), and (21). The DoD declines to update the rule content of § 170.6 to include a new subsection on DoD PMs and requesting activities and their responsibilities regarding marking CUI as that subject matter is already addressed for the DoD. DoD Instruction 5200.48 on CUI establishes policy, assigns responsibilities, and prescribes procedures for CUI throughout the DoD in accordance with 32 CFR part 2002, CFR for CUI to include 32 CFR 2002.20 Marking CUI; and 48 CFR 252.204-7008 and DFARS clause 252.204-7012. The CMMC Program requirements make no change to existing policies for information security implemented by the DoD. The DoD declined to modify the rule to further define the existing CMMC PMO oversight responsibilities, identified in § 170.6, which includes the CMMC AB and all other aspects of the program. b. CMMC-AB Comment: There were multiple comments regarding the CMMC Accreditation Body (AB). Ten comments were not relevant to the rule text. Multiple commenters asked about mechanisms to monitor the CMMC AB and how the DoD provides oversight. Seven comments provided valuable editorial recommendations that (printed page 83120) enhanced the existing rule text. Seven comments also raised concerns and asked for clarification about certification of the CMMC AB, its standing with international accreditation bodies and the effects of that standing on the C3PAOs. Two comments sought clarity on the CMMC AB's responsibilities and what resources they will provide to the CMMC ecosystem. One comment suggested incorporation by reference of specific CMMC AB generated artifacts. One comment requested clarity on terms and definitions regarding the CMMC AB. Response: Some comments received lacked relevance to the rule's content, including the establishment of outside entities. The DoD declines to respond to speculative or editorial comments about private citizens or entities, which are outside the scope of this rule. The DoD declines to respond to requests for documents related to the CMMC AB and the CAICO that lack relevance to the CMMC rule.

Information at rest refers to the state of information when it is not in process or in transit and is located on storage devices as specific components of systems. The focus of protection at rest is not on the type of storage device or the frequency of access but rather the state of the information. Organizations can use different mechanisms to achieve confidentiality protections, including the use of cryptographic mechanisms and file share scanning. Organizations may also use other controls including secure off-line storage in lieu of online storage when adequate protection of information at rest cannot otherwise be achieved or continuous monitoring to identify malicious code at rest. FURTHER DISCUSSION CUI at rest means information that is not moving through the network; typically this means data currently stored on hard drives, media, and mobile devices. Implement the necessary security controls to protect the confidentiality of CUI at rest. Although an approved 217 NIST SP 800-171A, pp. 59-60. 218 NIST SP 800-171 Rev. 2, p. 40.

), as amended by section 812 of National Defense Authorization Act for Fiscal Year 2017, which requires DoD to establish a data collection system to provide certain management information with regard to each purchase of services by a military department or defense agency that exceeds \$3 million for services in the following service acquisition portfolio groups: logistics management services, equipment-related services, knowledge-based services, and electronics and communications services. The basic DFARS clause 252.204-7023, Reporting Requirements for Contracted Services, and its alternate I require a contractor to report annually, in the System for Award Management, on the services performed under the contract or order, during the preceding Government fiscal year.

Specifically, the contractor is required to report the following: the total dollar amount invoiced for services performed during the preceding fiscal year; and the number of direct labor hours, including subcontractor hours (when applicable), expended on services performed during the previous Government fiscal year. This information collection will provide DoD with the ability to identify and report annually to Congress, in accordance with 10 U.S.C. 4505, on the inventory of contractor service contract actions. As an adjunct, the information will support DoD's total force management and in making strategic workforce planning and budget decisions pursuant to 10 U.S.C. 129a. DoD Clearance Officer: Mr. Tucker Lucas. Requests for copies of the information collection proposal should be sent to Mr. Lucas at whs.mc- (printed page 53594) alex.esd.mbx.dd-dod-information-collections@mail.mil. Jennifer D. Johnson, Editor/Publisher, Defense Acquisition Regulations System. [FR Doc. 2024-14088 Filed 6-26-24; 8:45 am] BILLING CODE 6001-FR-P

) From subsection (e)(1) because it is not always possible for NGA or other agencies to know in advance what information is both relevant and necessary for it to complete an identity comparison between individuals and a known or suspected terrorist. In addition, because NGA and other agencies may not always know what information about an encounter with a known or suspected terrorist will be relevant to law enforcement for the purpose of conducting an operational response. (5) From subsection (e)(2) because application of this provision could present a serious impediment to counterterrorism, law enforcement, or intelligence efforts in that it would put the subject of an investigation, study or analysis on notice of that fact, thereby permitting the subject to engage in conduct designed to frustrate or impede (printed page 14783) that activity. The nature of counterterrorism, law enforcement, or intelligence investigations is such that vital information about an individual frequently can be obtained only from other persons who are familiar with such individual and his/her activities. In such investigations, it is not feasible to rely upon information furnished by the individual concerning his own activities. (6) From subsection (e)(3), to the extent that this subsection is interpreted to require NGA to provide notice to an individual if NGA or another agency receives or collects information about that individual during an investigation or from a third party. Should the subsection be so interpreted, exemption from this provision is necessary to avoid impeding counterterrorism, law enforcement, or intelligence efforts by putting the subject of an investigation, study or analysis on notice of that fact, thereby permitting the subject to engage in conduct intended to frustrate or impede that activity. (7) From subsections (e)(4)(G) and (H) and (I) (Agency Requirements) and (f) (Agency Rules), because this system is exempt from the access provisions of 5 U.S.C. 552a(d). (8

). Finally, it should be noted that the Department provides established administrative due process to record subjects prior to final adverse determinations with respect to a denial or revocation for eligibility to access classified information or eligibility to occupy a national security position. Regulatory Procedures Executive Order 12866, 'Regulatory Planning and Review' and Executive Order 13563, 'Improving Regulation and Regulatory Review' Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distribute impacts, and equity). Executive Order 13563 also emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This rule is not a significant regulatory action under E.O. 12866. Executive Order 13771, 'Reducing Regulation and Controlling Regulatory Costs' This final rule is an E.O. 13771 deregulatory action. Details on the estimated cost savings of this rule are discussed in the 'expected cost savings' section of the preamble. 2 U.S.C. Ch. 25, 'Unfunded Mandates Reform Act' This final rule is not subject to the Unfunded Mandates Reform Act (UMRA) (2 U.S.C. 1532) because it does not contain a federal mandate that may result in the expenditure by state, local, and tribal governments, in the aggregate, or by the private sector, of \$100M or more in any one year. Public Law 96-354, 'Regulatory Flexibility Act' (5 U.S.C. Ch. 6) It has been certified that 32 CFR part 310 is not subject to the Regulatory Flexibility Act (5 U.S.C. 601), because it would not have a significant economic impact on a substantial number of small entities. The rule primarily implements the procedures for requesting access to and amendment of records covered by the Privacy Act and maintained by the Department of Defense. Public Law 96-511, 'Paperwork Reduction Act' (44 U.S.C. Chapter 35) It has been certified that 32 CFR part 310 does not impose reporting or recordkeeping requirements under the Paperwork Reduction Act of 1995. Executive Order 13132, 'Federalism' Executive Order 13132 establishes certain requirements that an agency must meet when it promulgates a proposed rule (and subsequent final rule) that imposes substantial direct requirement costs on State and local

governments, preempts State law, or otherwise has Federalism implications. This final rule will not have a substantial effect on State and local governments. List of Subjects in 32 CFR Part 310 Privacy Privacy Act Records maintained on individuals Accordingly, 32 CFR part 310 is revised to read as follows: PART 310·PROTECTION OF PRIVACY AND ACCESS TO AND AMEUREMENT OF INDIVIDUAL RECORDS UNDER THE PRIVACY ACT OF 1974 Subpart A·General Provisions 310.1 Purpose. 310.2 Definitions. (printed page 14731)

. This implementation specification would require a regulated entity to have in place technical controls that distinguish between users and technology assets, that are permitted to access the regulated entity's relevant electronic information systems and those that are not permitted to do so and would require that the controls permit or disallow access accordingly. Properly deployed network-based solutions can limit the ability of a hacker to gain access to an organization's network or impede the ability of a hacker already in the network from accessing other electronic information systems-especially systems containing sensitive data. [716] Access controls could include role-based access, user-based access, or any other access control mechanisms the organization deems appropriate. [717] Access controls need not be limited to computer systems-firewalls, network segmentation, and network access control solutions are effective means of limiting access to relevant electronic information systems. [718] Additionally, we propose to add an implementation specification for maintenance at proposed 45 CFR 164.312(a)(2)(viii) . Under this proposal, a regulated entity would be expressly required to review and test the effectiveness of the procedures and technical controls required by the implementation specifications associated with the standard for access control at least once every 12 months or in response to environmental or operational changes, whichever is more frequent, and modify as reasonable and appropriate. c. Section 164.312(b)(1)-Standard: Encryption and Decryption Encryption can reduce the risks and costs of unauthorized access to ePHI. [719] For example, if a hacker gains access to unsecured ePHI on a network server or if a device containing unsecured ePHI is stolen, a breach of PHI will be presumed and reportable under the Breach Notification Rule. [720] The Breach Notification Rule applies to unsecured PHI, which is PHI that is not rendered unusable, unreadable, or indecipherable to unauthorized persons through the use of a technology or methodology specified by the Secretary in guidance issued under the HITECH Act. [721] The Department's guidance on rendering unsecured PHI unusable, unreadable, or indecipherable to persons who are not authorized to access such PHI states that ePHI at rest (i.e., stored in an information system or electronic media) is considered secured if it is encrypted in a manner consistent with NIST Special Publication 800-111 [722] (-SP 800-111-). The ePHI encrypted in a manner consistent with SP 800-111 is not considered unsecured PHI and therefore qualifies for what is commonly known as the Breach Notification safe harbor, meaning that it is not subject to the requirements of the Breach Notification Rule. [723] Thus, by encrypting ePHI in a manner consistent with the Secretary's guidance, a regulated entity may not only fulfill its encryption obligation under the Security Rule, but also make use of the (printed page 968)

This method is often used when a foreign interest does not own voting interests sufficient to elect, or otherwise is not entitled to representation on the company's governing board. In such circumstances, the effects of foreign ownership will generally be mitigated by a resolution of the board of directors stating the company recognizes the elements of FOCI and acknowledges its continuing obligations under DD Form 441, ·DoD Security Agreement· (available at <http://www.dtic.mil/whs/directives/infomgt/forms/eforms/dd0441.pdf>). The resolution will identify the foreign shareholders and their representatives (if any) and note the extent of foreign ownership. The resolution will also include a certification that the foreign shareholders and their representatives will not require, will not have, and can be effectively excluded from access to all classified information in the possession of the contractor, and will not be permitted to occupy positions that may enable them to influence the organization's policies and practices in the performance of classified contracts. Copies of such resolutions will be furnished to all board members and principal management officials. (B) SCA. The SCA is a tailored FOCI mitigation agreement often used when a foreign interest does not effectively own or control a company or corporate family (i.e., the company or corporate family are under U.S. control), but the foreign interest is entitled to representation on the company's board. When an SCA is implemented, a U.S. citizen serves as an outside director, as defined in DoD 5220.22-M. DSS may determine the need for more than one outside director based on the FOCI analysis and risk assessments. (C) SSA. The SSA is a tailored FOCI mitigation agreement that preserves the foreign owner's right to be represented on the company's board (inside directors) with a direct voice in the business management of the

company while denying the foreign owner unauthorized access to classified information. An SSA is based on the analysis of the FOCI factors set forth in paragraph (b)(3) and is often used when a foreign interest effectively owns or controls a company or corporate family. DSS assesses the implications of the FOCI factors in accordance with paragraphs (b)(3) and (b)(4)(iii) of this section. U.S. citizens serve as outside directors in accordance with DoD 5220.22-M. (1) If a GCA requires a contractor cleared under an SSA to have access to proscribed information, the GCA will initiate action to consider a NID at the pre-contract phase to confirm that disclosure of such information is consistent with the national security interests of the United States. (2) Proscribed information includes TS; COMSEC material, excluding controlled cryptographic items when unkeyed and utilized with unclassified keys; RD; SAP; and SCI. (3

DFARS 252.204-7021 (Cybersecurity Maturity Model Certification Requirements) Requires CMMC certification at the level specified in the contract, effective Phase 1 November 10, 2025. Contractors should review the full text of DFARS 252.204-7021 in conjunction with their contracting officer and legal counsel to ensure full compliance. The clause should be read alongside the CMMC requirements at 32 CFR Part 170.

to address the use of performance-based payments. The primary objective of this rule is to remove the restrictions at DFARS 232.1001(a) and the clauses at 252.232-7012(b)(i) and 252.232-7013(b)(i) that limit performance-based payments to amounts not greater than costs incurred up to the time of payment, as required 10 U.S.C. 2307 . There were no significant issues raised by the public comments in response to the initial regulatory flexibility analysis. This rule will apply to approximately 55 small entities per year that are awarded contracts that provide performance-based contract payments from DoD. This rule adds a reporting requirement that will require an entry in the annual representations and certifications with regard to whether the offeror's financial statements are in compliance with Generally Accepted Accounting Principles. DoD estimates that the skill necessary for this requirement is at the journeyman level and that each entry will require an average of 6 minutes. This rule will not have a significant economic impact on small entities. There are no significant alternatives consistent with the stated objectives of the statute. VIII. Paperwork Reduction Act This rule affects the information collection requirements at DFARS subpart 232.10 (and associated clauses at DFARS 252.232-7012 and 252.232-7013, currently approved under OMB Control Number 0704-0359, DFARS Part 232, Contract Financing. The impact, however, is negligible, because only the last three lines of the table are deleted, which do not impose the predominance of the burden. This rule also adds a new information collection requirement that has been approved by the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). This information collection requirement has been assigned OMB Control Number 0750-0001, entitled ·Defense Federal Acquisition Regulation Supplement (DFARS), Performance-Based Payments·Representation·. List of Subjects in 48 CFR Parts 202 , 204 , 212 , 232 , and 252 Government procurement Jennifer Lee Hawes, Regulatory Control Officer, Defense Acquisition Regulations System. Therefore, 48 CFR parts 202 , 204 , 212 , 232 , and 252 are amended as follows: 1. The authority citation for 48 CFR parts 202 , 204 , 212 , 232 , and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1 . PART 202·DEFINITIONS OF WORDS AND TERMS 2. Amend section 202.101 by adding in alphabetical order a definition for ·Nontraditional defense contractor· to read as follows: 202.101 Definitions. * * * * * Nontraditional defense contractor means an entity that is not currently performing and has not performed any contract or subcontract for DoD that is subject to full coverage under the cost accounting standards prescribed pursuant to 41 U.S.C. 1502 and the regulations implementing such section, for at least the 1-year period preceding the solicitation of sources by DoD for the procurement (10 U.S.C. 2302(9)). * * * * * PART 204·ADMINISTRATIVE AND INFORMATION MATTERS 3. Amend section 204.1202 by· a.

), which prohibits agencies from procuring or obtaining, renewing a contract to procure or obtain, or using an IoT device if the agency's Chief Information Officer determines in certain situations that the use of such a device prevents compliance with NIST SP 800-213. The rule advises contracting officers at 39.X03-1(b) of the prohibition and how the prohibition may be waived by the head of the agency if certain criteria are met. B. FIS Using Cloud Computing Services When acquiring services to develop, implement, operate, or maintain a FIS (printed page 68405) using cloud computing services, agencies will identify the FIPS Publication 199 impact level and the corresponding Federal Risk and Authorization Management Program (FedRAMP) authorization level for all applicable cloud computing services in the contract. Safeguards, controls, and maintenance of certain systems within

the United States. Paragraph (c) of the clause 52.239-XX requires contractors to implement and maintain the security and privacy safeguards and controls in accordance with the FedRAMP level specified by the agency, engage in continuous monitoring activities, and provide continuous monitoring deliverables as required for FedRAMP approved capabilities. More information on these deliverables can be found in the "FedRAMP Continuous Monitoring Strategy Guide" at https://www.fedramp.gov/assets/resources/documents/CSP_Continuous_Monitoring_Strategy_Guide.pdf. Additionally, paragraph (c) specifies that, when a system is categorized as having FIPS Publication 199 high impact, contractors must maintain within the United States or its outlying areas (see FAR 2.101) all Government data that is not physically located on U.S. Government premises, unless otherwise specified in the contract. Government data. Paragraph (f) of the clause 52.239-XX requires contractors to provide and dispose of Government data and Government-related data in the manner and format specified in the contract. Contractors must also provide confirmation to the contracting officer that such data has been disposed of in accordance with contract closeout procedures. Other protections.

) If the USG agency does not approve the disclosure of the information related to the proposed classified visit, it will deny the classified visit request. The USG agency will advise the requesting government and the contractor to be visited of the reason for the denial. (2) The contractor may accept the visitor(s), but only information that is in the public domain may be disclosed during the classified visit. (C) Non-sponsorship. The USG agency will decline to render a decision on a classified visit request that is not in support of a USG program. The USG agency will furnish a declination notice indicating that the classified visit is not USG-approved (i.e., the classified visit is non-sponsored) to the requesting foreign government with an information copy to the U.S. contractor to be visited. (1) A declination notice does not preclude the classified visit, provided the contractor has, or obtains, an export authorization for the information involved and, has been notified that the requesting foreign government has provided the required security assurance of the proposed visitor to the USG agency in the original classified visit request. (2) It is the contractor's responsibility to consult applicable export regulations to determine licensing requirements regarding the disclosure of export-controlled information during such classified visits by foreign nationals. (D) Visits to subsidiaries. A classified visit request authorization for a classified visit to any element of a corporate family may be used for visits to other divisions or subsidiaries within the same corporate family in accordance with § 117.15(h)(3), provided disclosures are for the same purpose and the information to be disclosed does not exceed the parameters of the approved classified visit request. (E) Long-term classified visits and assignments of foreign nationals. Extended classified visits and assignments of foreign nationals to contractor locations can be authorized only when it is essential pursuant to a contract or government agreement (e.g., joint venture, liaison representative to a joint or multinational program, and direct commercial sale). The contractor will: (1) Consult with its empowered official for guidance. (2) Notify the CSA in advance of all long-term classified visits and assignments of foreign nationals. (3) Provide the CSA with a copy of the approved classified visit authorization or the USG export authorization. (4) Control of foreign visitors to U.S. contractors. (i) Contractor. The contractor will: (A) Establish procedures to ensure that foreign visitors are not afforded access to classified information except as authorized by an export license, approved visit request, or other exemption to the licensing requirements. (B) Not inform the foreign visitor of the scope of access authorized or of the limitations imposed by the government. (ii) Foreign visitors.

Privacy requesters are a diverse community, including lawyers, industry professionals, reporters, and members of the public. Costs for these requestors can include the time required to research the current Privacy rule for each component and the time and preparation required to submit a request/appeal. DoD Privacy subject matter experts estimate that 40% of Privacy requests to DoD may involve consultation of the Code of Federal Regulations and the department's several privacy regulations. DoD estimates the consolidation to one privacy regulation will save those referring to the CFR for Privacy guidance approximately 30 minutes of research, review, and compliance time. For purposes of estimating opportunity costs, DoD subject matter experts deemed it reasonable to use the average of a lawyer's/judicial law clerk's mean hourly wage (\$66.44/hour), as informed by the Bureau of Labor and Statistics, and the 2016 federal minimum wage (\$9/hour) to approximate an hourly wage for an average requester. That rate is \$37.72/hour. Through this consolidation, DoD expects to save the requester community at least \$63,686 annually, as reflected in the chart below using FY 2016 data (annualized costs over perpetuity at a 7 percent discount rate is \$63,686; present value costs

is -\$909,800). The cost savings anticipated by the repeal of the DoD Component rules are accounted for in this rulemaking and will not be separately noted in the individual repeal actions. (printed page 14729) Rule Component # 2016 access & amdmnt requests × 40% of privacy requests × Time per request (minutes) × Hourly wage of requester = Projected cost savings to public 311 OSD/JS 2,530 × 40 × 30 × \$37.72 = \$19,086.32 312 DoDIG 196 × 40 × 30 × 37.72 = 1,478.62 313 CJCS/JS 0 × 40 × 30 × 37.72 = 0.00 314 DARPA 0 × 40 × 30 × 37.72 = 0.00 315 USUHS 0 × 40 × 30 × 37.72 = 0.00 316 DISA 65 × 40 × 30 × 37.72 = 490.36 317 DCAA 10 × 40 × 30 × 37.72 = 75.44 318 DTRA 9 × 40 × 30 × 37.72 = 67.90 319 DIA 99 × 40 × 30 × 37.72 = 746.86 320 NSA/CSA 206 × 40 × 30 × 37.72 = 1,554.06 323 DLA 431 × 40 × 30 × 37.72 = 3,251.46 324 DFAS 261 × 40 × 30 × 37.72 = 1,968.98 326 NRO 18 × 40 × 30 × 37.72 = 135.79 327 DeCA 16 × 40 × 30 × 37.72 = 120.70 329 NGB 126 × 40 × 30 × 37.72 = 950.54 505 Army 2834 × 40 × 30 × 37.72 = 21,379.70 701 DON 1055 × 40 × 30 × 37.72 = 7,958.92 806b AF 541 × 40 × 30 × 37.72 = 4,081.30 Total 63,686.45 Changes Made in the DOD Privacy Program Final Rule After publishing the proposed rule, 'Department of Defense Privacy Program,' on September 13, 2018 (83 FR 46542), DoD published on October 17, 2018 a new system of records notice for the Personnel Vetting Records System, DUSDI 02-DoD (83 FR 52420), and a corresponding interim final rule (83 FR 52317

As stated by the Health Care Industry Cybersecurity Task Force in its 2017 report on the state of cybersecurity in health care: 'The health care system cannot deliver effective and safe care without deeper digital connectivity. If the health care system is connected, but insecure, this connectivity could betray patient safety, subjecting them to unnecessary risk and forcing them to pay unaffordable personal costs.' [137] In the event of a cybersecurity incident, patients' health, including their lives, may be at risk where such incident creates impediments to the provision of health care, such as interference with the operations of a critical medical device, or to the administrative or clinical operations of a regulated entity, such as preventing the scheduling of appointments or viewing of an individual's health history. [138] According to a Cybersecurity & Infrastructure Security Agency (CISA) statistical analysis of the effects of a hypothetical cyberattack on a model hospital, a hospital's relative performance will suffer amidst a cyberattack. [139] The analysis found that the hypothetical cyberattack would lead to hospital strain from inaccessible patient schedules and records, disrupted communication, and delays in processing and communicating test results in time to effectively treat individuals. [140] While the analysis did not find any deaths directly attributable to the hypothetical attack, it is logical to conclude that deaths or at least worsened outcomes are a significant risk where there are disruptions in communications, as well as delays in processing and communicating test results, especially for emergent or acute medical cases. For example, an inability to access an individual's pharmacy records could affect the ability of a pharmacist to identify known interactions between newly prescribed medications and an existing medication list, potentially leading to an individual's injury or death. Other studies have similarly found that cyberattacks can have a substantial effect on access to health care, and potentially mortality. [141] In fact, a more recent study found that cyberattacks had disproportionately negative effects on in-hospital mortality rates for Black patients who were already admitted to the hospital at the time of the cyberattack. [142] A recent survey found that 92 percent of surveyed health care organizations had experienced a cyberattack in the past year [143] and almost three-quarters of the respondents who had experienced a cyberattack reported negative effects on patient care, including delays in tests or procedures, longer stays, and increased mortality rates complications from medical procedures, and patient transfers or diversions to other facilities. [144] A recent letter from NCVHS referenced anecdotal accounts of patient deaths that have been attributed to ransomware attacks. [145]

Commingleing of RD, FRD, and TFNI with NSI in the same document should be avoided to the greatest degree possible. When mixing this information cannot be avoided, the marking requirements in 10 CFR part 1045 , section 140(f) and declassification requirements of 10 CFR part 1045 , section 155 apply. (10) Protection of RD and FRD. Most of the protection requirements for RD and FRD are similar to NSI and are based on the classification level. However, there are some protection requirements for certain RD information that may be applied through specific contract requirements by the GCA. These range from distribution limitations through the limitation of access to specifically authorized individuals to specific storage requirements, including the requirement for

IDSS, and additional accountability records. (i) Any DOE contractor that violates a classified information security requirement may be subject to a civil penalty under the provisions of 10 CFR part 824. (ii) Certification is required for individuals authorized access to specific Sigma categories, as appropriate. Address questions regarding these requirements to DOE's National Nuclear Security Administration, Office of Defense Programs. (iii) Storage and distribution requirements are determined by the classification level, category, and Sigma category. Sigma designation is not a requirement for all RD documents. Storage and distribution requirements will be dependent only on classification level and category. (11) Accountability. In addition to TOP SECRET information, some SECRET RD information is considered accountable (e.g., specific Sigma 14 matter). Each nuclear weapon data control point will keep a record of transactions involving Secret nuclear weapon data documents under its jurisdiction including origination, receipt, transmission, current custodian, reproduction, change of classification, declassification, and destruction. (12) Cybersecurity. Classified databases, systems, and networks containing RD and FRD are protected under the requirements developed and distributed by the DOE Office of the Chief Information Officer. (f) NNPI. NNPI is information associated with the Naval Nuclear Propulsion Program and is governed by Office of the Chief of Naval Operations (printed page 83363) Instruction (OPNAVINST) N9210.3, 'Safeguarding of Naval Nuclear Propulsion Information' (available at: [https://www.secnav.navy.mil/doni/Directives/09000%20General%20Ship%20Design%20and%20Support/09-200%20Propulsion%20Plants%20Support/N9210.3%20\(Unclas%20Portion\).pdf](https://www.secnav.navy.mil/doni/Directives/09000%20General%20Ship%20Design%20and%20Support/09-200%20Propulsion%20Plants%20Support/N9210.3%20(Unclas%20Portion).pdf)). Naval Reactors, a joint DOE/Department of Navy organization established under 50 U.S.C. 2406 and 2511

<https://www.hhs.gov/sites/default/files/ocr/privacy/hipaa/administrative/securityrule/techsafeguards.pdf?language=es>. Back to Citation 344. The Department previously acknowledged that information transmitted by a telephone voice response system in response to a telephone request, and some voice technology digitally produced from an information system and transmitted by telephone are both covered by this definition. See 68 FR 8334, 8342 (Feb. 20, 2003); 75 FR 40868, 40874 (July 14, 2010); and 78 FR 5566, 5575 (Jan. 25, 2013). Back to Citation 345. 78 FR 5566, 5575-5576 (Jan. 25, 2013). (c) NIST SP 800-37, titled 'Risk Management Framework for Information Systems and Organizations: A System Life Cycle Approach for Security and Privacy', Revision 2 (NIST SP 800-37 R2), describes the Risk Management Framework (RMF) and provides guidelines for applying the RMF to information systems and organizations. The RMF provides a disciplined, structured, and flexible process for managing

security and privacy risk that includes information security categorization; control selection, implementation, and assessment; system and common control authorizations; and continuous monitoring. The RMF includes activities to prepare organizations to execute the framework at appropriate risk management levels. The RMF also promotes near real-time risk management and ongoing information system and common control authorization through the implementation of continuous monitoring processes; provides senior leaders and executives with the necessary information to make efficient, cost-effective, risk management decisions about the systems supporting their missions and business functions; and incorporates security and privacy into the system development life cycle. Executing the RMF tasks links essential risk management processes at the system level to risk management processes at the organization level. In addition, it establishes responsibility and accountability for the controls implemented within an organization's information systems and inherited by those systems. This document is incorporated by reference as a source for definitions. (d) NIST SP 800-39, titled "Managing Information Security Risk: Organization, Mission, and Information System View," March 2011 (NIST SP 800-39 Mar2011), provides guidance for an integrated, organization-wide program for managing information security risk to organizational operations (i.e., mission, functions, image, and reputation), organizational assets, individuals, other organizations, and the Nation resulting from the operation and use of Federal information systems. NIST SP 800-39 Mar2011 provides a structured, yet flexible approach for managing risk that is intentionally broad-based, with the specific details of assessing, responding to, and monitoring risk on an ongoing basis provided by other supporting NIST security standards and guidelines. The guidance provided in this publication is not intended to replace or subsume other risk-related activities, programs, processes, or approaches that organizations have implemented or intend to implement addressing areas of risk management covered by other legislation, directives, policies, programmatic initiatives, or mission/business requirements. Rather, the risk management guidance described herein is complementary to and should be used as part of a more comprehensive Enterprise Risk Management (ERM) program. This document is incorporated by reference as a source for definitions.

3.7.1 Global | 3. 3.7.1 Global by Data Base ; In this scheme, each data base is assigned a classification equal to that of the most sensitive data it contains.

(Comment 45) Several comments state that, although retailers will not be required to keep track of foods sold to consumers, retailers will be required to keep records on those immediate subsequent recipients who are wholesalers or other retailers. The comments add that, unless the recordkeeping exclusion applies to all foods that are sold from the store, it is essentially meaningless. Food retailers do not know whether a person who comes into a store and buys food will be using the food for personal consumption or for a business purpose. To cover the possibility that a purchase was intended for business purposes would essentially require a retailer to record all consumer transactions. The comments state that this would not increase food security or consumer confidence. The comments also state that the trust of consumers is of tantamount importance and requiring documentation of all consumer transactions will diminish that trust without furthering the goal of food security. (Response) Although retailers must keep records of immediate subsequent recipients of food who are not consumers, retailers are not required to do so unless that information is reasonably available, for example, when the purchaser has an existing commercial account. (See response to comment 38 of this document.) Retailers need not ask the status of each purchaser, and retailers will not be required to record every consumer transaction. Under § 1.327(e) of this final rule, persons who operate retail food establishments that distribute food to persons who are not consumers are subject to all of the requirements in subpart J of this final rule. However, the requirements in § 1.345 of this final rule to establish and maintain records to identify the nontransporter and transporter immediate subsequent recipients that are not consumers applies as to those transactions only, and only to the extent the information is reasonably available. FDA notes that there is an exclusion with respect to food that is manufactured, processed, packed, held, received, or transported for personal consumption. Such activities are excluded from the rule because if a traceback or trace forward investigation is necessary, FDA can learn from sickened consumers the sources of the food they purchased, or notify consumers generally about food that presents a threat. Whether food is for personal consumption depends on many factors, but FDA would consider food prepared in a private home and transported for other than business purposes to qualify for this exclusion. An example of food covered by this exclusion includes food prepared for "pot luck" suppers.

Section 170.4 includes acronyms and definitions used in the rule text and can be used as a reference

while reading the text and tables. CMMC introduces new terms and associated definitions, and customizes definitions for existing terms, as applied to the CMMC Program. CMMC-custom terms and definitions are clearly marked to distinguish from terms sourced externally. CMMC also utilizes terms created by other authoritative sources, including NIST. Terms from other authoritative sources are also listed in § 170.4 and are properly sourced. The Department developed the following CMMC-custom terms to enhance understanding of the requirements and elements of the CMMC Program and welcomes comments on these definitions as part of the proposed rule: Accreditation Accreditation Body Assessment Self-Assessment CMMC Level 2 Certification Assessment CMMC Level 3 Certification Assessment Assessment Findings Report Assessment Team Asset Categories Authorized CMMC Assessment and Certification Ecosystem CMMC Assessment Scope CMMC Assessor and Instructor Certification Organization (CAICO) CMMC instantiation of eMASS CMMC Level 1 Self-Assessment CMMC Level 2 Conditional Certification Assessment CMMC Level 2 Conditional Self-Assessment CMMC Level 2 Final Certification Assessment CMMC Level 2 Final Self-Assessment CMMC Level 3 Conditional Certification Assessment CMMC Level 3 Final Certification Assessment CMMC Third-Party Assessment Organization (C3PAO) Contractor Risk Managed Assets Controlled Unclassified Information (CUI) Assets External Service Provider (ESP) Federal Contract Information (FCI) Assets Organization-Defined Organization Seeking Assessment (OSA) Organization Seeking Certification (OSC) Out-of-Scope Assets Periodically Process, store, or transmit Restricted Information Systems Security Protection Assets Specialized Assets Test Equipment. Section 170.5-Policy Section 170.5 addresses the policy underlying the rule. The protection of FCI and CUI on defense contractor information systems is crucial to the continuity of the missions and functions of the DoD. To that end, this rule requires that contractors and subcontractors implement the specified security requirements for the applicable CMMC Level. For CMMC Level 3, safeguards defined in NIST SP 800-172 and DoD-specified parameters (see table 1 to § 170.14(c)(4)) may be required. Program Managers and requiring activities identify the applicable CMMC Level. Factors used to determine which CMMC Level will be applied are included but not limited to the list found in § 170.5(b)(1-5). CMMC Program requirements will flow down to subcontractors, as applicable (see § 170.23). A DoD Service Acquisition Executive or a Component Acquisition Executive may elect to waive inclusion of CMMC Program requirements in a solicitation or contract.

- NIST continued the Journey to Cybersecurity Framework (CSF) 2.0 by releasing a CSF 2.0 Concept Paper, publishing a discussion draft of the CSF 2.0 Core, and issuing a draft CSF 2.0 with Core Implementation examples. Additionally, NIST published an analysis of comments received on each draft and hosted two hybrid workshops (1 st workshop & 2 nd workshop). - NIST continued to lead and support community engagement on cybersecurity supply chain risk management through the Software and Supply Chain Assurance (SSCA) Forum, support the Federal Acquisition Security Council, and refine supply-chain guidance in SP 800-161 Revision 1, Cybersecurity Supply Chain Risk Management Practices for Systems and Organizations . - NIST issued a working draft of the SP 800-55 Rev. 2, Performance Measurement Guide for Information Security for community discussion and feedback and hosted a cybersecurity measurement workshop on the current state of cybersecurity performance measurement, needs, and path forward. - NIST initiated updates to the Protecting Controlled Unclassified Information (CUI) Series, issued a pre-call for comment, released an initial public draft of SP 800-171r3, Protecting Controlled Unclassified Information in Nonfederal Systems and Organizations, and hosted a webinar to provide an overview of the draft. - NIST launched the Cybersecurity & Privacy Reference Tool (CPRT) - an online application that provides NIST guidance and frameworks in a consistent format for reference data and allows users to understand the relationships between NIST resources. - NIST continued the development of the Open Security Controls Assessment Language (OSCAL) - a set of eXtensible Markup Language (XML), JavaScript Object Notation (JSON), and Ain't Mark-up Language (YAML) formats that provide machine-readable representations of security and privacy information relative to the implementation, assessment, and continuous monitoring of systems.

It includes, but is not limited to: · configuration data required to operate a security protection asset, Additional Guidance on Level 2 Scoping CMMC Assessment Scope · Level 2 | Version 2.13 6 · log files generated by or ingested by a security protection asset, · data related to the configuration or vulnerability status of in-scope assets, and · passwords that grant access to the in-scope environment. Table 2. Security Protection Asset Examples Asset Type Security Protection Asset Examples People · Consultants who provide cybersecurity service · Managed service provider personnel who implement system maintenance · Enterprise network administrators Technology · Cloud-based security solutions · Hosted Virtual Private Network (VPN) services · SIEM solutions Facilities

· Co-located data centers · Security Operations Centers (SOCs) · OSA office buildings In addition, the OSA is required to: · document each asset in an asset inventory; there is no requirement to embed each asset in the SSP; · document the treatment of these assets in the SSP; and · provide a network diagram of the CMMC Assessment Scope (to include these assets) to facilitate scoping discussions during the pre-assessment. Contractor Risk Managed Assets Contractor Risk Managed Assets are not intended to , but are capable of processing, storing, or transmitting CUI because of the security policy, procedures, and practices in place. Contractor Risk Managed Assets are not required to be physically or logically separated from CUI Assets. Contractor Risk Managed Assets are part of the Level 2 CMMC Assessment Scope. These assets are managed using the OSA's risk-based information security policy, procedures, and practices. Furthermore, the assets must be assessed against CMMC requirements if insufficiently documented in the SSP or if the OSA's risk-based security policies, procedures, and practices documentation or other findings raise questions about these assets . In these cases, the assessor can conduct a limited check to identify deficiencies. In addition, the OSA is required to: · document each asset in an asset inventory; there is no requirement to embed each asset in the SSP; · document the treatment of these assets in the SSP; and

A regulated entity may be able to improve the control and review of the use of administrative access privileges, such as through a privileged access management system, to understand how privileged accounts are used within its environment and help detect and prevent the misuse of privileged accounts. [702] The proposed implementation specification would require a regulated entity to separate the unique user identities required by the implementation specification for unique user identification based on the type of access privileges used by a specific unique user. For example, the adoption of health IT that is certified through the ONC Health IT Certification Program as having the technical capability to establish user permissions for accessing, and performing actions with, electronic health information based on unique identifiers may contribute to a regulated entity's compliance with the proposed new implementation specification for administrative and increased access privileges, should the proposal be finalized. [703] This proposed new implementation specification aligns with the Department's essential CPG for Separate User and Privileged Accounts by addressing the separation of privileged or administrator access rights from common user accounts. [704] Additionally, the Department proposes to redesignate the implementation specification for emergency access procedures at 45 CFR 164.312(a)(2)(ii) as proposed 45 CFR 164.312(a)(2)(iii) and to modify it to require a regulated entity to establish both written procedures and technical procedures for obtaining necessary ePHI during an emergency and to implement them as needed. For example, we note that the adoption of health IT that is certified through the ONC Health IT Certification Program as having the technical capability to permit an identified set of users to access electronic health information during an emergency may contribute to a regulated entity's compliance with the proposed implementation specification for emergency access procedures, should the proposal be finalized. [705] Under the Department's proposal, the implementation specification for automatic logoff at 45 CFR 164.312(a)(2)(iii) would be redesignated as proposed 45 CFR 164.312(a)(2)(iv) and modified to require a regulated entity to deploy technical controls that terminate an electronic session after a period of inactivity. Deploying a mechanism to automatically terminate an electronic session after a period of inactivity reduces the risk of unauthorized access when a user forgets or is unable to terminate their session. [706] Failure to deploy automatic logoff not only increases the risk of unauthorized access and potential alteration or destruction of ePHI; it also impedes an organization's ability to properly investigate such unauthorized access because it would appear to originate from an authorized user. [707]

(t) The Provost Marshal General is authorized to act on all requests for provost marshal activities and law enforcement functions for the Army, all matters relating to police intelligence, physical security, criminal investigations, corrections and internment (to include confinement and correctional programs for U.S. prisoners, criminal investigations, provost marshal activities, and military police support. The Provost Marshal General is responsible for the Office of Security, Force Protection, and Law Enforcement Division and is the functional proponent for AR 190-series (Military Police) and 195-series (Criminal Investigation), AR 630-10 Absent Without Leave, Desertion, and Administration of Personnel Involved in Civilian Court Proceedings, and AR 633-30, Military Sentences to Confinement. (u) The Commander, U.S. Army Criminal Investigation Command, is authorized to act on requests for criminal investigative records of USACIDC headquarters, and its subordinate activities, and military police reports. This includes criminal investigation records, investigation-in-progress records, and all military police records and reports that result in

criminal investigation reports. This authority has been delegated to the Director, U.S. Army Crime Records Center. (v) The Commander, U.S. Army Human Resources Command, is authorized to act on requests for military personnel files relating to active duty personnel including, but not limited to military personnel matters, military education records including records related to the removal or suspension from a military school or class; personnel locator, physical disability determinations, and other military personnel administration records; records relating to military casualty and memorialization activities; heraldic activities, voting, records relating to identification cards, naturalization and citizenship, commercial solicitation, Military Postal Service Agency and Army postal and unofficial mail service. The Commander, U.S. Army Human Resources Command, is also authorized to act on requests concerning all personnel and medical records of retired, separated, discharged, deceased, and reserve component military personnel, unless such records clearly fall within another Denial Authority's authority. (w) The Commander, U.S. Army Resources Command-St. Louis has been delegated authority to act on behalf of the U.S. Army Human Resources Commander for requests concerning all personnel and medical records of retired, separated, discharged, deceased, and reserve component military personnel, unless such records clearly fall within another Denial Authority's authority. The authority does not include records relating to USAR plans, policies, and operations; changes in the organizational status of USAR units, mobilization and demobilization policies; active duty tours, and the individual mobilization augmentation program.

The primary purpose of the DIB CS/IA program is to share cyber security information to promote more effective cyber security, not only for the DIB, but also for the DoD and U.S. Government. The program contains numerous information handling and sharing restrictions, applicable to both the Government and DIB participants, to safeguard against any unauthorized collection, use, or dissemination of such information. However, the program does not limit the Government's ability to conduct lawful activities, including law enforcement, counterintelligence activities, or other activities in the interest of U.S. national security (§ 236.6(d)). No change is made to the rule.

Comment: One comment recommended that the rule incorporate privacy protections of the National Cyber Security Division's Joint Cybersecurity Services Pilot (JCSP). Response: The detailed processes summarized in the PIA for the DIB CS/IA program are comprehensive and ensure appropriate safeguards for PII provided by DIB participants in a similar manner as described in the PIA prepared for the Department of Homeland Security's JCSP. No change is made to the rule. Comment: One comment stated the interim rule should be amended to impose fines on private companies that intentionally or negligently disclose excessive PII. Response: It is not clear what the commenter meant by the term "excessive PII." As discussed above, the DIB CS/IA program only receives PII in two ways: (i) For program administration and management purposes; and (ii) for cyber incident response and analysis purposes. In both cases, DIB companies share information only when it is relevant for those authorized purposes. In addition, DIB companies are prohibited from sharing any information, including PII, unless they have determined that it has been lawfully collected and is authorized to be shared with the Government. If it were to appear that a company is reporting excessive information not relevant to the program, the Government would seek to work with the company to clarify the sharing guidelines and support the company's efforts to refine its processes to implement more effective limits on sharing unnecessary information. If, despite these efforts, a company continued to share information that the Government deemed inappropriate within the scope of the program, the Government would take appropriate actions on a case by case basis, including potentially terminating the information sharing relationship with that participant. This is a voluntary program and fines are not part of the program. No change is made to the rule. Comment: Two comments recommended changes to the definitions of cyber incident, compromise and threat. Response: The rule leverages established definitions to the maximum extent possible. The source for the definition of "compromise", "cyber incident" and "threat" are from the Committee on National Security Systems Instruction No. 4009, "National Information Assurance Glossary," (

108 If a comparable report meets the requirements of what is to be included in an assessment report (e.g., a report generated from a security or privacy management and reporting tool), then the comparable report would constitute the assessment report. NIST SP 800-37, REVISION 2 RISK MANAGEMENT FRAMEWORK FOR INFORMATION SYSTEMS AND ORGANIZATIONS A System Life Cycle Approach for Security and Privacy

the organization updates security and privacy plans, security and privacy assessment reports, and plans of action and milestones on an on going basis. Updates to the plans reflect modifications to controls based on risk mitigation activities carried out by system owners or common control providers. Updates to control assessment reports reflect additional assessment activities carried out to determine control effectiveness based on implementation details in the plans. Plans of action and milestones are updated based on progress made on the current outstanding items; address security and privacy risks discovered as part of control effectiveness monitoring; and describe how the system owner or common control provider intends to address those risks. The updated information raises awareness of the security and privacy posture of the system and the common controls inherited by the system, thereby, supporting near real-time risk management and the ongoing authorization process. The frequency of updates to risk management information is at the discretion of the system owner, common control provider, and authorizing officials in accordance with federal and organizational policies and is consistent with the organizational and system-level continuous monitoring strategies. The updates to information regarding the security and privacy posture of the system and the common controls inherited by the system are accurate and timely since the information provided influences ongoing actions and decisions by authorizing officials and other senior leaders within the organization. The use of automated support tools and organization-wide security and privacy program management practices ensure that authorizing officials can readily access the current security and privacy posture of the system. Ready access to the current security and privacy posture supports continuous monitoring and ongoing authorization and promotes the near real-time management of risk to organizational operations and assets, individuals, other organizations, and the Nation. Organizations ensure that information needed for oversight, management, and auditing purposes is not modified or destroyed when updating security and privacy plans, assessment reports, and plans of action and milestones. Providing an effective method to track changes to systems through configuration management procedures is necessary to achieve transparency and traceability in the security and privacy activities of the organization; to obtain individual accountability for any security or privacy actions; and to understand emerging trends in the security and privacy programs of the organization. References: [SP 800-30]; [SP 800-53A].

SECURITY AND PRIVACY REPORTING Task M-5 Report the security and privacy posture of the system to the authorizing official and other organizational officials on an ongoing basis in accordance with the organizational continuous monitoring strategy. Potential Inputs: Security and privacy assessment reports; plans of action and milestones; organization- and system-level risk assessment results; organization- and system-level continuous monitoring strategy; security and privacy plans; Cybersecurity Framework Profile. Expected Outputs: Security and privacy posture reports.¹⁰⁹ Primary Responsibility: System Owner; Common Control Provider; Senior Agency Information Security Officer; Senior Agency Official for Privacy. Supporting Roles: System Security Officer; System Privacy Officer. System Development Life Cycle Phase: New · Operations/Maintenance. Existing · Operations/Maintenance. ¹⁰⁹ If a comparable report meets the requirements of what is to be included in a security or privacy posture report (e.g., a report generated from a security or privacy management and reporting tool), then the comparable report would constitute the posture report.

. All executive agencies are required to comply with the same standards for protection of FCI and CUI in those regulations. Once attained, a current CMMC certification may be presented for consideration by any entity (including other government agencies) as an indicator that the security requirements associated with the certificate level (e.g., CMMC Level 2) have in fact been implemented. CMMC Program requirements are designed to ensure compliance with existing standards for protection of FCI and CUI and align directly to NIST guidelines (e.g., NIST SP 800-171 R2) and the basic safeguarding requirements of FAR clause 52.204-21 that apply to all executive agencies. Regulations issued by any executive agency must be aligned to these overarching requirements, therefore CMMC Program requirements will not conflict with any FCI or CUI safeguarding regulations that may be issued by other agencies as cited by the commenter. All executive agencies are permitted to submit and review comments as part of the formal rulemaking process, and additional coordination is not required. This rule provides a consistent way of verifying contractors' compliance with the referenced FAR and NIST requirements, in addition to those from NIST SP 800-172 Feb2021 where applicable. b. Requests To Recognize Alternate Standards Comment: Several commenters requested the rule be modified to accept or recognize alternate standards for the purpose of meeting CMMC assessment requirements. Some small to medium businesses recommended acceptance of healthcare relevant standards or other recognized certification frameworks as a substitute for CMMC and FedRAMP Equivalency. Another comment cited verbiage in the DFARS clause 252.204-7012 clause

that references DoD CIO approval to vary from NIST SP 800-171 requirements as rationale for revising the CMMC rule to permit acceptance of other standards such as the NERC Critical Infrastructure Protection standards which apply to North America's Bulk Electric System (BES). Some comments expressed concern that absent greater acceptance of the standards required by other agencies, companies complying with CMMC would be at a competitive disadvantage due to the perceived costs of complying with CMMC standards. Another comment expressed a similar concern but cited the need for acceptance of foreign C3PAOs to effectively scale CMMC to include assessment of foreign OSCs. (printed page 83147) Response: CMMC Program requirements apply to those contractors that seek to bid for DoD work which requires processing, storing, or transmitting FCI or CUI in a contractor owned information system. Section 170.20 addresses Standards Acceptance and delineates the only existing bases for accepting alternate standards in this rule. The DoD does not currently have standards acceptance with other Federal entities in lieu of the CMMC requirement.

And with the exception of publications that analyze the Security Rule, NIST's guidance does not specifically address the security of ePHI. CISA has issued cross-sector CPGs, but it is not ANSI-accredited. There may be other organizations that have set standards for the transmission of particular information, such as the secure transmission of images, but adopting such individual standards would not meet the Department's criteria. In this case, adoption of such standard would be far too granular and require the Department to revise the Security Rule at the same interval as the particular standard, which may be irregular. Additionally, given that the Department is limited to modifying each standard or implementation specification no more frequently than once every 12 months, this approach would be inefficient and could lead to a requirement that the Department update the Security Rule more than once a year, depending on when such individual standards or implementation specifications are revised. Even modifying the standards annually would require a significant investment of Department resources, not to mention the investment required of regulated entities to comply with an ever-changing set of requirements. Additionally, in 2021, Congress amended the HITECH Act to require the Secretary to consider whether a regulated entity has adequately demonstrated that it had in place recognized security practices for a certain period of time. [329] Congress defined 'recognized security practices' to include certain NIST publications; the approaches promulgated under (printed page 921) section 405(d) of the Cybersecurity Act of 2015; and other programs and processes that address cybersecurity and that are developed, recognized, or promulgated through regulations under other statutory authorities. [330]

- NICE released the National K12 Cybersecurity Education Roadmap with five major elements and accompanying strategies. - The NICE Community Coordinating Council launched five project teams that each support objectives from the NICE Strategic Plan. - NICE launched the Cybersecurity Apprenticeship Finder and supported a 120-Day Cybersecurity Apprenticeship Sprint in partnership with the U.S. Department of Labor. - A report, 'Measuring Cybersecurity Workforce Capabilities: Defining a Proficiency Scale for the NICE Framework', was submitted to Congress. - In response to the FY 2021 National Defense Authorization Act, NICE submitted a report to Congress on cybersecurity proficiencies and published cybersecurity career pathways information. - The Small Business Cybersecurity Corner released a series of videos with companion discussion guides on ransomware, phishing, and multi-factor authentication. - NIST continued to bring together the community through events, including the Federal Cybersecurity Workforce Summit and Webinars, Federal Information Security Educators (FISSEA) Forums, NICE Webinar Series, Cybersecurity Career Awareness Week, and by supporting the NICE Conference, NICE K12 Conference, and US Cyber Games through cooperative agreements.

<https://www.archives.gov/files/isoo/oversight-groups/nisp/2014-suitability-and-processes-report.pdf>). This review assessed USG policies, programs, processes, and procedures involving determinations of federal employee suitability, contractor fitness, and personnel security. The interagency working group also evaluated the collection, sharing, processing, and storage of information used to make suitability, credentialing, and security decisions. It found the need for better information sharing, increased oversight over background investigations, and consistent application of standards and policies for both Federal employees and contractors. The report identified 13 recommendations to improve how the Government performed suitability determinations and security clearances and the creation of SEAD 3 is a partial response to recommendation A.2. SEAD-3 requires enhanced additional reporting of foreign travel, foreign contacts and conduct/behavior that might jeopardize an individual from maintaining access or eligibility to access classified

information. Many of the requirements are a direct result of recent national security breaches by trusted insiders who have disclosed classified information to news media or foreign entities causing significant harm to the interests of the United States. SEAD 3 was designed to strengthen the safeguarding of national security equities, such as national security information, personnel, facilities, and technologies. These reporting requirements are important because individuals who incur a continuing security obligation need to be aware of the risks associated with foreign intelligence operations and/or possible terrorist activities directed against them in the U.S. and abroad, and to be aware they possess or have access to information that is highly sought after by foreign adversaries and competitors, including, but not limited to: Classified or sensitive information vital to national and economic security Emerging technologies and pioneering research and development Information relating to critical infrastructure sectors Proprietary secrets Security or counterintelligence information In particular, the risk of becoming an intelligence target increases greatly during foreign travel, be it for official or unofficial purposes. NISP Contractor cleared personnel can become the target of a foreign intelligence or security service at any time in any country. (printed page 83309) Collecting additional information on travel will help ensure basic counterintelligence awareness is implemented to effectively protect both the individual and the USG against foreign attempts to collect sensitive, proprietary, or classified information. Such measures could include arranging a pre-travel briefing from the entity Facility Security Officer. Reminders include, but are not limited to the following, which can be provided to:

This rule codifies the CMMC Program, elements of which are reflected in the CMMC Model. All CMMC Model requirements are derived from FAR 52.204-21, NIST SP 800-171 Rev 2, and NIST SP 800-172, which are configuration-controlled guidelines managed by NIST. As a result of the alignment of CMMC to NIST guidelines, the Department's requirements will continue to evolve as changes are made to the underlying NIST SP 800-171 Rev 2 and NIST SP 800-172 security requirements. Additional rulemaking may be necessary in the future to conform CMMC requirements described in this rule to any changes to the underlying information protection requirements defined in the foundational NIST guidelines.

Comment: Many comments were received requesting changes to CMMC Model 1.0. Several commenters requested changes to CMMC Level requirements and others had questions about the content and handling of CMMC Model updates. A few commenters made suggestions for restricting the current implementation, such as using only NIST SP 800-171 Rev 2 for the CMMC 1.0 implementation of Level 1-3 requirements and supplementing with additional requirements only in Levels 4 and 5. Similar comments recommended using NIST SP 800-171 Rev 2 for the initial CMMC rollout and later expanding to include additional CMMC requirements. A number of comments questioned the purpose and use of the CMMC 1.0 implementation of CMMC Level 2. Other comments requested information on updating CMMC requirements as new technology and threats emerge and new versions of NIST SP 800-171 Rev 2 and NIST SP 800-53 are released. Multiple comments were received on CMMC 1.0 Levels 4 and 5. Several commenters believed there to be a significant disconnect between NIST SP 800-171B/172 and CMMC 1.0 Levels 4 and 5, and issues with implementation of these levels. Many comments requested that Levels 4 and 5 be updated to allow for flexibility in implementation rather than require all the requirements as written. Reasons cited for allowing flexibility include reducing cost and assessment complexity as well as allowing for the ability to adapt based on architectural environments and dynamic threat models. Response: Changes were made in this rule to requirements in the former CMMC model based in part upon receipt of informal public comment. The CMMC Model was streamlined to three-tiers, which align to the protection requirements set forth in FAR 52.204-21, NIST SP 800-171 Rev 2, and NIST SP 800-172, and all CMMC-unique requirements and process maturity elements have been removed. The CMMC Model and program requirements will be evaluated as new technology and threats emerge and revised as appropriate. Comment: One comment included a request to identify instances where contractors would be better off using a classified environment, rather than CMMC version 1.0 Level 4 or 5, to protect the information. Response:

A CMMC Third-Party Assessment Organization (C3PAO) is an organization authorized by the Cyber AB to conduct CMMC Level 2 certification assessments. C3PAOs must meet specific qualifications including: employing certified CMMC assessors (CCAs), maintaining their own CMMC certification, following the CMMC Assessment Process (CAP), and being listed in the Cyber AB marketplace. During a CMMC Level 2 assessment, the C3PAO team evaluates the organization's implementation of all 110 NIST SP 800-171 security requirements through document review, interviews, and technical testing.

(incorporated by reference, see §.170.2), implementing DoD specified parameters to meet CMMC Level 3 requirements (see table 1 to §.170.14(c)(4) CMMC Level 3 Requirements). These additional

requirements are necessary to protect CUI being processed, stored, or transmitted in contractor information systems, when designated by a CMMC Level 3 requirement as defined by a DoD program manager or requiring activity. In general, the Department will identify a CMMC Level 3 requirement for solicitations supporting its most critical programs and technologies. (b) Program managers and requiring activities are responsible for identifying the CMMC Level that will apply to a procurement. Selection of the applicable CMMC Level will be based on factors including but not limited to: (1) Criticality of the associated mission capability; (2) Type of acquisition program or technology; (3) Threat of loss of the FCI or CUI to be shared or generated in relation to the effort; (4) Potential for and impacts from exploitation of information security deficiencies; and (5) Other relevant policies and factors, including Milestone Decision Authority guidance. (c) In accordance with the implementation plan described in § 170.3, CMMC Program requirements will apply to new DoD solicitations and contracts, and shall flow down to subcontractors who will process, store, or transmit FCI or CUI in performance of the subcontract, as described in § 170.23. (d) In very limited circumstances, a Service Acquisition Executive or Component Acquisition Executive in the DoD may elect to waive inclusion of CMMC Program requirements in a solicitation or contract, and in accordance with all applicable policies, procedures, and requirements. In such cases, contractors and subcontractors will remain obligated to comply with all applicable cybersecurity and information security requirements. (e) The CMMC Program does not alter any separately applicable requirements to protect FCI or CUI, including those requirements in accordance with FAR 52.204-21 (48 CFR 52.204-21), Basic Safeguarding of Covered Contractor Information Systems, or covered defense information in accordance with DFARS subpart 204.73 (48 CFR 204.73), Safeguarding Covered Defense Information and Cyber Incident Reporting, or any other applicable information protection requirements. The CMMC Program provides a means of verifying implementation of the security requirements set forth in FAR 52.204-21, NIST SP 800-171 Rev 2, and NIST SP 800-172, as applicable. Subpart B-Government Roles and Responsibilities § 170.6 CMMC PMO.

, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804 . III. Regulatory Flexibility Act DoD expects that this proposed rule may have an economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601 , et seq. Therefore, an Initial Regulatory Flexibility Analysis has been prepared and is summarized as follows: This rule would affect offerors that are owned by another business entity. As such, this DFARS rule would require an offeror to represent that, if it is owned or controlled by another business entity, it has entered the CAGE code and the name of that entity. DoD made 308,286 new contract awards to contractors with approximately 55,000 unique Data Universal Numbering System (DUNS) numbers in Fiscal Year 2011. Approximately 41,000 of these awards were to small-business unique DUNS. It is estimated that approximately 5% of these small business unique DUNS are corporations under another business entity. Therefore, DoD estimates that this rule will apply to approximately 2,050 small-business unique DUNS contractors. The rule does not duplicate, overlap, or conflict with any other Federal rules. There are no significant alternatives to accomplish the stated objectives of this rule. DoD invites comments from small business concerns and other interested parties on the expected impact of this rule on small entities. DoD will also consider comments from small entities concerning the existing regulations in subparts affected by this rule in accordance with 5 U.S.C. 610 . Interested parties must submit such comments separately and should cite 5 U.S.C. 610 (DFARS Case 2011-D044) in the correspondence. IV. Paperwork Reduction Act The rule contains information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). Accordingly, DoD has submitted a request for approval of a new information collection requirement concerning Ownership of Offeror (DFARS Case 2011-D044) to the Office of Management and Budget. A. Public reporting burden for this collection of information is estimated to average 0.5 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. The annual reporting burden estimated as follows: Respondents: 308,286. Responses per respondent: 1.5. Total annual responses: 462,429. Preparation hours per response: 0.5 hours. Total response burden hours: 231,215 hours. B. Request for Comments Regarding Paperwork Burden. Written comments and recommendations on the proposed information collection, including suggestions for reducing this burden, should be sent to Ms. Jasmeet Sehra at the Office of Management and Budget, Desk Officer for DoD, Room 10236, New Executive Office Building, Washington, DC 20503, or email Jasmeet_K._Sehra@omb.eop.gov ,

of Action and Milestones PRA·Paperwork Reduction Act RM·Risk Management SAM·System for Award Management SC·System and Communications Protection SCADA·Supervisory Control and Data Acquisition SI·System and Information Integrity SIEM·Security Information and Event Management SP·Special Publication SPRS·Supplier Performance Risk System SSP·System Security Plan (b) Definitions. Unless otherwise noted, these terms and their definitions are for the purposes of this part. Access Control (AC) means the process of granting or denying specific requests to obtain and use information and related information processing services; and/or entry to specific physical facilities (e.g., federal buildings, military establishments, or border crossing entrances), as defined in FIPS 201-3 (incorporated by reference, see §·170.2). Accreditation means a status pursuant to which a CMMC Assessment and Certification Ecosystem member (person or organization), having met all criteria for the specific role they perform including required ISO/IEC accreditations, may act in that role as set forth in §·170.8 for the Accreditation Body and §·170.9 for C3PAOs. (CMMC-custom term) Accreditation Body is defined in §·170.8 and means the organization responsible for authorizing and accrediting members of the CMMC Assessment and Certification Ecosystem, as required. The Accreditation Body must be approved by DoD. At any given point in time, there will be only one Accreditation Body for the DoD CMMC Program. The current Accreditation Body is doing business as the Cyber AB at cyberab.org. (CMMC-custom term) Advanced Persistent Threat (APT) means an adversary that possesses sophisticated levels of expertise and significant resources that allow it to create opportunities to achieve its objectives by using multiple attack vectors (e.g., cyber, physical, and deception). These objectives typically include establishing and extending footholds within the information technology infrastructure of the targeted organizations for purposes of exfiltrating information, undermining or impeding critical aspects of a mission, program, or organization; or positioning itself to carry out these objectives in the future. The advanced persistent threat pursues its objectives repeatedly over an extended period-of-time, adapts to defenders' efforts to resist it, and is determined to maintain the level of interaction needed to execute its objectives, as is defined in NIST SP 800-39, (incorporated by reference, see §·170.2). Assessment means the testing or evaluation of security controls to determine the extent to which the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security requirements for an information system or organization, as defined in §·170.15 to §·170.18. (CMMC-custom term) (i) Self-Assessment

(3) In the case of material which was inadvertently released as UNCLASSIFIED, the contractor will mark and protect the notice as classified at the CONFIDENTIAL level, unless it contains additional information warranting a higher classification. The contractor will cite the applicable Contract Security Classification Specification, or equivalent, or other classification guide on the ·Derived From· line and mark the notice with an appropriate declassification instruction. (k) Dissemination of improperly marked information. If the contractor inadvertently distributes classified material without the proper classification assigned to it, or without any markings to identify the material as classified, as appropriate, the contractor will: (1) Determine whether all holders of the material are cleared and authorized access to it. (2) If recipients are authorized persons, and the contractor disseminated the information through authorized channels, promptly provide written notice to all holders of the proper classification to be assigned. The contractor will also include the classification source as well as declassification instructions in the notification. (3) Report compromises to the CSA in accordance with the provisions of §·117.8(d), if: (i) Any of the recipients of the material are not authorized persons. (ii) Any material cannot be accounted for. (iii) The material was transmitted through unauthorized channels. (printed page 83339) (l) Marking foreign government classified material. Foreign government classified information will retain its original classification markings or will be assigned a U.S. classification that provides a degree of protection at least equivalent to that required by the foreign government entity that furnished the information in accordance with 32 CFR 2001.54 . The equivalent U.S. classification and the country of origin will be marked on the front and back in English. (m) Foreign government restricted information and ·in confidence· information. (1) Some foreign governments have a fourth level of classification that does not correspond to an equivalent U.S. classification that is identified as RESTRICTED information. In many cases, security agreements require RESTRICTED information to be protected as U.S. CONFIDENTIAL information. (2) Some foreign governments may have a category of unclassified information that is protected by law. This latter category is normally provided to other governments with the expectation that the information will be treated ·In Confidence·. The foreign government or international organization must state that the information is provided in confidence and that it must be protected from release. (i) 10 U.S.C. 130c protects information provided ·In Confidence· by foreign governments which is not classified but meets

special requirements. (ii) This provision also applies to RESTRICTED information which is not required by an agreement to be protected as classified information.

From the NIST SP 800-172 Rev 3 Final Public Draft: Appropriately scoping security requirements is an important factor in determining protection-234 related investment decisions and managing security risks for nonfederal organizations. If nonfederal organizations designate specific system components to process, store, or transmit CUI associated with a critical program or a high value asset, those organizations may limit the scope of the security requirements by isolating the system components in a separate CUI security domain. Isolation can be achieved by applying architectural and design concepts (e.g., implementing subnetworks with firewalls, software-defined perimeters, micro-segmentation, zero trust network architectures, and information flow control mechanisms). Security domains may employ physical separation, logical separat

of November 4, 2010, entitled "Controlled Unclassified Information," establishes a program to standardize executive branch management of information that requires safeguarding or dissemination controls. The National Archives and Records Administration's (NARA) Information Security Oversight Office (ISOO) is the executive agent for the Controlled Unclassified Information Program. (b) This section implements 32 CFR part 2002, Controlled Classified Information (CUI). (c) Part 24, Protection of Privacy and Freedom of Information, contains additional policy and procedures for safeguarding records that are protected by the Privacy Act. (d) Part 27, Patents, Data, and Copyrights, contains policy and procedures for safeguarding information in patent applications and patents. 4.403-3 Applicability. (a) The requirements for safeguarding CUI in this section apply when an offeror or contractor is expected to handle CUI, including instances when CUI resides on or transits through contractor information systems or within contractor facilities. (b) The CUI requirements in the clause at 52.204-XX, Controlled Unclassified Information, apply when CUI will be involved in the contract. The CUI requirements in the clause at 52.204-YY, Identifying and Reporting Information That Is Potentially Controlled Unclassified Information, apply when no CUI will be involved in the contract. 4.403-4 Policy. (a) The requiring activity will identify any CUI in the standard form (SF) XXX, Controlled Unclassified Information (CUI) Requirements, which must be incorporated in the contract. Contractors are required to safeguard only the CUI that is identified in the SF XXX. However, see 52.204-XX(c)(2). (b) Offerors and contractors are required to safeguard CUI pursuant to section 4.403-2. For CUI identified on an SF XXX that is incorporated into a contract, the contractor shall comply with the CUI requirements in the clause at 52.204-XX and on the form itself. (c) Unmarked or mismarked CUI is not considered a CUI incident unless the mismarking or lack of marking has resulted in the mishandling or improper dissemination of the information. Offerors are requested, and contractors are required, to notify the Government within 8 hours of discovery if they discover during the solicitation phase or performance of a contract any information they suspect is CUI, but is not listed on an SF XXX or is not marked or properly marked as required by an SF XXX. Offerors and contractors are not responsible for identifying or marking unmarked or mismarked CUI that is not identified in the SF XXX. (d) The Government shall protect against the improper use or release of information that includes contractor proprietary business information or contractor-attributional information to the extent required by law. (e) Applicable CUI requirements can be waived by the Government in accordance with 32 CFR 2002.38. 4.403-5 Procedures.

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of technical, physical, administrative, and management standards and guidelines for the cost-effective security and privacy of sensitive unclassified information in Federal computer systems. This Special Publication 800-series reports on ITL's research, guidance, and outreach efforts in computer security, and its collaborative activities with industry, government, and academic organizations.

Under the proposed rule, the CMMC Program will require all DoD contractors and subcontractors who handle Federal contract information (FCI) and Controlled Unclassified Information (CUI) to maintain cybersecurity protections of their systems. CMMC will create three levels of compliance, depending on the level of security necessary for which the contractor has access. Level 1 has 15 requirements focused on logging access to potential FCI. Level 2 includes minimum requirements for contractors

handling CUI and adds 110 requirements. Level 3 addresses an additional 24 requirements. Each level will pose varying challenges for small businesses of every kind to comply with the progressing requirements. Advocacy has commented on previous proposals for CMMC concerning the significant impact this will have on small business contractors. · Advocacy held outreach meetings with diverse small business stakeholders concerning this rule, both in-person and virtually. · Small businesses expressed concerns with how to compensate the increased costs due to implementing CMMC and asked for clarity on aspects of the proposed CMMC rule. Advocacy has four chief concerns with the proposed rule. · Advocacy requests clear and concise guidance for small business contractors and subcontractors to create enclaves in order to lessen the burden of compliance on the businesses. · The proposed rule states that different business segments or different enclaves of a business can be assessed or certified at different CMMC levels. Creating and implementing enclaves will be most effective when a large prime contractor creates these enclaves to ease the burden on small subcontractors. The rule mentions the use of enclaves but does not provide guidance on how to implement enclaves within a business. · DoD Response: The Department acknowledges the concerns articulated by the Small Business Administration (SBA) and commits to enhancing training provisions after the rule is final and effective. Moreover, the Department pledges to reinstate outreach endeavors targeting the broader industry and specifically small businesses to facilitate familiarity with CMMC requirements once the rule is final and effective. However, the Department does not intend to formulate specific directives (printed page 83203) pertaining to the configuration and segregation of corporate information systems into enclaves. Such determinations must be tailored to individual companies, considering a multitude of unique factors. External service providers (ESPs) will be a driving force for small businesses' compliance with CMMC requirements. ESPs are vendors that handle security related data or CUI on their own assets and software. The ability of ESPs to create effective and economically feasible services will allow businesses to enclave different operations more easily and avoid unduly costly compliance expenses. · SBA Comment 2:

Appropriate management practices are essential to operating and maintaining a secure server. Security practices entail the identification of an organization's information system assets and the development, documentation, and implementation of policies, standards, procedures, and guidelines that help to ensure the confidentiality, integrity, and availability of information system resources. To ensure the security of a server and the supporting network infrastructure, the following practices should be implemented: The classic model for information security defines three objectives of security: maintaining confidentiality, integrity, and availability. Confidentiality refers to protecting information from being accessed by unauthorized parties. Integrity refers to ensuring the authenticity of information-that information is not altered, and that the source of the information is genuine. Availability means that information is accessible by authorized users. Each objective addresses a different aspect of providing protection for information. - GLYPH<c=31;font=MIJOHI+Webdings> 'The potential impact is LOW if the loss of confidentiality, integrity, or availability could be expected to have a limited adverse effect on organizational operations, organizational assets, or individuals. A limited adverse effect means that, for example, the loss of confidentiality, integrity, or availability might (i) cause a degradation in mission capability to an extent and duration that the organization is able to perform its primary functions, but the effectiveness of the functions is noticeably reduced; (ii) result in minor damage to organizational assets; (iii) result in minor financial loss; or (iv) result in minor harm to individuals.

164.310 to clarify that the Security Rule requires that physical safeguards be applied to all ePHI in the possession of the regulated entity, that is, throughout the regulated entity's facilities. The Department also proposes to expand this section to expressly require a regulated entity to implement physical safeguards in accordance with not only 45 CFR 164.306 , but also 45 CFR 164.316 to connect the overarching documentation requirements. Consistent with the proposals to revise the general requirements in 45 CFR 164.306(c) and (d) , the Department proposes to remove any distinction between addressable and required implementation specifications in this section such that all specifications would be required. Also consistent with changes proposed elsewhere in this NPRM, the Department proposes to modify all four physical safeguard standards to require that the requisite policies and procedures be in writing [645] and implemented throughout the enterprise. [646] Under this proposal, a regulated entity that could not produce a written policy describing how it will implement a required physical safeguard and demonstrate that the safeguard is in effect and operational throughout the enterprise would not be in compliance with the standard. Consistent with our proposals to require that regulated entities maintain their

administrative safeguards, the Department also proposes to require a regulated entity to maintain its security measures by reviewing and testing the required security measures at least once every 12 months, and by modifying the same as reasonable and appropriate. Additionally, we propose to modify certain standards and implementation specifications to ensure that regulated entities understand their obligations to ensure the confidentiality, integrity, and availability of ePHI by implementing physical safeguards to protect their relevant electronic information systems and/or the technology assets in their relevant electronic information systems. b. Section 164.310(a)(1)-Standard: Facility Access Controls The Department proposes to modify the standard for facility access controls at 45 CFR 164.310(a)(1) to clarify that the policies and procedures required by this standard must be in writing and address physical access to all of a regulated entity's relevant electronic information systems and the facility or facilities in which these systems are housed and to add a paragraph to clarify the organization of the regulatory text. The Department also proposes to modify the implementation specifications associated with the standard for facility access controls. Specifically, we propose to modify the implementation specifications for contingency operations, facility security plan, and access control and validation procedures at 45 CFR 164.310(a)(2)(i) through (iii) to clarify that we expect a regulated entity to not only establish and implement policies and procedures, but also that we expect them to be in writing.

109 If a comparable report meets the requirements of what is to be included in a security or privacy posture report (e.g., a report generated from a security or privacy management and reporting tool), then the comparable report would constitute the posture report. NIST SP 800-37, REVISION 2 RISK MANAGEMENT FRAMEWORK FOR INFORMATION SYSTEMS AND ORGANIZATIONS A System Life Cycle Approach for Security and Privacy

CHAPTER THREE PAGE 81 This publication is available free of charge from:

<https://doi.org/10.6028/NIST.SP.800-37r2> Discussion: The results of monitoring activities are documented and reported to the authorizing official and other selected organizational officials on an ongoing basis in accordance with the organizational continuous monitoring strategy. Other organizational officials who may receive security and privacy posture reports include, for example, chief information officer, senior agency information security officer, senior agency official for privacy, senior accountable official for risk management or risk executive (function), information owner or steward, incident response roles, and contingency planning roles. Security and privacy posture reporting can be event-driven, time-driven, or event- and time-driven.¹¹⁰ The reports provide the authorizing official and other organizational officials with information regarding the security and privacy posture of the systems including the effectiveness of implemented controls. Security and privacy posture reports describe the ongoing monitoring activities employed by system owners or common control providers. The reports also include information about security and privacy risks in the systems and environments of operation discovered during control assessments, auditing, and continuous monitoring and how system owners or common control providers plan to address those risks. Organizations have flexibility in the breadth, depth, formality, form, and format of security and privacy posture reports. The goal is efficient ongoing communication with the authorizing official and other organizational officials as necessary, conveying the current security and privacy posture of systems and environments of operation and how the current posture affects individuals, organizational missions, and business functions. At a minimum, security and privacy posture reports summarize changes to the security and privacy plans, security and privacy assessment reports, and plans of action and milestones that have occurred since the last report. The use of automated security and privacy management and reporting tools (e.g., a dashboard) by the organization facilitates the effectiveness and timeliness of security and privacy posture reporting. The frequency of security and privacy posture reports is at the discretion of the organization and in compliance with federal and organizational policies. Reports occur at appropriate intervals to transmit security and privacy information about systems or common controls but not so frequently as to generate unnecessary work or expense. Authorizing officials use the security and privacy posture reports and consult with the senior accountable official for risk management or risk executive (function), senior agency information security officer, and senior agency official for privacy to determine if a reauthorization action is necessary. Security and privacy posture reports are marked, protected, and handled in accordance with federal and organizational policies. Security and privacy posture reports can be used to satisfy FISMA reporting requirements for documenting remediation actions for security and privacy weaknesses or deficiencies. Reporting on security and privacy posture is intended to be ongoing and should not be interpreted as requiring the time, expense, and formality associated with the information provided

for the initial authorization. Rather, reporting is conducted in a cost-effective manner consistent with achieving the reporting objectives. References: [SP 800-53A]; [SP 800-137]; [NIST CSF] (Core [Identify, Protect, Detect, Respond, Recover Functions]). ONGOING AUTHORIZATION Task M-6 Review the security and privacy posture of the system on an ongoing basis to determine whether the risk remains acceptable. Potential Inputs: Risk tolerance; security and privacy posture reports; plans of action and milestones; organization- and system-level risk assessment results; security and privacy plans. Expected Outputs: A determination of risk; ongoing authorization to operate, ongoing authorization to use, ongoing common control authorization; denial of ongoing authorization to operate, denial of ongoing authorization to use, denial of ongoing common control authorization. 110 See Appendix F for additional information about time- and event-driven authorizations and reporting.

Ms. Angela James. Requests for copies of the information collection proposal should be sent to Ms. James at whs.mc-alex.esd.mbx.dd-dod-information-collections@mail.mil. Jennifer Lee Hawes, Regulatory Control Officer, Defense Acquisition Regulations System. [FR Doc. 2020-11477 Filed 5-27-20; 8:45 am] BILLING CODE 5001-06-P

for procuring the devices quite often is not an expert at all.' The availability of sample procurement language can be of great benefit in improving the security of products procured by organizations. Most workshop participants agreed that manufacturers of IoT devices currently lack market incentives to prioritize cybersecurity as a concern when designing, marketing, and supporting their products. Some counterexamples were presented in which informed customers do recognize the advantages of enhanced security. This suggests that enhanced cybersecurity could demonstrably be a market advantage if it is emphasized. Workshop poll results showed strong support (71 %) for government mandates as a mechanism for enhancing IoT cybersecurity (poll #4), and general agreement (55 %) that developers of IoT devices currently lack appropriate incentives to secure their products (poll #2). Participants supported a mixture of regulatory guidance, customer education, supply chain pressures, and other considerations to create the economic incentives to shift the overall IoT device market toward enhanced cybersecurity.

The two addressable implementation specifications for the transmission security standards are under 45 CFR 164.312(e)(2). The implementation specification for integrity controls requires a regulated entity, when it is reasonable and appropriate, to implement security measures to ensure that electronically transmitted ePHI is not improperly modified without detection until the ePHI has been disposed. [682] The implementation specification for encryption requires a regulated entity, when it is reasonable and appropriate, to implement a mechanism to encrypt ePHI. (printed page 964) 2. Issues To Address While the intention of 45 CFR 164.312 is for regulated entities to develop and put into place technical controls, the Department is aware that regulated entities have not always achieved the degree of protection for ePHI that we intended. Absent a definition of 'implement,' some regulated entities might interpret the term to mean something other than implementing technical controls to ensure the confidentiality, integrity, and availability of ePHI. This misinterpretation may leave ePHI partially unprotected because regulated entities may not implement safeguards throughout their enterprise. As discussed above with respect to both the administrative and physical safeguards, the Department is also concerned that regulated entities are not making the connection between the maintenance requirement at 45 CFR 164.306(d) and the requirement to implement technical safeguards, and therefore, are not reviewing or updating their policies and procedures for technical safeguards. Additionally, the Department believes that regulated entities may not be recognizing that their obligations under the Security Rule to protect ePHI are not limited to protecting electronic information systems that create, receive, maintain, or transmit ePHI, but necessarily include other electronic information systems that affect the confidentiality, integrity, or availability of ePHI. While the Security Rule relies on a flexible and scalable approach to compliance, the health care industry's shift to a digital environment has substantially increased both the risk to ePHI and the prevalence of technological solutions for addressing those risks. Additionally, the cost of such solutions has, in many cases, decreased over time, as is often the case with technology. For example, when the original Security Rule was published, tools to encrypt ePHI had limited availability, were more costly, and were not user-friendly, particularly for small health care providers. [683] By contrast, in 2024, the technical ability to encrypt data may be seamless in many applications, inexpensive, and widely available in commercial software and hardware products. [684] Where an encryption solution is not integrated into an application, software, or hardware, third-party solutions are often

available. [685] Thus, we do not believe that it is appropriate for such provisions to be addressable. [686]

Do not leave items that would be of value to a foreign intelligence service unattended in hotel rooms or stored in hotel safes. Limit sensitive discussions hotel rooms or other public places are not suitable locations to discuss sensitive information. Not use computer or facsimile equipment at foreign hotels or business centers for sensitive matters. Not divulge information to anyone unauthorized to hear it. Ignore or deflect intrusive inquiries or conversation about business or personal matters. Keep a laptop computer as carry-on baggage never check it with other luggage and, if possible, remove or control storage media. Confirm before the foreign travel whether it is necessary or even advisable to take a laptop computer. Report any suspicious contacts or incidents to the entity FSO to report to the applicable CSA. Contractors in the NISP also have a responsibility for recognizing and avoiding personal behaviors and activities that may impact their continued eligibility for access to classified information. This includes, but is not limited to the following activities which may be of potential security, insider threat, or counterintelligence concern An unwillingness to comply with rules, regulations, or security requirements Unexplained affluence or excessive indebtedness Alcohol abuse Illegal use or misuse of drugs or drug activity Apparent or suspected mental health issues where there is reason to believe it may impact the individual's ability to protect classified information or other information prohibited by law from disclosure Criminal conduct Any activity that raises doubts as to whether the individual's continued national security eligibility is clearly consistent with national security interests Misuse of U.S. Government property or information systems This rule will result in fewer contract performance delays by the small number of U.S. contractors with NTIB ownership operating under an SSA. With Section 842 of Public Law 115-232 implemented there will no longer be at least a 60 day minimum delay for USG contracting activities and NTIB covered entities to wait for NIDs after contract award for access to proscribed information when all other requirements have been met. When a GCA submits a NID to the applicable CSA, there is an initial 30 days to process the request, which includes verification of the NID requirement. If the NID also includes a requirement for controlling agency concurrence (i.e., ODNI for SCI, DOE for RD or NSA for COMSEC), the CSA submits the request to the applicable controlling agencies who then have 30 more days for its analysis and decision. Section 842 of Public Law 115-232 is deregulatory by statute as reflected in this rule. Congress required that the NTIB policy framework foster a defense free-trade area among the defense-related research and development sectors of the United States, Canada, Australia and the United Kingdom. Section 881 of Public Law 114-328

(L) From subsection (g) because portions of this system of records are compiled for law enforcement purposes and have been exempted from the access provisions of subsections (d) and (f). (printed page 14755) (19) System identifier and name. A0195-6 USACIDC, Criminal Investigation Accreditation and Polygraph Examiner Evaluation Files. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (B) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (C) Evaluation material used to determine potential for promotion in the Military Services may be exempt pursuant to 5 U.S.C. 552a(k)(7) , but only to the extent that the disclosure of such material would reveal the identity of a confidential source. (D) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(2) , (k)(5), or (k)(7) from subsections 5 U.S.C. 552a (c)(3), (d), (e)(1), (e)(4)(G), (e)(4)(H), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) , (k)(5), and (k)(7). (iii) Reasons. (A) From subsections (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (d), because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious

impediment to law enforcement. (C) From subsection (e)(1) because in the course of criminal investigations, information is often obtained concerning the violation of laws or civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this valuable information be retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought.

The Department is concerned about the potential effects of such incidents in health care, where they would jeopardize the confidentiality, integrity, and availability of ePHI. Finally, consistent with the concerns expressed above about the implications of recent caselaw and the uncertainty it might cause among regulated entities assessing whether they have adequately protected their ePHI, the Department is concerned that the existing Security Rule may not provide sufficient instruction to regulated entities about (printed page 965) how they must maintain specific security measures.

3. Proposals The Department retains the requirements for technical safeguards generally and proposes additions and modifications to the existing standards and implementation specifications.

a. Section 164.312·Technical Safeguards The Department proposes to expand the primary provision at 45 CFR 164.312 to clarify that regulated entities as a general matter must implement and document the implementation of technical safeguards adopted for compliance with the Security Rule. This proposal would clarify that the requirement to implement and document technical safeguards would apply to all technical safeguards, including technical controls, implemented by a regulated entity to protect the confidentiality, integrity, and availability of all ePHI it creates, receives, maintains, or transmits. As noted above, the current provision at 45 CFR 164.312 does not reference the documentation requirements in 45 CFR 164.316 . Therefore, for clarity, we propose to explicitly require in 45 CFR 164.312 that documentation of technical safeguards conforms to the requirements in 45 CFR 164.316 . This proposed change would clarify that a regulated entity must document the policies and procedures required to comply with this rule and how entities considered the flexibility factors in 45 CFR 164.306(b) . It would also clarify that a regulated entity must document each action, activity, and assessment required by the Security Rule. The Department considers the documentation requirements and other provisions of 45 CFR 164.316 to apply to all of the safeguards, including the technical safeguards, and this proposal is intended to remove any potential uncertainty among regulated entities. Additionally, we propose to add maintenance requirements separately to the implementation specifications for particular technical safeguards in 45 CFR 164.312 , as discussed below and consistent with our proposals to add similar requirements to particular administrative and physical safeguards.

A final regulatory flexibility analysis (FRFA) has been prepared consistent with the Regulatory Flexibility Act, 5 (printed page 19692) U.S.C. 601, et seq. The FRFA is summarized as follows: The Department of Defense is amending the Defense Federal Acquisition Regulation Supplement (DFARS) to modify the text of DFARS clause 252.204-7002, Payment for Subline Items Not Separately Priced, to simplify and conform the clause text to current Government contract line item structure terminology. The objective of this rule is to clarify the intent of the clause for contractors, when submitting invoices under contracts that contain items that are not separately priced. The modification of this DFARS clause supports a recommendation from the DoD Regulatory Reform Task Force. No public comments were received in response to the initial regulatory flexibility analysis. Based on an average of data for fiscal year 2016 through 2018 from the Federal Procurement Data System and Electronic Document Access, DoD awards approximately 12,435 contracts annually that includes the DFARS clause 252.204-7002. Of the 12,435 awards, approximately 4,924 contracts (40%) are awarded to 1,564 unique small business entities. Based on the available data and the objective of the rule, DoD does not anticipate that this proposed rule will significantly impact small business entities. This rule does not include any new reporting, recordkeeping, or other compliance requirements for small businesses. This rule does not duplicate, overlap, or conflict with any other Federal rules. There are no known significant alternative approaches to the rule that would meet the stated objectives. VI. Paperwork Reduction Act The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). List of Subjects in 48 CFR Parts 204 and 252 Government procurement Jennifer Lee Hawes, Regulatory Control Officer, Defense Acquisition Regulations System. Therefore, 48 CFR parts 204 and 252 are amended as follows: 1. The authority citation for 48 CFR parts 204 and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1 . PART 204-ADMINISTRATIVE AND INFORMATION MATTERS 2. Amend section 204.7104-1: a. In paragraph (b)(3)(iii), by removing ·subsection· and adding ·section· in its place; and b. By revising paragraph (b)(3)(iv). The revision reads as follows: 204.7104-1 Criteria for establishing. * *

* * * (b) * * * (3) * * * (iv) When the price for items not separately priced is included in the price of another contract line or subline item, it may be necessary to withhold payment on the priced contract line or subline item until the included line or subline items that are not separately priced have been delivered. See the clause at 252.204-7002, Payment for Contract Line or Subline Items Not Separately Priced. 3. Revise section 204.7109 to read as follows: 204.7109 Contract clauses.

(9) A DA activity will notify requesters seeking National Security Council (NSC) or White House documents that they should write directly to the NSC or White House for such documents. DA documents in which the NSC or White House have a concurrent reviewing interest will be forwarded to the Department of Defense, Office of Freedom of Information and Security Review, which will coordinate with the NSC or White House, and return the documents to the originating DA activity after NSC or White House review. NSC or White House documents discovered in DA activity files which are responsive to a Privacy Act request will be forwarded to DOD for coordination and return with a release determination. (10) To the extent referrals are consistent with the policies expressed above; referrals between offices of the same DA activity are authorized. (l) Reproduction fees. (1) Use fees only to recoup direct reproduction costs associated with granting access. (2) DA activities may use discretion in their decision to charge for the first copy of records provided to an individual to whom the records pertain. Thereafter, fees will be computed pursuant to the fee schedule set forth in AR 25-55, including the fee waiver provisions. (3) Checks or money orders for fees should be made payable to the Treasurer of the United States and will be deposited in the miscellaneous receipts of the treasury account maintained at the activity's finance office. (4) Reproduction costs shall only include the direct costs of reproduction and shall not include costs of: (i) Time or effort devoted to searching for or reviewing the records by personnel; (ii) Fees not associated with the actual cost of reproduction; (iii) Producing a copy when it must be provided to the individual without cost under another regulation, directive, or law; (iv) Normal postage; (v) Transportation of records or personnel; or (vi) Producing a copy when the individual has requested only to review the records and has not requested a copy, and the only means of allowing review is to make a copy (e.g., the records are stored in a computer and a copy must be printed to provide individual access, or the activity does not wish to surrender temporarily the original records for the individual to review). (m) Privacy Act case files. (1) Whenever an individual submits a Privacy Act request, a case file will be established. This Privacy Act case file is a specific type of file that is governed by a specific Privacy Act system of records notice. In no instance will the individual's Privacy Act request and corresponding Army actions be included in the individual's military personnel file or other military filing systems, such as adverse action files or general legal files, and in no instance will the Privacy Act case file be used to (printed page 24503) make an adverse determination about the individual. (2) The case file will be comprised of the request for access/amendment, grants, refusals, coordination action(s), and all related papers. § 505.6

(Response) Foreign persons, except those who transport food in the United States, are not subject to this final rule; however, persons that import food from foreign countries are subject to the rule. FDA believes that the compliance timeframes specified in § 1.368 of this final rule give all persons subject to this final rule, including importers, sufficient time to determine what steps are needed to be able to comply with the final rule, and to be in compliance on their respective compliance dates, while allowing FDA to meet its statutory objective of ensuring that persons that manufacture, process, pack, hold, transport, distribute, receive, or import food in the United States establish and maintain records that will significantly improve FDA's ability to address credible threats of serious adverse health consequences or death to humans or animals. (Comment 173) One comment states that the proposed delay in the compliance date for small businesses does not adequately address small business needs. One comment states that FDA should provide businesses with additional assistance with compliance. (Response) FDA has increased the compliance period for small businesses from 12 months to 18 months, and for very small businesses from 18 months to 24 months. With respect to additional assistance, in accordance with the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA), FDA plans to publish a small entities compliance guide to assist small and very small businesses with complying with the recordkeeping requirements. As described previously, FDA also plans to conduct outreach activities to explain the requirements of this final rule to affected entities. (Comment 174) One comment states that the phase-in for small and very small businesses is not a good idea because if the consequences are as grave as FDA claims, everyone must be required to comply at the earliest possible time, allowing for systems and procedural development and employee

training. The comment states that a phase-in of the regulations would pose a threat to public health and safety, should not be part of this regulation, and would be against the public interest. (Response) The Bioterrorism Act specifically states that, in issuing these regulations, the Secretary shall take the size of a business into account. FDA considered reduced requirements for, or even exempting, small businesses. However, most food products and ingredients pass through at least one small business during commerce. In addition, more than 80 percent of the covered entities are considered very small businesses. If FDA were to exempt small businesses from these regulations, permit shorter record retention periods, or subject them to reduced records requirements, FDA's tracing investigations would be severely compromised. Given the foregoing, FDA believes it is appropriate to give small and very small businesses additional time to come into compliance with the regulations.

| ID | Description |
|-----|-----| | CWE-1272 |
Sensitive Information Uncleared Before Debug/Power State Transition | | CWE-1300 | Improper Protection of Physical Side Channels | | CWE-1189 | Improper Isolation of Shared Resources on System-on-a-Chip (SoC) | | CWE-1244 | Internal Asset Exposed to Unsafe Debug Access Level or State | | CWE-1191 | On-Chip Debug and Test Interface with Improper Access Control | | CWE-1231 | Improper Prevention of Lock Bit Modification | | CWE-1233 | Security-Sensitive Hardware Controls with Missing Lock Bit Protection | | CWE-1274 | Improper Access Control for Volatile Memory Containing Boot Code | | CWE-1260 | Improper Handling of Overlap Between Protected Memory Ranges | | CWE-1240 | Use of a Cryptographic Primitive with a Risky Implementation | | CWE-1256 | Improper Restriction of Software Interfaces to Hardware Features | ## 3.1.

(Response) FDA has carefully considered these comments and agrees that businesses should be given additional time to comply in view of the programming, training, and business practice adjustments that will be needed. Section 1.368 of the final rule requires large businesses (500 or more full-time equivalent employees) to be in compliance within December 9, 2005. Small businesses (those with fewer than 500, but more than 10 full-time equivalent employees) must be in compliance within June 9, 2005, and very small businesses that employ 10 or fewer full-time equivalent employees must be in compliance within December 11, 2006. The extended compliance times for small and very small businesses are based on the total number of full-time equivalent employees within the entire business, not just at each individual establishment. FDA does not believe that extending more time is appropriate given the need for the regulations to help improve FDA's ability to address credible threats of serious adverse health consequences or death to humans or animals from accidental or deliberate contamination of food. In the event of an outbreak of foodborne illness, such information will help FDA and other authorities determine the source and cause of the event. In addition, the information will enable FDA to notify more quickly the consumers and/or facilities that might be affected by the outbreak. Further, the Bioterrorism Act directs FDA to take into account the size of a business in promulgating regulations. Consistent with this provision, FDA has: (1) Provided a full exemption for very small retailers based on the rationale stated previously; (2) provided a partial exemption for small (11 to 500 employees) and large (more than 500 employees) retailers from having to establish and maintain records as to immediate subsequent recipients; and (3) provided extended compliance times for very small businesses and small businesses in all sectors. (Comment 163) Some comments state that the transportation chain information requirements, by themselves, are so complex they simply cannot be developed in such a short timeframe even if industry were not dealing with several other major security-related regulatory efforts under the Trade Act of 2002 and the Maritime Transportation Security Act of 2002. (printed page 71610) The comments ask FDA to require more reasonable timetables that would be less costly and have a more realistic chance of successful compliance. (Response) As stated in the response to the comment 162, FDA has modified the compliance timeframes proposed. The final rule gives covered persons 12, 18, or 24 months after the date of publication to come into compliance, depending on the size of the business. The extended compliance times for small and very small businesses are based on the total number of full-time equivalent employees within the entire business, not just at each individual establishment.

Memberships Taxonomic information to organize weaknesses into hierarchies and categories 3. Modes of Introduction Descriptions of the life cycle phase in which the CWE can be introduced 4. Applicable Platforms Involved languages and technologies 5. Common Consequences Affected security attributes and likelihoods (e.g., confidentiality, integrity, availability, access control, authentication, and authorization) 6. Demonstrative Examples Hypothetical examples of the weakness 7. Observed Examples Actual observed examples of the weaknesses, usually with CVE references 8. Potential Mitigations Protection methods - Authentication (i.e., proving the identity of an actor) - Authorization (i.e., ensuring that a given actor can access a resource) - Accountability (i.e., tracking the activities that were performed) 2. An attacker can unlock hardware (e.g., to enter debug mode) using leaked or stolen credentials that were often necessarily shared among multiple entities (e.g., for hardware products not created by a single company, via vertical integration) [CWE1273]. 3. An attacker can obtain sensitive information from debug messages that unnecessarily reveal security details, often reducing security by obscurity (e.g., location of password hashes) [CWE-1295]. 4. An attacker can obtain security-relevant state information by observing different behaviors that are indicative of the hardware state (e.g., in timing, responses, and control flow) [CWE-203]. 5. An attacker can obtain security-sensitive information by leveraging physical access to the hardware to measure phenomena (e.g., physical side channels, such as real-time power consumption) [CWE-1300] [CWE-1255]. 6. An attacker can obtain sensitive data by evaluating and probing shared microarchitectural resources in contexts that should be isolated (e.g., caches and branch prediction logic) [CWE-1303]. 7.

)) have been the basis for CDRH's Classification Product Code structure and organization. These 16 Panels have largely been the driving force for CDRH's internal organizational structure as well. These Panels were established with the 1976 Medical Device Amendments, and rulemaking is required in order to add to or modify the Panels. However, rulemaking has resulted in very few additions or modifications to the Panels and subgroups since 1976. In order to respond to the evolution of device technology, classification product codes were created to assist in accurate identification and tracking of current medical devices and to allow for tracking and easy reference of predicate device types. Classification product codes are a method of classifying medical devices. CDRH and a subset of CBER-regulated medical device product codes consist of a three-letter combination that associates a device's type with a product classification designated for the application. Classification product codes and information associated with these devices, such as names and attributes, are assigned by CDRH to support their regulation. The purpose of this guidance document is to educate regulated industry and FDA Staff on how, when, and why to use classification product codes for medical devices regulated by CDRH and CBER. This document describes how classification product codes are used in a variety of FDA program areas to regulate and track medical devices. This document is limited to medical devices as defined in section 201(h) of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321(h)) and does not discuss classification products codes used to regulate nonmedical electronic radiation-emitting products. The scope of the guidance document includes devices described in the existing classification under parts 862 through 892. It also describes how classification product codes are used for CBER regulated devices, which currently do not fall within this existing classification. This guidance may be applicable to future devices. It also covers unclassified devices and devices not yet classified. In the Federal Register of January 3, 2012 (77 FR 125), FDA announced the availability of the draft guidance document. Interested persons were invited to comment by May 2, 2012. Five comments were received with multiple recommendations pertaining to the administrative processes and policies regarding medical device classification product codes. In response to these comments, FDA revised the guidance document to clarify the processes and policies as appropriate. II. Significance of Guidance This guidance is being issued consistent with FDA's good guidance practices regulation (21 CFR 10.115

Overwhelmingly, workshop participants agreed that customers lack an awareness that cybersecurity capabilities can vary among devices when they make purchasing decisions about IoT. This appears to be true regardless of whether the customers are individual consumers or those responsible for procurement in organizational environments. In the consumer space the buyer's assumption generally is that if a product is on the market, its safety and security can be assumed. A UK study found that consumers focus on IoT device features and costs as the most important discriminators, with cybersecurity either not on the list of customer priorities or at best lagging far behind as a decision criterion. Mike Bergman of the Consumer Technology Association (CTA) stated that 'we have been doing this research for years and years and the answers never changed. Cybersecurity is not on this list. So while it might be a good idea to try to get it on the list · it is going to be a very

long and expensive education process.' Where meaningful cybersecurity information about a product is available, a further challenge is educating customers about how to understand the information available and interpret its implications when using the product in their environments. In organizational procurement environments, the staff responsible for procurement contracts typically lack subject matter expertise regarding cybersecurity and need education and training in leveraging contractual language to mandate security for procurements. Peter Stephens said 'whenever I speak to procurement organizations, whether they are retailers or housing, manufacturing, builders or other organizations who use smart devices in some format, the person responsible for procuring the devices quite often is not an expert at all.' The availability of sample procurement language can be of great benefit in improving the security of products procured by organizations.

(C) Exempt portions of this system also contain information considered relevant and necessary to make a determination as to qualifications, eligibility, or suitability for Federal civilian employment, military service, Federal contracts, or access to classified information, and was obtained by providing an express or implied assurance to the source that his or her identity would not be revealed to the subject of the record. (D) The notice of this system of records published in the Federal Register sets forth the basic statutory or related authority for maintenance of the system. (E) The categories of sources of records in this system have been published in the Federal Register in broad generic terms. The identity of specific sources, however, must be withheld in order to protect the confidentiality of the source, of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (F) This system of records is exempted from procedures for notice to an individual as to the existence of records pertaining to him/her dealing with an actual or potential civil or regulatory investigation, because such notice to an individual would be detrimental to the successful conduct and/or completion of an investigation, pending or future. Mere notice of the fact of an investigation could inform the subject or others that their activities are under, or may become the subject of, an investigation. This could enable the subjects to avoid detection, to influence witnesses improperly, to destroy records, or to fabricate testimony. (G) Exempt portions of this system containing screening board reports. (H) Screening board reports set forth the results of oral examination of applicants for a position as a special agent with the Naval Investigation Service Command. Disclosure of these records would reveal the areas pursued in the course of the examination and thus adversely affect the result of the selection process. Equally important, the records contain the candid views of the members composing the board. Release of the records could affect the willingness of the members to provide candid opinions and thus diminish the effectiveness of a program which is essential to maintaining the high standards of the Special Agent Corps., i.e., those records constituting examination material used solely to determine individual qualifications for appointment in the Federal Service. (14) System identifier and name. N05520-5, Personnel Security Program Management Records System. (i) Exemptions. (A) Information specifically authorized to be classified under E.O. 12958, as implemented by DOD 5200.1-R, may be exempt pursuant to 5 U.S.C. 552a(k)(1). (B) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, military service, Federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5)

title that reflects their duties, and they may lack sufficient professional skills (e.g., communications, relationship-building) that are viewed as essential in security awareness roles [SANS][WOELK]. In addition, the lack of understanding that security awareness is a unique discipline may lead to ill-prepared awareness professionals [BADA]. However, it is unclear if these challenges also apply to security awareness professionals in the United States (U.S.) government.

flour from five different companies rather than depend on a single company as its supplier. The flour from the five companies may be stored in one common silo before being used in the manufacture of the cookies. In this scenario, the manufacturer could identify, depending on the date the flour was received from each company and placed in the silo and when the silo was emptied, the various companies that were the sources of the flour. Under this situation, the information is not reasonably available to determine a single source of the flour used in a particular lot of cookies. The information reasonably available to the manufacturer would be the identity of all of the potential sources of the flour for each finished lot of cookies. However, if the manufacturer had dedicated silos for each supplier of flour, then the information would be reasonably available to the manufacturer to specify the specific source of the flour for each finished product. If we determine that additional guidance is needed, FDA will consider issuing guidance in the future to explain this requirement further. Again, FDA notes that this requirement now appears in § 1.345(b) of this final rule and has been deleted from § 1.337(a) of this final rule. (Comment 98) One comment states that manufacturers of packaging face the same issues as processors who deal with commingled ingredients. The comment explains that, during the manufacture of multiple-layer packaging products, it is common to use multiple lots of raw material within a master roll of semifinished or finished product. An example of this condition would be a paper/foil lamination where one roll of foil and three to four rolls of paper are used in the same production run. In this situation, the lot numbers of the raw materials and the lot numbers of the finished products may be known, but it cannot be determined with precision which lot of the input materials is in an individual roll of finished product. (Response) Manufacturers of packaging (the outer packaging of food that bears the label and does not contact the food) are excluded from all requirements of subpart J of this final rule unless such persons also manufacture, process, pack, transport, distribute, receive, hold or import food in the United States, in which case they are subject to §§ 1.361 and 1.363 of this final rule as to the food's packaging. Manufacturers of food contact substances, whether or not the substances are the finished container that directly contacts the food, are excluded from all of the requirements of subpart J, except §§ 1.361 and 1.363 of this final rule. Therefore, such manufacturers are not required to know which lot of the input materials is in an individual roll of finished product.

This publication provides guidance to organizations on identifying, assessing, and mitigating cybersecurity risks throughout the supply chain at all levels of their organizations. The publication integrates cybersecurity supply chain risk management (C-SCRM) into risk management activities by applying a multilevel, C-SCRM-specific approach, including guidance on the development of C-SCRM strategy implementation plans, C-SCRM policies, C-SCRM plans, and risk assessments for products and services. acquire; C-SCRM; cybersecurity supply chain; cybersecurity supply chain risk management; information and communication technology; risk management; supplier; supply chain; supply chain risk assessment; supply chain assurance; supply chain risk; supply chain security. |

.....

the Department believes that it is essential to propose modifications to strengthen its protections for the confidentiality, integrity, and availability of ePHI to address the changing health care environment. We also believe it is important to clarify the obligations of regulated entities and emphasize the importance of protecting the confidentiality, integrity, and availability of ePHI. We believe that the proposed revisions would require regulated entities to consider and potentially modify their safeguards more regularly, which would better enable them to quickly respond to changes in the environment and be consistent with cybersecurity best practices. While we do not expect that

compliance with the Security Rule will (printed page 920) prevent all breaches or interruptions in the confidentiality, integrity, or availability of ePHI, we believe that it will prevent many and enable regulated entities to identify, mitigate, and remediate the damage more quickly if there is a breach or other security incident, thereby reducing harm to individuals and the overall costs of such occurrences to regulated entities and to the U.S. health care system. As such, the proposed modifications would support a primary goal of HIPAA's Administrative Simplification provisions: improving the efficiency and effectiveness of the U.S. health care system by encouraging the development of health information systems through the establishment of uniform standards and requirements for electronic transmission of ePHI, including those for security. [316] E. The Secretary Must Develop Standards for the Security of ePHI Because None Have Been Developed by an ANSI-Accredited Standard Setting Organization HIPAA requires the Secretary to adopt standards that have been developed, adopted, or modified by a standard setting organization accredited by ANSI, except in certain circumstances. [317] For example, HIPAA permits the Secretary to develop standards where no relevant standards have been developed, adopted, or modified by an ANSI-accredited standard setting organization. In developing, adopting, or modifying a standard, the Secretary is required to consult with standard setting organizations, NCVHS, and with the appropriate Federal and State agencies. [318] The statutory definition of the term "standard" applies only to standards for electronic transactions and data elements for such transactions that are appropriate for: (1) the financial and administrative transactions described in the statute; and (2) other financial and administrative transactions consistent with the goals of improving the operation of the health care system and reducing administrative costs, as determined appropriate by the Secretary. [319] Under HIPAA, security is not considered a financial or administrative transaction, or a data element of such transaction. [320]

(D) From subsection (e)(2) because collecting information to the fullest extent possible directly from the subject individual may or may not be practical in a criminal and/or civil investigation. (E) From subsection (e)(3) because supplying an individual with a form containing a Privacy Act Statement would tend to inhibit cooperation by many individuals involved in a criminal and/or civil investigation. The effect would be somewhat adverse to established investigative methods and techniques. (F) From subsection (e)(4) (G) through (I) because this system of records is exempt from the access provisions of subsection (d). (G) From subsection (e)(5) because the requirement that records be maintained with attention to accuracy, relevance, timeliness, and completeness would unfairly hamper the investigative process. It is the nature of law enforcement for investigations to uncover the commission of illegal acts at diverse stages. It is frequently impossible to determine initially what information is accurate, relevant, timely, and least of all complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light. (H) From subsection (e)(8) because the notice requirements of this provision could present a serious impediment to law enforcement by revealing investigative techniques, procedures, and existence of confidential investigations. (I) From subsection (f) because the agency's rules are inapplicable to those portions of the system that are exempt and would place the burden on the agency of either confirming or denying the existence of a record pertaining to a requesting individual might in itself provide an answer to that individual relating to an on-going investigation. The conduct of a successful investigation leading to the indictment of a criminal offender precludes the applicability of established agency rules relating to verification of record, disclosure of the record to that individual, and record amendment procedures for this record system. (J) For comparability with the exemption claimed from subsection (f), the civil remedies provisions of subsection (g) must be suspended for this record system. Because of the nature of criminal investigations, standards of accuracy, relevance, timeliness, and completeness cannot apply to this record system. Information gathered in an investigation is often fragmentary and leads relating to an individual in the context of one investigation may instead pertain to a second investigation. (3) System identifier and name. CIG-15, Departmental Inquiries Case System. (i) Exemption. Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2)

or (v) improve personnel skills, expertise, and understanding. Appendix E provides three tables that identify specific assurance-related controls that are included in the low-, moderate-, and high-impact baselines described in Appendix D. The controls described assist organizations in defining the controls needed to satisfy minimum assurance requirements. Where additional assurance is desired to achieve risk management objectives, Table E-4 provides additional security controls and control enhancements to achieve enhanced assurance.

(Response) Farms are excluded from these regulations, as are foreign persons, except for foreign persons who transport food in the United States. Therefore, foreign farmers who ship live food animals to the United States are exempt from this final rule (unless they transport the animals into the United States themselves). FDA notes, however, that although foreign exporters of food into the United States are exempt from these recordkeeping requirements, they must comply with the prior notice regulations issued under the Bioterrorism Act (part 1, subpart I). FDA also notes that an importer of live food animals into the United States would be required to establish and maintain records under these regulations given (printed page 71575) that importers are not exempt from this final rule. (Comment 36) One comment states that, although the proposed rule exempts farms, it may still result in a recordkeeping burden for them. The comment states that, in practice, the farmer will be expected to generate paperwork so that those delivering and dropping products off at the farm will be able to comply with the final rule. Although farms may be exempt on the face of the rule, the comment states that, in reality, farmers will have to generate large amounts of paperwork for their suppliers, truckers, and buyers. The comment states that the final rule needs to make clear that farmers will not be responsible, or expected to generate, paperwork for those complying with this rule. (Response) Farms are specifically exempted from the requirements of these regulations. Only those persons subject to these regulations must establish and maintain records of the immediate previous sources and immediate subsequent recipients of food that they manufacture, process, pack, transport, distribute, receive, hold, or import. This final rule does not require a farm to establish or maintain records for those who are subject to this regulation. 3. Restaurants (Comment 37) Several comments state that retail food stores offer a variety of services and conveniences to consumers, including foods that are prepared in-store and ready for immediate consumption, and that the restaurant-type facilities in the retail store should be excluded from the recordkeeping requirements.

The aggregate loss of intellectual property and CUI from the DoD supply chain severely undercuts U.S. technical advantage, limits and disrupts business opportunities associated with technological superiority, and ultimately threatens our national defenses and economy. By incorporating heightened cybersecurity into acquisition programs, the CMMC Program provides the Department assurance that contractors and subcontractors are meeting DoD's cybersecurity requirements and provides a key mechanism to adapt to an evolving threat landscape. This is critically important to the Department because defense contractors are the target of increasingly frequent and complex cyberattacks by adversaries and non-state actors. Dynamically enhancing DIB cybersecurity to meet these evolving threats and safeguarding the information that supports and enables our warfighters is a top priority for the Department. The CMMC Program is a key component of the Department's DIB cybersecurity effort. CMMC provides uniform and improved DoD cybersecurity requirements in three (3) levels, using the security requirements in NIST SP 800-171 R2 and a selected subset of those in NIST SP 800-172 Feb2021. With this rule, the Department is publishing supplemental guidance documents to assist the public and in particular, small businesses, with CMMC implementation, increasing the likelihood of successful implementation and strengthening cybersecurity across the DIB. CMMC decreases the burden and cost on companies protecting FCI by allowing all companies at Level 1, and a subset of companies at Level 2, to demonstrate compliance through self-assessments. CMMC allows companies, under certain limited circumstances, to make a Plan of Action & Milestones (POA&M) to provide additional time to achieve a Final CMMC Status. These key updates to CMMC benefit the DoD and our national interest by providing: improved safeguarding of competitive advantages through requirements flow-down to the defense contractor supply chain and protections for proprietary information and capabilities, and increased efficiency in the economy and private markets as a result of the streamlining of cybersecurity requirements, the resulting improvements in cybersecurity, and accountability across the supply chain.

From the DoD SP 800-171 Rev 3 Organization-Defined Parameters: McKeown Performing the Duties of the Deputy DoD CIO for Cybersecurity and DoD Chief Information Security Officer Attachment: As stated Attachment A: NIST SP 800-171 Revision 3 ODP Values Access Control 3.1.1 System Account Management a. Define the types of system accounts allowed and prohibited. b. Create, enable, modify, disable, and remove system accounts in accordance with policy, procedures, prerequisites, and criteria. c. Specify: 1. Authorized users of the system, 2. Group and role membership, and 3. Access authorizations (i.e., privileges) for each account. d. Authorize access to the system based on: 1. A valid access authorization and 2. Intended system usage. e. Monitor the use of system accounts. f. Disable system accounts when: 1. The accounts have expired,

During the processing of a Privacy Act request (which may include access requests, amendment requests, and requests for review for initial denials of such requests), exempt materials from other systems of records may in turn become part of the case record in this system. To the extent that copies of exempt records from those 'other' systems of records are entered into this system, the Office of the Secretary of Defense hereby claims the same exemptions for the records from those 'other' systems that are entered into this system, as claimed for the original primary system of which they are a part. (ii) Authority. 5 U.S.C. 552a(j)(2) , (k)(1), (k)(2), (k)(3), (k)(4), (k)(5), (k)(6), and (k)(7). (iii) Reasons. Records are only exempt from pertinent provisions of 5 U.S.C. 552a to the extent such provisions have been identified and an exemption claimed for the original record and the purposes underlying the exemption for the original record still pertain to the record which is now contained in this system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided the President and others are not compromised, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, to preserve the confidentiality and integrity of Federal testing materials, and to safeguard evaluation materials used for military promotions when furnished by a confidential source. The exemption rule for the original records will identify the specific reasons why the records are exempt from specific provisions of 5 U.S.C. 552a . (printed page 14806) (14) System identifier and name. DHRA 02, PERSEREC Research Files. (i) Exemption. (A) Investigative material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (B) Therefore, portions of this system may be exempt pursuant to 5 U.S.C. 552a(k) (5) from the following subsections of 5 U.S.C. 552a(c)(3) , (d), and (e)(1). (ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons.

(g) Certain commercial items and initial provisioning spares for weapons systems are requested and subsequently solicited using units of measure such as kit, set, or lot. However, there are times when individual items within that kit, set, or lot are not grouped and delivered in a single shipment. This creates potential contract administration issues with inspection, acceptance, and payment. In such cases, solicitations should be structured to allow offerors to provide information about products that may not have been known to the Government prior to solicitation and propose an alternate line item structure as long as the alternate is consistent with the requirements of 204.71, which provides explicit guidance on the use of contract line items and subline items, and with PGI 204.71. 3. Revise section 204.7109 to read as follows: 204.7109 Solicitation provision and contract clause. (a) Use the clause at 252.204-7006, Billing Instructions, in solicitations and contracts if Section G includes- (1) Any of the standard payment instructions at PGI 204.7108(d)(1) through (6); or (2) Other payment instructions, in accordance with PGI 204.7108(d)(12), that require contractor identification of the contract line item(s) on the payment request. (b) Use the provision at 252.204-7011, Alternative Line Item Structure, in solicitations for commercial items and initial provisioning spares. PART 212-ACQUISITION OF COMMERCIAL ITEMS 4. Amend section 212.301 by revising paragraph (f)(iv) to read as follows: 212.301 Solicitation provisions and contract clauses for the acquisition of commercial items. (f) * * * (iv) Use the provisions and clauses prescribed elsewhere in DFARS as follows: (A) Use the provision at 252.204-7011, Alternative Line Item Structure, as prescribed in 204.7109(b). (B) Use the provision at 252.209-7001, Disclosure of Ownership or Control by the Government of a Terrorist Country, as prescribed in 209.104-70(a). (C) Use the clause at 252.211-7003, Item Identification and Valuation, as prescribed in 211.274-4. (D) Use the clause at 252.211-7006, Radio Frequency Identification, as prescribed in 211.275-3. (E) Use the provision at 252.225-7010, Commercial Derivative Military Article-Specialty Metals Compliance Certificate, as prescribed in 225.7003-5(b). (F) Use the clause at 252.225-7040, Contractor Personnel Authorized to Accompany U.S. Armed Forces Deployed Outside the United States, as prescribed in 225.7402-4. (G) Use the clause at 252.225-7043, Antiterrorism/Force Protection Policy for Defense Contractors Outside the United States, in solicitations and contracts that include the clause at 252.225-7040. (H) Use the clause at 252.232-7009, Mandatory Payment by Governmentwide Commercial Purchase Card, as prescribed in 232.1110. (I) Use the clause at 252.232-7010, Levies on Contract Payments, as prescribed in 232.7102. (J) Use the clause at 252.232-7011, Payments in Support of Emergencies and Contingency Operations, as prescribed in

3.2.4 | Evaluation of Potential Consequences... 3.2.4 Evaluation of Potential Consequences The final component of risk identification is documenting the potential consequences of each risk listed in the register. 3.2.4, the practitioner can create a set of risk scenarios (described at the beginning of Section 3) in the risk description column of the Cybersecurity Risk Register (CSRR), including the source of uncertainty, predisposing conditions, resources affected, and anticipated result.

- Section 2 describes the need for effective recovery planning in advance of a cyber event. The section provides information about improving enterprise resiliency, recovery processes and procedures, recovery communications, and insight sharing. - Section 3 provides guidance for achieving continuous improvement of the organization's recovery processes and security posture. It emphasizes the need to validate recovery capabilities using a variety of techniques, including asking personnel for feedback on recovery plans, policies, and procedures, and periodically conducting exercises and tests that address real-world recovery. - Section 4 gives examples of recovery metrics that may help organizations to measure and monitor their recovery performance over time. - Section 5 summarizes the recommendations introduced in earlier sections to develop a recovery playbook which is composed of tactical and strategic phases. - Section 6 provides an example of a data breach cyber event recovery scenario that demonstrates the application of guidance in earlier sections. - Section 7 presents a second example covering a ransomware event recovery scenario. - Appendix A-includes a checklist of recovery actions. - Appendix B-provides mappings from the recovery processes and activities to the Cybersecurity Framework and related NIST SP 800-53 security controls. - Appendix C-provides a list of acronyms and abbreviations that appear in the document. - Appendix D-includes a list of references that provide additional information for the reader. Effective planning is a critical component of an organization's preparedness for cyber event recovery. As part of an ongoing organizational information security program, recovery planning enables participants to understand system dependencies; critical personnel identities such as crisis management and incident management roles; arrangements for alternate communication channels, services, and facilities; and many other elements of business continuity.

This rule does not require any specific reporting, recordkeeping or compliance requirements. It does, however, recognize the need for information technology contractors to implement appropriate safeguards and countermeasures to minimize supply chain risk. This rule, by itself, does not require contractors to deploy additional supply chain risk protections, but leaves it up to the individual contractors to take the steps they think are necessary to maintain existing or otherwise required safeguards and countermeasures as necessary for their own particular industrial methods to protect their supply chain. The rule does not duplicate, overlap, or conflict with any other Federal rules. Consistent with the stated objectives of section 806 and the DoDI, no viable alternatives exist. Possible alternatives considered included having all contractors report, on all contracts, the nature of the supply chain risk mitigation efforts they have applied to their manufacturing processes. This would be unduly burdensome for both contractors and the Government. Another alternative is not to have section 806 clauses apply to commercial and COTS items or purchases below the simplified acquisition threshold. However, the requirements of section 806 should apply to contracts and subcontracts at or below the simplified acquisition threshold because the malicious introduction of unwanted functions may occur at any dollar threshold. Therefore, it would not be in the best interest of the Federal Government to exempt contracts and subcontracts at or below the simplified acquisition threshold from this requirement. In a like manner, the requirements of section 806 should apply to the procurement of commercial items (including COTS items) because the intent of the statute is to protect the supply chain which in turn protects all NSS. Commercial and COTS information technology supplies and services often become part of NSSs. Protection of the NSSs using the authority of section 806 requires application in all information technology supply and services contracts. Therefore, exempting commercial (including COTS) items from application of the statute would negate the intended effect of the statute. DoD invites comments from small business concerns and other interested parties on the expected impact of this rule on small entities. DoD will also consider comments from small entities concerning the existing regulations in subparts affected by this rule in accordance with 5 U.S.C. 610 . Interested parties must submit such comments separately and should cite 5 U.S.C. 610 (DFARS Case 2012-D050) in correspondence. V. Paperwork Reduction Act The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the (printed page 69270)

a. CMMC Cost Assumptions and Estimates Comment: Several commenters questioned or refuted the cost estimates and/or the assumptions and mathematical approach upon which the cost estimates were based. Several commenters requested clarification around the cited difference in both cost and hours between the CMMC certification process and the DoD Assessment process, the accounting for completion of NIST SP 800-171 Rev 2 requirements, and cost distinction between enterprise and enclave assessments. Two commenters stated that the estimated number of subcontractors was low, and one commenter suggested that the \$5 million threshold for small businesses excluded a large number of small businesses from the calculations. One commenter asked whether duplication of assessments was considered for small businesses who support many prime contractors. Additional commenters believed costs were absent from the calculations, to include the cost of completing POA&M, management costs for small companies to achieve maturity, and costs for international suppliers. A number of comments requested additional estimates based on adjustments to labor rates for benefits and taxes, each of the assessment levels, and small, medium, and large companies. One commenter asked for clarification on the calculations used to estimate public savings. One commenter questioned why North American Industry Classification System (NAICS) code 54715 pertaining to sensitive CUI was not included in the calculations. Response:

stomize assessments based on organizational policies and requirements, known threat and vulnerability information, system and platform dependencies, operational considerations, and tolerance for risk. 1 | Access Control | Maintenance | Security Assessment and Monitoring |

From the DoD SP 800-171 Rev 3 Organization-Defined Parameters: MCKEOWN.DA VID.W.1034948 Digitally signed by MCKEOWN.DAVID.W.1034 948050 Date: 2025.04.10 14:34:00 -04'00' David W. McKeown Performing the Duties of the Deputy DoD CIO for Cybersecurity and DoD Chief Information Security Officer Attachment: As stated

Using the terms of the ISO/IEC 17020:2012(E), the activity of the C3PAO is an inspection, rather than a certification. The C3PAO is an inspection body, not a certification body, and is responsible for conducting the Level 2 certification assessment [Inspection]. The rule was revised to delete terms related to granting or revoking certification assessment status. The DoD reserves the right to conduct a DCMA DIBCAC assessment of the OSA, as provided for under the DFARS clause 252.204-7012 and DFARS clause 252.204-7020. DoD declines to extend the period for C3PAOs to achieve compliance with ISO/IEC 17020:2012(E). The Department has determined that 27 months is reasonable and sufficient for a C3PAO to achieve compliance. The rule was also updated in § 170.9(b)(11) to clarify that audit information must be provided upon request. 14. Ecosystem Capacity Comment: Commenters expressed concern that the demand for third-party assessments amongst the defense industrial base will exceed the capacity of available Certified CMMC Assessors and Certified CMMC Professionals and government assessors which may prevent timely and affordable audits or cause businesses to lose out on DoD contracts. To mitigate the concerns, one commenter suggested delaying phase-in of certification assessment by two years, by relying on self-assessment. One commenter warned of solicitation protests if companies are kept out of a competitive procurement due to a slow CMMC assessment process. Another suggested that insufficient assessors may shrink the market for DoD contractors and compromise assessment quality. Commenters were apprehensive that DoD projections for certification demand didn't factor in all subcontractors and that the CMMC Accreditation Body lacks a strategy for scaling to meet increased C3PAO demand. Additionally, one commenter pointed out that the rule indicates companies can pursue a certification assessment at any time after the rule is published, which could tie up already limited C3PAO resources and impede assessment opportunities for other companies bidding on an upcoming contract. Another expressed concern that often-extensive travel times required for assessors to reach rural-based companies like electric cooperatives will disincentivize assessors from prioritizing these companies and prevent their timely assessment.

usage) to home IoT devices may result in increased costs, design changes, or have an impact on functionality. Mark Haney gave an example of having to charge a smart watch battery daily versus weekly. Panelist Andrew Tierney gave another example using multi-factor authentication (MFA): 'MFA represents a massive security improvement and stops password phishing. However, because consumers don't want barriers, some companies are hurt by deploying MFA. Consumers will go elsewhere.' These examples illustrate what can occur when

2 3.1.11 33 Review DoD Cybersecurity FAQ Q53.2 for information on minimum values. AC.L2-3.1.12 · Control Remote Access CMMC Assessment Guide · Level 2 | Version 2.13 40 AC.L2-3.1.12 · CONTROL REMOTE ACCESS Monitor and control remote access sessions. ASSESSMENT OBJECTIVES [NIST SP 800-171A]34 Determine if: [a] remote access sessions are permitted; [b] the types of permitted remote access are identified; [c] remote access sessions are controlled; and [d] remote access sessions are monitored. POTENTIAL ASSESSMENT METHODS AND OBJECTS [NIST SP 800-171A]34 Examine [SELECT FROM: Access control policy; procedures addressing remote access implementation and usage (including restrictions); configuration management plan; system security plan; system design documentation; system configuration settings and associated documentation; remote access authorizations; system audit logs and records; other relevant documents or records]. Interview [SELECT FROM: Personnel with responsibilities for managing remote access connections; system or network administrators; personnel with information security responsibilities]. Test [SELECT FROM: Remote access management capability for the system]. DISCUSSION [NIST SP 800-171 REV. 2]35 Remote access is access to organizational systems by users (or processes acting on behalf of users) communicating through external networks (e.g., the internet). Remote access methods include dial-up, broadband, and wireless. Organizations often employ encrypted virtual private networks (VPNs) to enhance confidentiality over remote connections. The use of encrypted VPNs does not make the access non- remote; however, the use of VPNs, when adequately provisioned with appropriate control (e.g., employing encryption techniques for confidentiality protection), may provide sufficient assurance to the organization that it can effectively treat such connections as internal networks. VPNs with encrypted tunnels can affect the capability to adequately monitor network communications

traffic for malicious code. 34 NIST SP 800-171A, p. 14. 35 NIST SP 800-171 Rev. 2, pp. 13-14.

(ii) Future classified negotiations may occur within 12 months. (iii) There is reasonable likelihood the subcontractor may be awarded a classified subcontract. (iv) Subcontracting that involves access to FGI. (A) A U.S. contractor may award a subcontract that involves access to FGI to another U.S. contractor after verifying with the CSA that the prospective subcontractor has the appropriate entity eligibility determination and a classified information storage capability, and review of the prime contract to determine if there are any contractual limitations for approval before awarding a subcontract. The contractor awarding a subcontract will provide appropriate security classification guidance and incorporate the pertinent security provisions in the subcontract. (B) The contractor cannot award subcontracts involving FGI to a contractor in a third country or to a U.S. entity with a limited entity eligibility determination based on third-country FOCI without the express written consent of the originating foreign government. The CSA will coordinate with the appropriate foreign government authorities. (b) Security classification guidance. (1) Prime contractors will ensure that a Contract Security Classification Specification, or equivalent, is incorporated in each classified subcontract. (i) When preparing classification guidance for a subcontract, the prime contractor may extract pertinent information from: (A) The Contract Security Classification Specification, or equivalent, issued with the prime contract. (B) Security classification guides issued with the prime contract. (C) Any security guides that provide guidance for the classified information furnished to, or that will be generated by, the subcontractor. (ii) The Contract Security Classification Specification, or equivalent, prepared by the prime contractor will be certified by a designated official of the contractor. (iii) In the absence of exceptional circumstances, the classification specification will not contain any classified information. If classified supplements are required as part of the Contract Security Classification Specification, or equivalent, they will be identified and forwarded to the subcontractor by separate correspondence. (2) An original Contract Security Classification Specification, or equivalent, will be included with each RFQ, RFP, IFB, or other solicitation to ensure that the prospective subcontractor is aware of the security requirements of the subcontract and can plan accordingly. An original Contract Security Classification Specification, or equivalent, will also be included in the subcontract awarded to the successful bidder. (3) A revised Contract Security Classification Specification, or equivalent, will be issued as necessary during the lifetime of the subcontract when the security requirements change. (4) Requests for public release by a subcontractor will be forwarded through the prime contractor to the GCA. (printed page 83347) (c)

Cyber incident means actions taken through the use of computer networks that result in an actual or potentially adverse effect on an information system and/or the information residing therein. (f) Cyber intrusion damage assessment means a managed, coordinated process to determine the effect on defense programs, defense scientific and research projects, or defense warfighting capabilities resulting from compromise of a DIB participant's unclassified computer system or network. (g) Defense Industrial Base (DIB) means the Department of Defense, Government, and private sector worldwide industrial complex with capabilities to perform research and development, design, produce, and maintain military weapon systems, subsystems, components, or parts to satisfy military requirements. (h) DIB participant means a DIB company that has met all of the eligibility requirements to participate in the voluntary DIB CS/IA information sharing program as set forth in this part (see § 236.7). (i) Government means the United States Government. (j) Government Furnished Information (GFI) means information provided by the Government under the voluntary DIB CS/IA program, including but not limited to cyber threat information and information assurance practices. (k) Information means any communication or representation of knowledge such as facts, data, or (printed page 62436) opinions in any medium or form, including textual, numerical, graphic, cartographic, narrative, or audiovisual. (l) Information system means a discrete set of information resources organized for the collection, processing, maintenance, use, sharing, dissemination, or disposition of information. (m) Threat means any circumstance or event with the potential to adversely impact organization operations (including mission, functions, image, or reputation), organization assets, individuals, other organizations, or the Nation through an information system via unauthorized access, destruction, disclosure, modification of information and/or denial of service. (n) U.S. based means provisioned, maintained, or operated within the physical boundaries of the United States. (o) U.S. citizen means a person born in the United States or naturalized. § 236.3 Policy. It is DoD policy to: (a) Establish a comprehensive approach for enhancing and supplementing DIB information assurance capabilities to safeguard covered

defense information on covered DIB systems. (b) Increase the Government and DIB situational awareness of the extent and severity of cyber threats to DoD information. § 236.4 Procedures. (a) The Government and each DIB participant will execute a voluntary standardized agreement, referred to as a Framework Agreement (FA), to share, in a timely and secure manner, on a recurring basis, and to the greatest extent possible, cyber security information relating to information assurance for covered defense information on covered DIB systems.

From the NIST SP 800-172 Rev 3 Final Public Draft: Summary of Enhanced Security Requirements 3120
This appendix provides a consolidated list of the enhanced security requirements in Sec. 3. The type of enhanced security requirement is indicated in the last column of Table 2. · A designation of ·E· indicates that the security requirement enhances a requirement in SP 800-171 [12] and includes AP 800-171 requirement. · A designation of ·T· indicates that the security requirement is sourced to a control tailored out of the SP 800-53B [13] moderate baseline in SP 800-171 and includes the SP 800-53 control. · A designation of ·S· indicates that the security requirement does not enhance a specific requirement in SP 800-171 but can be used to strengthen the protection of CUI associated with critical programs or high value assets. It inc

Document or reference in the system security plan the security solution selected, the rationale for the security solution, and the risk determination. (xvii) RA.L3-3.11.5e Assess the effectiveness of security solutions at least annually or upon receipt of relevant cyber threat information, or in response to a relevant cyber incident, to address anticipated risk to organizational systems and the organization based on current and accumulated threat intelligence. (xviii) RA.L3-3.11.6e Assess, respond to, and monitor supply chain risks associated with organizational systems and system components. (xix) RA.L3-3.11.7e Develop a plan for managing supply chain risks associated with organizational systems and system components; update the plan at least annually, and upon receipt of relevant cyber threat information, or in response to a relevant cyber incident. (xx) CA.L3-3.12.1e Conduct penetration testing at least annually or when significant security changes are made to the system, leveraging automated scanning tools and ad hoc tests using subject matter experts. (xxi) SC.L3-3.13.4e Employ physical isolation techniques or logical isolation techniques or both in organizational systems and system components. (printed page 89129) (xxii) SI.L3-3.14.1e Verify the integrity of security critical and essential software using root of trust mechanisms or cryptographic signatures. (xxiii) SI.L3-3.14.3e Ensure that Specialized Assets including IoT, IIoT, OT, GFE, Restricted Information Systems, and test equipment are included in the scope of the specified enhanced security requirements or are segregated in purpose-specific networks. (xxiv) SI.L3-3.14.6e Use threat indicator information and effective mitigations obtained from, at a minimum, open or commercial sources, and any DoD-provided sources, to guide and inform intrusion detection and threat hunting. 1 Roman numerals in parentheses before the Security Requirement are for numbering purposes only. The numerals are not part of the naming convention for the requirement. (d) Implementation. Assessment of security requirements is prescribed by NIST SP 800-171A (incorporated by reference, see § 170.2) and NIST SP 800-172A (incorporated by reference, see § 170.2). Descriptive text in these documents support OSA implementation of the security requirements and use the terms organization-defined and periodically. Except where referring to an Organization-Defined Parameter (ODP), organization-defined means as determined by the OSA being assessed. Periodically means occurring at regular intervals. As used in many requirements within CMMC, the interval length is organization-defined to provided contractor flexibility, with an interval length of no more than one year. § 170.15 CMMC Level 1 Self-Assessment and Affirmation requirements. (a) CMMC Level 1 Self-Assessment. To comply with CMMC Level 1 requirements, the OSA must meet the requirements detailed in paragraphs (a)(1) and (2) of this section. (1) Self-Assessment.

(iii) On a tear-off sheet attached to the form; or (iv) As a separate supplement to the form. (b) Forms issued by non-DoD activities. (1) Forms subject to the Privacy Act issued by other Federal Agencies must have a Privacy Act Statement. Always ensure the statement prepared by the originating Agency is adequate for the purpose for which the form shall be used by the DoD activity. If the Privacy Act Statement provided is inadequate, the DoD Component concerned shall prepare a new statement or a supplement to the existing statement before using the form. (2) Forms issued by agencies not subject to the Privacy Act (State, municipal, and other local agencies) do not contain Privacy Act Statements. Before using a form prepared by such agencies to collect personal data subject to this part, an appropriate Privacy Act Statement must be added. Subpart D-Access by Individuals § 310.17 Individual access to personal information. (a) Individual access. (1) The

access provisions of this part are intended for use by individuals who seek access to records about themselves that are maintained in a system of records. Release of personal information to individuals under this part is not considered public release of the information. (2) Make available to the individual to whom the record pertains all of the personal information contained in the system of records except where access may be denied pursuant to an exemption claimed for the system (see subpart F to this part). However, when the access provisions of this subpart are not available to the individual due to a claimed exemption, the request shall be processed to provide information that is disclosable pursuant to the DoD Freedom of Information Act program (see 32 CFR , part 286). (b) Individual requests for access. Individuals shall address requests for access to personal information in a system of records to the system manager or to the office designated in the DoD Component procedural rules or the system notice. (c) Verification of identity. (1) Before granting access to personal data, an individual may be required to provide reasonable proof of his or her identity. (2) Identity verification procedures shall not: (i) Be so complicated as to discourage unnecessarily individuals from seeking access to information about themselves; or (ii) Be required of an individual seeking access to records that normally would be available under the DoD Freedom of Information Act Program (see 32 CFR , part 286). (iii) When an individual seeks personal access to records pertaining to themselves in person, proof of identity is normally provided by documents that an individual ordinarily possesses, such as employee and military identification cards, driver's license, other licenses, permits or passes used for routine identification purposes.

Conversely, if a restaurant/retail facility's sales of food it does not prepare and sell for immediate consumption are 10 percent or more of its total food sales, FDA believes that such sales are a significant portion of the facility's activities. Such a facility's retail food sales are exempt only from the requirement to establish and maintain records of sales to consumers. The restaurant/retail facility's sales of food it prepares and sells for immediate consumption remain exempt from all of the requirements of subpart J of this final rule. As noted earlier, retail facilities are required to keep records of sales to nonconsumers only to the extent that information is reasonably available. Section 306 of the Bioterrorism Act specifically exempts restaurants, but not retailers. FDA believes persons, including retailers, must establish and maintain records of immediate previous sources to ensure that FDA can quickly and effectively conduct a traceback in a food-related emergency. However, a retail food establishment that employs 10 or fewer full-time equivalent employees is excluded from all of the requirements of this final rule, except §§ 1.361 and 1.363. (See response to comment 38 of this document for a further discussion of FDA's rationale underlying this exclusion.) (Comment 44) Several comments state that, although they make every effort to provide food to their customers in a timely and efficient manner, a small percentage of the food that is in a grocery store is sent to a reclamation center from which it is either returned to the manufacturer or sent to food banks. Reclamation centers are currently the largest single source of food donations for food banks. Food may be sent to reclamation centers if its packaging is damaged or if it is past the "best if used by" date. The system for sending food to reclamation centers is simple: The unsaleable products are collected in banana cartons and then shipped to the center where the food is sorted and either donated to charitable organizations, such as food banks, or returned to the manufacturers. No records are kept by the store of the foods shipped to the reclamation center.

The RDA protocol is designed as an interface between a local SQL server and a remote SQL processor. The use of RDA on an open network may expose the system to many threats, including eavesdropping, packet replay, and host spoofing. These threats can be minimized by employing encryption techniques and strong authentication measures. RDA has built-in facilities which allow for the exchange of authentication data.

Investigatory information compiled for law-enforcement purposes, other than information that is covered by the general exemption (see § 310.28). If an individual is denied any right, privilege or benefit he or she is otherwise entitled by Federal law or for which he or she would otherwise be eligible as a result of the maintenance of the information, the individual shall be provided access to the information except to the extent that disclosure would reveal the identity of a confidential source. This exemption provides limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. (i) The information must be compiled for some investigative law enforcement purpose, such as a criminal investigation by a DoD office, whose principal function is not law enforcement, or a civil investigation. (ii) The exemption does not

apply to investigations conducted solely for the purpose of a routine background investigation (see paragraph (a)(5) of this section), but will apply if the investigation is for the purpose of investigating DoD personnel who are suspected of violating statutory or regulatory authority. (iii) The exemption can continue to be claimed even after the investigation has concluded and there is no future likelihood of further enforcement proceedings. (3) (k)(3). Records maintained in connection with providing protective services to the President and other individuals under 18 U.S.C. 3056, Powers, Authorities, and Duties of United States Secret Service. (4) (k)(4). Records maintained solely for statistical research or program evaluation purposes and that are not used to make decisions on the rights, benefits, or entitlement of an individual except for census records that may be disclosed under 13 U.S.C. 6, Information for other Federal Departments and Agencies. (5) (k)(5). Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, military service, Federal contracts, or access to classified information, but only to the extent such material would reveal the identity of a confidential source. (i) This exemption permits protection of confidential sources used in background investigations, employment inquiries, and similar inquiries that are for personnel screening to determine suitability, eligibility, or qualifications. (ii) This exemption is applicable not only to investigations conducted prior to the hiring of an employee, but it also applies to investigations conducted to determine continued employment suitability or eligibility. (printed page 18776) (6) (k)(6). Testing or examination material used solely to determine individual qualifications for appointment or promotion in the Federal or military service, if the disclosure would compromise the objectivity or fairness of the test or examination process. (7) (k)(7).

- identify known and anticipated threats to the satellite ground segment and supporting infrastructure; - protect the systems that the ground segment relies on through policy, training, resilience, and access control; - detect a loss of ground segments' confidentiality, integrity, or availability; - respond to confidentiality breaches of Telemetry, Tracking, and Command (TT&C) and a manipulation or loss of satellite commands or telemetry in a timely, effective, and resilient manner; and - recover from anomalies in a timely, effective, and resilient manner. This section was created by using the Cybersecurity Framework, as described in Section 3.2. The tables summarize the Subcategories within a Category for a Function. The Informative References provide additional guidance.

minimum) level of security for each relevant electronic information system and technology asset in its relevant electronic information systems and to maintain such information systems and technology assets according to those secure baselines. Consistent with our proposals regarding risk analysis and risk management planning, the Department intends for a regulated entity to establish its security baseline and to maintain that baseline even when technology changes. For example, a regulated entity that uses software to access ePHI would be required to update the software with patches as reasonable and appropriate. But where a developer ceases to support a software, it would be reasonable and appropriate for the regulated entity to take steps to either replace it or to otherwise ensure that its level of security remains consistent with the regulated entity's established baseline. Under this proposal, if finalized, the Department would expect a regulated entity to continually monitor its relevant electronic information systems and technology assets in its relevant electronic information systems to ensure that the secure baselines established by the regulated entity are maintained and take appropriate actions when a relevant electronic information system or technology asset in a relevant electronic information system fails to meet the established baselines. A regulated entity's secure baselines would be determined based on its risk analysis and use of security settings that are consistent across its relevant electronic information systems and technology assets in its relevant electronic information systems. For example, the risk analysis may determine that a manufacturer's default settings for a particular technology asset are insufficient. Accordingly, the regulated entity may establish the baseline for settings that should be applied to the particular asset and similar technologies across the regulated entity's enterprise. This proposed standard aligns with the Department's enhanced CPG for Configuration Management, which calls for regulated entities to define secure device and system settings. It also aligns with the enhanced CPG for Detect and Respond to Relevant Threats and Tactics, Techniques, and Procedures by calling for regulated entities to include malware protection in their security baseline to detect threats and protect electronic information systems. [748] Additionally, the proposed standard also aligns with the Department's essential CPG for Email Security, which addresses the reduction of risks from email-based threats. [749] The Department proposes five implementation

specifications for the proposed standard for configuration management. [750] Under the proposed implementation specification for anti-malware protection at proposed 45 CFR 164.312(c)(2)(i)

(iii) If a company disputes a DSS determination that the company is under FOCI, or disputes the DSS determination regarding the types of actions necessary to mitigate or negate the FOCI, the company may appeal in writing those determinations to the Director, DSS, for a final agency decision no later than 30 days after receipt of written notification of the DSS decision. The company must identify the specific relief sought and grounds for that relief in its appeal. In response, the Director, DSS, may request additional information from the company. At a minimum, DSS will respond to appeals within 30 days, either with a decision or an estimate as to when a decision will be rendered. DSS will not release pre-decisional information to the company, its legal counsel, or any of its representatives without the express written approval of the applicable GCAs who own the data and any other USG entities with an interest in the company's FOCI action plan. (iv) DoD recognizes that FOCI concerns may arise in a variety of other circumstances, all of which cannot be listed in this subpart. In FOCI cases involving any foreign ownership or control, DSS will advise and consult with the appropriate GCAs, including those with special security needs, regarding the required FOCI mitigation or negation method and provide those GCAs with the details of the FOCI factors and any associated risk assessments. DSS and GCAs will meet to discuss the FOCI action plan, when determined necessary by either DSS or the applicable GCAs. When DSS determines that a company may be ineligible for an FCL by virtue of FOCI, or that additional action by the company may be necessary to mitigate the FOCI or associated risks, DSS will promptly notify the company and require it to submit a FOCI action plan to DSS within 30 calendar days of the notification. In addition, DSS will advise company management that failure to submit the requested plan within the prescribed period of time will result in termination of FCL processing or initiation of action to revoke an existing FCL, as applicable. (v) In instances where the identification of a foreign owner or voting interest of five percent or more cannot be adequately ascertained (e.g., the participating investors in a foreign investment or hedge fund, owning five percent or more of the company, cannot be identified), DSS may determine that the company is not eligible for an FCL.

example, an organization might require that laptops not be left unattended when taken to hotels, conferences, and other locations where third parties could easily gain physical access to the devices. Organizations may also have physical security requirements for papers and other non-computer media that contain sensitive information and are taken outside the organization's facilities. - - Encrypting files stored on telework devices and removable media such as CDs and flash drives. This prevents attackers from readily gaining access to information in the files. Many options exist for protecting files, including encrypting individual files or folders, volumes, and hard drives. Generally, using an encryption method to protect files also requires the use of an authentication mechanism (e.g., password) to decrypt the files when needed. - - Ensuring that information stored on telework devices is backed up. If something adverse happens to a device, such as a hardware, software, or power failure or a natural disaster, the information on the device will be lost unless it has been backed up to another device or removable media. Some organizations permit teleworkers to back up their local files to a centralized system (e.g., through VPN remote access), whereas other organizations recommend that their teleworkers perform local backups (e.g., burning CDs, copying files onto removable media). Teleworkers should perform backups, following their organizations' guidelines, and verify that the backups are valid and complete. 5 It is important that backups on removable media be secured at least as well as the device that they backed up. For

example, if a computer is stored in a locked room, then the media also should be in a secured location; if a computer stores its data encrypted, then the backups of that data should also be encrypted. - - Ensuring that information is destroyed when it is no longer needed.

Correlating audit record review, analysis, and reporting processes helps to ensure that they do not operate independently, but rather collectively. Regarding the assessment of a given organizational system, the requirement is agnostic as to whether this correlation is applied at the system level or at the organization level across all systems. FURTHER DISCUSSION Companies must review, analyze, and report audit records to help detect and respond to security incidents in a timely manner for the purpose of investigation and corrective actions. Collection of audit logs into one or more central repositories may facilitate correlated review. 70 NIST SP 800-171A, p. 23. 71 NIST SP 800-171 Rev. 2, p. 19.

One comment asked why the rule does not include requirements for LTPs, and another requested additional rule text to clarify the relationship between an ATP and the CAICO in administrative matters of students. One comment recommended not requiring CCIs to provide qualification and training information to the CAICO. One comment recommended a method for reducing a perceived redundancy in the rule text between ecosystem-related sections. Two comments asserted that a CCI certification is redundant because individuals attempting to become CCIs are already certified as CCPs or CCAs. One comment asked that a new requirement be added to the rule under § 170.12 to address the transition of Provisional Instructors to CCIs. Response: The CMMC rule does not use the term Licensed Training Provider (LTP), as training providers are not required to be licensed. The correct term for CMMC training providers is Approved Training Provider (ATP). The CMMC rule contains the requirements to create the training for the CMMC Program. § 170.10 contains the requirements for the CAICO to ensure compliance with ISO/IEC 17024:2012(E) and to ensure all training products, instruction, and testing materials are of high quality. DoD disagreed with a comment to delete a requirement in the rule for CCIs to update the CAICO regarding qualification, training experience, and other information relating to their competency to teach within the CMMC ecosystem. Viewing and verifying CCI qualifications is an important element of quality assurance in the CAICO's role of training, testing, authorizing, certifying, and recertifying CMMC assessors, instructors, and related individuals. § 170.12(b) in the rule was updated to add the requirement for a CCI to be certified at or above the level of training they are delivering. The DoD also modified § 170.12(a)(11) to add CMMC Certified Professional (CCP) candidates. The DoD declined to remove the certification requirement for CCIs. Although CMMC Certified Assessors have the technical background, that does not imply that they meet all the instructor-unique qualifications necessary to be a CCI. The DoD modified § 170.12 to include requirements for Provisional Instructors prior to their transition to a CMMC Certified Instructor. Any Provisional Instructor (PI) will be required to achieve certification under the CMMC Certified Instructor (CCI) program within 18 months of the final rule publication. The PI designation ends 18 months after the effective date of the rule. f. Conflicts of Interest and Code of Professional Conduct Comment:

Additional information about this publication is available at <https://csrc.nist.gov/pubs/ir/8523/final>, including related content, potential updates, and document history. State agencies that have already implemented MFA may decide to offer an MFA service to local agencies within their jurisdiction, as shown in Fig. 9. This model might be offered only to small or rural agencies who may lack the necessary funding and/or knowledge to implement MFA on their own, or the state might consider a shared service model where identity services are offered to all eligible and interested agencies within the state. Such an approach could result in economies of scale that could save costs for both state and local agencies and could also reduce the number of MFA architectures and implementations needed across the state. Establishing a state-shared service might also afford agencies greater ability to influence vendor capabilities and updates, including updates to support standards and best practices for MFA. - [1] U.S. Department of Justice (2024) Criminal Justice Information Services (CJIS) Security Policy, Version 6.0. (National Institute of Standards and Technology, Gaithersburg, MD), NIST Special Publication (SP) 800-63-4. <https://doi.org/10.6028/NIST.SP.800-63-4> - [4] Temoshok D, Fenton JL, Choong YY, Lefkovitz N,

Upon submission, the Government must review approximately 28 continuous monitoring strategies provided by contractors each year (see 39.X03(f)). It is estimated that a GS 15/step 5 employee will spend 20 hours reviewing, analyzing, and processing a contractor's submission. Using an average loaded wage rate of \$113.46 for GS 15/step 5 employees, the total annual estimated cost for the Government to review, analyze, and file 28 continuous monitoring strategy submissions each year is approximately \$63,538 (28 responses * 20 hours * \$113.46). V. Executive Orders 12866 and 13563 Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This rule is a significant regulatory action under E.O. 12866, and therefore, was subject to review under Section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. VI. Regulatory Flexibility Act DoD, GSA, and NASA do not expect this proposed rule, when finalized, to have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601-612, because the rule applies to a small number of entities that develop, implement, operate, or maintain a FIS on behalf of the Government. However, an Initial Regulatory Flexibility Analysis (IRFA) has been performed and is summarized as follows: DoD, GSA, and NASA are proposing to amend the Federal Acquisition Regulation (FAR) to implement standardized cybersecurity contractual requirements across Federal agencies for unclassified Federal Information Systems (FIS) pursuant to recommendations received in accordance with paragraph (i) of section 2 of E.O. 14028, 'Improving the Nation's Cybersecurity,' dated May 12, 2021. The objective of this rule is to implement standardized cybersecurity requirements in Federal contracts for services to develop, implement, operate, or maintain a FIS on behalf of the Government. This rule will help protect and secure FISs, while streamlining the cybersecurity requirements for applicable contracts and improving contractor and Federal compliance with cybersecurity requirements for these systems. The legal basis for this rule is paragraph (i) of section 2 of Executive Order 14028, 'Improving the Nation's Cybersecurity,' dated May 12, 2021; and paragraphs (a) and (b)(1) of section 7 of the Internet of Things (IoT) Cybersecurity Improvement Act of 2020 (Pub. L. 116-207). Promulgation of FAR regulations is authorized by 40 U.S.C. 121(c) ; 10 U.S.C. chapter 4 and 10 U.S.C. chapter 137 legacy provisions (see 10 U.S.C. 3016); and 51 U.S.C. 20113 .

From the NIST SP 800-172 Rev 3 Final Public Draft: The defender then analyzes (malware and forensic analysis) the malware captured in the honeynet to determine the nature of the attacker's TTPs, allowing it to develop appropriate defenses. NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 INTENDED EFFECT IMPACT ON RISK EXPECTED RESULTS Reveal Increase the awareness of risk factors and the relative effectiveness of remediation approaches across the stakeholder community to support common, joint, or coordinated risk response. Reduce the likelihood of impact, particularly in the future. · The adversary loses the advantage of surprise and possible deniability. · The adversary's ability to compromise one organization's systems to attack another organization is impair

) The CSA, GCA, or controlling agency becomes aware of adverse information that impacts the entity eligibility determination. (ii) The CSA's threat assessment pertaining to the entity indicates a risk to one of the categories of proscribed information. (iii) The CSA becomes aware of any material change regarding the source, nature, and extent of FOCI. (iv) The entity's record of NISP compliance, based on CSA reviews, becomes less than satisfactory. Consult DOE Order 470.4B for additional information and requirements for processing NID requests for access to RD. (5) Under any of the circumstances in paragraphs (d)(2)(iii)(B)(4)(i) through (d)(2)(iii)(B)(4)(iv) in this section, the CSA determines whether the entity remains eligible for access to classified information, it must change the FOCI mitigation measure in order to remain eligible for access to classified information, or the CSA must terminate or revoke the access to classified information. (6) When an entity is eligible for access to classified information that includes a favorable NID for SCI, RD, or COMSEC, the CSA does not have to request a new NID concurrence for the same entity if the access to classified information requirements for the relevant category of proscribed information and terms remain unchanged for: (i) Renewing the contract or agreement. (ii) New task orders issued under the contract or agreement. (iii) A new contract or

agreement that contains the same provisions as the previous one (this usually applies when the contract or agreement is for a program or project.) (iv) Renewing the SSA. (7) Under certain conditions, entities under an SSA may not require a NID for one or more categories of proscribed information in accordance with CSA-provided guidance. Categories of proscribed information for entities under SSAs not requiring a NID will be recorded in the CSA's system of record for entity eligibility determinations. (iv) Voting Trust (VT) or Proxy Agreement (PA). The VT and the PA are arrangements that vest the voting rights of the foreign-owned stock in cleared U.S. citizens approved by the USG. Under a VT, the foreign owner transfers legal title its ownership interests in the entity to the trustees. Under a PA, the foreign owner's voting rights are (printed page 83333) conveyed to the proxy holders. Neither arrangement imposes any restrictions on the entity's eligibility to have access to classified information or to compete for classified contracts. (A) Establishment of a VT or PA involves the selection of trustees or proxy holders, all of whom must become members of the entity's governing board. Both arrangements must provide for the exercise of all prerogatives of ownership by the trustees or proxy holders with complete freedom to act independently from the foreign owners, except as provided in the VT or PA. The arrangements may limit the authority of the trustees or proxy holders by requiring approval be obtained from the foreign owner with respect to issues such as: (1

State and local officials who assist with FD&C Act examinations and inspections are issued one or two types of credentials that differ in scope. All commissioned individuals receive Certificates of Commission and are permitted to receive and review FDA documents. A subset of commissioned individuals also receive personal ·pocket credentials· identifying them as FDA commissioned officers and authorizing them to perform additional activities such as conducting inspections, collecting samples, and verifying records. To obtain pocket credentials, State and local officials undergo an Office of Personnel Management level 5 background investigation. FDA commission credentials are different from the PIV badges issued to FDA employees and contractors, and are manufactured and issued by FDA's Office of Security Operations, and are not within the scope of HHS department-wide SORN No. 09-90-0777. II. The Privacy Act The Privacy Act of 1974 (Pub. L. 93-579) (5 U.S.C. 552a), as amended, governs the means by which the U.S. Government collects, maintains, and uses information about individuals in a system of records. A ·system of records· is a group of any records under the control of a Federal Agency from which information about an individual is retrieved by the individual's name or other personal identifier. The Privacy Act requires each Agency to publish in the Federal Register a SORN identifying and describing each system of records the Agency maintains, including the purposes for which the Agency uses information about individuals in the system, the routine uses for which the Agency discloses such information outside the Agency, and how individual record subjects can exercise their rights under the Privacy Act (for example, to determine if the system contains information about them). (printed page 72688) A. System Number 09-10-0022 B. System Name FDA Commissioning of State and Local Officials, HHS/FDA/OR. C. Security Classification Unclassified. D. System Location Records are maintained at several FDA Headquarters locations and in component offices of the FDA, in both Montgomery County, MD and field locations across the United States. E. Categories of Individuals Covered by the System The records in this system will contain data collected from the FDA commissioning applications of individuals who are State and local officials who wish to be commissioned under section 702(a)(1)(A) of the FD&C Act. This information is gathered for the purpose of processing and validating each individual's qualifications for commissioning, to initiate the mandatory background investigation, and to track the status of commissioned officials.

Incident Response Recommendations and Considerations for Cybersecurity Risk Management ##

(2) The Office of the Secretary of Defense issued a policy memorandum in 2001 that provided greater protection of DOD personnel in the aftermath of 9/11 by requiring information that personally identifies DOD personnel be more carefully scrutinized and limited. In general, the Department of Defense has specifically advised that DOD components are not to release lists of names, duty addresses, present or past position titles, grades, salaries, and performance standards of DOD military members and civilian employees. At the office director level or above, the release of information will be limited to the name, official title, organization, and telephone number, provided a determination is made that disclosure does not raise security or privacy concerns. No other information, including room numbers, will normally be released about these officials. Consistent with current policy, information on officials below the office director level may continue to be released if their positions or duties require frequent interaction with the public.

(3) Disclosure of records pertaining to personnel of overseas, sensitive, or routinely deployed units shall be prohibited to the extent authorized by 10 U.S.C. 130b . (e) Release of home addresses and home telephone numbers. (1) The release of home addresses and home telephone numbers normally is prohibited. This release is normally considered a clearly 'unwarranted invasion' of personal privacy and is exempt from mandatory release under the FOIA. However, home addresses and home telephone numbers may still be released if: (i) The individual has indicated previously in writing that he or she has no objection to the release; (ii) The source of the information to be released is a public document such as commercial telephone directory or other public listing; (iii) The release is required by Federal statute (for example, pursuant to federally funded state programs to locate parents who have defaulted on child support payments) (See 42 U.S.C. 653); or (iv) The releasing of information is pursuant to the routine use exception or the 'intra-agency need to know' exception to the Privacy Act. (2) A request for a home address or telephone number may be referred to the last known address of the individual for a direct reply by the individual to the requester. In such cases, the requester shall be notified of the referral. (3) Do not sell or rent lists of individual names and addresses unless such action is specifically authorized by the appropriate

authority. (f) Emergency Recall Rosters. (1) The release of emergency recall rosters normally is prohibited. Their release is normally considered a clearly ·unwarranted invasion· of personal privacy and is exempt from mandatory release under the FOIA. Emergency recall rosters should only be shared with those who have an ·official need to know· the information, and they should be marked ·For Official Use Only· (See AR 25-55).

a FIS that uses non-cloud computing services and a FIS that uses cloud computing services). When an acquisition requires the use of both non-cloud computing services and cloud computing services in performance of the contract, the rule would require compliance with the policies, procedures, and requirements for each service approach, as they respectively apply to the FIS. This rule proposes to: (1) add a new FAR subpart 39.X, ·Federal Information Systems,· to prescribe policies and procedures for agencies when acquiring services to develop, implement, operate, or maintain a FIS; (2) add and revise definitions in parts 2 and 39.X using current language from statute, regulation, Office of Management and Budget memoranda and circulars, and National Institute of Standards and Technology (NIST) Special Publications (SP) guidance; (3) make conforming changes to parts 4, 7, 37, and 39 to further implement policies and procedures described below; and (4) add two new FAR clauses to be used in contracts for services to develop, implement, operate, or maintain a FIS: FAR clause 52.239-YY, ·Federal Information Systems Using Non-Cloud Computing Services,· which is included in solicitations and contracts that use non-cloud computing services in performance of the contract; and FAR clause 52.239-XX, ·Federal Information Systems Using Cloud Computing Services,· which is included in solicitations and contracts that use cloud computing services in performance of the contract. The policies and requirements specified in this rule are discussed below. A. FISs Using Non-Cloud Computing Services FIPS Publication 199 Impact Level and Mandatory Security and Privacy Controls. As each requirement will vary in scope, as well as the function of each FIS, adequate security and privacy controls must be identified when agencies define their acquisition requirements. Agencies will use Federal Information Processing Standard (FIPS) Publication 199 to categorize the FIS based on its impact analysis of the information processed, stored, or transmitted by the system. As a result of the analysis, the FIPS Publication 199 impact level of the FIS, as well as a set of necessary security and privacy controls for the FIS, will be specified by the agency in the contract. As part of the security and privacy controls identified by the agency, the rule would require agencies to address multifactor authentication, administrative accounts, consent banners, Internet of Things device controls, and assessment requirements, when applicable, in every applicable contract. The proposed rule adds text to FAR part 7 to ensure that acquisition planners develop agency requirements in accordance with the rule's requirements. Records Management and Government Access.

Tier 3 addresses risk from an information system perspective and is guided by the risk context, risk decisions and risk activities at Tiers 1 and 2. Tier 3 risk management activities include: (i) categorizing organizational information systems; (ii) allocating security controls to organizational information systems and the environments in which those systems operate consistent with the organization's established enterprise architecture and embedded information security architecture; and (iii) managing the selection, implementation, assessment, authorization, and ongoing monitoring of allocated security controls as part of a disciplined and structured system development life cycle process implemented across the organization. At Tier 3, information system owners, common control providers, system and security engineers, and information system security officers make risk-based decisions regarding the implementation, operation, and monitoring of organizational information systems. Based on these day-to-day operational riskbased decisions, authorizing officials make follow-on risk-based decisions on whether or not the information systems are initially authorized to operate within the designated environments of operation or continue to receive authorization to operate on an ongoing basis. These ongoing riskbased decisions are informed by the risk management process with guidance from the risk executive (function) and the various architectural considerations supporting the mission/business processes. In addition, the activities at Tier 3 provide essential feedback to Tiers 1 and 2. New vulnerabilities discovered in an organizational information system, for example, may have systemic implications that extend organization-wide. Those same vulnerabilities may trigger changes to the enterprise architecture and embedded information security architecture or may require an adjustment to the organizational risk tolerance.

. This proposed standard would require a regulated entity to deploy technical controls to create and maintain backups of relevant electronic information systems. It would also require a regulated entity to review and test the effectiveness of such technical controls at least once every six

months or in response to environmental or operational changes, whichever is more frequent, and modify them as reasonable and appropriate. The Department would not require a regulated entity to test every relevant electronic information system; rather, the requirement to test the effectiveness of the controls would permit a regulated entity to review the relevant log files and to test a representative sample of the backup of its relevant electronic information systems. This proposed standard would reduce potential gaps in the data that needs to be backed up and recovered, to ensure that regulated entities address compliance across relevant electronic information systems. It is crucial to a regulated entity's recovery from an emergency or other occurrence, including a security incident, that adversely affects its relevant electronic information systems to create and maintain backups of such information systems that comprise the infrastructure that maintains and supports the confidentiality, integrity, and availability of ePHI. The Department would expect that the extent of this activity would be affected by the size and complexity of the relevant electronic information systems used by a regulated entity. It is also consistent with NIST guidance, which directs regulated entities to consider whether backups or images of operating systems, devices, software, and configuration files necessary to support the (printed page 980) confidentiality, integrity, and availability of ePHI. [817]

4. Request for Comment The Department requests comments on the foregoing proposals, including any benefits, drawbacks, or unintended consequences. We also request comment on the following considerations in particular:

- a. Whether there are additional technical safeguards that the Department should require regulated entities to implement.
- b. Whether there are additional implementation specifications that should be adopted for any of the proposed or existing technical safeguards.
- c. Whether the Department should extend the standard for encryption and decryption and associated implementation specifications to require encryption of all relevant electronic information systems.

3.4.5 | Application Whitelisting ... 3.4.5 Application Whitelisting Application whitelisting technologies, also known as application control programs, are used to specify which applications are authorized for use on a host. 3.4.5) to prevent unauthorized applications from being run within it.

Below is a summary of the significant program changes and adjustments proposed since the approved 2024 ICR; because the ICR addresses regulatory burdens associated with the full suite of HIPAA Rules, the changes and adjustments include updated data and estimates for some provisions of the HIPAA Rules that are not affected by this proposed rule. These program changes and adjustments form the bases for the burden estimates presented in the ICR associated with this NPRM. Adjusted Estimated Annual Burdens of Compliance

- (1) Updating the number of covered entities.
- (2) Updating hourly wage rates.
- (3) Adjusting downward the number of estimated requests for an exception to Federal preemption of State law to the prior baseline of 1 request per year.
- (4) Adjusting downward the estimated hourly burden for regulated entities to report security incidents (not breaches) from 20 hours per monthly report to 10 hours per monthly report.
- (5) Updating the number of research disclosures.

New Burdens Resulting From Program Changes In addition to the adjustments above, the Department proposes to add new annual estimated burdens as a result of program changes, as follows:

- (1) A burden of 2 hours for each regulated entity to conduct a Security Rule compliance audit.
- (2) A burden of 2 hours for each business associate (including each subcontractor) to provide verification of compliance with technical safeguards.
- (3) A burden of .5 hours for each covered entity to obtain verification of business associates' compliance with technical safeguards.
- (4) A burden of .083 hours for each business associate to obtain verification of subcontractors' compliance with technical safeguards.
- (5) A burden of 1 hour for each regulated entity to provide notification to other regulated entities of workforce members' termination of access to ePHI.
- (6) A burden of 1.5 hours for each regulated entity to deploy MFA.
- (7) A burden of 4.5 hours for each regulated entity to perform network segmentation.
- (8) A burden of .5 hours for approximately 76.56 percent of regulated entities to disable unused ports and remove extraneous software.
- (9) A burden

of 3 hours for each regulated entity to conduct penetration testing. (10) A burden of .5 hours for each regulated entity to notify covered entities or business associates, as applicable, upon activation of a contingency plan. (11) A burden of .5 hours for each insurer and third-party administrator to update health plan documents. (12) A burden of 2 hours for each regulated entity to update the content of its cybersecurity awareness and Security Rule training program. (13) A burden of 3.5 hours for each regulated entity to update its policies and procedures. (14) A burden of 1 hour for each regulated entity to update business associate agreements. (15) A burden of 52.92 hours for each health plan sponsor to modify safeguards for its relevant electronic information systems to meet Security Rule standards. List of Subjects 45 CFR Part 160 Administrative practice and procedure

From the NIST SP 800-172 Rev 3 Final Public Draft: 03.02.03E Literacy and Awareness Training Feedback 801 Provide feedback on organizational training results to the following personnel [Assignment: organization-defined personnel]. DISCUSSION Training feedback includes literacy and role-based training results, which can indicate a potentially serious problem, especially the failures of personnel in critical roles. Managers should be made aware of such situations so that they can respond accordingly. Training feedback supports the evaluation and update of organizational training content and methodology. This requirement does not enhance a specific requirement in SP 800-171 but can be used to strengthen the protection of CUI associated with critical programs or high value assets. PROTECTION STRATEGY DLO ADVERSARY EFFECTS Preclu

(8) Nothing contained in this section affects the authority of a Federal agency head to limit, deny, or revoke access to classified information under its statutory, regulatory, or contract jurisdiction. (b) Factors. Factors relating to the entity, relevant foreign interests, and the government of such foreign interests, as appropriate, will be considered in the aggregate to determine whether an applicant entity is under FOCI, its eligibility for access to classified information, and the protective measures required. These factors include: (1) Record of espionage against U.S. targets, either economic or government. (2) Record of enforcement actions against the entity for transferring technology without authorization. (3) Record of compliance with pertinent U.S. laws, regulations, and contracts or agreements. (4) Type and sensitivity of the information the entity would access. (5) Source, nature, and extent of FOCI, including whether foreign interests hold a majority or minority position in the entity, taking into consideration the immediate, intermediate, and ultimate parent entities. (6) Nature of any relevant bilateral and multilateral security and information exchange agreements. (7) Ownership or control, directly or indirectly, in whole or in part, by a foreign government. (8) Any other factor that indicates or demonstrates capability of foreign interests to control or influence the entity's operations or management. (c) Procedures. An entity is required to complete an SF 328 during the process for an entity eligibility determination or when significant changes occur to information previously submitted. In the case of a corporate family, the form may be a consolidated response rather than separate submissions from individual members of the corporate family based on CSA guidance. (1) If an entity provides any affirmative answers on the SF 328, or the CSA receives other information which indicates that the applicant entity may be under FOCI, the CSA will make a risk-based determination regarding the relative significance of the information in regard to: (i) Whether the applicant is under FOCI. (ii) The extent and manner to which the FOCI represents a risk to the national security or may adversely impact classified contract performance. (iii) The type of actions, if any, that would be necessary to mitigate or negate the effects of FOCI to a level deemed acceptable to the USG. The CSA will advise entities on the CSA's appeal channels for disputing CSA FOCI determinations. (2) When an entity with a favorable eligibility determination enters into negotiations for the proposed merger, acquisition, or takeover by a foreign interest, the entity will submit notification to the CSA of the commencement of such negotiations. (i) The submission will include the type of transaction under negotiation (e.g.,

cybersecurity attacks impacting the Nation's economy? In addition, the U.S. Government, as a potential user of electric vehicles and EVSE, is concerned about how cybersecurity threats to the charging infrastructure might affect government activities. These concerns, as well as policy interests in the adoption of electric vehicles, have led to research efforts sponsored by federal agencies to examine potential cybersecurity issues. Because EVSE is a relatively new infrastructure, multiple researchers pointed out the lack of understanding of the risks and necessary controls. As a result, multiple researchers devoted significant attention to the development of threat models. Reliable threat models are needed to help determine what risks exist

and what controls might mitigate such risks. Without threat models, it is difficult for manufacturers, users, and the Government to make risk-based decisions on the controls needed. - Threat Model of Vehicle Charging Infrastructure (Sandia National Labs) - Enabling Secure and Resilient XFC: A Software/Hardware-Security Co-Design Approach (Virginia Tech) - Consequence-Driven Cybersecurity for High-Power Charging Infrastructure (Idaho National Labs) - Cybersecurity for Grid Connected eXtreme Fast Charging (XFC) Station (CyberX) (ABB)

(8) Address all appeals arising from the CMMC assessor, instructor, and practitioner authorizations and certifications process through use of internal processes in accordance with ISO/IEC 17024:2012, or subsequent revisions. (9) Maintain records for a period of six (6) years of all procedures, processes, and actions related to fulfillment of the requirements set forth in this section and provide the Accreditation Body access to those records. (10) Provide the Accreditation Body information about the authorization and accreditation status of assessors, instructors, training community, and publishing partners. (11) Ensure separation of duties between individuals involved in testing activities, training activities, and certification activities. (12) Safeguard and require any subcontractor, as applicable, to safeguard the confidentiality of applicant, candidate, and certificate-holder information and ensure the overall security of the certification process. (13) Ensure that all personal information is encrypted and protected in all CAICO and CAICO subcontractor, as applicable, information systems and databases. (14) Ensure the security of assessor and instructor examinations and the fair and credible administration of examinations. (15) Neither disclose nor allow any subcontractor, as applicable, to disclose CMMC data or metrics related to authorization or certification activities to any entity other than the Accreditation Body and DoD, except as required by law. (16) Require retraining and recertification of CCAs, CCIs, and CCPs upon significant change to DoD's CMMC Program requirements under this rule. § 170.11 CMMC Certified Assessor (CCA). (a) Roles and responsibilities. CCAs, in support of a C3PAO, conduct CMMC Level 2 Certification Assessments of OSCs in accordance with NIST SP 800-171A (incorporated by reference, see § 170.2), the assessment processes defined in § 170.17, and the scoping requirements defined in § 170.19. CCAs are certified by the CAICO after successful completion of the CCA training and testing requirements set forth in paragraph (b) of this section. A CCA may conduct CMMC Level 2 Certification Assessments and participate on a C3PAO Assessment Team. (b) Requirements. CCAs shall: (1) Obtain and maintain certification from the CAICO in accordance with the requirements set forth in § 170.10. Certification is valid for 3 years from the date of issuance. (2) Comply with the Accreditation Body policies for Conflict of Interest, Code of Professional Conduct, and Ethics set forth in § 170.8(b)(17). (3) Complete a Tier 3 background investigation resulting in a determination of national security eligibility. This Tier 3 background investigation will not result in a security clearance and is not being executed for the purpose of government employment. The Tier 3 background investigation is initiated using the Standard Form (SF) 86. These positions are designated as non-critical sensitive with a risk designation of 'Moderate Risk' in (printed page 89127)

3.1.2 | Base Metrics... 3.1.2 Perceived Target Value (PTV) The Perceived Target Value metric measures the likelihood of attack using the configuration issue in an environment relative to vulnerable systems in other environments. 3.1.2 Base Metrics ## 3.

employing the technology? Often we are not seeing that information.' An essential element of manufacturer communications is clear explanation of customer responsibilities for IoT device cybersecurity. Consumers, for example, primarily need basic installation and configuration guidance, whereas organizational customers need more extensive documentation to address device configurability, deployment of devices at scale, and information enabling the organization to ensure it is able to satisfy its legal obligations. All customers need clarity regarding available manufacturer communications channels, frequency of software updates, and end-of-life dates beyond which specific IoT devices will no longer be supported.

3.2.7 | Tampering of Storage-Related Log and Audit Data... 3.2.7 Tampering of Storage-Related Log and Audit Data The tampering of storage-related log and audit data is where an attacker deletes or modifies log data to prevent an effective audit trail in an effort to conceal the attack (in real-time or afterwards) or to mislead the people investigating attacks with false information.

CIS Safeguard 3.12 · Segment Data Processing and Storage Based on Sensitivity Segment data processing and storage, based on the sensitivity of the data. Do not process sensitive data on

enterprise assets intended for lower sensitivity data. Implementation Groups: 2,3 Asset Type: network Security Function: protect Parent Control: Data Protection

§ 164.414 Administrative requirements and burden of proof. (a) Administrative requirements. A covered entity is required to comply with the administrative requirements of § 164.530(b) , (d) , (e) , (g) , (h) , (i) , and (j) with respect to the requirements of this subpart. (b) Burden of proof. In the event of a use or disclosure in violation of subpart E, the covered entity or business associate, as applicable, shall have the burden of demonstrating that all notifications were made as required by this subpart or that the use or disclosure did not constitute a breach, as defined at § 164.402 .

means any agreement between one or more Federal laboratories and one or more non-Federal parties under which the Government, through its laboratories, provides personnel, services, facilities, equipment, intellectual property, or other resources with or without reimbursement (but not funds to non-Federal parties) and the non-Federal parties provide funds, personnel, services, facilities, equipment, intellectual property, or other resources toward the conduct of specified research or development efforts which are consistent with the missions of the laboratory; except that such term does not include a procurement contract or cooperative agreement as those terms are used in sections 6303, 6304, and 6305 of title 31. Corporate family means an entity, its parents, subsidiaries, divisions, and branch offices. Counterintelligence means information gathered and activities conducted to protect against espionage, other intelligence activities, sabotage, or assassinations conducted for or on behalf of foreign powers, organizations or persons, or international terrorist activities, but not including personnel, physical, document or communications security programs. Courier means a cleared employee, designated by the contractor, whose principal duty is to transmit classified material to its destination, ensuring that the classified material remains under their constant and continuous protection and that they make direct point-to-point delivery. CRYPTO means the marking or designator that identifies unencrypted COMSEC keying material used to secure or authenticate telecommunications carrying classified or sensitive USG or USG-derived information. This includes non-split keying material used to encrypt or decrypt COMSEC critical software and software based algorithms. CSA means an agency designated as having NISP implementation and security responsibilities for its own agencies (including component agencies) and any entities and non-CSA agencies under its cognizance. The CSAs are: DoD; DOE; NRC; ODNI; and DHS. CSO means an organizational unit to which the head of a CSA delegates authority to administer industrial security services on behalf of the CSA. CUI means information the USG creates or possesses, or that an entity creates or possesses for or on behalf of the USG, that a law, regulation, or USG-wide policy requires or permits an agency to handle using safeguarding or dissemination controls. However, CUI does not include classified information or information a non-executive branch entity possesses and maintains in its own systems that did not come from, or was not created or possessed by or for, an executive branch agency or an entity acting for an agency. Custodian means an individual who has possession of, or is otherwise charged with, the responsibility for safeguarding classified information. Cybersecurity

Participation in the DIB CS Program is voluntary. Program application and participation costs are described in the cost analysis section of this proposed rule. These costs are voluntarily incurred and associated with the labor and resource costs to complete the required program paperwork, including execution of the Framework Agreement, to submit information to the Government, and to receive information from the Government. The costs associated with applying to the DIB CS Program are associated exclusively with labor costs and estimated to be \$18.15 per company. None of the program's offering come at an additional fee to DIB participants and additional costs related to participation are estimated based on the time investment (labor hours) required to obtain the benefits as described in the cost analysis of this preamble. Therefore, the Regulatory Flexibility Act, as amended, does not require us to prepare a regulatory flexibility analysis. D. Sec. 202, Public Law 104-4 , ·Unfunded Mandates Reform Act· Section 202 of the Unfunded Mandates Reform Act of 1995 (2 U.S.C. 1532) requires agencies to assess anticipated costs and benefits before issuing any rule whose mandates require spending in any one year of \$100 million in 1995 dollars, updated annually for inflation. When the Federal Government passes legislation requiring a State, local, or tribal government to perform certain actions or offer certain programs but does not include any funds for the actions or programs in the law, an unfunded mandate results. This proposed rule will not mandate any requirements for State, local, or tribal governments, and will not mandate private sector incurred costs above the \$100 million threshold defined in 2 U.S.C. 1532 . E.

Public Law 96-511, "Paperwork Reduction Act" (44 U.S.C. Chapter 35) This proposed rule contains the following information collection requirements under the Paperwork Reduction Act (PRA) of 1995. 0704-0489, "DoD's Defense Industrial Base (DIB) Cybersecurity (CS) Activities Cyber Incident Reporting," 0704-0490, "DoD's Defense Industrial Base (DIB) Cybersecurity (CS) Points of Contact (POC) Information." With the revisions in eligibility criteria, DoD expects the burden associated with both collections to increase as additional defense contractors join the DIB CS Program and additional cyber threat information is reported. DOD is requesting comments on both collections as part of this proposed rule. Additional information regarding these collections of information including all background materials can be found at <https://www.reginfo.gov/public/do/PRAMain> by using the search function to enter either the title of the collection or the Office of Management and Budget (OMB) Control Number. Comments are invited on:

Access Control: Access to IT and OT systems is based on the principle of least privilege depending on the user's role in the organization. Proper authorization and approval by the Director of Operations are required prior to granting access or operating any components of the manufacturing system. Controls are in place to restrict access through authentication methods and other technical means. Passwords are managed through a formal process and secure log-on procedures. Sensitive systems are explicitly identified and audited regularly. 1. Employees must complete cybersecurity awareness training and agree to uphold the acceptable use policy. 2. Employees must immediately notify the Director of Operations if an unescorted or unauthorized individual is found in the facility. 3. Employees must always use a secure password on all systems as per the password policy. These credentials must be unique and must not be used on other external systems or services. 4. Terminated employees must return all company records, in any format. 5. Employees must verify with the Director of Operations that authorizations have been granted before allowing external personnel to connect to the IT or OT network. 6. Employees must report any physical or cybersecurity incidents to the Director of Operations.

The Department proposes to add a definition of "electronic information system" to better distinguish the concept from the broader category of an information system. Accordingly, the Department would limit the definition to an interconnected set of electronic information resources under the same direct management control that shares common functionality. Under this proposal, an electronic information system generally would include technology assets, such as hardware, software, electronic media, data, and information. 8. Modifying the Definition of "Information System" a. Current Provision and Issues To Address As discussed above, the Department seeks to clarify the scope of an information system, as compared to an electronic information system. We believe that it would be beneficial to align the common elements of these terms and clarify the relationship between them, given their importance to compliance with requirements of the Security Rule. Additionally, the changes in the environment, such as the shift to cloud-based computing, may raise questions regarding the Department's interpretation of "direct management control." b. Proposal Accordingly, the Department proposes to modify the definition of "information system," to clarify that an information system "generally," not just "normally," includes hardware, software, data, communications, and people. The Department believes this proposed modification, combined with the existing broad reference to "resources," more accurately reflects the typical components of an information system and the full extent of resources that are addressed by the Security Rule. We also propose to remove "applications" from the list of technology assets that are generally included in an information system because applications are a type of software, making the inclusion of applications redundant. This proposed modification would not alter our interpretation that an information system includes applications. We use this opportunity to affirm that a technology asset

may be included as part of the information systems of multiple regulated entities where such regulated entities all have direct management control over the technology asset. For example, both a health care provider and a cloud-based EHR vendor have direct management control over the ePHI in the cloud-based EHR. Accordingly, such ePHI generally is part of both the information system of the health care provider and of the cloud-based EHR vendor. Additionally, the EHR that is used to create, receive, maintain, or transmit ePHI, regardless of whether it is accessed using software installed on the health care provider's workstation(s) or an internet browser, generally is also part of the information system of both entities because both the health care provider and the vendor have direct management control over the EHR.

9. Modifying the Definition of ·Malicious software·

a. Current Provision and Issues To Address

(Response) FDA continues to believe that facilities that provide food to interstate conveyances should not be covered by the restaurant exclusion because they do not provide food directly to the consumer for immediate consumption. In fact, the food is prepared and provided to several possible intermediaries before reaching the consumer, such as the packer, transporter, and/or distributor, before reaching the interstate conveyance (e.g., airplanes, passenger trains, and cruise ships) that actually provides the food directly to the consumer for immediate consumption. FDA believes the risk is substantially higher when the food is not prepared and served directly to consumers for immediate consumption, but rather goes through a number of intermediaries before it reaches the consumer. In a traceback investigation, it is critical for FDA to be able to identify each entity that handled the suspect food. FDA would lose this ability if interstate conveyance caterers were exempted. In addition, this requirement is consistent with the registration interim final rule, which requires interstate conveyance caterers to register as manufacturers/processors. (Comment 77) Several comments urge FDA to reconsider the proposed regulations for airline caterers. The comments state that these proposed requirements are onerous, unnecessary, and are being unfairly applied to that industry and would bury the industry in volumes of information. The comments note that the same rationale FDA used for partially exempting retail facilities should apply to airline caterers as well. The comments further state that the airline catering industry currently must be in compliance with many Government regulatory agencies (FDA, Federal Aviation Administration (FAA), USDA, Environmental Protection Agency, Transportation Security Administration (TSA)), and that they have strict specifications for products and vendors, whereas most food service (printed page 71592) operations do not. The comments also note that they currently employ security companies to monitor their staff, the food processes in which they prepare meals, the equipment the food items are loaded into, and the process of how it gets on board the aircraft. They also state that their customers have always expected traceability of all products used on their flights as part of their food safety and hygiene audits to resolve flight passenger complaints, food poisoning reports, and for other purposes, but not to the extent that is required by the proposed rule.

CMMC Program Requirements make no change to existing policies for information security requirements implemented by DoD. Policies for CUI and creation of program documentation, to include Security Classification Guides and FedRAMP equivalency are separate from this rule. Relevant policies include DoDI 5200.48 ·Controlled Unclassified Information· and DoD Manual 5200.45 ·Instructions for Developing Security Classification Guides· for example. [23] Some comments received lacked relevance to the rule's content, which is limited to specific CMMC program requirements. Changes to FAR and DFARS requirements are beyond the scope of this rule, as are the contents and updating of DoD's FAQ and Procurement Toolbox web pages. CMMC program requirements do not result in any change to which DoD organization makes the contract award. Recommendations to adopt standard DoD contracting procedures (i.e., to exclude CUI information in the basic award) are not within the scope of this rule, which outlines program requirements. The DoD limits the (printed page 83108) burden of CMMC compliance by requiring annual affirmations rather than annual assessments. Affirmations required for the CMMC program indicate that a DoD contractor has achieved and intends to maintain compliance with the applicable DoD information security requirements. The CMMC program is designed only to validate implementation of the information security standards in FAR clause 52.204-21, NIST SP 800-171 R2, and a selected subset of NIST SP 800-172 Feb2021. This rule does not address the other DFARS clause 252.204-7012 requirements for cyber incident reporting. The CMMC assessment framework will not alter, alleviate, or replace the cyber incident reporting aspects of DFARS clause 252.204-7012, which will remain effective where applicable. Classified information is managed differently from CUI, and different safeguarding regulations apply to these different categories of information (each of which are defined in 32 CFR part 2002). CMMC Program requirements are aligned to the requirements for safeguarding of CUI and are unrelated to the

requirements for safeguarding classified information. ·Export Controlled· is a category of CUI. To the extent that a company generates information it considers proprietary, but which is explicitly excluded from the definition of CUI (see 32 CFR part 2002), no CMMC requirements would apply. As the CMMC program requirements make no change to existing policies for information security requirements implemented by DoD, dialogues with industry to identify CUI is outside the scope of this 32 CFR part 170 CMMC Program rule. Several existing requirements directly address the human factors of cybersecurity, particularly those in the Awareness and Training, Personnel Security, and Physical Protection domains. Additional training and education on the topics of CUI safeguarding requirements, cybersecurity hygiene, and other useful topics may be found at: www.archives.gov/cui/training.html

Verification and Test Methods for Access Control Policies/Models ## Verification and Test Methods for Access Control Policies/Models Access control systems are among the most critical of computer security components. Faulty policies, misconfigurations, or flaws in software implementations can result in serious vulnerabilities. To formally and precisely capture the security properties that access control should adhere to, access control models are usually written, bridging the gap in abstraction between policies and mechanisms. Identifying discrepancies between policy specifications and their intended function is crucial because correct implementation and enforcement of policies by applications is based on the premise that the policy specifications are correct. As a result, policy specifications represented by models must undergo rigorous verification and validation through systematic verification and testing to ensure that the policy specifications truly encapsulate the desires of the policy authors. Verifying the conformance of access control policies and models is a non-trivial and critical task, and one important aspect of such verification is to formally check the inconsistency and incompleteness of the model and safety requirements of the policy, because an access control model and its implementation do not necessarily explicitly express the policy, which can also be implicitly embedded by mixing with direct access constraints or other access control models.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 204, 232, and 252 [Docket DARS-2019-0019] RIN 0750-AK37 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Proposed rule. SUMMARY: DoD is proposing to amend the Defense Federal Acquisition Regulation Supplement (DFARS) to implement a section of the National Defense Authorization Act for Fiscal Year 2017, which amends 10 U.S.C. 2307 to address the use of performance-based payments. DATES: Comment Date: Comments on the proposed rule should be submitted in writing to the address shown below on or before July 1, 2019, to be considered in the formation of a final rule. ADDRESSES: Submission of Comments: Submit comments identified by DFARS Case 2019-D002, using any of the following methods: · Federal eRulemaking Portal: <http://www.regulations.gov> . Search for ·DFARS Case 2019-D002· Select ·Comment Now· and follow the instructions provided to submit a comment. Please include ·DFARS Case 2019-D002· on any attached documents. · Email: osd.dfars@mail.mil . Include DFARS Case 2019-D002 in the subject line of the message. · Fax: 571-372-6094. · Mail: Defense Acquisition Regulations System, Attn: Ms. Amy G. Williams, OUSD(A&S)DPC/DARS, Room 3B941, 3060 Defense Pentagon, Washington, DC 20301-3060. Comments received generally will be posted without change to <http://www.regulations.gov> , including any personal information provided. To confirm receipt of your comment(s), please check www.regulations.gov , approximately two to three days after submission to verify posting (except allow 30 days for posting of comments submitted by mail). FOR FURTHER INFORMATION CONTACT: Ms. Amy Williams, DPC/DARS, at 571-372-6106. SUPPLEMENTARY INFORMATION: I. Background DoD is proposing to amend DFARS subpart 232.10, Performance-Based Payments; amend the clauses at DFARS 252.232-7012, Performance-Based Payments-Whole Contract Basis, and DFARS 252.232-7013, Performance-Based Payments-Deliverable Item Basis; and add a new provision at 252.232-70XX, Performance-Based Payments-Representation, to implement section 831 the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2017, which amends 10 U.S.C. 2307 to address the use of performance-based payments. A proposed rule was published in the Federal Register on August 23, 2018 (83 FR 42831

updates on the review being conducted of the National Information Assurance Partnership, results of

the first Privacy Trust Survey of the U.S. government, customer relations management in the U.S. Postal Service (USPS), specifications and implementations of the Trusted Computing Group's Secure Platform and security issues with voice over IP (VoIP).

§ 170.9 CMMC Third-Party Assessment Organizations (C3PAOs). (a) Roles and responsibilities. C3PAOs are organizations that are responsible for conducting Level 2 certification assessments and issuing Certificates of CMMC Status to OSCs based on the results. C3PAOs must be accredited or authorized by the Accreditation Body in accordance with the requirements set forth. (b) Requirements. C3PAOs shall: (1) Obtain authorization or accreditation from the Accreditation Body in accordance with § 170.8(b)(3)(i) and (ii) . (2) Comply with the Accreditation Body policies for Conflict of Interest, Code of Professional Conduct, and Ethics set forth in § 170.8(b)(17) ; and achieve and maintain compliance with ISO/IEC 17020:2012(E) (incorporated by reference, see § 170.2) within 27 months of authorization. (3) Require all C3PAO company personnel participating in the Level 2 certification assessment process to complete a Tier 3 background investigation resulting in a determination of national security eligibility. This includes the CMMC Assessment Team and the quality assurance individual. This Tier 3 background investigation will not result in a security clearance and is not being executed for the purpose of government employment. The Tier 3 background investigation is initiated using the Standard Form (SF) 86 (www.gsa.gov/reference/forms/questionnaire-for-national-security-positions). These positions are designated as non-critical sensitive with a risk designation of 'Moderate Risk' in accordance with 5 CFR 1400.201(b) and (d) and the investigative requirements of 5 CFR 731.106(c)(2) . (4) Require all C3PAO company personnel participating in the Level 2 certification assessment process who are not eligible to obtain a Tier 3 background investigation to meet the equivalent of a favorably adjudicated Tier 3 background investigation. DoD will determine the Tier 3 background investigation equivalence for use with the CMMC Program only. (5) Comply with Foreign Ownership, Control or Influence (FOCI) by: (i) Completing and submitting Standard Form (SF) 328 (www.gsa.gov/reference/forms/certificate-pertaining-to-foreign-interests), Certificate Pertaining to Foreign Interests, upon request from DCSA and undergo a National Security Review with regards to the protection of controlled unclassified information based on the factors identified in 32 CFR 117.11(b) using the procedures outlined in 32 CFR 117.11(c) . (ii) Receiving a non-disqualifying eligibility determination from the CMMC PMO resulting from the FOCI risk assessment in order to proceed to a DCMA DIBCAC CMMC Level 2 assessment, as part of the authorization and accreditation process set forth in paragraph (b)(6) of this section. (iii) Reporting any change to the information provided on its SF 328 by resubmitting the SF 328 to DCSA within 15 business days of the change being effective. A disqualifying eligibility determination, based on the results of the change, will result in the C3PAO losing its authorization or accreditation. (6) Undergo a Level 2 certification assessment meeting all requirements for a Final Level 2 (C3PAO) in accordance with the procedures specified in § 170.17(a)(1) and (c) , with the following exceptions: (i) The assessment will be conducted by DCMA DIBCAC. (ii) The assessment will not result in a CMMC Status of Level 2 (C3PAO) nor receive a Certificate of CMMC Status. (7) Provide all documentation and records in English. (8) Submit pre-assessment and planning material, final assessment reports, and CMMC certificates of assessment into the CMMC instantiation of eMASS. (9) Unless disposition is otherwise authorized by the CMMC PMO, maintain all assessment related records for a period of six (6) years. Such records include any materials generated by the C3PAO in the course of an assessment, any working papers generated from Level 2 certification assessments; and materials relating to monitoring, education, training, technical knowledge, skills, experience, and authorization of all personnel involved in assessment activities; contractual agreements with OSCs; and organizations for whom consulting services were provided. (10) Provide any requested audit information, including any out-of-cycle from ISO/IEC 17020:2012(E) requirements, to the Accreditation Body. (11) Ensure that all personally identifiable information (PII) is encrypted and protected in all C3PAO information systems and databases. (12) Meet the requirements for Assessment Team composition. An Assessment Team must include at least two people: a Lead CCA, as defined in § 170.11(b)(10) , and at least one other CCA. Additional CCAs and CCPs may also participate on an Assessment Team. (13) Implement a quality assurance function that ensures the accuracy and completeness of assessment data prior to upload into the CMMC instantiation of eMASS. Any individual fulfilling the quality assurance function must be a CCA and cannot be a member of an Assessment Team for which they are performing a quality assurance role. A quality assurance individual shall manage the C3PAO's quality assurance reviews as defined in paragraph (b)(14) of this section and the appeals process as required by paragraphs (b)(19) and (20) of this section and in accordance with ISO/IEC 17020:2012(E) (incorporated by reference, see § 170.2) and ISO/IEC 17011:2017(E) (incorporated by reference, see

§ 170.2). (14) Conduct quality assurance reviews for each assessment, including observations of the Assessment Team's conduct and management of CMMC assessment processes. (15) Ensure that all Level 2 certification assessment activities are performed on the information system within the CMMC Assessment Scope. (16) Maintain all facilities, personnel, and equipment involved in CMMC activities that are in scope of their Level 2 certification assessment and comply with all security requirements and procedures as prescribed by the Accreditation Body. (17) Ensure that all assessment data and information uploaded into the CMMC instantiation of eMASS assessment data is compliant with the CMMC assessment data standard as set forth in eMASS CMMC Assessment Import Templates on the CMMC eMASS website: <https://cmmc.emass.apps.mil> . This system is accessible only to authorized users. (18) Issue Certificates of CMMC Status to OSCs in accordance with the Level 2 certification assessment requirements set forth in § 170.17 , that include, at a minimum, all industry CAGE codes associated with the information systems addressed by the CMMC Assessment Scope, the C3PAO name, assessment unique identifier, the OSC name, and the CMMC Status date and level. (19) Address all OSC appeals arising from Level 2 certification assessment activities. If the OSC or C3PAO is not satisfied with the result of the appeal either the OSC or the C3PAO can elevate the matter to the Accreditation Body for final determination. (20) Submit assessment appeals, review records, and decision results of assessment appeals to DoD using the CMMC instantiation of eMASS.

the DRBG mechanism. The randomness source can be an entropy source or an RBG. || Reseed | To acquire additional bits that will affect the internal state of the DRBG mechanism. || Secure Channel | A path for transferring data between two entities or components that ensures confidentiality, integrity and replay protection, as well as mutual authentication between the entities or components. The secure channel may be provided using approved cryptographic, physical or procedural methods, or a combination thereof. Sometimes called a trusted channel. || Security Strength | A number associated with the amount of work (that is, the number of operations of some sort) that is required to break a cryptographic algorithm or system in some way. In this Recommendation, the security strength is specified in bits and is a specific value from the set {112, 128, 192, 256}. If the security strength associated with an algorithm or system is S bits, then it is expected that (roughly) 2^S basic operations are required to break it. || Seed | Noun : A string of bits that is used as input to a DRBG mechanism. The seed will determine a portion of the internal state of the DRBG, and its entropy must be sufficient to support the security strength of the DRBG. Verb : To acquire bits with sufficient entropy for the desired security strength. These bits will be used as input to a DRBG mechanism to determine a portion of the initial internal state.

This requirement applies to portable storage devices (e.g., USB memory sticks, digital video disks, compact disks, external or removable hard disk drives). NIST SP 800-111 provides guidance on storage encryption technologies for end user devices. FURTHER DISCUSSION CUI can be stored and transported on a variety of portable media, which increases the chance that the CUI can be lost. When identifying the paths CUI flows through your company, identify devices to include in this requirement. 149 NIST SP 800-171A, p. 43. 150 NIST SP 800-171 Rev. 2, p. 30.

DoD declines to add Approved Publishing Partner (APP) and Approved Training Providers (ATP), or sections to the rule. The CMMC Program defines the requirements for the ecosystem. Specific requirements for publishing and training guidelines are determined by the CAICO and do not require the oversight of the DoD. The CMMC Rule does not use the term Licensed Training Provider (LTP), as the LTPs are not required to be licensed. The acronym ATP means Approved Training Provider which encompasses the same role in the CMMC Ecosystem. The DoD does not intend to further delay implementation of CMMC to provide an 18 to 24-month grace period from the official release of the rule to build curriculum. The DoD has reviewed commenter recommendations and revised the rule as follows: The CMMC rule has been updated to state that the CAICO must be accredited by a U.S. based signatory to ILAC or other relevant IAF mutual recognition arrangements and operate in accordance with ISO/IEC 17011:2017(E). The DoD has removed the term ‘practitioner’ from §-170.10(b)(8) for clarity and changed the term subcontractor to training service support provider. e. CCPs and CCAs Comment: Some comments requested DoD's response to speculations about market forces, competitiveness of the CMMC Certified Professional (CCP) and CMMC Certified Assessment (CCA) roles and career opportunities, assessor burnout, complexity of CMMC ecosystem, and a limited assessor pool. Several comments identified administrative changes or preferred rewording or reordering of the CCP and CCA sections of the ecosystem requirements. For example, two commenters objected to repeating the requirement to meet CoPC and COI requirements for each Ecosystem member in §-170.8.

Another comment requested deletion of the requirement for all documentation and records to be provided in English. One commenter recommended revising proficiency and experience requirements for CCPs, CCAs, and Lead CCAs. Another requested clarification on what requirements govern the certification of a CCA and requested the rule allow the CAICO to establish the certification validity period. One comment recommended all additional assessor certification requirements in § 170.11(b)(6)(ii) be removed from the rule, so that only those prerequisite training requirements identified by the CAICO would apply. Another comment suggested that a requirement prohibiting assessors from use of personally owned IT that is contained in the CCA section at § 170.11 also be added to the C3PAO requirements section at § 170.9. Two commenters objected to the restrictions on CCAs sharing information with people outside the assessment team. (printed page 83123)

(8) Disclosures under emergency circumstances. No No (9) Disclosures to the Congress. No No (10) Disclosures to the GAO. No No (11) Disclosures pursuant to court orders. No No (12) Disclosure to consumer reporting agencies. No No (c)(1) Making disclosure accountings. No No (2) Retaining disclosure accountings. Yes Yes (c)(3) Making disclosure accounting available to the individual. Yes No (c)(4) Informing prior recipients of corrections. Yes Yes (d)(1) Individual access to records. Yes Yes (2) Amending records. Yes Yes (3) Review of the Component's refusal to amend a record. Yes Yes (4) Disclosure of disputed information. Yes Yes (5) Access to information compiled in anticipation of civil action. Yes Yes (e)(1) Restrictions on collecting information. Yes No (e)(2) Collecting directly from the individual. Yes No (3) Informing individuals from whom information is requested. No No (e)(4)(A) Describing the name and location of the system. No No (B) Describing categories of individuals. No No (C) Describing categories of records. No No (D) Describing routine uses. No No (E) Describing records management policies and practices. No No (F) Identifying responsible officials. Yes Yes (e)(4)(G) Procedures for determining if a system contains a record on an individual. Yes Yes (H) Procedures for gaining access. Yes Yes (I) Describing categories of information sources. Yes No (e)(5) Standards of accuracy. No No (e)(6) Validating records before disclosure. No No (e)(7) Records of First Amendment activities. No No (e)(8) Notification of disclosure under compulsory legal process. No No (e)(9) Rules of conduct. No No (e)(10) Administrative, technical, and physical safeguards. No No (11) Notice for new and revised routine uses. Yes Yes (f)(1) Rules for determining if an individual is subject of a record. Yes Yes (f)(2) Rules for handling access requests. Yes Yes (f)(3) Rules for granting access. Yes Yes (f)(4) Rules for amending records. Yes Yes (f)(5) Rules regarding fees. Yes No (g)(1) Basis for civil action. Yes No (g)(2) Basis for judicial review and remedies for refusal to amend. Yes No (g)(3) Basis for judicial review and remedies for other failure to comply. Yes No (g)(4) Basis for judicial review and remedies for other failure to comply. Yes No (g)(5) Jurisdiction and time limits. Yes No (h) Rights of legal guardians. No No (i)(1) Criminal penalties for unauthorized disclosure. No No (2) Criminal penalties for failure to publish. No No (3) Criminal penalties for obtaining records under false pretenses. Yes 1 No (j) Rulemaking requirement. N/A No (j)(1) General exemption for the Central Intelligence Agency. N/A No (j)(2) General exemption for criminal law enforcement records. Yes No (k)(1) Exemption for classified material. N/A No (k)(2) Exemption for law enforcement material. Yes N/A (k)(3) Exemption for records pertaining to Presidential protection. Yes N/A (k)(4) Exemption for statistical records. Yes N/A (k)(5) Exemption for investigatory material compiled for determining suitability for employment or service. Yes N/A (k)(6) Exemption for testing or examination material. Yes N/A

The assessment team may obtain information during an assessment that the organization does not want to disclose publicly. The assessment team has an obligation to safely and securely store and protect the confidentiality of all security assessment related records and information, including limiting access to the individuals that need to know the information. When using, storing, and transmitting information related to the assessment, the assessment team shall follow the guidelines established by the organization in addition to all relevant laws, regulations, and standards regarding the need, protection, and privacy of information. During the authorization decision process, the DAO must evaluate the assessment findings for the issuer and for each issuing facility within the authorization boundary. If the issuer has outsourced some of its services or functions, the DAO must review all relevant assessments and authorizations that have been granted to the external service provider and include them as a part of the overall evaluation of risk to the organization. - . Review - An evaluation of documentation that describes plans, policies, and procedures in order to verify that they are adequate, understood by management and operations personnel, and that they are in accordance with applicable policies, regulations, standards, technical guidelines, and

organizational guidance. - · Interview - a directed conversation with one or more issuer personnel in which both preestablished and follow-on questions are asked, responses documented, discussion encouraged, and conclusions reached. - · Observe - a real-time viewing of PIV processes in operation, including all information system components of the issuer involved in creation, issuance, maintenance, and termination of PIV Cards or Derived PIV Credentials.

Section Name	Description
ISCM Strategy Management	Elements related to the breadth and depth of the ISCM strategy
System Level Strategy	Elements related specifically to ISCM strategy at the system level
ISCM Program Management	Elements related to the design and management of the ISCM program
Control Assessment Rigor	Elements related to the relationship between control assessments and risk
Security Status Monitoring	Elements related to the monitoring of ISCM data and metrics
Common Control Assessment	Elements related to the assessment of common controls
System-Specific Control Assessment	Elements related to the assessment of system-specific controls
ISCM Results Included in Risk Assessment	Elements related to the use of ISCM in risk assessment
Threat Information	Elements related to the awareness and monitoring of cyber threat data
External Service Providers	Elements related to the external hosting of assets
Security-Focused Configuration Management	Elements related to the processes for managing security configurations
Section Name	Description
Impact of Changes to Systems and Environments	Elements related to

- The unbundling of functional requirements from each other and from assurances. - The creation of protection profiles by assembling pre-defined components and elaborating them to specific product targets. - The explicit separation of documentation, process, and evaluation assurance. - Recognition of Ease of Use, Physical Protection, and Flaw Remediation (this > thought to be especially important to retain) as requirements. Identification and authentication must be strengthened. There is too much emphasis on passwords, especially when privacy is not assured by physical means. Passwords alone are insufficient in many cases; provision should be explicit for alternative technology.

3.1.3 Automate Selected Defect Checks... 3.1.3 Automate Selected Defect Checks The main steps to implement automation are described in this section.

(Response) Under §§ 1.337 and 1.345 of this final rule, if you are a nontransporter, you must establish and maintain records to identify the date you received and released food. Food is released when it moves from one covered activity to another covered activity (unless both activities are conducted by the same person). For example, an article of food is released from the manufacturer when it is given to the transporter. The food is released again when the transporter delivers the food to a grocery store. Where the manufacturer transports its own food to the grocery store, however, the food is not released when the manufacturer loads his trucks, but rather when the manufacturer delivers the food to the grocery store. 6. Lot or Code Number/Other Identifier (Comment 108) Several comments state that some products do not have lot numbers (e.g., bulk produce and restaurant foods). The comments state that character/number string on the package may be hard to identify as a lot code; food product with closed lot codes requires deciphering; lot codes may be on nonvisible portions of the packaging or on the invoice; the integrity of the lot code may be compromised or unreadable if the outer packaging is damaged; and this requirement potentially forces the manufacturer either to stop using or to shorten the lot codes, which would be counterproductive to addressing public health concerns in this initiative. Another comment states that the requirement to record lot or code number/other identifier would be time inefficient and time consuming. One comment states the agency should require lot number tracing when information is reasonably available. (Response) FDA recognizes the difficulties in some situations of recording lot/code number or other identifiers of food. FDA has revised the final rule to only require that persons who manufacture, process, and pack food to record lot/code numbers or other identifiers. See §§ 1.337(a)(4) and 1.345(a)(4) of this final rule. Furthermore, this requirement only applies to the extent the information exists. FDA has learned through comments that tracking lot/code numbers or other identifiers throughout the manufacturing/processing and packing of food is not a problem, because in most cases it is currently being done or capable of being done. It is during the transporting, distribution, and holding of food (e.g., from the warehouse distribution centers to

the retail store or restaurant) that such tracking becomes a problem. FDA also learned that the food industry is moving in the direction of being able to track the lot or code number or other identifier throughout the entire food chain, but that the current technology has not made such tracking cost efficient.

. Under this proposal, a regulated entity would be expressly required to review and test the effectiveness of the technology assets and/or technical controls required by the respective implementation specifications of this section at least once every 12 months or in response to environmental or operational changes, whichever is more frequent, and modify as reasonable and appropriate. f. Section 164.312(e)-Standard: Integrity Improper alteration or destruction of ePHI, even unintentionally, can result in clinical quality problems, including patient safety issues, for a covered entity. [767] Workforce members or business associates may make accidental or intentional changes that improperly alter or destroy ePHI. [768] Data can also be altered or destroyed without human intervention, such as by electronic media errors or failures. [769] It is important to protect ePHI from being compromised, regardless of the source. [770] The current standard for integrity at 45 CFR 164.312(c)(1) requires implementation of policies and procedures, rather than actual deployment of technical controls, to ensure integrity of ePHI. To improve the effectiveness of this standard, the Department proposes to redesignate it as proposed 45 CFR 164.312(e) and modify it for clarity. Under the proposal, a regulated entity would be required to deploy technical controls to protect ePHI from improper alteration or destruction when at rest and in transit and to review and test the effectiveness of such technical controls at least once every 12 months or in response to environmental or operational changes, whichever is more frequent, and modify as reasonable and appropriate. For example, the adoption of health IT that is certified through the ONC Health IT Certification Program as having the technical capability to verify that the electronically exchanged health information contained within the health IT has not been altered, using a hashing algorithm that meets certain requirements, may contribute to a regulated entity's compliance with the proposed standard for integrity. [771] The Department proposes to remove the implementation specification at 45 CFR 164.312(c)(2) because technical controls to corroborate that ePHI has not been altered or destroyed in an unauthorized manner are commonly built into hardware and protocols today. Thus, it is unnecessary to require a regulated entity to specifically deploy such controls. g. Section 164.312(f)(1)-Standard: Authentication Authentication ensures that a person is in fact who they claim to be before being allowed access to ePHI by providing proof of identity. [772] The Department proposes to redesignate the standard for person or entity authentication at 45 CFR 164.312(d) as 45 CFR 164.312(f)(1) to rename it ·Authentication· to reflect its broad purpose, and to add a paragraph heading to clarify the organization of the regulatory text. Additionally, consistent with our proposals to define (printed page 974)

, to add a paragraph heading to clarify the organization of the regulatory text, and to modify the regulatory text to clarify that a regulated entity would be required to implement written policies and procedures to ·respond to,· rather than ·address,· security incidents. Additionally, we propose to clarify expectations by adding an implementation specification for planning and testing at proposed 45 CFR 164.308(a)(12)(ii)(A) (1) that would require a regulated entity to establish written security incident response plan(s) and procedures documenting how workforce members are to report suspected or known security incidents and how the regulated entity will respond to suspected or known security incidents. [599] Internal reporting is an essential component of security incident procedures. [600] Plans and procedures for (printed page 954) reporting of suspected or known security incidents may address to whom, when, and how such incidents are to be reported. The recipient(s) and the content of such reports, according to such plans and procedures, may vary based on the type of incident and the role of the workforce member making the report. We do not propose to dictate the form, format, or content of such report. Rather, we believe that regulated entities would be best situated to identify the point(s) of contact for their organization (e.g., Chief Information Security Officer, IT security team, business associate engaged to support incident response activities for the regulated entity) for such reports and the type of information they need to determine how to respond to the suspected or known security incident. The proposal to require a regulated entity to establish written security incident response plans and procedures for how it will respond to suspected or known security incidents would align with the enhanced CPG for Third Party Incident Reporting because it would address the procedures for how and when a business associate would report to a covered entity or another business associate known or suspected security incidents, as required by proposed 45 CFR 164.314(a)(2)(i)(C) . [601]

Under proposed 45 CFR 164.308(a)(12)(ii)(A) (2) and (3), the regulated entity would be required to implement written procedures for testing and revising the security incident response plan(s) and then, using those written procedures, review and test its security incident response plans at least once every 12 months and document the results of such tests. The regulated entity would also be required to modify the plan(s) and procedures as reasonable and appropriate, based on the results of such tests and the regulated entity's circumstances. This proposal, if finalized, would include requirements that align with the Department's essential CPG for Basic Incident Planning and Preparedness to have effective responses to and recovery from security incidents. [602]

CIS Control 12 · Network Infrastructure Management Establish, implement, and actively manage (track, report, correct) network devices, in order to prevent attackers from exploiting vulnerable network services and access points. Secure network infrastructure is an essential defense against attacks. This includes an appropriate security architecture, addressing vulnerabilities that are, often times, introduced with default settings, monitoring for changes, and reassessment of current configurations. Network infrastructure includes devices such as physical and virtualized gateways, firewalls, wireless access points, routers, and switches. Default configurations for network devices are geared for ease-of-deployment and ease-of-use · not security. Potential default vulnerabilities include open services and ports, default accounts and passwords (including service accounts), support for older vulnerable protocols, and pre-installation of unneeded software. Attackers search for vulnerable default settings, gaps or inconsistencies in firewall rule sets, routers, and switches and use those holes to penetrate defenses. They exploit flaws in these devices to gain access to networks, redirect traffic on a network, and intercept data while in transmission. Network security is a constantly changing environment that necessitates regular re-evaluation of architecture diagrams, configurations, access controls, and allowed traffic flows. Attackers take advantage of network device configurations becoming less secure over time as users demand exceptions for specific business needs. Sometimes the exceptions are deployed, but not removed when they are no longer applicable to the business's needs. In some cases, the security risk of an exception is neither properly analyzed nor measured against the associated business need and can change over time.

From the NIST SP 800-172 Rev 3 Final Public Draft: · Mission -Essential: The agency that owns the information or information system cannot accomplish its Primary Mission-E ssential Functions (PMEF), as approved in accordance with Presidential Policy Directive NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 40 (PPD-40) National Continuity Policy, within expected timelines without the information or information 2938

The rule adds an Alternate I to the provision at FAR 52.204-16, Commercial and Government Entity (CAGE) Code Reporting, to address that prime contractors shall ensure subcontractors under classified solicitations provide the location of subcontractor performance listed on the DD Form 254 to reflect a corresponding unique CAGE code for each listed location unless the work is being performed at a Government facility, in which case the agency location code shall be used. FAR provision 52.204-16 is used when FAR 52.204-6, Unique Entity Identifier, or 52.204-7, System for Award Management, is used. The provision with its Alternate I is used when the clause 52.204-2, Security requirements is included. The rule also adds a new Alternate I to FAR 52.204-18, Commercial and Government Entity Code Maintenance, that requires prime contractors to ensure that subcontractors maintain their CAGE code(s) throughout the life of the contract when the contract may require access to classified information (unless the contracting agency is not covered by the NISP and has prescribed a clause and alternates that are substantially the same as those at 52.204-2, Security Requirements) and if the provision 52.204-16, Commercial and Government Entity Code Reporting, is used with its Alternate I. The rule also relocates the definition of CAGE code to FAR subpart 2.1, Definitions, from FAR subpart 4.18, since the term is used in multiple FAR sections and clauses. III. Applicability to Contracts at or Below the Simplified Acquisition Threshold (SAT) and for Commercial Items, Including Commercially Available Off-the-Shelf (COTS) Items This proposed rule does not create any new provisions or clauses, nor does it change the applicability of any existing provisions or clauses included in solicitations and contracts valued at or below the SAT, or for commercial items, including COTS items. IV. Executive Order 13771 This rule is not subject to E.O. 13771 , Reducing Regulation and Controlling Regulatory Costs, because this rule is not a significant regulatory action under E.O. 12866 . V. Executive Orders 12866 and 13563 E.O.s 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and,

if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804 . VI. Regulatory Flexibility Act DoD, GSA, and NASA do not expect this rule to have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act,

(d) Address vigorous congressional and public interest in increasing cyber security and information assurance activities through government-industry cooperation. (e) Immediately provide a voluntary framework for DOD and DIB companies to share information to address sophisticated cyber threats that represent an imminent threat to U.S. national security and economic security interests. Until this rule is published as an interim final rule, eligible DIB companies cannot receive USG information about cyber threats and mitigation strategies or share information about cyber incidents that may compromise critical DOD programs and missions. Without this information, eligible DIB companies' ability to protect USG information cannot be fully effective. While this vulnerability remains open, the USG faces an elevated risk that critical program information (printed page 27616) could be compromised, resulting in potential economic losses or damage to U.S. national security. For example, the compromise of such information can significantly diminish return on DIB company and U.S. Government research and development investment and represents a loss of intellectual property that compromises the security and technical advantages of DoD weapons systems. DIB CS/IA activities, including the collection, management and sharing of information for cyber security purposes, support and implement the following national and DoD-specific guidance and authority: information assurance (IA) requirements to establish programs and activities to protect DoD information and DoD information systems, including information and information systems operated and maintained by contractors or others in support of DoD activities (see 10 U.S.C. 2224 ; and the Federal Information Security Management Act (FISMA), codified at 44 U.S.C. 3541 et seq.); critical infrastructure protection responsibilities, in which DoD is the sector specific agency for the DIB sector, (see Homeland Security Presidential Directive 7 (HSPD-7), Critical Infrastructure Identification, Prioritization, and Protection-).

A.3.6. Data Protection 1 access to home networks. They also have robust networking capabilities, giving them utility for a wide range of attacks. Other router product components present their own risks. Backends may aggregate data from one or more customers, making them attractive targets for attackers. Mobile applications may be installed in relatively hostile environments due to malware and other vectors of attack. ISO 31000 [ISO31000] is a foundational resource that developers should use for risk management. NIST's Risk Management Framework for Information Systems and Organizations: A System Life Cycle Approach for Security and Privacy , SP 800-37 Rev. 2 [SP800-37r2] may also be useful guidance for risk management.

Sections 236.4 and 236.5 and 236.7 of this final rule contain information collection requirements. These collection requirements were published in the preamble of the interim final rule that published on May 11, 2012 (77 FR 27617) for public comment. No comments were received on the collection requirements. OMB preapproved the collection requirements and assigned them OMB Controls Numbers 0704-0489 and 0704-0490. (printed page 62435) Executive Order 13132 , Federalism It has been certified that 32 CFR part 236 does not have federalism implications, as set forth in Executive Order 13132 . This rule does not have substantial direct effects on: (a) The States; (b) The relationship between the National Government and the States; or (c) The distribution of power and responsibilities among the various levels of Government. List of Subjects in 32 CFR Part 236 Contracts Security measures Accordingly 32 CFR part 236 is revised to read as follows: PART 236-DEPARTMENT OF DEFENSE (DoD)-DEFENSE INDUSTRIAL BASE (DIB) VOLUNTARY CYBER SECURITY AND INFORMATION ASSURANCE (CS/IA) ACTIVITIES 236.1 Purpose. 236.2 Definitions. 236.3 Policy. 236.4 Procedures. 236.5 Cyber security information sharing. 236.6 General provisions. 236.7 DIB participant eligibility requirements. Authority: 10 U.S.C. 2224 ; 44 U.S.C. 3506 ; 44 U.S.C. 3544 . §-236.1 Purpose. Cyber threats to DIB unclassified information systems represent an unacceptable risk of compromise of DoD information and pose an imminent threat to U.S. national security and economic security interests. DoD's voluntary DIB CS/IA program enhances and supplements DIB participants' capabilities to safeguard DoD information that resides on, or transits, DIB

unclassified information systems. § 236.2 Definitions. As used in this part: (a) Attribution information means information that identifies the DIB participant, whether directly or indirectly, by the grouping of information that can be traced back to the DIB participant (e.g., program description, facility locations). (b) Compromise means disclosure of information to unauthorized persons or a violation of the security policy of a system in which unauthorized intentional, or unintentional, disclosure, modification, destruction, loss of an object, or the copying of information to unauthorized media may have occurred. (c) Covered defense information means unclassified information that: (1) Is: (i) Provided by or on behalf of the DoD to the DIB participant in connection with an official DoD activity; or (ii) Collected, developed, received, transmitted, used, or stored by the DIB participant in support of an official DoD activity; and (2) Is: (i) Controlled Technical Information means technical information with military or space application (see 10 U.S.C. 130(c))

3.1.2 | ZTA y el uso de la microsegmentación... 3.1.2 ZTA y el uso de la microsegmentación Una empresa puede optar por implementar una ZTA basada en el emplazamiento de los recursos individuales o grupos de recursos en un único segmento de red protegido por un componente de seguridad denominado puerta de enlace (gateway).

Copies of all initial denials shall be maintained by each DoD Component in a form suitable for rapid retrieval, periodic statistical compilation, and management evaluation. Records denied for any of the reasons contained in § 286.14 (for which no appeal was filed) shall be maintained for a period of 6 years to meet the statute of limitations requirement. (f) Special mail services. The DoD Components are authorized to use registered mail, certified mail, certificates of mailing, and return receipts. However, their use should be limited to instances where it appears advisable to establish proof of dispatch or receipt of FOIA correspondence. The requester shall be notified that they are responsible for the full costs of special services. A commercial delivery service may be used provided the requester asks for such service to receive the requested information in a timelier manner and the requester pays directly for the service. (g) Receipt account. The Treasurer of the United States has established an account for FOIA receipts. This account, receipt account 3210, shall be used for depositing all FOIA receipts, except receipts for ·Working Capital· and non appropriated funded activities. Components are reminded that the account number must be preceded by the appropriate disbursing office two-digit prefix. ·Working Capital· and non-appropriated funded activity FOIA receipts shall be deposited to the applicable fund. All money orders or checks remitting FOIA fees should be made payable to the U.S. Treasurer. § 286.20 Appeals (a) General. If the DoD Component IDA denies a record for any of the reasons contained in § 286.14 the DoD Component shall advise the requester that the decision may be appealed in writing to a designated appellate authority. The Component will further advise the requester that the appeal should be accompanied by a copy of the denial letter. In addition to appeal rights associated with the denial of information, the following are adverse determinations and are subject to appeal: (1) The disapproval of a fee category claim by a requester, the disapproval of a request for waiver or reduction of fees, and a dispute regarding fee estimates. (2) A determination not to grant expedited processing. (3) Not providing a response determination to a FOIA request within the statutory time limits. (4) Any determination found to be adverse in nature by the requester. (b) FOIA/Privacy Act appeals . When denials have been made under the provisions of the Privacy Act and the (printed page 71861) FOIA and the denied information is contained in a Privacy Act system of records, appeals shall be processed under both the Privacy Act and the FOIA. If the denied information is not maintained in a Privacy Act system of records, the appeal shall be processed under the FOIA. (c) Time of receipt

Section 170.12 addresses the roles and responsibilities of a CMMC Certified Instructor (CCI) to teach CMMC assessor candidates. The CAICO trains and tests candidate CCIs per the requirements set forth in § 170.12(b). Candidate CCIs are provided with a list of requirements to obtain and maintain certification, compliance with Accreditation Body policies, work activity exclusions, confidentiality expectations, non-disclosure clause, non-public training related information, forbidden consulting services, and reporting requirements. Section 170.13·CMMC Certified Professional (CCP) Section 170.13 addresses the roles and responsibilities of a CMMC Certified Professional (CCP) required to provide advice, consulting, and recommendations to clients. The CAICO trains and tests candidate CCPs per the requirements set forth in § 170.13(b) with CCP certification issued upon successful completion. A CCP can participate on CMMC Level 2 Certification Assessments with CCA oversight, however CCAs are responsible for making final assessment determinations. A list

of CCP requirements is provided for obtaining and maintaining certification, compliance with Accreditation Body policies, completion of a Tier 3 background investigation or equivalent, sharing assessment specific information, and reporting requirements. (printed page 89065) Section 170.14-CMMC Model Section 170.14 addresses the structure, security requirement contents, organization, sourcing, and numbering of the security requirements that comprise the CMMC Model. It also provides an overview of the assessment process. The CMMC Model consists of three (3) levels, each containing security requirements taken directly from existing regulations and guidelines. Firstly, §-170.14(2) defines CMMC Level 1 as the 15 requirements listed in the FAR clause 52.204-21(b)(1). Secondly, §-170.14(3) defines CMMC Level 2 as the 110 requirements from the NIST SP 800-171 Rev 2. Lastly, §-170.14(4) defines CMMC Level 3 as 24 selected requirements from the NIST SP 800-172. The CMMC security requirements are organized into domains following the approach taken in NIST SP 800-171 Rev 2. The numbering of the CMMC security requirements, addressed in §-170.14(c)(1), is of the form DD.L#-REQ where the 'DD' is the two-letter domain abbreviation, the 'L#' is the CMMC Level, and the 'REQ' is based directly on the numbering in the source. Assessment criteria for these security requirements, as described in §-170.14(d), is based on security requirement assessment guidance provided in NIST SP 800-171A and NIST SP 800-172A. Section 170.15-CMMC Level 1 Self-Assessment and Affirmation Requirements

IMDs are tiny computing platforms that run firmware in extremely power constrained environments. They offer data storage for static data (such as device information), relatively static data (such as patient identification, medical condition, therapy configuration) and dynamic data (such as recent patient readings and audit logs). IMDs offer wireless access for read and write operations to the data on the IMD (including the firmware) to a variety of stakeholders and roles. Some of the threats to wireless IMDs include device reprogramming, data extraction, data tampering, repeated access attempts and data flooding. Vulnerabilities include unsecured communication channels, inadequate authentication and access control, weak audit mechanisms and meager storage. The resulting risks include patient safety compromise resulting from firmware malfunction or therapy misconfiguration, device unavailability due to battery power depletion, patient privacy loss due to data leakage to unauthorized parties, and inappropriate medical follow-up due to tampering of patient readings. While some cyber threats may be unintentional, various motivations exist for deliberate cyber attacks, such as patient information gathering, negative impact to patient health status, ego satisfaction of the attacker, as well as gaining competitive advantage over another vendor through negative press. Identification of the various data types within an IMD is an essential step in analyzing the security and privacy risks of such devices. Possible data types include firmware (though technically not 'data'), device identification data, patient identification and health condition data, therapy configuration data, patient readings, audit log data, and other data.

IBM RS/6000 CIO AIX Version 4.1.1 IBM RS/6000 PowerPC AJX Version 3.2.5 Product Supplier: International Business Machines Corporation Product: AIX Version 3.2.5 for RISC System/6000 with PTFs: Product Supplier: The Santa Cruz Operation, Inc. (the CUI Program) or make exceptions for the categories of CUI or the Designating Agency for the CUI. CMMC requirements apply to DoD contracts that will involve processing, storing, or transmitting of FCI or CUI on any non-Federal information system. (printed page 83119) 13. The CMMC Ecosystem Roles, Responsibilities and Requirements a. Government Comment: Some comments asked how the Department plans to address complaints and concerns from ecosystem stakeholders and the process by which disputes between OSCs and C3PAOs or the CMMC AB are resolved. Two comments wanted the CMMC PMO to document a process for ecosystem stakeholders to register complaints or use of Service Level Agreements to hold the Department accountable to respond. Some asked whether the DoD could be subject to litigation challenging DoD's reliance on the CMMC AB's appeals process to resolve disputes between OSCs and C3PAOs. The commenters asserted resolving such disputes may be an inherently governmental function. One commenter noted that transactions between OSCs and C3PAOs for initiating an assessment are beyond the DoD's authority to regulate, since the DoD is not a party to the transaction. They perceived DoD's indirect oversight of C3PAOs through the CMMC AB as creating conflicts of interest and potential legal liabilities. One commenter requested the DoD modify the rule to state the CMMC PMO is responsible for the assessment and monitoring of the CMMC AB, as well as the CMMC AB's performance of its roles. One commenter noted the ISO/IEC 17011:2017(E) requirements that the CMMC AB must meet and asked why the rule identifies a timeline for compliance

instead of requiring immediate accreditation. One commenter referenced a CMMC-related Request for Information issued prior to CMMC program development to gauge industry's capability to provide the necessary ecosystem accreditation and management functions. They asserted no response was provided to their RFI response. One comment suggested the CMMC PMO should develop a process to act as the authoritative source for assessment interpretations to ensure consistency. One person asked which DoD office authored the rule. Another noted the realignment of the CMMC PMO from OUSD(A&S) to DoD CIO and asked whether this indicated a lack of OUSD(A&S) involvement in the program. One commenter noted that DoD Program Managers and requiring activities have a role in the CMMC Program and suggested that their responsibilities for marking and managing CUI be added to the rule. One commenter wanted to require DIBCAC assessors to complete CCP and CCA training and certification exams through a CAICO approved licensed training provider. Response:

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft)
Enhanced Security Requirements for Protecting CUI September 2025 Organization-generated alerts are focused on information sources that are external 2391

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. This publication provides a broad overview of the Glossary's design. It describes the methodology, assumptions, and constraints used in the development of the underlying database and associated online user interface application (available at <https://csrc.nist.gov/glossary>). Specific implementation details are out of scope of this publication.

. The key element in determining the applicability of this factor is whether disclosure will inform, or have the potential to inform the public, rather than simply the individual requester or small segment of interested persons. The identity of the requester is essential in this situation in order to determine whether such requester has the capability and intention to disseminate the information to the public. Mere assertions of plans to author a book, researching a particular subject, doing doctoral dissertation work, or indigence are insufficient without demonstrating the capacity to further disclose the information in a manner that will be informative to the general public. Requesters should be asked to describe their qualifications, the nature of their research, the purpose of the requested information, and their intended means of dissemination to the public. (D) The significance of the contribution to public understanding . In applying this factor, the Components must differentiate the relative significance or impact of the disclosure against the current level of public knowledge, or understanding which exists before the disclosure. In other words, will disclosure on a current subject of wide public interest be unique in contributing previously unknown facts, thereby enhancing public knowledge, or will it basically duplicate what is already known by the general public? A decision regarding significance requires objective judgment, rather than subjective determination, and must be applied carefully to determine whether disclosure will likely lead to a significant public understanding of the issue. The Components shall not make value judgments as to whether the information is important enough to be made public. (ii) Disclosure of the information ·is not primarily in the commercial interest of the requester. · Determining ·commercial interest· requires consideration of the following issues: (A) The existence and magnitude of a commercial interest . If the request is determined to be of a commercial interest, the Components should address the magnitude of that interest to determine if the requester's commercial interest is primary, as opposed to any secondary personal or non-commercial interest. In addition to profit-making organizations, individual persons or other organizations may have a commercial interest in obtaining certain records. Where it is difficult to

determine whether the requester is of a commercial nature, the Components may draw inference from the requester's identity and circumstances of the request. The Components are reminded that in order to apply the commercial standards of the FOIA, the requester's commercial benefit must clearly override any personal or non-profit interest. (B) The primary interest in disclosure

From the NIST SP 800-172 Rev 3 Final Public Draft: Security-relevant changes include unauthorized changes to established configuration settings or the unauthorized elevation of NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 system privileges. This requirement is sourced to a control tailored out of the SP 2222

The CSF should be used in conjunction with other resources (e.g., frameworks, standards, guidelines, leading practices) to better manage cybersecurity risks and inform the overall management of information and communications technology (ICT) risks at an enterprise level. The CSF is a flexible framework that is intended to be tailored for use by all organizations regardless of size. Organizations will continue to have unique risks - including different threats and vulnerabilities - and risk tolerances, as well as unique mission objectives and requirements. Thus, organizations' approaches to managing risks and their implementations of the CSF will vary. A CSF Organizational Profile describes an organization's current and/or target cybersecurity posture in terms of the Core's outcomes. Organizational Profiles are used to understand, tailor, assess, prioritize, and communicate the Core's outcomes by considering an organization's mission objectives, stakeholder expectations, threat landscape, and requirements. An organization can then prioritize its actions to achieve specific outcomes and communicate that information to stakeholders. 1. A Current Profile specifies the Core outcomes that an organization is currently achieving (or attempting to achieve) and characterizes how or to what extent each outcome is being achieved. 2. A Target Profile specifies the desired outcomes that an organization has selected and prioritized for achieving its cybersecurity risk management objectives. A Target Profile considers anticipated changes to the organization's cybersecurity posture, such as new requirements, new technology adoption, and threat intelligence trends.

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 v Call for Patent Claims 87 Th is public review includes a call for information on essential patent claims (claims whose use would be required for compliance with the guidance or requirements in this Information Technology Laboratory (ITL) draft publication). Such guidance and/or requirements may be directly stated in this ITL Publication or by reference to another publication. This call also includes disclosure, where known, of the existence of pending U.S. or foreign patent applications relating to this ITL draft publication and of any relevant unexpired U.S. or foreign patents. ITL may require from the patent holder, or a party authorized to make assurances on its beh

(F) From subsections (e)(4)(G), (H), and (I) because it will provide protection against notification of investigatory material which might alert a subject to the fact that an investigation of that individual is taking place, and the disclosure of which would weaken the on-going investigation, reveal investigatory techniques, and place confidential informants in jeopardy who furnished information under an express promise that the sources' identity would be held in confidence (or prior to the effective date of the Act, under an implied promise). In addition, this system of records is exempt from the access provisions of subsection (d). (G) From subsection (e)(5) because the requirement that records be maintained with attention to accuracy, relevance, timeliness, and completeness would unfairly hamper the investigative process. It is the nature of law enforcement for investigations to uncover the commission of illegal acts at diverse stages. It is frequently impossible to determine initially what information is accurate, relevant, timely, and least of all complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light. (H) From subsection (f) because the agency's rules are inapplicable to those portions of the system that are exempt and would place the burden on the agency of either confirming or denying the existence of a record pertaining to a requesting individual might in itself provide an answer to that individual relating to an on-going investigation. The conduct of a successful (printed page 14774) investigation leading to the indictment of a criminal offender precludes the applicability of established agency rules relating to verification of record, disclosure of the record to the individual and record amendment procedures for this record system. (I) From subsection (g) because this system of records should be exempt to the extent that the civil remedies relate to provisions of 5 U.S.C. 552 a from which

this rule exempts the system. (7) System identifier and name. LDIA 0900, Accounts Receivable, Indebtedness and Claims. (i) Exemption. During the course of accounts receivable, indebtedness or claims actions, exempt materials from other systems of records may in turn become part of the case record in this system. To the extent that copies of exempt records from those other systems of records are entered into this system, the DIA hereby claims the same exemptions for the records from those other systems that are entered into this system, as claimed for the original primary system of which they are a part. (ii) Authority. 5 U.S.C. 552a(k)(2) through (k)(7). (iii) Reasons. Records are only exempt from pertinent provisions of 5 U.S.C. 552a

(C) Report to the covered entity any security incident of which it becomes aware, including breaches of unsecured electronic protected health information as required by § 164.410. (D) Report to the covered entity activation of its contingency plan under § 164.308(a)(13) without unreasonable (printed page 1020) delay, and in no case later than 24 hours after activation of the contingency plan. (ii) Other arrangements. The covered entity is in compliance with paragraph (a)(1) of this section if it has another arrangement in place that meets the requirements of § 164.504(e)(3). (iii) Business associate contracts with subcontractors. The requirements of paragraphs (a)(2)(i) and (ii) of this section apply to the contract or other arrangement between a business associate and a subcontractor required by § 164.308(b)(1)(ii) in the same manner as such requirements apply to contracts or other arrangements between a covered entity and business associate. (b)(1) Standard: Requirements for group health plans. Except when the only electronic protected health information disclosed to a plan sponsor is disclosed pursuant to § 164.504(f)(1)(ii) or (iii), or as authorized under § 164.508, a group health plan must ensure that its plan documents provide that the plan sponsor will reasonably and appropriately safeguard electronic protected health information created, received, maintained, or transmitted to or by the plan sponsor on behalf of the group health plan. (2) Implementation specifications. The plan documents of the group health plan must be amended to incorporate provisions to require the plan sponsor to do all of the following: (i) Safeguard implementation. Implement the administrative, physical, and technical safeguards that covered entities and business associates are required to implement under §§ 164.308(a), 164.310, and 164.312. (ii) Separation. Ensure that the adequate separation required by § 164.504(f)(2)(iii) is supported by the administrative, physical, and technical safeguards implemented in accordance with paragraph (b)(2)(i) of this section. (iii) Agents. Ensure that any agent to whom it provides this information agrees to implement the administrative, physical, and technical safeguards in accordance with paragraph (b)(2)(i) of this section. (iv) Security incident awareness. Report to the group health plan any security incident of which it becomes aware. (v) Contingency plan activation. Report to the group health plan activation of its contingency plan, adopted in accordance with § 164.308(a)(13) as required by paragraph (b)(2)(i) of this section, without unreasonable delay and in no case later than 24 hours after activation of the contingency plan. § 164.316 Documentation requirements. (a) Standard: Documentation. A covered entity or business associate must do all of the following in written form, which may be electronic, taking into consideration the factors in § 164.306(b):

CIS Safeguard 14.6 · Train Workforce Members on Recognizing and Reporting Security Incidents Train workforce members to be able to recognize a potential incident and be able to report such an incident. Implementation Groups: 1,2,3 Asset Type: data Security Function: protect Parent Control: Security Awareness and Skills Training

(D) From subsections (e)(4)(G) and (H) because this system of records is compiled for investigative purposes and is exempt from the access provisions of subsections (d) and (f). (E) From subsection (e)(4)(I) because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. NRO will, nevertheless, continue to publish such a notice in broad generic terms as is its current practice. (printed page 14789) (F) Consistent with the legislative purpose of the Privacy Act of 1974, the NRO will grant access to nonexempt material in the records being maintained. Disclosure will be governed by NRO's Privacy Regulation, but will be limited to the extent that the identity of confidential sources will not be compromised; subjects of an investigation of an actual or potential criminal or civil violation will not be alerted to the investigation; the physical safety of witnesses, informants and law enforcement personnel will not be endangered; the privacy of third parties will not be violated; and that the disclosure would not otherwise impede effective law enforcement. Whenever possible,

information of the above nature will be deleted from the requested documents and the balance made available. The controlling principle behind this limited access is to allow disclosures except those indicated above. The decisions to release information from these systems will be made on a case-by-case basis. (5) System identifier and name. QNRO-19, Customer Security Services Personnel Security Files. (i) Exemption. (A) Investigatory material compiled for law enforcement purposes may be exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (B) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5), but only to the extent that such material would reveal the identity of a confidential source. (C) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(2) and/or (k)(5) from the following subsections of 5 U.S.C. 552a(c)(3), (d), (e)(1), (e)(4)(G), (H) and (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(5). (iii) Reasons.

discussed above, the Department recognizes that the health care environment has changed in a way that necessitates thorough and frequent review of and updates to documentation. By proposing to specify how often documentation must be updated, the Department would clarify that we expect regulated entities to review and update their documentation at regular intervals, in addition to doing so in response any changes to a security measure. Cybersecurity and data protection is an evolving process, which makes formal, updated, and detailed documentation imperative for data protection. By reviewing and updating its documentation, including its written policies and procedures, at least annually and in response to changes to its security measures, a regulated entity should have a full understanding of its implemented security measures and be able to determine which measures should be updated to protect the confidentiality, integrity, and availability of ePHI. As discussed above and consistent with the proposed changes to 45 CFR 164.306, the Department is proposing to remove the term "required" from 45 CFR 164.316(b)(1) through (3). 4. Request for Comment The Department requests comment on the foregoing proposals, including any benefits, drawbacks, or unintended consequences. We also request comment on the following consideration in particular: a. Whether it would be appropriate to require regulated entities to review and update documentation for security measures at least once every 12 months. If not, please explain. b. Whether it is clear that 45 CFR 164.316 provides regulated entities with directions on when and how they are to document all security measures across all safeguard requirements. If not, please explain. c. Whether it is feasible for regulated entities to document all of the actions, activities, and assessments required by the Security Rule as proposed at 45 CFR 164.316(a)(2). If not, please explain. I. Section 164.318 Transition Provisions 1. Current Provisions and Issues To Address Section 164.318 established the compliance dates for the initial implementation of the security standards for health plans, health care clearinghouses, and health care providers in 2005 and 2006. [866] Covered entities have been required to comply with the security standards for almost 20 years, and the initial implementation of the security standards is no longer applicable. Because of this, the Department believes that these provisions are no longer necessary. 2. Proposal The Department proposes to remove the information in 45 CFR 164.318 and replace the language with provisions for transitioning to the revised Security Rule, should the proposals included in this NPRM be adopted.

(Response) The provisions describe the specific information a covered entity must keep, but do not specify the form or type of system in which those records must be maintained. As stated in both the proposed and final § 1.330, these provisions do not require duplication of existing records if those records contain all of the information required by subpart J of this final rule. If a person subject to these provisions keeps records of all of the information as required by subpart J in compliance with other Federal, State, or local regulations, or for any other reason, e.g., as a result of its own business practices, then those records may be used to meet these requirements. Such records may include, but are not limited to, purchase orders, bills of lading, invoices, and shipping documents. Moreover, entities do not have to keep all of the information required by this final rule in one set of records. If they have records containing some of the required information, they may keep those existing records and keep, either separately or in a combined form, any new data required by this final rule. There is no obligation to create an entirely new record or compilation of records

containing both existing and new information, even if the records containing some of the required information were not created at the time the food was received or released. Our intent is to have as little impact as possible on current recordkeeping practices if those records can meet the requirements of these regulations. FDA received numerous comments, as discussed further in section III.G of this document on “Can existing records satisfy the requirements of this subpart?” that agreed with this approach to not specify the type and format of the records and to allow flexibility to use existing recordkeeping systems. In addition, comments state that individual companies are in a better position to decide in what format records are needed based on knowledge of applicable business practices and cost structures. For these reasons, FDA has not included a model form in this final rule. (Comment 2) Several comments state that the food industry has repeatedly demonstrated the ability to identify and remove product from grocery store shelves very quickly. The comments suggest that the diversion of substantial resources that would be necessary to implement the agency's proposed regulations would not further food security, but instead would diminish the overall efficiency of the food distribution system, which is necessary to serve food safety and security needs and commercial purposes.

21 U.S.C. 348(h)(6)). Person includes individual, partnership, corporation, and association. Recipe means the formula, including ingredients, quantities, and instructions, necessary to manufacture a food product. Because a recipe must have all three elements, a list of the ingredients used to manufacture a product without quantity information and manufacturing instructions is not a recipe. Restaurant means a facility that prepares and sells food directly to consumers for immediate consumption. “Restaurant” does not include facilities that provide food to interstate conveyances, central kitchens, and other similar facilities that do not prepare and serve food directly to consumers. (1) Facilities in which food is directly provided to humans, such as cafeterias, lunchrooms, cafes, bistros, fast food establishments, food stands, saloons, taverns, bars, lounges, catering facilities, hospital kitchens, day care kitchens, and nursing home kitchens, are restaurants. (2) Pet shelters, kennels, and veterinary facilities in which food is directly provided to animals are restaurants. Transporter means a person who has possession, custody, or control of an article of food in the United States for the sole purpose of transporting the food, whether by road, rail, water, or air. Transporter also includes a foreign person that transports food in the United States, regardless of whether that foreign person has possession, custody, or control of that food for the sole purpose of transporting that food. Transporter's immediate previous source means a person from whom a transporter received food. This source can be either another transporter or a nontransporter. Transporter's immediate subsequent recipient means a person to whom a transporter delivered food. This recipient can be either another transporter or a nontransporter. You means a person subject to this subpart under § 1.326. § 1.329 Do other statutory provisions and regulations apply? (a) In addition to the regulations in this subpart, you must comply with all other applicable statutory provisions and regulations related to the establishment and maintenance of records for foods except as described in paragraph (b) of this section. For example, the regulations in this subpart are in addition to existing recordkeeping regulations for low acid canned foods, juice, seafood, infant formula, color additives, bottled water, animal feed, and medicated animal feed. (b) Records established or maintained to satisfy the requirements of this subpart that meet the definition of electronic records in § 11.3(b)(6) (21 CFR 11.3 (b)(6)) of this chapter are exempt from the requirements of part 11 of this chapter. Records that satisfy the requirements of this subpart but that are also required under other applicable statutory provisions or regulations remain subject to part 11 of this chapter. § 1.330 Can existing records satisfy the requirements of this subpart?

(A) The contractor will provide a copy of the authorization to the CSA. (B) The CSA will provide a copy of the authorization to the Department of State Directorate of Defense Trade Controls (DDTC). (e) International visits. (1) General. (i) The contractor will establish procedures to monitor international visits by their employees and visits or assignments of foreign nationals to the contractor location. Doing so will ensure that the disclosure of, and access to, classified export-controlled articles related to classified information are limited to those that are approved by an export authorization. (ii) Contractors cannot use visit authorizations to employ or otherwise acquire the services of foreign nationals that require access to export-controlled information. An export authorization is required for such situations. (2) International visits by U.S. contractor employees. (i) Types and purpose of international visits. (A) One-time visits. A visit for a single, short-term occasion (normally 30 days or fewer) for a specified purpose. (B) Recurring visits. Intermittent, recurring visits over a specified period of time, normally up to one year in

duration, in support of a government-approved arrangement, such as an agreement, contract, or license. By agreement of the governments, the term of the authorization may be for the duration of the arrangement, subject to annual review, and validation. (C) Long-term visits. A single visit for an extended period of time, normally up to one year, in support of an agreement, contract, or license. (D) Emergency visits. A visit related to a specific government-approved contract, international agreement or announced request for proposal, and failure to make the visit could be reasonably expected to seriously jeopardize performance on the contract or program, or result in the loss of a contract opportunity. (ii) Requests for visits. Visit requests are necessary to make administrative arrangements and disclosure decisions and obtain security assurances. (A) Many foreign governments require the submission of a visit request for all visits to a government facility or a cleared contractor facility, even though classified information may not be involved. They may also require that the requests be received a specified number of days in advance of the visit. (B) The contractor can obtain information pertaining to the visit (printed page 83353) requirements of other governments and the NATO from the CSA. The contractor must obtain an export authorization if classified export controlled articles or technical data is to be disclosed or if information to be divulged is related to a classified USG program, unless the disclosure of the information is covered by other agreements, authorizations, or exemptions. (iii) Request format.

Per FAR clause 52.204-XX, Controlled Unclassified Information, upon request, a contractor shall submit the description of the system security plan required by NIST SP 800-171, Revision 2, (and NIST SP 800-172, when applicable) and any associated plans of action for any planned implementations or mitigations to the Government to demonstrate the contractor's implementation or planned implementation of the security requirements. Requests for the system security plan are expected to be rare or limited to, for example, instances where the Government is dealing with a CUI incident, or an agency determines that it is necessary to verify a contractor's system security plan based on the criticality of a program and the CUI being handled on the contractor's information system. Comply with any additional security requirements identified in the Requirements Document. In addition to the security requirements outlined in the SF XXX and the CUI clause, the requirements document in the contract may require the Contractor to comply with additional security requirements beyond NIST SP 800-171, Revision 2, to address unique requirements to protect CUI Basic at higher than the moderate confidentiality level in accordance with 32 CFR 2002.14(h)(2) . The Contractor shall also implement additional information security requirements it reasonably determines necessary to provide adequate security in a dynamic environment. Comply with Additional Notification Requirements. Unmarked or mismarked CUI is not considered a CUI incident if the mismarking has not resulted in the mishandling or improper dissemination of the information. Per the new solicitation provision and contract clauses, offerors are requested and contractors are required to notify the Contracting Officer Representative or other designated agency official concerning any unmarked or mismarked CUI if discovered. Such occurrences are expected to be rare. Comply with Additional Marking Requirements. To the maximum extent practicable, offerors and contractors are required to identify and mark any proprietary business or contractor-attributable information. The following compliance requirements are attributed only to non-defense contractors and subcontractors that handle CUI, since defense contractors are already required to comply with these requirements pursuant to DFARS clause 252.204-7012: Comply with NIST SP 800-171, Revision 2.

Three comments said the affirmation language needs revision because maintaining perfect scores is not possible and asking individuals to affirm continuous compliance is unreasonable. One commenter voiced apprehension that signing the affirmation statement would make a person criminally liable under the False Claims Act, due to the need for system maintenance to fix things that break. One commenter expressed concern that continuous monitoring by contractors increases cost and burden to stay in compliance and opens companies up to False Claims Act liabilities. One of these commenters recommended DoD rely on representation and self-assessment in lieu of affirmations to indicate that the offeror meets the requirements of the CMMC level required by the solicitation. Two commenters requested clarification on what affirmation entails. Another commenter requested modification to clarify that the Affirming Official will attest only that the requirements are implemented as of the certification date, or proposal submission date, and requested removal of affirmation references to continuous compliance. Two commenters urged the Department to align the annual affirmation timeline with the 3-year assessment timeline to ensure consistency and reduce potential False Claims Act liability. One commenter also incorrectly believed a prime contractor affirmation would be made on behalf of its entire supply chain. Another commenter asked DoD to clarify that an organization may obtain from C3PAOs a limited review of changes made since the last assessment in support of required

affirmations and noted that the DoD or CMMC AB may wish to clarify what supporting evidence is required for annual affirmations. Additionally, the commenter recommended that DoD reconsider the requirements for CMMC Level 1 since these are covered by System for Award Management (SAM). One commenter asked, in reference to POA&M closeout affirmations, if there was no longer an expectation that a C3PAO will confirm the close out of a POA&M. One commenter provided a recommendation to include an executive summary in the affirmation that includes POA&M related metrics as an indicator of an OSA's effective O&M, security, and continuous monitoring activities. Response:

Scoping for CMMC Level 2, as detailed in § 170.19(c), consists of all assets that process, store, or transmit CUI, and all assets that provide security protections for these assets. These assets are fully assessed against the applicable CMMC security requirements identified in § 170.14(c)(3) and following the Level 2 self-assessment procedures in § 170.16(c) or the Level 2 certification assessment procedures in § 170.17(c). In addition, Contractor Risk Managed Assets, which are assets that can, but are not intended to, process, store, or transmit CUI because of security policy, procedures, and practices in place, are documented and are subject to a limited check that may result in the identification of a deficiency, as addressed in table 3 to § 170.19(c)(1). Finally, Specialized Assets, which are assets that can process, store, or transmit CUI but are unable to be fully secured, including: Internet of Things (IoT) devices, Industrial Internet of Things (IIoT) devices, Operational Technology (OT), Government Furnished Equipment (GFE), Restricted Information Systems, and Test Equipment, are documented but are not assessed against other CMMC security requirements, as addressed in table 3 to § 170.19(c)(1). All other assets are out-of-scope and are not considered in the assessment. Scoping for CMMC Level 3, as detailed in § 170.19(d), consists of all assets that can (whether intended to or not) or do process, store, or transmit CUI, and all assets that provide security protections for these assets. The CMMC Level 3 Assessment Scope also includes all Specialized Assets but allows an intermediary device to provide the capability for the Specialized Asset to meet one or more CMMC security requirements, as needed. These assets (or the applicable intermediary device, in the case of Specialized Assets) are fully assessed against the applicable CMMC security requirements identified in § 170.14(c)(4) and following the procedures in § 170.18(c). All other assets are out-of-scope and are not considered in the assessment. If an OSA utilizes an ESP, including a Cloud Service Provider (CSP), that does not process, store, or transmit CUI, the ESP does not require its own CMMC assessment. The services provided by the ESP are assessed as part of the OSC's assessment as Security Protection Assets. Section 170.20 Standards Acceptance Section 170.20 addresses how OSCs that, prior to the effective date of this rule, have achieved a perfect score on a DCMA DIBCAC High Assessment with the same scope as a Level 2 CMMC Assessment Scope, will be given a CMMC Status of Level 2 (C3PAO). Section 170.21 Plan of Action and Milestones Requirements

. However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source. (C) Portions of this system of records may be exempt from the provisions of 5 U.S.C. 552a(c)(3) ; (d); (e)(1); (e)(4)(G), (H), and (I); and (f). (ii) Authority. 5 U.S.C. 552a(k)(1) and (k)(2) . (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would permit individuals to obtain valuable information concerning the nature of the investigation and would present a serious impediment to the orderly conduct of any investigative activities. Such accounting could result in the release of properly classified information which would compromise the national defense or disrupt foreign policy. (B) From subsections (d) and (f) because access to the records would inform individuals of the existence and nature of the investigation; provide (printed page 14766) information that might result in the concealment, destruction, or fabrication of evidence; possibly jeopardize the safety and well-being of informants, witnesses and their families; likely reveal and render ineffectual investigatory techniques and methods and sources of information; and possibly result in the invasion of the personal privacy of third parties. Access could result in the release of properly classified information which could compromise the national defense or disrupt foreign policy. Amendment of the records would interfere with the ongoing investigation and impose an impossible administrative burden by requiring investigations to be continually reinvestigated. (C) From subsection (e)(1) because in the course of the investigation it is not always possible, at least in the early stages of the inquiry, to determine relevance and or necessity as such determinations may only occur after the information has been evaluated. Information may be obtained concerning the actual or potential violation of laws or regulations other than those relating to the

ongoing investigation. Such information should be retained as it can aid in establishing patterns of improper activity and can provide valuable leads in the conduct of other investigations. (D) From subsection (e)(4)(G) and (H) because this system of records is exempt from individual access pursuant to subsections (k)(1) and (k)(2) of the Privacy Act of 1974. (E) From subsection (e)(4)(I) because it is necessary to protect the confidentiality of sources and to protect the privacy and physical safety of witnesses. Although the system is exempt from this requirement, the DON has published a notice in broad, generic terms in the belief that this is all that subsection (e)(4)(I) of the Act requires. (10) System identifier and name. N05300-3, Faculty Professional Files. (i)

(i) A contractor's notification of a third-party request for access to Government data or any associated metadata, or access to information systems with access to Government data or any associated metadata (52.239-YY(i)(3)); (j) A contractor's request to publish or disclose the details of any safeguards either designed or developed by the contractor under the contract, or otherwise provided by the Government (52.239-YY(i)(4)); (k) A contractor's submission of its operational technology equipment list, when requested by the agency (52.239-YY(k)(3)); and (l) Any other relevant contractor or third-party requests for access or data not covered herein. 39.X04 Contract clauses. When acquiring services to develop, implement, operate, or maintain a FIS, the contracting officer shall insert: (a) The clause at 52.239-YY, Federal Information Systems Using Non-Cloud Computing Services, in solicitations and contracts that use, or are anticipated to use, non-cloud computing services in performance of the contract; and (b) The clause at 52.239-XX, Federal Information Systems Using Cloud Computing Services, in solicitations and contracts that use, or are anticipated to use, cloud computing services in performance of the contract. PART 52. SOLICITATION PROVISIONS AND CONTRACT CLAUSES 19. Amend section 52.204-9 by: a. Revising the date of the clause; and b. Removing from paragraph (d) "Federally-controlled information" and adding "Federal information" in its place. The revision reads as follows: 52.204-9 Personal Identity Verification of Contractor Personnel. * * * * * Personal Identity Verification of Contractor Personnel (DATE) * * * * * 20. Amend section 52.212-5 by: a. Revising the date of the clause; b. Redesignating paragraphs (b)(63) through (64) as paragraphs (b)(65) through (66); c. Adding new paragraphs (b)(63) and (64); d. Redesignating paragraph (e)(1)(xxiv) as paragraph (e)(1)(xxvi); e. Adding new paragraphs (e)(1)(xxiv) and (xxv); f. In Alternate II by: i. Revising the date of Alternate II; ii. Redesignating paragraphs (e)(1)(ii)(W) as paragraph (e)(1)(ii)(Y); and adding new paragraphs (e)(1)(ii)(W) and (X); The revisions and additions read as follows: 52.212-5 Contract Terms and Conditions Required To Implement Statutes or Executive Orders-Commercial Products and Commercial Services. * * * * * Contract Terms and Conditions Required To Implement Statutes or Executive Orders-Commercial Products and Commercial Services (DATE) * * * * * (b) * * * _ (63) 52.239-YY Federal Information Systems Using Non-Cloud Computing Services (DATE) (E.O. 14028 and 15 U.S.C. 278g-3e). _ (64) 52.239-XX Federal Information Systems Using Cloud Computing Services (DATE) (E.O. 14028). * * * * * (e)(1) * * * (xxiv) 52.239-YY Federal Information Systems Using Non-Cloud Computing Services (DATE) (E.O. 14028 and 15 U.S.C. 278g-3e). (xxv) 52.239-XX Federal Information Systems Using Cloud Computing Services (DATE) (E.O. 14028). * * * * * Alternate II. (DATE) * * * (e)(1) * * * (ii) * * *

(5) Appropriate administrative, technical, and physical safeguards shall be established, based on the media (e.g., paper, electronic, etc.) involved, to ensure the security of the records and to prevent compromise or misuse during storage, transfer, or use, including working at authorized alternative worksites. (c) No record shall be maintained on how an individual exercises rights guaranteed by the First Amendment to the Constitution, except as follows: (1) When specifically authorized by statute; (2) When expressly authorized by the individual on whom the record is maintained; or (3) When the record is pertinent to and within the scope of an authorized law enforcement activity. (d) Notices shall be published in the Federal Register and reports shall be submitted to Congress and the Office of Management and Budget, in accordance with, and as required by, 5 U.S.C. 552a, OMB Circular A-130, and DoD 5400.11-R, as to the existence and character of any system of records being established or revised by the DoD Components. Information shall not be collected, maintained, used, or disseminated until the required publication and review requirements, as set forth in 5 U.S.C. 552a, OMB Circular A-130, and DoD 5400.11-R, are satisfied. (e) Individuals shall be permitted, to the extent authorized by 5 U.S.C. 552a and DoD 5400.11-R, to: (1) Determine what records pertaining to them are contained in a system of records. (2) Gain access to such records and obtain a copy of those records or a part thereof. (3) Correct or amend such records once it has been determined that the records are not accurate, relevant, timely, or

complete. (4) Appeal a denial of access or a request for amendment. (f) Disclosure of records pertaining to an individual from a system of records shall be prohibited except with the consent of the individual or as otherwise authorized by 5 U.S.C. 552a, DoD 5400.11-R, and DoD 5400.7-R. When disclosures are made, the individual shall be permitted, to the (printed page 18761) extent authorized by references 5 U.S.C. 552a and/or DoD 5400.11-R, to seek an accounting of such disclosures from the DoD Component making the release. (g) Disclosure of records pertaining to personnel of the National Security Agency, the Defense Intelligence Agency, the National Reconnaissance Office, and the National Geospatial-Intelligence Agency shall be prohibited to the extent authorized by Public Law 86-36 (1959) and 10 U.S.C. 424. Disclosure of records pertaining to personnel of overseas, sensitive, or routinely deployable units shall be prohibited to the extent authorized by 10 U.S.C. 130b. Disclosure of medical records is prohibited except as authorized by DoD 6025.18-R. [6] (h) Computer matching programs between the DoD Components and the Federal, State, or local governmental agencies shall be conducted in accordance with the requirements of 5 U.S.C. 552a, OMB Circular A-130, and DoD 5400.11-R.

provide required technical support. - Insider threats: Insider threats come from people within the organization who have internal information and may have the privileges needed to access the HPC system. Insider threats can be classified into accidental/unintentional threats and malicious/intentional threats. Unintentional threats come from the unintended side effects of normal actions and activity. In contrast, a malicious insider may intentionally upload malicious code into the HPC system.

(C) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, military service, Federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5), but only to the extent that such material would reveal the identity of a confidential source. (D) Evaluation material used to determine potential for promotion in the Military Services may be exempt pursuant to 5 U.S.C. 552a(k)(7), but only to the extent that the disclosure of such material would reveal the identity of a confidential source. (E) Portions of this system of records are exempt from the following subsections of the Privacy Act: (c)(3), (d), (e)(4)(G) and (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(1), (k)(2), (k)(5), and (k)(7). (iii) Reasons. Granting individuals access to information collected and maintained in this system of records could interfere with orderly investigations; result in the disclosure of classified material; jeopardize the safety of informants, witnesses, and their families; disclose investigative techniques; and result in the invasion of privacy of individuals only incidentally related to an investigation. Material will be screened to permit access to unclassified information that will not disclose the identity of sources who provide the information to the Government under an express or implied promise of confidentiality. (13) System identifier and name. N05520-4, NCIS Investigative Files System. (i) Exemptions. (A) Parts of this system may be exempt pursuant to 5 U.S.C. 552a(j)(2) if the information is compiled and maintained by a component of the agency which performs as its principal function any activity pertaining to the enforcement of criminal laws. (B) Portions of this system of records are exempt from the following subsections of the Privacy Act: (c)(3), (c)(4), (d), (e)(2), (e)(3), (e)(4)(G) through (I), (e)(5), (e)(8), (f), and (g). (ii) Authority. 5 U.S.C. 552a(j)(2). (iii) Reasons. (A) Granting individuals access to information collected and maintained by this activity relating to the enforcement of criminal laws could interfere with the orderly investigations, with the orderly administration of justice, and possibly enable suspects to avoid detection or apprehension. Disclosure of this information could result in the concealment, destruction, or fabrication of evidence, and jeopardize the safety and well-being of informants, witnesses and their families, and law enforcement personnel and their families. Disclosure of this information could also reveal and render ineffectual investigative techniques, sources, and methods used by these components and could result in (printed page 14767)

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analysis to advance the development and productive use of information technology. ITL's responsibilities include the development of technical, physical, administrative, and management standards and guidelines for the cost-effective security and privacy of sensitive unclassified information in Federal computer systems. This Special Publication 800-series reports on ITL's research, guidance, and

outreach efforts in computer security and its collaborative activities with industry, government, and academic organizations. The authors, Karen Kent and Tim Grance of the National Institute of Standards and Technology, and Suzanne Chevalier and Hung Dang of Booz Allen Hamilton, wish to thank their colleagues who reviewed drafts of this document and contributed to its technical content. The authors would particularly like to acknowledge Rick Ayers, Wayne Jansen, Peter Mell, and Murugiah Souppaya of NIST, and Adam Feldman, Mike Noblett, and Joseph Nusbaum of Booz Allen Hamilton, for their keen and insightful assistance throughout the development of the document. The authors would also like to express their thanks to security experts Susan Ballou (Office of Law Enforcement Standards), Brian Carrier (Purdue University), Eoghan Casey (Stroz Friedberg, LLC), Duane Crider (Microsoft), Kurt Dillard (Microsoft), Dean Farrington (Wells Fargo Bank), Jessica Reust (Stroz Friedberg, LLC), Marc Rogers (Purdue University), and Miles Tracy (U.S. Federal Reserve System), as well as representatives from the Department of State, for their particularly valuable comments and suggestions.

The E-Government Act of 2002 (Public Law 107-347), passed by the one hundred and seventh Congress and signed into law by the President in December 2002, recognized the importance of information security to the economic and national security interests of the United States. Title III of the E-Government Act, entitled the Federal Information Security Management Act (FISMA) of 2002, tasked NIST with the responsibility of developing security standards and guidelines for the federal government including the development of: FIPS Publication 199, Standards for Security Categorization of Federal Information and Information Systems, approved by the Secretary of Commerce in February 2004, is the first of two mandatory security standards required by the FISMA legislation. 2 FIPS Publication 200, the second of the mandatory security standards, specifies minimum security requirements for information and information systems supporting the executive agencies of the federal government and a risk-based process for selecting the security controls necessary to satisfy the minimum security requirements. This standard will promote the development, implementation, and operation of more secure information systems within the federal government by establishing minimum levels of due diligence for information security and facilitating a more consistent, comparable, and repeatable approach for selecting and specifying security controls for information systems that meet minimum security requirements. The minimum security requirements cover seventeen security-related areas with regard to protecting the confidentiality, integrity, and availability of federal information systems and the information processed, stored, and transmitted by those systems.

(i) Prior to taking any action to downgrade or declassify information, the contractor will seek guidance from the GCA. If the GCA approves such action, the contractor will cancel all old classification markings with the new markings substituted, whenever practical. For documents, at a minimum the outside of the front cover, the title page, the first page, and the outside of the back will reflect the new classification markings, or include the designation UNCLASSIFIED. The contractor will re-mark other material by the most practical method for the type of material involved to ensure that it is clear to the holder what level of classification is assigned to the material. (ii) When the GCA notifies contractors of downgrading or declassification actions that are contrary to the markings shown on the material, the contractor will re-mark material to indicate the change and notify other holders if further dissemination was made. The contractor will mark the material to indicate the: (A) Authority for the action. (B) Date of the action. (C) Identity and position of the individual taking the action. (2) If the volume of material is such that prompt re-marking of each classified item cannot be accomplished without unduly interfering with operations, the contractor may attach a downgrading and declassification notice to the inside of the file drawers or other storage container instead of the re-marking otherwise required. (3) When such documents or materials are withdrawn from the container solely for transfer to another container, or when the container is transferred from one place to another, the transfer may be made without re-marking if the notice is attached to the new container or remains with each shipment. (4) For the purpose of paragraphs (i)(2) and (i)(3) in this section, the contractor must include in the downgrading and declassification notice: (i) The authority for the downgrading or declassification action. (ii) The date of the action. (iii) The storage container to which it applies. (j) Upgrading action. (1) When the contractor receives notice from the GCA to upgrade material to a higher level; for example, from CONFIDENTIAL to SECRET, the contractor will: (i) Immediately enter the new markings on the material according to the notice to upgrade, and strike through all the superseded markings. (ii) Enter the authority for and the date of the upgrading action on the material. (iii) Ensure all records affected are stored at the appropriate level of security,

including digital networks and systems. Upgrades requiring network or system adjustment will be coordinated with the GCA to mitigate or account for impact on the execution of the contract. (2) The contractor will notify all holders to whom they disseminated the material. The contractor will not mark the notice as classified unless it contains additional information warranting classification.

1. the results of a self-assessment of the OSA's implementation of the basic safeguarding requirements set forth in § 170.15 associated with the contractor information system(s) used in performance of the contract; and 2. an initial affirmation of compliance, and then annually thereafter, an affirmation of continued compliance as set forth in § 170.22. 3. the Level 1 self-assessment cost burden will be addressed as part of the 48 CFR part 204 CMMC Acquisition final rule. Level 2 Self-Assessment Level 2 self-assessment requires compliance with the security requirements set forth in NIST SP 800-171 R2 to protect CUI. CMMC Level 2 does not add any additional security requirements to those identified in NIST SP 800-171 R2. OSAs will submit the following information in SPRS: 1. the results of a self-assessment of the OSA's implementation of the NIST SP 800-171 R2 requirements set forth in § 170.16 associated with the covered contractor information system(s) used in performance of the applicable contract. 2. an initial affirmation of compliance, and, if applicable, a POA&M closeout affirmation, and then annually thereafter, an affirmation of continued compliance set forth in § 170.22. 3. the Level 2 self-assessment cost burden will be addressed as part of the 48 CFR part 204 CMMC Acquisition final rule. Level 2 Certification Assessment Level 2 certification assessment requires compliance with the security requirements set forth in § 170.17 to protect CUI. CMMC Level 2 does not add any additional security requirements to those selected in NIST SP 800-171 R2. A Level 2 certification assessment of the applicable contractor information system(s) provided by an authorized or accredited C3PAO is required to validate implementation of the NIST SP 800-171 R2 security requirements prior to award of any prime contract or subcontract and exercise of option. The C3PAO will upload the Level 2 certification assessment results in the CMMC instantiation of eMASS which will feed the information into SPRS. OSCs will submit in SPRS an initial affirmation of compliance, and, if necessary, a POA&M closeout affirmation, and then annually following the Final CMMC Status Date, an affirmation of continued compliance as set forth in § 170.22. The Level 2 certification assessment cost burdens are included in this part (printed page 83174) with the exception of the requirement for the OSC to upload the affirmation in SPRS that is included in the 48 CFR part 204 CMMC Acquisition final rule and an update to DFARS collection approved under OMB Control Number 0750-0004, Assessing Contractor Implementation of Cybersecurity Requirements . Additionally, the information collection reporting requirements for the CMMC instantiation of eMASS are included in a separate ICR for this part and cover only those requirements pertaining to the CMMC process. Level 3 Certification Assessment

As stated in § 170.14(c), CMMC Level 1 requirements are found in FAR clause 52.204-21, CMMC Level 2 requirements are found in NIST SP 800-171 R2, and CMMC Level 3 requirements are a selected subset of NIST SP 800-172 Feb2021 requirements as specified in the 32 CFR part 170 CMMC Program rule in table 1 of § 170.14. NIST SP 800-171A Jun2018 provides authoritative procedures for assessing NIST SP 800-171 R2 security requirements and the CMMC Level 2 Assessment Guide provides additional guidance for assessing CMMC Level 2 security requirements. Both documents are referenced in the 32 CFR part 170 CMMC Program rule, at §§ 170.16(c) and 170.17(c). It is recommended that an OSA develop a SSP as a best practice at Level 1, however, it is not required for a CMMC Level 1 self-assessment. A CMMC assessment does not include Non-Federal Organization (NFO) controls from table E in NIST SP 800-171 R2 nor the DFARS clause 252.204-7021 flow down and reporting requirements. DoD concurs that CMMC provides no mechanism for addressing insider threats posed by political divisions in Congress. However, insider threat in general is addressed in the following CMMC security requirements: AT.L2-3.2.3-Insider Threat Awareness; AC.L2-3.1.7-Privileged Functions; PS.L3-3.9.2e-Adverse Information. b. Transition to Future NIST Requirements Comment: Many commenters raised concerns about the CMMC Proposed Rule's citation of a specific version of a relevant baseline document, i.e., NIST SP 800-171 R2. The expressed concerns focused mainly on a perceived potential for a timing conflict between the NIST revision requirements based on DFARS clause 252.204-7012 (revision in effect at time of solicitation) and this CMMC Program rule which specifies NIST SP 800-171 R2. Commentors provided a variety of differing suggestions to address these concerns. Some commenters recommended that no revision number be included, while others recommended citing Revision 3 rather than Revision 2. Others recommended delaying the CMMC Program. Some recommended changing DFARS clause 252.204-7012 or issuing a class deviation to address

differences between the NIST revisions cited. Those that recommended citing to Revision 3 noted that to do otherwise could delay compliance with Revision 3 beyond NIST's anticipated finalization of that publication. Commenters noted that the criteria defined in guidance explaining how to assess against NIST requirements (i.e., NIST SP 800-171A Jun2018) does not identify a revision number for the NIST SP 800-171 requirements to which they apply. In addition to the comments about NIST (printed page 83144) SP 800-171 R2 and NIST SP 800-171 Revision 3, some commenters questioned how DoD would implement or how long the DoD would allow for transitioning to each future version of NIST standards once approved.

Contractors will be responsible for safeguarding classified information in their custody or under their control, with approval for such storage of classified information by the applicable CSA. Individuals are responsible for safeguarding classified information entrusted to them. Contractors will provide the extent of protection to classified information sufficient to reasonably protect it from loss or compromise. (1) Oral discussions. Contractors will ensure that all cleared personnel are aware of the prohibition against discussing classified information over unsecured telephones, in public conveyances or places, or in any other manner that permits interception by unauthorized persons. (2) End of day security checks. (i) Contractors that store classified material will establish a system of security checks at the close of each working day to verify that all classified material and security repositories have been appropriately secured. (ii) Contractors that operate multiple work shifts will perform the security checks at the end of the last working shift in which classified material was removed from storage for use. The checks are not required during continuous 24-hour operations. (3) Perimeter controls. (i) Contractors authorized to store classified material will establish and maintain a system to deter and detect unauthorized introduction or removal of classified material from their facility without proper authority. (ii) If the unauthorized introduction or removal of classified material can be reasonably prevented through technical means (e.g., an intrusion detection system), which are encouraged, no further controls are necessary. The contractor will provide appropriate authorization to personnel who have a legitimate need to remove or transport classified material for passing through designated entry or exit points. (iii) The contractor will: (A) Provide appropriate authorization to personnel who have a legitimate need to remove or transport classified material for passing through designated entry or exit points. (B) Conspicuously post notices at all pertinent entries and exits that persons who enter or depart the facility are subject to an inspection of their personal, except under circumstances where the possibility of access to classified material is remote. (C) Limit inspections to buildings or areas where classified work is being performed. (D) Establish the extent, frequency, and location of inspections in a manner consistent with contractual obligations and operational efficiency. The contractor may use any appropriate random sampling technique. (E) Seek legal advice during the formulation of implementing procedures. (F) Submit significant problems pertaining to perimeter controls and inspections to the CSA. (iv) Contractors will develop procedures for safeguarding classified material in emergency situations. (printed page 83340) (A) The procedures should be as simple and practical as possible and adaptable to any type of emergency that may reasonably arise.

(2) A widely used exception to requests for information from local and state government agencies and Federal agencies not within the DOD is the routine use exception to the Privacy Act. (3) The most widely used exception to requests for information from other DOD components is the 'intra-agency need to know' exception to the Privacy Act. Officers and employees of the DOD who have an official need for the records in the performance of their official duties are entitled to Privacy Act protected information. Rank, position, or title alone does not authorize access to personal information about others. An official need for the information must exist before disclosure. (4) For the purposes of disclosure and disclosure accounting, the Department of Defense (DOD) is considered a single agency. (c) Disclosures under AR 25-55, the Freedom of Information Act (FOIA) Program. (1) Despite Privacy Act protections, all records must be disclosed if the Freedom of Information Act (FOIA) requires their release. The FOIA requires release unless the information is exempted by one or more of the nine FOIA exemptions. (2) Required release under the FOIA. The following are examples of personal information that is generally not exempt from the FOIA; therefore, it must be released to the public, unless covered by paragraphs (d)(2) and (d)(3) of this section. The following list is not all inclusive: (i) Military Personnel- (A) Rank, date of rank, active duty entry date, basic pay entry date, and gross pay (including base pay, special pay, and all allowances except Basic Allowance for Housing); (B) Present and past duty assignments, future stateside assignments; (C) Office/unit name, duties address and telephone number (DOD policy may

require withholding of this information in certain circumstances); (D) Source of commission, promotion sequence number, military awards and decorations, and professional military education; (E) Duty status, at any given time; (F) Separation or retirement dates; (G) Military occupational specialty (MOS); (H) Active duty official attendance at technical, scientific or professional meetings; and (I) Biographies and photos of key personnel (DOD policy may require withholding of this information in certain circumstances). (ii) Federal civilian employees- (A) Present and past position titles, occupational series, and grade; (B) Present and past annual salary rates (including performance awards or (printed page 24505) bonuses, incentive awards, merit pay amount, Meritorious or Distinguished Executive Ranks, and allowances and differentials); (C) Present and past duty stations; (D) Office or duty telephone number (DOD policy may require withholding of this information in certain circumstances); and

The Department anticipates that the most significant direct costs on State and local governments would be for conducting a Security Rule compliance audit; notifying covered entities or business associates, as applicable, upon activation of a contingency plan; notifying covered entities of changes or termination of workforce members' access to ePHI; deploying MFA; removing extraneous software; and penetration testing; providing or obtaining verification of business associates' compliance with technical safeguards; updating health plan documents; updating policies and procedures; and updating workforce training. However, the costs involved can be attributed to the statutory requirements of the Administrative Simplification provisions of HIPAA and would be similar in kind to those borne by non-government-operated regulated entities, which the proposed RIA above addresses in detail. In considering the principles in and requirements of E.O. 13132 , the Department believes that these proposed modifications to the Security Rule would not significantly affect the rights, roles, and responsibilities of the States and requests comment on this analysis.

E. Assessment of Federal Regulation and Policies on Families Section 654 of the Treasury and General Government Appropriations Act of 1999 [1031] requires Federal departments and agencies to determine whether a proposed policy or regulation could affect family well-being. If the determination is affirmative, then the Department or agency must prepare an impact assessment to address criteria specified in the law. This proposed rule is expected to strengthen family well-being because it would ensure a baseline of security measures for individuals' PHI, and medical information and decisions based on that information are at the heart of family decision making. If finalized, the provisions in this proposed rule may be carried out only by the Federal Government because it would modify Federal law on cybersecurity in health care, ensuring that American families have confidence that the privacy of their PHI is secured by consistent safeguards, regardless of the State where they are located when health care is provided. Such health care privacy and is vital for individuals who seek or access health care. F. Paperwork Reduction Act of 1995 Under the PRA, [1032] agencies are required to submit to OMB for review and approval any reporting or recordkeeping requirements inherent in a proposed or final rule and are required to publish such proposed requirements for public comment. To fairly evaluate whether an information collection should be approved by the OMB, section 3506(c)(2)(A) of the PRA requires that the Department solicit comment on the following issues: 1. Whether the information collection is necessary and useful to carry out the proper functions of the agency. 2. The accuracy of the agency's estimate of the information collection burden. 3. The quality, utility, and clarity of the information to be collected.

(Comment 73) FDA requested comments on whether persons subject to the proposed rule always or usually know at the time a perishable food is released whether or not it is intended to be processed into nonperishable food. Two comments state that distributors have no way of knowing whether a perishable food will be processed into a nonperishable food by other parties. Buyers do not always disclose how the product will be used and may utilize it in more than one way. Therefore, producers of perishable food will have to retain records for the longer period, if they are held accountable for the further distribution and use of their products as nonperishable food. (Response) FDA agrees with the comments that covered persons may not know at the time they release food if it is intended to be processed into a food that meets the 2-year record retention requirement. FDA clarifies that the retention period depends upon the status of the food at the time you release a food to your immediate subsequent recipient, regardless of whether it is intended or not to be processed into nonperishable food in the future. 12. Pet Food There were no comments on the definition of pet food, however, FDA has decided to include all animal feeds, including pet food, under these regulations. Therefore, there is no longer a need to define the term ·pet food· and FDA has deleted this definition from the final rule. 13. Recipe (Comment 74) Three comments state that the

proposed definition of recipe is internally inconsistent and ambiguous, and request clarification of its precise meaning. One comment characterizes the proposed definition as confusing and nearly nonsensical. The comment suggests that this definition be removed and that instead § 1.362 of this final rule be modified to add, for example, 'Notwithstanding the exclusion of recipes for food from this subpart, all of the ingredients in a food are subject to this subpart.' Four comments state that the provisions in the proposed rule are inconsistent with the protection of recipes required by the Bioterrorism Act. The Bioterrorism Act and accompanying legislative history make it clear that the records authority does not apply to recipes. The comments urge FDA to further clarify that information on both the quantitative and qualitative ingredients in a proprietary formula are not covered by the proposed recordkeeping requirements or by the records access authority. According to the comments, in its ordinary meaning, a 'recipe' includes three elements: The ingredients, the quantities, and the procedure. However, the fundamental element, and the one which in most cases is the most commercially sensitive, is the ingredient list. The comments state that it is not reasonable to define 'recipe' to exclude the list of ingredients to obtain access to the list. The comments state that FDA is exceeding its statutory authority under the Bioterrorism Act.

From the NIST SP 800-172 Rev 3 Final Public Draft: NIST SP 800-172r3 fpd (Final Public Draft)
Enhanced Security Requirements for Protecting CUI September 2025 INTENDED EFFECT IMPACT ON RISK
EXPECTED RESULTS Delay Increase the amount of time needed for the threat event to result in
adverse impacts. Reduce the likelihood of impact and/or the level of impact. The adversary
achieves the intended effects but not within the intended period. Example: The protection measures
(e.g., access controls, encryption) allocated to resources increase in number and strength based
on resource criticality (calibrated defense-in- depth). The frequency of authentication challenges
varies randomly (temporal unpredictability) and with increased frequency for more critical
resources. The result is that it takes the attacker more time to succeed

A record from a system of records maintained by a DOD component may be disclosed as a routine use to the General Services Administration for the purpose of records management inspections conducted under authority of 44 U.S.C. Sections 2904 and 2906. (12) Disclosure of Information to National Archives and Records Administration Routine Use. A record from a system of records maintained by a DOD component may be disclosed as a routine use to NATIONAL ARCHIVES AND RECORDS ADMINISTRATION for the purpose of records management inspections conducted under authority of 44 U.S.C. sections 2904 and 2906. (13) Disclosure to the Merit Systems Protection Board Routine Use. A record from a system of records maintained by a DOD component may be disclosed as a routine use to the Merit Systems Protection Board, including the Office of the Special Counsel for the purpose of litigation, including administrative procedures, appeals, special studies of the civil service and other merit systems, review of Office of Personnel Management or component rules and regulations, investigation of alleged or possible prohibited personnel practices, including administrative proceedings involving any individual subject of a DOD investigation, and such other functions, promulgated in 5 U.S.C. sections 1205 and 1206, or as may be authorized by law. (14) Counterintelligence Purposes Routine Use. A record from a system of records maintained by a DOD component may be disclosed as a routine use outside the DOD or the U.S. Government for the purpose of counterintelligence activities authorized by U.S. Law or Executive Order or for the purpose of enforcing laws, which protect the national security of the United States. Appendix E to Part 505-Litigation Status Sheet (a) Case Number: The number used by a DA activity for reference purposes; Requester; (b) Document Title or Description: Indicates the nature of the case, such as 'Denial of access', 'Refusal to amend', 'Incorrect records', or other violations of the Act (specify); (c) Litigation: Date complaint filed, Court, and Case File Number; (d) Defendants: DOD component and individual; (e) Remarks: Brief explanation of what the case is about; (f) Court action: Court's finding and disciplinary action (if applicable); and (g) Appeal (If applicable): Date complaint filed, court, case File Number, court's finding, disciplinary action (if applicable). Appendix F to Part 505-Example of a System of Records Notice (a) Additional information and guidance on Privacy Act system of records notices are found in DA PAM 25-51. The following elements comprise a Privacy Act system of records notice for publication in the Federal Register: (b) System Identifier: A0025-55 AHRC-DA FOIA/P Office assigns the notice number, for example, A0025-55, where 'A' indicates 'Army,' the next number represents the publication series number related to the subject matter, and the final letter group shows the system manager's command. In this case, it would be U.S. Army Human Resources Command.

From the NIST SP 800-172 Rev 3 Final Public Draft: on behalf of (an agency) 3026 A situation that occurs when (i) a non-executive branch entity uses or operates an information system or maintains

or collects information for the purpose of processing, storing, or transmitting federal information; and (ii) those activities are not incidental to providing a service or product to the Government. [5] operational technology The hardware, software, and firmware components of a system used to detect or cause changes in physical processes through the direct control and monitoring of physical devices. organization An entity of any size, complexity, or positioning within an organizational structure. [7 , adapted] penetration-resistant architecture An architecture that uses technology and procedures to limit the opportunities for an adver

(b) Each such FA between the Government and a DIB participant must comply with and implement the requirements of this part, and will include additional terms and conditions as necessary to effectively implement the voluntary information sharing activities described in this part with individual DIB participants. (c) DoD's DIB CS/IA Program Office is the overall point of contact for the program. The DoD Cyber Crime Center's DoD-DIB Collaborative Information Sharing Environment (DC3/DCISE) is the operational focal point for cyber threat information sharing and incident reporting under the DIB CS/IA program. (d) The Government will maintain a Web site or other Internet-based capability to provide potential DIB participants with information about eligibility and participation in the program, to enable the online application or registration for participation, and to support the execution of necessary agreements with the Government. <http://dibnet.dod.mil/>. (e) Prior to receiving GFI from the Government, each DIB participant shall provide the requisite points of contact information, to include security clearance and citizenship information, for the designated personnel within their company (e.g., typically 3-10 company designated points of contact) in order to facilitate the DoD-DIB interaction in the DIB CS/IA program. The Government will confirm the accuracy of the information provided as a condition of that point of contact being authorized to act on behalf of the DIB participant for this program. (f) GFI will be issued via both unclassified and classified means. DIB participant handling and safeguarding of classified information shall be in compliance with the National Industrial Security Program Operating Manual (NISPOM) (DoD 5220.22-M). The Government shall specify transmission and distribution procedures for all GFI, and shall inform DIB participants of any revisions to previously specified transmission or procedures. (g) Except as authorized in this part or in writing by the Government, DIB participants may use GFI to safeguard covered defense information only on covered DIB systems that are U.S. based; and share GFI only within their company or organization, on a need to know basis, with distribution restricted to U.S. citizens. However, in individual cases, upon request of a DIB participant that has determined that it requires the ability to share the information with a non U.S. citizen, or to use the GFI on a non-U.S. based covered DIB system, and can demonstrate that appropriate information handling and protection mechanisms are in place, the Government may authorize such disclosure or use under appropriate terms and conditions. (h) DIB participants shall maintain the capability to electronically disseminate GFI within the Company in an encrypted fashion (e.g., using Secure/Multipurpose Internet Mail Extensions (S/MIME), secure socket layer (SSL), Transport Layer Security (TLS) protocol version 1.2, DoD-approved medium assurance certificates).

One respondent commented that mundane systems will be over classified by program managers as NSS and that NSS classifications should be reserved to an appropriate level above program manager. This respondent further stated that DoD should take steps to clearly designate systems as 'NSS' and limit the NSS classification. Another respondent stated that because the interim rule incorporates the definition in 44 U.S.C. 3542(b) for 'National Security System', the rule's approach to include the clause in all DoD contracts seems contrary to the legislative intent to limit application to 'covered procurements' as defined in section 806(e)(3) of the FY 2011 NDAA. This respondent further suggested that DoD more narrowly define when contracting officers should include and use this clause (e.g., what types of programs) and create some independent review of contracting activities' decisions to apply the interim rule. Response: In the final rule, the use of the provision and clause is only required when acquiring information technology, whether as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system, as defined at DFARS 252.239-7302. In accordance with DoD Instruction 8510.01, Risk Management Framework (RMF) for DoD Information Technology (IT), the requiring activity/program office will designate systems as NSS when it registers them in the DoD Component registry (e.g., DoD Information Technology Portfolio Repository (DITPR)). c. Flowdown Comment: One respondent suggested that because the clause is written to require flowdown to subcontractors regardless of tier, the Government intends to have the right to direct a supplier at any tier to be excluded for a contract. The respondent further stated that this could lead to even greater disruption of a program's supply chain since the loss of a supplier at a remote tier can have ripple effects on all higher-tier contractors and that the potential costs for the delay, disruption, and potential workarounds required to address the situation could be enormous. Failing to address the effects of exclusion of subcontractors almost guarantees that implementation of this rule will result in claims and disputes. Response: The requirement to include the substance of DFARS clause 252.239-7018 in subcontracts has been removed from this final rule. d. Other Applications Comment: One respondent commented that DoD should clarify whether or not the rule applies to embedded processing, whether the rule applies to cloud computing acquisitions, and whether cloud computing acquisitions are

covered procurement actions as a class, since these types of acquisitions are not directly addressed in the interim rule. Response: The rule applies when acquiring information technology, whether as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system. This includes embedded processing and cloud computing acquisitions if they are NSS.

PS.L2-3.9.1 · Screen Individuals CMMC Assessment Guide · Level 2 | Version 2.13 176 The effective screening of personnel provided by this requirement, PS.L2-3.9.1, improves upon the effectiveness of authentication performed in IA.L2-3.5.2. Example You are in charge of security at your organization. You complete standard criminal background and credit checks of all individuals you hire before they can access CUI [a]. Your screening program follows appropriate laws, policies, regulations, and criteria for the level of access required for each position. Potential Assessment Considerations · Are appropriate background checks completed prior granting access to organizational systems containing CUI [a]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.9.1 PS.L2-3.9.2 · Personnel Actions CMMC Assessment Guide · Level 2 | Version 2.13 177 PS.L2-3.9.2 · PERSONNEL ACTIONS Ensure that organizational systems containing CUI are protected during and after personnel actions such as terminations and transfers. ASSESSMENT OBJECTIVES [NIST SP 800-171A]159 Determine if: [a] a policy and/or process for terminating system access and any credentials coincident with personnel actions is established; [b] system access and credentials are terminated consistent with personnel actions such as termination or transfer; and [c] the system is protected during and after personnel transfer actions. POTENTIAL ASSESSMENT METHODS AND OBJECTS [NIST SP 800-171A]

(Comment 22) One comment asks that FDA clarify in the regulation that domestic grain-handling, feed manufacturing/ingredient or processing facilities dedicated solely to exporting bulk or processed agricultural commodities to other countries are exempt from the recordkeeping requirement unless the commodities, products, or byproducts they handle are introduced into U.S. commerce. The comment states that this clarification would be consistent with the statutory language and FDA's proposed regulations. (Response) The proposed rule applied to persons who manufacture, process, pack, transport, distribute, receive, hold, or import food intended for consumption in the United States, unless the person qualifies for an exclusion in § 1.327. This provision has been changed in the final rule. The Bioterrorism Act does not limit the recordkeeping authority to food that is consumed in the United States. FDA's intent in the proposed rule was to apply the recordkeeping provisions to the full reach of section 306 of the Bioterrorism Act with respect to domestic persons. In contrast, the registration interim final rule that FDA issued under section 305 of the Bioterrorism Act only requires those facilities that manufacture, process, pack, or hold food for consumption in the United States to register. The proposed recordkeeping rule inadvertently added the same qualifier as is in the registration interim final rule: That is, it only applied to food that was intended for consumption in the United States. FDA is removing this qualifying language from the final rule to ensure that all persons that manufacture, process, pack, transport, distribute, receive, hold, or import food in the United States are subject to this final rule unless otherwise exempt. FDA believes this coverage is necessary because foods intended for export could easily be diverted into domestic commerce. In addition, not everyone in the food supply chain may know if the food is intended for consumption in the U.S. or intended solely for export. Therefore, such a limitation in this rulemaking could create holes in a tracing investigation. Further, FDA is concerned that exempting foods intended for export from the recordkeeping regulations could lead to such foods being targeted for tampering and reintroduction into domestic commerce because they would prove more intractable to tracing investigations. (Comment 23) One comment asks whether small growers who provide a raw agricultural commodity to a cooperative must keep records and whether the cooperative must list all of the growers.

automation and control systems Part 3-3: System security requirements and security levels (ISA,
North Carolina, USA).

The regulated entity has put in place reasonable and appropriate compensating controls in accordance with the regulated entity's emergency access procedures and contingency plan. As part of its documentation, a regulated entity would need to include the controls that have been deployed, a record of the fact that the compensating controls are in use, and a record indicating that the compensating controls have been reviewed and approved by the regulated entity's Security Official. Proposed 45 CFR 164.312(f)(2)(iv)(B) (3) would require the Security Official to review and document the effectiveness of the compensating controls at least once every 12 months or in response to an environmental or operational change, whichever is more frequent. A determination regarding the effectiveness of the technical controls would be based on their ability to secure the regulated entity's ePHI and its relevant electronic information systems. Last, we propose to add an implementation specification for maintenance at proposed 45 CFR 164.312(f)(2)(v) . Under this proposal, a regulated entity would be expressly required to review and test the effectiveness of the technical controls required by this standard at least once every 12 months or in response to (printed page 977) environmental or operational changes, whichever is more frequent, and modify as reasonable and appropriate. h. Section 164.312(g)-Standard: Transmission Security Transmission security protects against the interception of ePHI in the communications networks used by regulated entities to transmit ePHI. [789] The Department proposes to redesignate the standard for transmission security as proposed 45 CFR 164.312(g) and to modify the standard consistent with other proposals made elsewhere in this NPRM, as described below. Specifically, we propose to clarify the existing standard by requiring a regulated entity to deploy technical controls to guard against unauthorized access to ePHI in transmission over an electronic communications network. For example, adoption of health IT that is certified through the ONC Health IT Certification Program as having the technical capability to establish a trusted connection using encrypted and integrity message protection or a trusted connection for transport and deploying such capability may contribute to a regulated entity's compliance with the proposed standard for transmission security. [790] These proposed changes are consistent with the Department's proposals to replace ·implement· with ·deploy· in the context of technical safeguards to differentiate between implementation of a written policy or procedure and deployment of technical controls.

The requirement to ·provide all documentation and records in English· refers to official information that would be provided to the CMMC Assessor and Instructor Certification Organization (CAICO) or the DoD. The terms do not pertain to all materials used in the delivery of a course. The DoD disagreed with the recommendation to delete the § 170.12(b)(7) requirement for keeping CMMC training records and information confidential. ·Training activities· do not include course material. The example in § 170.12(b)(7) (student records) makes clear the type of data covered by the rule.

2. Time Limits and Other Constraints Comment: One comment recommended that the CAICO, instead of the DoD, determine the frequency of CMMC Certified Instructor (CCI) certification. Another requested clarification on the length of time that a CCI may not provide consulting services. One comment recommended changing the rule to require CCIs to provide updates to the CAICO and the CMMC AB no less than annually, in lieu of ·most up to date·. Two comments expressed concern that CCIs are not allowed to provide consulting services to OSCs; one of the comments asserted this would result in reduced quality of training for CMMC Certified Professionals (CCP) and CMMC Certified Assessors (CCA). One comment expressed disagreement with the requirement prohibiting CCIs from exam development and exam proctoring. Another comment recommended a rule update indicating CCIs can teach both CCA and CMMC Certified Professional (CCP) candidates. Response: The DoD declined a commenter's request to modify the rule to allow the CAICO to determine the requirement for validity period of a CCI certification. The DoD considers the 3-year certification period for CCIs as a key CMMC program requirement that is to be enforced by the CAICO. The DoD modified § 170.12(b)(4) to read ·annually· instead of ·most up to date· to clarify the reporting requirement. All CMMC ecosystem members are required to abide by the appropriate ethics and conflicts of interest (COI) policies established by the CMMC AB and CAICO. Rule content pertaining to ethics, quality assurance functions, record keeping, data encryption, security, and other functions across the ecosystem are tailored to reflect the role each entity fills in the ecosystem. The DoD defined COI requirements to reduce the possibility that a CMMC Ecosystem member acting in one capacity may bias, or be biased by, clients that are paying them to perform another CMMC related service. CCIs are not permitted to develop or proctor exams to avoid participating in any activity, practice, or transaction that could result in an actual or perceived conflict of interest.

3. Relationship to CAICO and Other Ecosystem Members Comment:

A written request for DoD records that reasonably describes the record(s) sought. The request should also indicate a willingness to pay processing fees even if it contains a request for a fee waiver. Written requests may be received by postal service or other commercial delivery means, by facsimile, or electronically. All requests must have a postal mailing address included, even if they are received by facsimile or electronically. FOIA requester. Any person, including a partnership, corporation, association, State or State agency, foreign government, foreign national, or a lawyer or other representative acting on behalf of any person, who submits a FOIA request. This definition specifically excludes agencies within the Executive Branch of the Federal Government. FOIA requester service center . Defined in E.O. 13392 . IDA. An official who has been granted authority by the Head of the DoD Component to withhold information requested under the FOIA for one or more of the 9 categories of records exempt from mandatory disclosure. An IDA may also deny a fee category claim by a requester, deny a request for expedited processing, deny a request for a waiver or reduction of fees, review a fee estimate, and confirm that no records were located in response to a request. Perfected FOIA request. A FOIA request that meets the conditions identified in definition ·FOIA request· and arrives at the FOIA office of the DoD Component in possession of the records. Also referred to as a ·correct· request. Privacy Act system of records. Defined in DoD 5400.11-R [1] . Public interest. The interest in obtaining official information that sheds light on an agency's performance of its statutory duties because the information falls within the statutory purpose of the FOIA to inform citizens about their Government's activities. Search. Includes all time spent looking, both manually and electronically, for records that are responsive to a FOIA request. The term ·search· also includes a page-by-page or line-by-line identification (if necessary) of material in the record to determine if it, or portions of it, are responsive to the request. Time spent reviewing documents to determine whether to apply one or more of the statutory exemptions is not search time; it is review time. (1) Duplication. The process of making a copy of a document in response to a FOIA request. Such copies can take the form of paper, microfiche, or audiovisual or machine-readable documentation (e.g., magnetic tape or disc), among others. (2) Review. The examination of documents located in response to a FOIA request to determine whether one (printed page 71849) or more of the statutory exemptions permit withholding. Review also includes processing the documents for disclosure, such as excising them for release. Review does not include the time spent resolving general, legal or policy issues regarding the application of exemptions.

Submitter.

CIS Safeguard 16.12 · Implement Code-Level Security Checks Apply static and dynamic analysis tools within the application life cycle to verify that secure coding practices are being followed.

Implementation Groups: 3 Asset Type: applications Security Function: protect Parent Control: Application Software Security

(C) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, military service, Federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (D) Testing or examination material used solely to determine individual qualifications for appointment or promotion in the Federal service may be exempt pursuant to 5 U.S.C. 552a(k)(6) , if the disclosure would compromise the objectivity or fairness of the test or examination process. (E) Evaluation material used to determine potential for promotion in the Military Services may be exempt pursuant to 5 U.S.C. 552a(k)(7) , but only to the extent that the disclosure of such material would reveal the identity of a confidential source. (F) Portions of this system of records are exempt from the following subsections of the Privacy Act: (d), (e)(1), and (f)(2), (3), and (4). (ii) Authority. 5 U.S.C. 552a(k)(1) , (k)(2), (k)(5), (k)(6), and (k)(7). (iii) Reasons. (A) Subsection (d) because granting individuals access to information relating to the preparation and conduct of litigation would impair the development and implementation of legal strategy. Accordingly, such records are exempt under the attorney-client privilege. Disclosure might also compromise on-going investigations and reveal confidential informants. Additionally, granting access to the record subject would seriously impair the Navy's ability to negotiate settlements or pursue other civil remedies. Amendment is inappropriate because the litigation files contain official records including transcripts, court orders, investigatory materials, evidentiary materials such as exhibits, decisional memorandum and other case-related papers. Administrative due process could not be achieved by the ·ex parte· correction of such materials. (B) Subsection (e)(1) because it is not possible in all instances to determine relevancy or necessity of specific information in the early stages of case development. What appeared relevant and necessary when collected, ultimately may be deemed unnecessary upon assessment in the context of devising legal strategy. Information collected during civil litigation investigations which is not used during subject case is often retained to provide leads in other cases or to establish patterns of activity. (C) Subsections (f)(2), (3), and (4) because this record system is exempt from the individual access provisions of subsection (d). (18) System identifier and name. N01000-5, Naval Clemency and Parole Board Files. (i) Exemption. (A) Parts of this system may be exempt pursuant to 5 U.S.C. 552a(j)(2) if the information is compiled and maintained by a component of the agency which performs as its principal function any activity pertaining to the enforcement of criminal laws.

CIS Safeguard 8.9 · Centralize Audit Logs Centralize, to the extent possible, audit log collection and retention across enterprise assets. Implementation Groups: 2,3 Asset Type: network Security Function: detect Parent Control: Audit Log Management

Administrative staff manuals and instructions, or portions thereof, that establish DoD policy or interpretations of policy that affect the public. This provision does not apply to instructions for employees on tactics and techniques to be used in performing their duties, or to instructions relating only to the internal management of the DoD Component. Examples of manuals and instructions not normally made available are: (1) Those issued for audit, investigation, and inspection purposes, or those that prescribe operational tactics, standards of performance, or criteria for defense, prosecution, or settlement of cases. (printed page 71853) (2) Operations and maintenance manuals and technical information concerning munitions, equipment, systems, and intelligence activities. (d) ·(a)(2)(D)· records. Records released to the public pursuant to 5 U.S.C. 552(a)(3) because of the nature of the subject matter, have become or are likely to become the subject of subsequent requests for substantially the same records. Two additional requests satisfy the criterion of subsequent requests. These records are referred to as ·FOIA-processed (a)(2) records.· (1) The DoD Components shall decide on a case by case basis whether records fall into this category, based on the following factors: (i) The previous experience of the DoD Component with similar records. (ii) The particular circumstances of the records involved, including their nature and the type of information they contain. (iii) The identity and number of requesters and whether there is widespread press, historic, or commercial interest in the records.

(2) This provision of § 286.8 is intended for situations where public access in a timely manner is important. It is not intended to apply where there may be a limited number of requests over a short period of time from a few requesters. The DoD Components may remove the (a)(2)(D) records from their Web site when the appropriate officials determine that access is no longer necessary according to the factors of § 286.8(d)(1). (3) Should a requester submit a FOIA request for FOIA-processed (a)(2) records and insist that it be processed, the DoD Components shall process the request. However, the DoD Components have no obligation to process a FOIA request for 552(a)(2)(A), (B), and (C) records because these records are required to be made available to the public. § 286.9 Indexes. (a) (a)(2) records. (1) Each DoD Component shall maintain in each FOIA reading room an index of records described in § 286.7 that are issued, adopted, or promulgated, after July 4, 1967.

A determination has been made under the authority of the Secretary of Defense that urgent and compelling reasons exist to promulgate this interim rule without prior opportunity for public comment. This action is necessary because of the urgent need to protect the National Security Systems (NSS) and the integrity of the supply chain to NSS. It is necessary to reduce supply chain risk in the acquisition of sensitive information technology systems that are used for intelligence or cryptologic activities; used for command and control of military forces; or from an integral part of a weapon system by avoiding sabotage, maliciously introducing unwanted functions, or other subversion of the design, integrity, manufacturing, production, installation, operation or maintenance of systems. Such acquisition decisions are made daily and, like other cybersecurity measures, the costs to mitigate supply chain risk after a system is already in operation can be very high. In addition, as this is a pilot authority set to expire on September 30, 2018, and the Congress has requested a report on the effectiveness of the authority not later than January 1, 2017, therefore DoD must make this tool available immediately to begin the pilot program and gather feedback for the report to Congress. The globalization of information technology has increased the vulnerability of DoD to attacks on its systems and networks. Failure to implement this rule may cause harm to the Government and to individuals relying on the integrity of NSS, for example, the risk of allowing the malicious insertion of software code or an unwanted function designed to degrade DOD's sensitive systems. DoD has proceeded cautiously to ensure that this rule very closely mirrors the authorities provided in the statute and has little leeway to vary from those terms. However, pursuant to 41 U.S.C. 1707 and FAR 1.501-3(b), DoD will consider public comments received in response to this interim rule in the formation of the final rule. List of Subjects in 48 CFR Parts 208, 212, 215, 233, 239, 244, and 252 Government procurement Manuel Quinones, Editor, Defense Acquisition Regulations System. Therefore, 48 CFR parts 208, 212, 215, 233, 239, 244, and 252 are amended as follows: 1. The authority citation for 48 CFR parts 208, 212, 215, 233, 239, 244, and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR Chapter 1. PART 208-REQUIRED SOURCES OF SUPPLIES AND SERVICES 2. Add section 208.405 to read as follows: 208.405 Ordering procedures for Federal Supply Schedules. In all orders and blanket purchase agreements involving the development or delivery of any information technology, whether acquired as a service or as a supply, consider the need for an evaluation factor regarding supply chain risk (see subpart 239.73). 3. Amend section 208.7402 by: a. Designating the text as paragraph (1); and b. Adding new paragraph (2) to read as follows: 208.7402 General. (1) * * *

The regulations in this subpart do not require duplication of existing records if those records contain all of the information required by this subpart. If a covered person keeps records of all of the information as required by this subpart to comply with other Federal, State, or local regulations, or for any other reason, then those records may be used to meet these requirements. Moreover, persons do not have to keep all of the information required by this rule in one set of records. If they have records containing some of the required information, they may keep those existing records and keep, either separately or in a combined form, any new information required by this rule. There is no obligation to create an entirely new record or compilation of records containing both existing and new information, even if the records containing some of the required information were not created at the time the food was received or released. Requirements for Nontransporters to Establish and Maintain Records to Identify the Nontransporter and Transporter Immediate Previous Sources of Food § 1.1337 What information must nontransporters establish and maintain to identify the nontransporter and transporter immediate previous sources of food? (a) If you are a nontransporter, you must establish and maintain the following records for all food you receive: (1) The name of the firm, address, telephone number and, if available, the fax number and e-mail address of the nontransporter immediate previous source, whether domestic or foreign; (2) An

adequate description of the type of food received, to include brand name and specific variety (e.g., brand x cheddar cheese, not just cheese; or romaine lettuce, not just lettuce); (3) The date you received the food; (4) For persons who manufacture, process, or pack food, the lot or code number or other identifier of the food (to the extent this information exists); (5) The quantity and how the food is packaged (e.g., 6 count bunches, 25 pound (lb) carton, 12 ounce (oz) bottle, 100 gallon (gal) tank); and (6) The name of the firm, address, telephone number, and, if available, the fax number and e-mail address of the transporter immediate previous source (the transporter who transported the food to you). Requirements for Nontransporters to Establish and Maintain Records to Identify the Nontransporter and Transporter Immediate Subsequent Recipients of Food §1.345 What information must nontransporters establish and maintain to identify the nontransporter and transporter immediate subsequent recipients of food? (a) If you are a nontransporter, you must establish and maintain the following records for food you release: (1) The name of the firm, address, telephone number, and, if available, the fax number and e-mail address of the nontransporter immediate subsequent recipient, whether domestic or foreign;

IST received 57 submissions, 56 of which were accepted for the first round of evaluation. After four months of evaluation, 32 of the first-round candidates proceeded to the second round of evaluation. Zero Trust is the term for a set of cybersecurity paradigms to move network defenses from static, physical, network-based perimeters to software-defined security mechanisms based on users, assets, and resources. A zero trust architecture (ZTA) uses zero trust principles to plan enterprise infrastructure and workflows.

To assist the Government: (1) in carrying out a program of inspection to safeguard against threats and hazards to the security and privacy of Government data, or (2) for the purpose of audits, investigations, inspections or similar activities, paragraph (c) of the clause 52.239-YY would require contractors to provide the Government's authorized representatives, which includes CISA (for civilian agencies) as well as other Federal agencies as specified by the contracting officer, with timely and full access to Government data and Government-related data, timely access to contractor personnel involved in performance of the contract, and specifically for the purpose of audit, investigation, inspection, or other similar activity, physical access to any contractor facility with Government data including any associated metadata. If the contractor receives a request for access from CISA, the contractor must confirm the validity of the request by contacting CISA and notifying the contracting officer in writing of the request for access. Assessments. When a FIS is designated as a moderate or high FIPS Publication 199 impact level, paragraph (d) of the clause 52.239-YY would require contractors: (1) to conduct, at least annually, a cyber threat hunting and vulnerability assessment to search for vulnerabilities, risks, and indicators of compromise; and (2) to perform to an annual, independent assessment of the security of each FIS. Upon completion, contractors would submit the results of an assessment, including any recommended improvements or risk mitigations, to the contracting officer. The agency will review the results of the assessment. The agency may require the contractor to implement the recommended improvement or mitigation. The agency may provide the contractor with a rationale for not requiring the contractor to implement the recommendation or mitigation, and if so, the contractor would document the agency's rationale in the System Security Plan (SSP). If the contractor contracts with a third-party assessment organization to perform these assessments, contractors must enter into a confidentiality agreement with the organization to protect Federal data under the contract. To assist with mitigating any potential conflicts of interest, the clause would also require contractors to notify the contracting officer of any existing business relationships the contractor may have with the organization. Specification of Additional Security and Privacy Controls.

Many commenters had questions about existing CMMC conflict of interest (Col) requirements and had suggestions for further protecting the impartiality of the CMMC Program. One commenter requested the Department develop a mechanism to prevent third-party assessment organizations from delaying re-evaluation of NOT MET requirements to create a pipeline of future assessment work. The commenter recommended removing the 10-day re-evaluation deadline requirement currently in the CMMC Rule to prevent any conflicts of interest. Another commenter stated that allowing a (printed page 83125) commercial entity to manage the CMMC 'ecosystem' creates a scenario 'fox watching the henhouse' condition and that fraud and abuse will be rampant. Some commenters questioned the legality of the current CMMC AB's establishment and alleged unethical behavior by its Board of Directors. They cited the number of resignations among its Board of Directors as evidence of internal politics, conflicts of interests, or ethics concerns. One commenter suggested the 6-month 'cooling off period' between

an employee leaving the CMMC AB and supporting other CMMC roles be extended to one year to ensure impartiality within the CMMC Program. Another commenter claimed an informational newsletter offered by the CMMC AB to ecosystem members violates the conflicts of interest requirements. In addition, commenters alleged that the CMMC AB's progress (prior to final rule publication) toward ISO/IEC compliance violates the terms of its contract with DoD, which the DoD should terminate. Commenters also stated that DoD's no-cost contract with the current CMMC AB has forced them to focus on generating revenue instead of building a CMMC Assessor cadre. One commenter cited publicly available tax filings of the current CMMC AB to substantiate that view. Another commenter noted concerns that the rule permits a timeline for meeting the ISO/IEC requirements, rather than requiring immediate compliance, and suggested that it would be more advantageous to cite different ISO/IEC requirements (for conformity assessment) than those identified in the rule. One commenter wrote that significant delays in CMMC implementation this far beyond the Department's earlier objectives of 2020 constitute fraud and claimed that DoD representatives directed companies to comply with requirements that have become irrelevant due to changes in program requirements that occurred during rulemaking. Many commenters stated the Department needs to further clarify existing CoI requirements for CCIs, CCAs, and CCPs in the CMMC Rule text. Specifically, commenters suggested the DoD:

(1) Except as otherwise authorized by subpart E of this part, disclosure of information from a system of records to any person or entity outside the Department of Defense (see § 310.21(b)) may only be made pursuant to a routine use that has been established for the specific system of records. Such uses are the so-called "external routine uses." (2) Each routine use shall include to whom the information is being disclosed and what use and purpose the information will be used. Routine uses shall be written as follows: (i) "To * * *. [person or entity outside of DoD that will receive the information] to * * *. [what will be done with the information] for the purpose(s) of * * * [what objective is sought to be achieved]." (ii) To the extent practicable, general statements, such as "to other Federal agencies as required" or "to any other appropriate Federal agency" shall be avoided. (3) Blanket routine uses (Appendix C to this part) have been adopted that apply to all Component system notices. The blanket routine uses appear at the beginning of each Component's compilation of its system notices. (i) Each system notice shall contain a statement whether or not the blanket routine uses apply to the system. (ii) Each notice may state that none of the blanket routine uses apply or that one or more do not apply. (j) Policies and Practices For Storing, Retiring, Accessing, Retaining, and Disposing of Records. This caption is subdivided into four parts: (1) Storage. Indicate the medium in which the records are maintained. (For (printed page 18778) example, a system may be "automated, maintained on compact disks, diskettes," "manual, maintained in paper files," or "hybrid, maintained in a combination of paper and automated form.") Storage does not refer to the container or facility in which the records are kept. (2) Retrieval. Specify how the records are retrieved (for example, name, SSN, or some other unique personal identifier assigned the individual). (3) Safeguards. Identify the system safeguards (such as storage in safes, vaults, locked cabinets or rooms, use of guards, visitor registers, personnel screening, or password protected IT systems). Also identify personnel who have access to the systems. Do not describe safeguards in such detail as to compromise system security. (4) Retention and Disposal. Indicate how long the record is retained. When appropriate, also state the length of time the records are maintained by the Component, when they are transferred to a FRC, time of retention at the Records Center and when they are transferred to the National Archivist or are destroyed. A reference to a Component regulation without further detailed information is insufficient. If records are eventually destroyed as opposed to being retired, identify the method of destruction (e.g., shredding, burning, pulping, etc). (k) System manager or managers and address. (1) List the title and address of the official responsible for the management of the system.

3.6.2 SHA-512/256 For SHA-512/256, the initial hash value, H (0) , shall consist of the following eight 64-bit words, in hex: `` (0) 0 H = 22312194FC2BF72C (0) 1 H = 9F555FA3C84C64C2 (0) 2 H = 2393B86B6F53B151 (0) 3 H = 963877195940EABD (0) 4 H = 96283EE2A88EFFE3 (0) 5 H = BE5E1E2553863992 (0) 6 H = 2B0199FC2C85B8AA (0) 7 H = 0EB72DDC81C52CA2 `` These words were obtained by executing the SHA-512/t IV Generation Function with t = 256. 3.6.2; and 2.

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive

use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. The Special Publication 800-series reports on ITL's research, guidelines, and outreach efforts in information system security, and its collaborative activities with industry, government, and academic organizations. - The application is made up of a set of loosely coupled components called microservices. Each of the microservices can be hosted on different physical or virtual machines (VMs) and even be geographically distributed (e.g., within several facilities that belong to the enterprise, such as the headquarters, branch offices, and in various cloud service provider environments). - Any transaction involving the application may also involve one or more inter-service (microservice) calls across the network. - A widespread feature (though not necessarily a requirement for cloud-native applications) is the presence of a software platform called the service mesh that provides an integrated set of all application services (e.g., services discovery, networking connections, communication resilience, and security services like authentication and authorization). - Zero trust is the term for an evolving set of cybersecurity paradigms that move defenses from static, network-based perimeters to focus on users and resources. It is a set of security primitives rather than a particular set of technologies.

Establish written policies and procedures for identifying, prioritizing, acquiring, installing, evaluating, and verifying the timely installation of patches, updates, and upgrades throughout the covered entity's or business associate's relevant electronic information systems. (B) Maintenance. Review and test written policies and procedures required by paragraph (a)(4)(ii)(A) of this section at least once every 12 months, and modify such policies and procedures as reasonable and appropriate. (C) Application. Patch, update, and upgrade the configurations of relevant electronic information systems in accordance with the written policies and procedures required by paragraph (a)(4)(ii)(A) of this section and based on the results of the covered entity's or business associate's risk analysis required by paragraph (a)(2) of this section, the vulnerability scans required by § 164.312(h)(2)(i), the monitoring of authoritative sources required by § 164.312(h)(2)(ii), and penetration tests required by § 164.312(h)(2)(iii), within a reasonable and appropriate period of time, as follows, except to the extent that an exception at paragraph (a)(4)(ii)(D) of this section applies: (1) Within 15 calendar days of identifying the need to patch, update, or upgrade the configuration of a relevant electronic information system to address a critical risk in accordance with this paragraph (a)(4)(ii)(C), where a patch, update, or upgrade is available; or, where a patch, update, or upgrade is not available, within 15 calendar days of a patch, update, or upgrade becoming available. (2) Within 30 calendar days of identifying the need to patch, update, or upgrade the configuration of a relevant electronic information system to address a high risk in accordance with this paragraph (a)(4)(ii)(C), where a patch, update, or upgrade is available; or, where a patch, update, or upgrade is not available, within 30 calendar days of a patch, update, or upgrade becoming available. (3) As determined by and documented in the covered entity's or business associate's policies and procedures under paragraph (a)(4)(ii)(A) of this section for all other patches, updates, and upgrades to the configuration of a relevant electronic information system. (D) Exceptions. This paragraph (a)(4)(ii)(D) applies only to the extent that a covered entity or business associate documents that an exception in this paragraph (a)(4)(ii)(D) applies and that all other applicable conditions are met. (1) A patch, update, or upgrade to the configuration of a relevant electronic information system is not available to address a risk identified in the risk analysis under paragraph (a)(2) of this section. (2) The only available patch, update, or upgrade would adversely affect the confidentiality, integrity, or availability of electronic protected health information. (E) Alternative measures.

Section 170.17 addresses how an OSC will achieve and maintain compliance with CMMC Level 2 Certification Assessment. The OSC must successfully implement the security requirements listed in § 170.14(c)(3) within its Level 2 CMMC Assessment Scope as described in § 170.19(c). Successful implementation requires meeting all objectives defined in NIST SP 800-171A for the corresponding CMMC Level 2 security requirements. After implementation, the OSC must hire a C3PAO to perform an assessment to verify the implementation. The C3PAO will score the OSC using the scoring methodology provided in § 170.24. All objectives must be met in order for a security requirement to be considered fully implemented; in some cases, if not all objectives are met, some security requirements may be placed on a POA&M as defined in § 170.21. If the minimum score has been achieved and some security requirements are in a POA&M, the OSC has a Conditional Certification Assessment; if the minimum score has been achieved and no security requirements are in a POA&M, the OSC has a

Final Certification Assessment. For Conditional Certification Assessments, a POA&M close-out must be conducted within 180 days as described in § 170.21(b). After both Conditional Certification Assessment and Final Certification Assessment, the C3PAO will input the OSC's results into the CMMC instantiation of eMASS as described in § 170.17(a)(1)(i). After both Conditional Certification Assessment and Final Certification Assessment, the OSC must submit an affirmation as described in § 170.22. In order to be eligible for a contract with a CMMC Level 2 Certification Assessment requirement, the OSC must have a CMMC Level 2 Conditional Certification Assessment or CMMC Level 2 Final Certification Assessment and have submitted an affirmation. The CMMC Level 2 Certification Assessment must be completed tri-annually and the affirmation must be completed annually. Section 170.18: CMMC Level 3 Certification Assessment and Affirmation Requirements Section 170.18 addresses how an OSC will achieve and maintain compliance with CMMC Level 3 Certification Assessment. The OSC must have a CMMC Level 2 Final Certification Assessment based on its Level 3 CMMC Assessment Scope. The OSC must successfully implement the security requirements listed in § 170.14(c)(4) and table 1 to § 170.14(c)(4) within its Level 3 CMMC Assessment Scope as described in § 170.19(d). Successful implementation requires meeting all objectives defined in NIST SP 800-172A for the corresponding CMMC Level 3 security requirements. After implementation, the OSC must contact DCMA DIBCAC to perform an assessment to verify the (printed page 89066)

The DoD Components shall interpret FOIA requests liberally when determining which records are responsive, and may release non-responsive information. Responsive documents may contain large amounts of non-responsive information, the review of which may cause delays in responding to the requester. In these cases, the DoD Components should identify the information which is non-responsive, redact it, and annotate it as non-responsive. The Components shall not apply these procedures to documents that have a relatively small percentage of non-responsive information. Additionally, redactions of non-responsive information shall not be made in sections smaller than the paragraph level. That is, a non-responsive sentence within an otherwise responsive paragraph shall not be redacted as non-responsive. (p) Honoring form or format requests. The DoD Components shall provide the record in any form or format requested if the record is readily reproducible in that form or format in the Component's automated system. Every effort will be made to ensure the copy provided is in a reasonably usable form. The DoD Components shall make reasonable efforts to use available office equipment to digitally reproduce hard copy records onto digital media. If a Component must outsource to reproduce a record into the requested format, the readily-reproducible criterion is not met. In responding to requests for records, the DoD Components shall make reasonable efforts to search for records in electronic form or format if maintained in automated systems, except when such efforts would significantly interfere with the operation of the automated systems. Such determinations shall be made on a case by case basis. (q) Annual report. The Annual FOIA Report is mandated by 5 U.S.C. 552(e)(1) and completed on a fiscal year basis. Additionally, E.O. 13392 requires additional reporting in the annual report through fiscal year 2007. Due to the magnitude of the requested statistics and the need to ensure accuracy, the DoD Components shall track this data as requests are processed. This will also facilitate quick compilation of the statistics in completing the report. (1) Each September, DFOIPO shall post on its Web site instructions to the Components concerning Component input for the annual report. The DoD Components shall forward their report to DFOIPO no later than November 30. In turn, the DA&M shall produce a consolidated report for submission to the Attorney General, and will place a copy of this report on the Internet for public access. The DoD Components shall use the current edition of DD Form 2564, 'Annual Report: Freedom of Information Act.' (2) This reporting requirement is assigned Report Control Symbol DD-DA&M(A)1365, Freedom of Information Act Report to Congress. Subpart B-FOIA Reading Rooms § 286.7 Requirements. (a) Reading room. The FOIA requires records described in 5 U.S.C. 552(a)(2)(A)

The Federal Information Processing Standards Publication Series of the National Institute of Standards and Technology (NIST) is the official series of publications relating to standards and guidelines adopted and promulgated under the provisions of Section 5131 of the Information Technology Management Reform Act of 1996 (Public Law 104-106) and the Federal Information Security Management Act of 2002 (Public Law 107-347). These mandates have given the Secretary of Commerce and NIST important responsibilities for improving the utilization and management of computer and related telecommunications systems in the federal government. The NIST, through its Information Technology Laboratory, provides leadership, technical guidance, and coordination of government efforts in the development of standards and guidelines in these areas. NATIONAL SECURITY SYSTEM: Any information system (including any telecommunications system) used or operated by an agency or by a contractor of

an agency, or other organization on behalf of an agency- (i) the function, operation, or use of which involves intelligence activities; involves cryptologic activities related to national security; involves command and control of military forces; involves equipment that is an integral part of a weapon or weapons system; or is critical to the direct fulfillment of military or intelligence missions (excluding a system that is to be used for routine administrative and business applications, for example, payroll, finance, logistics, and personnel management applications); or, (ii) is protected at all times by procedures established for information that have been specifically authorized under criteria established by an Executive Order or an Act of Congress to be kept classified in the interest of national defense or foreign policy. [44 U.S.C., SEC. 3542]

- Implements A Secure Software Development Process - Practices Secure Design and Vulnerability Remediation - Practices Responsible Vulnerability Reporting Disclosure - Uses Multifactor Authentication (if applicable) - Free from Hard Coded Secrets - Uses Strong Cryptography (if applicable) - User Data is Identified and Secured ## 2.2.2.2 Practices Secure Design and Vulnerability Remediation Practices Secure Design and Vulnerability Remediation

The Paperwork Reduction Act (44 U.S.C. chapter 35) applies; however, the proposed changes to the FAR do not impose additional information collection requirements to the paperwork burden previously approved under the Office of Management and Budget (OMB) Control Number 0704-0567, entitled 'Department of Defense Contract Security Classification Specification'. The proposed rule also touches but does not impact information collection requirements concerning the CAGE code. OMB Control Number 9000-0185, Commercial and Government Entity Code was established by OMB under FAR case 2012-024, but requires final clearance under this case. This clearance covers the following: Offerors that do not already have a CAGE code to obtain and provide a CAGE code referred to as North Atlantic Treaty Organization (NATO) CAGE (NCAGE) code for foreign entities; offerors to represent whether they are owned or controlled by another entity, and if so, to provide the CAGE code and name of such entity; and contractors to communicate any change to the CAGE code to the contracting officer within 30 days after the change. As a part of this case, the Regulatory Secretariat has submitted a request for approval of this information collection requirement to OMB. (printed page 33203) A. Public reporting burden for the collection of information under OMB Control number 9000-0185 includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. The annual reporting burden is estimated as follows: Respondents: 735. Total annual responses: 11,358. Total burden hours: 5,616.75. B. Request for Comments Regarding Paperwork Burden. DoD, GSA and NASA are soliciting comments from the public in order to: Evaluate whether this collection of information is necessary for the proper performance of the functions of the FAR, including whether the information will have practical utility; Evaluate the accuracy of the estimate of the burden, including the validity of the methodology and assumptions used; Enhance the quality, utility, and clarity of the information to be collected; and Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate collection techniques or other forms of information technology. Organizations and individuals desiring to submit comments on the information collection requirements should submit comments no later than September 10, 2019 to: FAR Desk Officer, OMB, Room 10102, NEOB, Washington, DC 20503, and a copy GSA. The copy to GSA can be submitted by either of the following methods: Federal eRulemaking Portal: This website provides the ability to type short comments directly into the comment field or attach a file for lengthier comments. Go to <http://www.regulations.gov> and follow the instructions on the site. Mail:

In recognition of the pervasive cyber threat both to DoD and to the DIB, CMMC Program requirements are designed to ensure compliance with existing standards for protection of FCI and CUI. These cybersecurity requirements align directly to NIST guidelines (NIST SP 800-171 R2 and NIST SP 800-172 Feb2021) and the basic safeguarding requirements in FAR clause 52.204-21 that apply to all executive agencies. Since December 2017, DFARS clause 252.204-7012 has required contractors to implement the NIST SP 800-171 security requirements to provide adequate security as applicable for processing, storing, or transmitting CUI on non-Federal information systems, as needed in support of the performance of a DoD contract. The executive branch's CUI Program is codified in 32 CFR part 2002 and establishes policy for designating, handling, and decontrolling information that qualifies as CUI. The definition of CUI and general requirements for its safeguarding are included in 32 CFR 2002.4 and 2002.14 . 32 CFR 2002.14(h)(2) specifically requires that Agencies must use NIST SP 800-171 when establishing security requirements to protect CUI's confidentiality on non-Federal

information systems . . . Contractually, DFARS clause 252.204-7012 requires contractors to implement the NIST SP 800-171 R2 security requirements, and that requirement applies, regardless of the number of computers or components in a non-Federal information system or the size of the contractor or subcontractor, as applicable. DoD's original implementation of security requirements for adequate safeguarding of CUI relied upon self-attestation by contractors. Since that time, the DoD Inspector General and the DCMA found contractors did not consistently implement mandated system security requirements for safeguarding CUI and recommended DoD take steps to assess a contractor's ability to protect this information. The DoD has streamlined requirements to reduce the burden of compliance on contractors. Analysis of costs to meet CMMC requirements is provided in the regulatory impact analysis for this rule. As described in the estimate included with the rule, the major cost categories for compliance with CMMC requirements include costs for completing a self-assessment (e.g.,

We also believe that the current maintenance requirement in 45 CFR 164.306(e) would benefit from increased specificity in light of the dramatic transformation of the health IT environment discussed above. For example, providing the frequency with which regulated entities must review and update their security measures would improve the security of ePHI and regulated entities' compliance with the Security Rule. The Security Rule's maintenance requirement would be further strengthened by requiring regulated entities to test their security measures to verify their sufficiency, and by clarifying the Department's expectations regarding documentation. Regulated entities' lack of documentation about how they implement security measures makes it difficult for them to know what security measures they have in fact implemented and to demonstrate compliance with the requirements of the Security Rule. Finally, the maintenance requirement in 45 CFR 164.306(e) is not included in or designated as a Security Rule standard, although it explicitly references the overarching documentation requirements in 45 CFR 164.316(b)(2)(iii) . Thus, there is overlap between the two sections that may be causing confusion regarding the obligations of regulated entities to maintain security measures.

3. Proposals

a. Section 164.306(a)-General Requirements The Department proposes to expand the introductory language to the general requirements provision at 45 CFR 164.306(a) to clarify the extent to which the general requirements apply to the obligations of regulated entities with respect to ePHI that they create, receive, maintain, or transmit. Under the proposal, the Department would clarify that the general requirements apply to ·all· ePHI. Additionally, the Department proposes to move language from paragraph (a)(1) to paragraph (a) to further emphasize that regulated entities must apply the requirements of the Security Rule to protect all of the ePHI they create, receive, maintain, or transmit. We also propose to clarify that ·each· regulated entity would be required to apply the obligations in paragraphs (a)(1) through (4) to all ePHI it creates, receives, maintains, or transmits. The Department believes that this proposal would stress to regulated entities that each and every covered entity and business associate would be responsible for ensuring it meets Security Rule requirements with respect to all ePHI. The Department believes this proposed change would also help address issues raised by current interpretations of the Security Rule that suggest that its plain wording may not require regulated entities to fully implement each security measure to protect all ePHI. Thus, the Department's proposed language would clarify that a security measure must be implemented such that it protects the security of all ePHI and all information systems that affect the confidentiality, integrity, and availability of ePHI.

establishments) would experience higher costs than the average cost per establishment because each firm would need to apply the proposals to all of their establishments. In the context of the RFA, HHS generally considers an economic impact exceeding 3 percent of annual revenue to be significant, and 5 percent or more of the affected small entities within an identified industry to represent a substantial number. More than 5 percent of the small covered entities listed under the NAICS codes in table 4 are one-establishment firms with fewer than five employees, [1005] so the analysis must determine how the effects of the quantified costs on one-establishment firms compare to their revenues. As explained above, the cost for a one-establishment firm is \$1,235, so only small firms whose revenues are below \$41,167 [= \$1,235/0.03] would experience an effect exceeding 3 percent. Among the NAICS codes for health care providers, the small firms with the lowest revenues are one-establishment HMO [Health Maintenance Organization] Medical Centers (NAICS 621491) with fewer than five employees, which had an estimated average yearly revenue in 2021 of \$108,000. Residential Intellectual and Developmental Disability Facilities (NAICS 623210) had the second lowest revenues for one-establishment firms with fewer than five employees, with \$180,000. Offices of Mental Health Practitioners (NAICS 621330) have the third lowest revenues for one-establishment firms with fewer

than five employees, with \$189,000. Thus, the Department believes that almost all regulated entities have annual revenues that exceed these amounts. The Department acknowledges that there may be very small firms—namely firms without employees—whose revenues are below \$41,167. We believe that such firms would comply with the regulation by purchasing services from software and web-hosting companies whose costs may increase as a result of the proposed changes. Such software and web-hosting companies would be business associates, and thus costs to them are already accounted for. We believe that, to the extent that these business associates decide to recover their minor cost increases by raising the prices of the services sold to non-employer firms, these incremental costs passed through to their small-firm customers would be negligible because they will be spread among many non-employer firms. The Department has separately analyzed the effects of the NPRM on health plan sponsors and does not view the projected costs as a significant burden because the proposed changes would result in annualized costs per plan sponsor of approximately \$6,133 [= \$4,552,995,816/742,411 health plan sponsors]. The quantified impact of \$6,133 per health plan sponsor would only apply to those sponsors whose annual revenue is \$204,433 or less. [1006] The Department believes there are few, if any, group health plan sponsors with annual revenues below this amount because the average revenue of a U.S. business with 1-4 employees is \$387,000 [

(Comment 75) A comment states that FDA's procedures for the exercise of its records access authority should embody recognition of the special status of confidential ingredients, as follows: First, FDA should provide that it will not routinely seek access to records that would require the disclosure of confidential ingredient information; second, if FDA concludes that it needs access to information about ingredients, it should present a written explanation to the custodian of the records that sets forth the basis for the agency's conclusion; and third, FDA should seek records access in an orderly manner, beginning with ingredients other than flavors and spices. The comment states that it will not be possible for FDA to assess simultaneously each ingredient in a product as the potential source of the problem that is being investigated. Given that flavor and spice information is highly confidential and that the low levels of use of those ingredients make it unlikely that one of them will be the source of the problem investigated, it is reasonable to provide that requesting information on flavors and spices will occur only as a last resort. Finally, FDA should provide for special procedures to ensure that, when flavor and spice information is obtained, it is properly protected from disclosure, whether advertently or otherwise. The comment urges FDA to implement a system to adequately safeguard against the inadvertent release of proprietary and confidential information. Among other things, such information should be shared within FDA only to the limited extent necessary to conduct the particular investigation that resulted in the disclosure. The comment asserts that highly proprietary information about product formulas should not be widely distributed within the agency, and all persons who are made privy to the information should be reminded explicitly of the confidential nature of the information. Moreover, the comment states that FDA should amend its public information regulations to provide expressly that information obtained under the records access authority is exempt from disclosure under one or more of the exemptions under the Freedom of Information Act (FOIA) (5 U.S.C. 552). (Response) FDA's procedure for accessing records is outside the scope of this final rule. FDA will consider these comments when it develops guidance for its investigations outlining how FDA intends to implement its access authority in section 414(a) of the FD&C Act. Such guidance will be subject to public comment under FDA's good guidance practice regulations (CGPs) § 10.115 (21 CFR 10.115). 14. Restaurant

(Comment 160) One comment states that the rules on recordkeeping are not enforceable outside the United States. The comment states that any legal proceedings based on failure to comply with the final rule that could result in confiscation of assets held in the United States or action against foreign executives visiting U.S. territory would be considered by a foreign country to be a very grave step. This would be unworkable in practice and problematic in terms of bilateral relations. The comment requests that FDA clarify that no enforcement action will be taken against foreign persons outside the United States. (Response) Foreign persons, except those who transport food in the United States, are not subject to subpart J of this final rule and thus, for the most part, the concerns raised by the comment are moot. If FDA needs to access records kept by foreign persons, FDA intends to work in cooperation with the relevant competent authorities to do so. (Comment 161) One comment encourages FDA not to use incidental infractions of its final recordkeeping regulations as a pretext for bringing additional enforcement actions for alleged violations of other agency regulations that are outside the scope of the Bioterrorism Act. (Response) Nothing in the proposed or final rule suggests that FDA would take such actions. O. Comments on What Are the Compliance Dates for This Subpart? (Proposed § 1.368) (Comment 162) Many comments strongly urge FDA to revise

the compliance dates in the proposed rule. The comments state that given the scope of the proposed requirements it is not possible for industry to be in compliance within the 6, 12, or 18 months proposed by FDA. The comments state that each of the new requirements imposes programming, training, and business practice adjustments that FDA must take this into account in setting an appropriate effective date for the regulation. The recommendations that FDA received from comments are as follows: 9 to 12 months for larger businesses; 1 year regardless of the size of the business; 18 months regardless of the size of the business; 18 months for large firms and 24 to 30 months for smaller firms, depending on their numbers of employees; an additional 1 year for each entity group; and 2 to 7 additional years.

From the NIST SP 800-172 Rev 3 Final Public Draft: Sign appropriate access agreements prior to being granted access; and NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 2. Re-sign access agreements to maintain access to systems when access 1390 agreements have been updated or [Assignment: organization-defined frequency]. D
DISCUSSION Access agreements include nondisclosure agreements, acceptable use agreements, rules of behavior, and conflict-of-interest agreements. Signed access agreements include an acknowledgement that individuals have read, understand, and agree to abide by the constraints associated with systems processing, storing, or transmitting CUI to which they have authorized access. This requirement is sourced to a control tailored out of the SP 800-53B [13]

The CSA may approve contractors to transmit SECRET or CONFIDENTIAL information within the United States and its territorial areas by means of a commercial delivery entity that is a current holder of the GSA contract for overnight delivery, and which provides nation-wide, overnight service with computer tracking and reporting features (a list of current contract holders may be found at: <https://www.archives.gov/isoo/faqs#what-is-overnightcarriers>). Such entities do not need to be determined eligible for access to classified information. (i) Prior to CSA approval, the contractor must establish and document procedures to ensure the proper protection of incoming and outgoing classified packages, including the street delivery address, for each cleared facility intending to use GSA-listed commercial delivery entities for overnight services. (ii) Contractors will establish procedures for the use of commercial delivery entities in accordance with 32 CFR part 2001 . The procedures will: (A) Confirm that the commercial delivery entity provides nationwide, overnight delivery service with automated in-transit tracking of the classified packages. (B) Ensure the package integrity during transit and that incoming shipments are received by appropriately cleared personnel. (C) Not be used for COMSEC, NATO, or FGI. (4) Couriers and hand carriers. Contractors may designate cleared employees as couriers or hand carriers. Contractors will: (i) Brief employees providing such services on their responsibility to safeguard classified information and keep classified material in their possession at all times. (ii) Provide employees with an identification card or badge which contains the contractor's name and the name and a photograph of the employee. (iii) Make arrangements in advance of departure for overnight storage at a USG installation or at a cleared contractor's facility that has appropriate storage capability, if needed. (iv) Conduct an inventory of the material prior to departure and upon return. The employee will carry a copy of the inventory with them. (5) Use of commercial passenger aircraft. The contractor may authorize cleared employees to hand carry classified material aboard commercial passenger aircraft. (i) Routine processing. Employees hand carrying classified material are subject to routine processing by airline security agents. Hand-held packages will normally be screened by x-ray examination. If security personnel are not satisfied with the results of the inspection and requests the prospective passenger to open a classified package for visual examination, the traveler must inform the screener that the carry-on items contain USG classified information and cannot be opened. Under no circumstances may traveler or security personnel open the classified material unless required by customs or other government officials. (ii) Special processing.

CIS Safeguard 4.7 · Manage Default Accounts on Enterprise Assets and Software Manage default accounts on enterprise assets and software, such as root, administrator, and other pre-configured vendor accounts. Example implementations can include: disabling default accounts or making them unusable. Implementation Groups: 1,2,3 Asset Type: users Security Function: protect Parent Control: Secure Configuration of Enterprise Assets and Software

to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal their wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that would make them difficult or impossible to reach in order to

satisfy any Government claim growing out of the investigation or proceeding. (C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsections (e)(4)(G) and (H) because this system of records is compiled for law enforcement purposes and is exempt from the access provisions of subsections (d) and (f). (E) From subsection (e)(4)(I) because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. NRO will, nevertheless, continue to publish such a notice in broad generic terms as is its current practice. (F) Consistent with the legislative purpose of the Privacy Act of 1974, the NRO will grant access to nonexempt material in the records being maintained. Disclosure will be governed by NRO's Privacy Regulation, but will be limited to the extent that the identity of confidential sources will not be compromised; subjects of an investigation of an actual or potential criminal violation will not be alerted to the investigation; the physical safety of witnesses, informants and law enforcement personnel will not be endangered, the privacy of third parties will not be violated; and that the disclosure would not otherwise impede effective law enforcement. Whenever possible, information of the above nature will be deleted from the requested documents and the balance made available. The controlling principle behind this limited access is to allow disclosures except those indicated above. The decisions to release information from these systems will be made on a case-by-case basis. (2) System identifier and name. QNRO-10, Inspector General Investigative Files. (i) Exemption. This system may be exempt pursuant to 5 U.S.C. 552a(j)(2) if the information is compiled and maintained by a component of the agency which performs as its principle function any activity pertaining to the enforcement of criminal laws. Any portion of this system which falls within the provisions of 5 U.S.C. 552a(j)(2) may be exempt from the following subsections of 5 U.S.C. 552a (c)(3), (c)(4), (d), (e)(1), (e)(2), (e)(3), (e)(4)(G), (H), and (I), (e)(5), (e)(8), (f), and (g). (ii) Authority. 5 U.S.C. 552a(j)(2) . (iii) Reasons.

(A) From subsection (c)(3) and (d) when access to accounting disclosures and access to or amendment of records would cause the identity of a confidential source to be revealed. Disclosure of the source's identity not only will result in the Department breaching the promise of confidentiality made to the source, but it will impair the Department's future ability to compile investigatory material for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, Federal contracts, or access to classified information. Unless sources can be assured that a promise of confidentiality will be honored, they will be less likely to provide information considered essential to the Department in making the required determinations. (B) From (e)(1) because in the collection of information for investigatory purposes, it is not always possible to determine the relevance and necessity of particular information in the early stages of the investigation. In some cases, it is only after the information is evaluated in light of other information that its relevance and necessity becomes clear. Such information permits more informed decision making by the Department when making required suitability, eligibility, and qualification determinations. (15) System identifier and name. DCIFA 01, CIFA Operational and Analytical Records. (i) Exemption. This system of records is a compilation of information from other Department of Defense and U.S. Government systems of records. To the extent that copies of exempt records from those `other' systems of records are entered into this system, OSD hereby claims the same exemptions for the records from those `other' systems that are entered into this system, as claimed for the original primary system of which they are a part. (ii) Authority. 5 U.S.C. 552a(j)(2) , (k)(1), (k)(2), (k)(3), (k)(4), (k)(5), (k)(6), and (k)(7). (iii) Reasons. Records are only exempt from pertinent provisions of 5 U.S.C. 552a to the extent (A) such provisions have been identified and an exemption claimed for the original record and (B) the purposes underlying the exemption for the original record still pertain to the record which is now contained in this system of records. In general, the exemptions are claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided the President and others are not compromised, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, and to preserve the confidentiality and integrity of Federal evaluation materials. The exemption rule for the original records will identify the specific reasons why the records are exempt from specific provisions of 5 U.S.C. 552a . (16) System identifier and name.

not safeguarding CUI in accordance with contract requirements), the Contractor may be financially liable for Government costs incurred in the course of the response and mitigation efforts in addition to any other damages at law or remedies available to the Government for noncompliance. (9)(i) The Government will protect contractor bid or proposal information, contractor proprietary business information, and contractor-attributational information related to a CUI incident, against unauthorized use or release to the extent required by law. (ii) The agency may release outside the Government contractor bid or proposal information, contractor proprietary business information, and contractor-attributational information that is not created by or for the Government, but that is related to a CUI incident. (A) To entities with missions that may be affected by such information; (B) To entities that may be called upon to assist in the diagnosis, detection, or mitigation of CUI incidents; or (C) For national security purposes, including cyber situational awareness. (iii) The Government may use and release contractor bid or proposal information, contractor proprietary business information, and contractor-attributational information, created by or for the Government and related to a CUI incident, outside of the Government for purposes and activities associated with responding to a CUI incident and for any other lawful Government purpose or activity. (iv) In any authorized release, the Government will minimize the contractor proprietary business information and contractor-attributational information that it includes. (10) An agency, at its sole discretion, may obtain assistance from Federal agencies or entities outside the Government, such as third-party firms to aid incident response activities. (11) The SF XXX will list in Part C, Section IV incident reporting requirements that differ from or are in addition to those in this clause, such as requirements for CUI in a CUI Specified category. (h) Subcontracts. (1) Except for the acquisitions in paragraph (h)(2), in subcontracts at any tier, or other contractual instruments, for which performance involves CUI identified in the SF XXX, Controlled Unclassified Information (CUI) Requirements, the Contractor shall: (i) Include this clause, including this paragraph (h), without alteration except to identify the parties; (ii) Include the information in the SF XXX, Controlled Unclassified Information (CUI) Requirements, modified as required to address the CUI that applies to the subcontract; and (iii) Require subcontractors to notify the prime Contractor or next higher tier subcontractor within 8 hours of discovery of a suspected or confirmed CUI incident.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 204, 212, and 252 [Docket DARS-2017-0016] RIN 0750-AJ55 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Final rule. SUMMARY: DoD is issuing a final rule amending the Defense Federal Acquisition Regulation Supplement (DFARS) to remove a provision that provided guidelines to offerors when proposing an alternative line item structure in response to a solicitation. DATES: Effective May 30, 2018. FOR FURTHER INFORMATION CONTACT: Ms. Carrie Moore, telephone 571-372-6093. SUPPLEMENTARY INFORMATION: I. Background DoD is amending the DFARS to remove DFARS provision 252.204-7011, Alternative Line Item Structure, the associated prescription at DFARS 204.7109(b), and a cross-reference at DFARS 212.301(f)(ii)(C). DFARS provision 252.204-7011 advises offerors that they may propose an alternative to the contract line item structure included in the solicitation. The purpose of this provision is to ensure that the resulting contract structure is economically and administratively advantageous to both the Government and the contractor. This provision is prescribed for use in all solicitations that use Federal Acquisition Regulation (FAR) part 12 procedures for the acquisition of commercial items or for the initial provisioning of spares. However, this DFARS provision is duplicative of the information provided in FAR provision 52.204-22, Alternative Line Item Proposal, which is included in all solicitations. When the DFARS provision was implemented, no standardized guidance on line item structure existed for the Government or contractors. A final rule was published in the Federal Register on January 13, 2017, at 82 FR 4709 to implement a uniform line item structure in the FAR for all Federal Government. That final rule established FAR provision 52.204-22, Alternate Line Item Proposal, which covers the information included in DFARS 252.204-7011. As a result, the DFARS provision is now redundant and can be removed. The removal of this DFARS provision supports a recommendation from the DoD Regulatory Reform Task Force. On February 24, 2017, the President signed Executive Order (E.O.) 13777, 'Enforcing the Regulatory Reform Agenda,' which established a Federal policy 'to alleviate unnecessary regulatory burdens' on the American people. In accordance with E.O. 13777

The concept of Attribute Based Access Control (ABAC) has existed for many years. It represents a point in the space of logical access control that includes access control lists, role-based access control, and the ABAC method for providing access based on the evaluation of attributes. Traditionally, access control has been based on the identity of a user requesting execution of a capability to perform an operation (e.g., read) on an object (e.g., a file), either directly, or through predefined attribute types such as roles or groups assigned to that user. Practitioners have noted that this approach to access control is often cumbersome to manage given the need to associate capabilities directly to users or their roles or groups. It has also been noted that the requester qualifiers of identity, groups, and roles are often insufficient in the expression of real-world access control policies. An alternative is to grant or deny user requests based on arbitrary attributes of the user and arbitrary attributes of the object, and environment conditions that may be globally recognized and more relevant to the policies at hand. This approach is often referred to as ABAC. In November 2009, the Federal Chief Information Officers Council (Federal CIO Council) published the Federal Identity, Credential, and Access Management (FICAM) Roadmap and Implementation Plan v1.0 [FEDCIO1], which provided guidance to federal organizations to evolve their logical access control architectures to include the evaluation of attributes as a way to enable access within and between organizations across the Federal enterprise. In December 2011, the FICAM Roadmap and Implementation Plan v2.0 [FEDCIO2] took the next step of calling out ABAC as a recommended access control model for promoting information sharing between diverse and disparate organizations.

Accordingly, the Department of Defense proposes to amend 32 CFR part 117 as follows: PART 117-NATIONAL INDUSTRIAL SECURITY PROGRAM OPERATING MANUAL (NISPOM) 1. The authority citation for part 117 continues to read as follows: Authority: 32 CFR part 2004 ; E.O. 10865 ; E.O. 12333 ; E.O. 12829 ; E.O. 12866 ; E.O. 12968 ; E.O. 13526 ; E.O. 13563 ; E.O. 13587 ; E.O. 13691 ; Public Law 108-458 ; Title 42 U.S.C. 2011 et seq.; Title 50 U.S.C. Chapter 44; Title 50 U.S.C. 3501 et seq. 2. Amend §117.3 in paragraph (b) by adding in alphabetical order the definitions of ·Authorization to operate· and ·Pedestrian door locks· to read as follows: (printed page 86293) §117.3 Acronyms and definitions. * * * * * (b) *** Authorization to operate means an approval granted by an authorizing official for a system to process classified information. * * * * * Pedestrian door locks means a series of GSA-approved (FF-L-2890C) preassembled locks designed, tested, and approved for security, fire safety, life safety, and accessibility when installed on doors located in the occupants anticipated path of travel to a means of egress to evacuate the facility in a fire emergency. * * * * * 3. Amend §117.5 by revising paragraph (d) to read as follows: §117.5 Information collections. * * * * * (d) DoD collection. ·DoD Security Agreement·, is assigned OMB Control Number: 0704-0194. ·National Industrial Security System·, a CSA information collection, is assigned OMB Control Number: 0704-0571, and is a DoD information collection used to conduct its monitoring and oversight of contractors. Department of Defense ·Contract Security Classification Specification·, (available at: <https://www.esd.whs.mil/Portals/54/Documents/DD/forms/dd/dd0254.pdf> and <https://www.dcsa.mil/is/nccs/>), is assigned OMB Control Number: 0704-0567 and used by both DoD and agencies which have an industrial security agreement with DoD. ·Defense Information System for Security·, is assigned OMB Control Number: 0704-0573. Defense Information System for Security is a DoD automated system for personnel security, providing a common, comprehensive medium to record, document, and identify personnel security actions within DoD including submitting adverse information, verification of security clearance status, requesting investigations, and supporting continuous evaluation activities. It requires personal data collection to facilitate the initiation, investigation and adjudication of information relevant to DoD security clearances and employment suitability determinations for active duty military, civilian employees and contractors seeking such credentials. * * * * * 4. Amend §117.7 by: a. Revising paragraph (b) introductory text; b. In paragraph (f) introductory text, removing the words ·official reviews· and adding in their place the words ·security reviews·; c. In paragraph (f)(2), adding the words ·for review· after the word ·Providing·; and d. Revising paragraphs (h)(1)(i) and (h)(1)(ii)(A). The revisions read as follows: §117.7 Procedures. * * * * * (b) Contractor Security Officials.

Changes to the health care environment and the operations of regulated entities have increased the importance of implementing strong security measures to protect ePHI and the information systems that create, receive, maintain, or transmit it. While we recognize the burdens posed by such implementation on regulated entities, there is also a clearly documented increase in the number of breaches of unsecured PHI and instances of cybercriminals accessing ePHI without authorization at

regulated entities. The changes to the health care environment, including the increase in breaches and cyberattacks, and operations of regulated entities have made it increasingly likely that unauthorized persons will seek to obtain ePHI and disrupt the U.S. health care system. Additionally, the clearly documented failure of regulated entities to fully implement the policies and procedures required by the Security Rule and apply the required security measures throughout their operations has caused the Department to question whether the existing Security Rule should be revised to clarify and strengthen the obligations of regulated entities and revisit our (printed page 917) decision from 2013. [268] In many cases involving a breach of ePHI that OCR has investigated, a breach may not have occurred, or would have been less widespread and disruptive, had the regulated entities fully implemented the provisions of the Security Rule. [269]

2. NCVHS Believes That the Security Standards Evolve To Address Changes in the Health Care Environment The Department is not alone in believing that the Security Rule should be strengthened to address concerns about whether -regulated entities are sufficiently protecting the confidentiality, integrity, and availability of ePHI. An inquiry conducted by NCVHS between July 2021 and September 2023 reached the same conclusion. [270] During this inquiry, NCVHS listened to the testimony of cybersecurity experts and Department officials. The experts and Department officials consistently voiced their concerns about the major increase in incidents and, in particular, the widespread lack of robust risk analysis on the part of covered entities and business associates that would lead to prior planning for, and mitigation of, a range of cybersecurity threats. [271] In response to this inquiry and consistent with their statutory mandate, [272] NCVHS transmitted two letters to the Secretary with recommendations for improving cybersecurity practices in the health care industry, including recommendations for modifying the Security Rule. [273] As part of the explanation for its concerns, NCVHS cited a 2021 survey of acute and ambulatory care organizations that found only 32 percent of those organizations had a comprehensive security program, while only 26 percent of the long-term and post-acute care facilities met the minimum security requirements. [274] Specifically, NCVHS made the following recommendations for improvements to the Security Rule:

(6) The title and business address of the agency official who is responsible for the SOR, (7) The agency procedures whereby an individual can be notified at his request if the SOR contains a record pertaining to him, (8) The agency procedures whereby an individual can be notified at his request how he can gain access to any record pertaining to him contained in the SOR, and how he can contest its contents; and (9) The categories of sources of records in the system. Timeliness.

Sufficiently current to ensure that any determination based on the record will be accurate and fair.

§ 329.4 Policy. In accordance with 32 CFR part 310 , it is NGB's policy that: (a) Personal information contained in any SOR maintained by any NGB organization will be safeguarded to the extent authorized by 5 U.S.C. 552a , Appendix I of Office of Management and Budget Circular No. A-130, and any other applicable legal requirements. (b) NGB will collect, maintain, use, and disseminate personal information only when it is relevant and necessary to achieve a purpose required by a statute or Executive Order. (c) NGB will collect personal information directly from the individuals to whom it pertains to the greatest extent possible and will provide individuals a PAS at the time of collection when the information being collected will be filed and/or retrieved by the subject's name or other unique identifier. The PAS will contain the following elements, as required by 5 U.S.C. 552a : (1) The statutory authority or Executive Order that allows for the solicitation, (2) The intended use/purpose that will be made of the information collected, (3) The routine uses that may be made of the information collected; and (4) Whether it is mandatory or voluntary for the individual to disclose the requested information and the non-punitive effects on the individual for not providing all or any part of the requested information. Collection can only be mandatory if the statutory authority or Executive Order cited provides a penalty for not providing the information. (d) NGB offices maintaining records and information about individuals will ensure that such data is protected from unauthorized access, use, dissemination, disclosure, alteration, and/or destruction. Offices will (printed page 24127) establish safeguards to ensure the security of personal information is protected from threats or hazards that might result in substantial harm, embarrassment, inconvenience, or unfairness to the individual using guidelines found in 32 CFR part 310, subpart B , 32 CFR part 310, Appendix A, and DoD Manual (DoDM) 5200.01, Volume 4, entitled "DoD Information Security Program: Controlled Unclassified Information (CUI)" (Available at http://www.dtic.mil/whs/directives/corres/pdf/520001_vol4.pdf). (e) NGB offices shall permit individuals to access and have a copy of all or any portion of records about them, unless an exemption for the system has been properly established (see 5 U.S.C. 552a , 32 CFR part 310, subparts D and F , and section 7 of

SUPPLEMENTARY INFORMATION: I. Background DoD, GSA, and NASA are proposing to revise the FAR to provide standardized cybersecurity contractual requirements across Federal agencies for Federal information systems (FIS) by implementing: (1) recommendations received in accordance with paragraph (i) of section 2 of Executive Order (E.O.) 14028, "Improving the Nation's Cybersecurity," dated May 12, 2021; and (2) paragraphs (a) and (b)(1) of section 7 of the Internet of Things (IoT) Cybersecurity Improvement Act of 2020 (Pub. L. 116-207). Other aspects of section 2 of E.O. 14028 are being implemented in FAR Case 2021-017, Cyber Threat and Incident Reporting and Information Sharing. This rulemaking does not implement Office of Management and Budget Memorandum M-22-18, Enhancing the Security of the Software Supply Chain through Secure Software Development Practices, issued September 14, 2022. The United States faces persistent and increasingly sophisticated malicious cyber campaigns that threaten the public and private sectors' security and privacy. The Council of Economic Advisors estimates that malicious cyber activity cost the U.S. economy between \$57 billion and \$109 billion in 2016. With threats continuing to grow, this activity could yield costs of more than \$1 trillion over a decade. In addition to the aggregate effect on the economy, the impact of a single cyber incident to an individual company can be crippling. An October 2020 study from the Cybersecurity and Infrastructure Security Agency (CISA) in the Department of Homeland Security (DHS), entitled "Cost of a Cyber Incident: Systematic Review and Cross-Validation," indicates that the average per-incident cost to small businesses of less than 250 employees and medium-sized businesses of at least 250 employees, but less than 1,000 employees, could range from \$5,000 to \$226,000, and from \$102,000 to \$40 million for large businesses of 1,000 employees or more. The Government must improve its efforts to identify, deter, protect against, detect, and respond to these actions. Contractors must be able to adapt to the continuously changing threat environment, ensure products are built and operate securely, and coordinate with the Government to foster a more secure cyberspace. It also is essential that the Government and its contractors take a coordinated approach to complying with applicable security and privacy requirements, which are closely related, though they come from independent and separate disciplines. In the end, the trust the United States places in its digital infrastructure should be proportional to how trustworthy and transparent that infrastructure is, and to the consequences it will incur if that trust is misplaced. The Government has a responsibility to protect and secure its computer systems, whether they are cloud-based, on-premises, or a hybrid of the two. The scope of that protection and security must encompass the systems that process data (e.g.,

(F) From subsection (e)(3) because the requirement that individuals supplying information be provided with a form stating the requirements of subsection (e)(3) would constitute a serious impediment to law enforcement in that it could compromise the existence of a confidential investigation, reveal the identity of confidential sources of information and endanger the life and physical safety of confidential informants. (G) From subsections (e)(4)(G) and (e)(4)(H) because portions of this system of records have been exempted from the access provisions of subsection (d), making these subsections not applicable. (H) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (I) From subsection (e)(5) because in the collection of information for law enforcement purposes it is impossible to determine in advance what information is accurate, relevant, timely, and complete. With the passage of time, (printed page 14748) seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light and the accuracy of such information can only be determined in a court of law. The restrictions of subsection (e)(5) would restrict the ability of trained investigators and intelligence analysts to exercise their judgment in reporting on investigations and impede the development of intelligence necessary for effective law enforcement. (J) From subsection (e)(8) because the individual notice requirements of subsection (e)(8) could present a serious impediment to law enforcement as this could interfere with the ability to issue search authorizations and could reveal investigative techniques and procedures. (K) From subsection (f) because portions of this system of records have been exempted from the access provisions of subsection (d). (L) From subsection (g) because portions of this system of records are compiled for law enforcement purposes and have been exempted from the access provisions of subsections (d) and (f). (7) System identifier and name. A0040-5b DASG, Army Public Health Data Repository (APHDR). (i) Exemption. (A) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he

would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of such information, the individual will be provided access to such information except to the extent that disclosure would reveal the identity of a confidential source.

3.2.1 Chief Information Officer... 3.2.1 Chief Information Officer The Chief Information Officer (CIO) ensures that the organization's security posture is adequate.

AC.L2-3.1.9 · Privacy & Security Notices CMMC Assessment Guide · Level 2 | Version 2.13 34
AC.L2-3.1.9 · PRIVACY & SECURITY NOTICES Provide privacy and security notices consistent with applicable CUI rules. ASSESSMENT OBJECTIVES [NIST SP 800-171A]27 Determine if: [a] privacy and security notices required by CUI-specified rules are identified, consistent, and associated with the specific CUI category; and [b] privacy and security notices are displayed. POTENTIAL ASSESSMENT METHODS AND OBJECTS [NIST SP 800-171A]27 Examine [SELECT FROM: Privacy and security policies, procedures addressing system use notification; documented approval of system use notification messages or banners; system audit logs and records; system design documentation; user acknowledgements of notification message or banner; system security plan; system use notification messages; system configuration settings and associated documentation; other relevant documents or records]. Interview [SELECT FROM: System or network administrators; personnel with information security responsibilities; personnel with responsibility for providing legal advice; system developers]. Test [SELECT FROM: Mechanisms implementing system use notification]. DISCUSSION [NIST SP 800-171 REV. 2]28 System use notifications can be implemented using messages or warning banners displayed before individuals log in to organizational systems. System use notifications are used only for access via logon interfaces with human users and are not required when such human interfaces do not exist. Based on a risk assessment, organizations consider whether a secondary system use notification is needed to access applications or other system resources after the initial network logon. Where necessary, posters or other printed materials may be used in lieu of an automated system banner. Organizations consult with the Office of General Counsel for legal review and approval of warning banner content. 27 NIST SP 800-171A, pp. 12-13. 28 NIST SP 800-171 Rev. 2, p. 13.

Although ·food· for purposes of section 306 of the Bioterrorism Act means the same as in section 201(f) of the FD&C Act, FDA is using its discretion to exclude some food from the record establishment and maintenance provisions. Persons who manufacture, process, pack, transport, distribute, receive, hold, or import food contact substances other than the finished container that directly contacts the food are excluded from all the requirements of subpart J of this final rule, except §§ 1.361 and 1.363. Persons who place food directly in contact with its finished container are subject to all of the requirements of subpart J as to the finished container that directly contacts that food. All other persons who manufacture, process, pack, transport, distribute, receive, hold, or import the finished container that directly contacts the food are excluded from the requirements of subpart J as to the finished container, except the record access provisions for existing records under §§ 1.361 and 1.363. FDA determined that requiring such persons to establish and maintain records is not necessary in order to address credible threats of serious adverse health consequences or death to humans and animals. (Comment 62) One comment states that food packaging other than immediate food-contact packaging defined as ·food· in the FD&C Act should not be included within the scope of this final rule. This appears to be consistent with FDA's intent in that the term ·packaging· is neither defined nor used in the proposed rules. One comment states that the inner packaging that is in direct contact with the food provides a barrier to contamination from outer packaging components. Therefore, the comment agrees with FDA's conclusion that shipping containers and outer packaging not in direct contact with food poses only a small risk from contamination and should be omitted from recordkeeping requirements. One comment believes strongly that ·packaging· is not ·food· for purposes of the Bioterrorism Act. Even if FDA disagrees, the agency is urged to exclude from the recordkeeping obligation all (printed page 71586)

means an electronic computing device and electronic media stored in its immediate environment. Workstation includes but is not limited to the following types of devices: a server, desktop computer, laptop computer, virtual device, and mobile device such as a smart phone or tablet.
§ 164.306 Security standards: General rules. (a) General requirements. Each covered entity and business associate must do the following with respect to all electronic protected health information it creates, receives, maintains, or transmits: (1) Ensure the confidentiality, integrity, and availability of the electronic protected health information. (2) Protect against any reasonably

anticipated threats or hazards to the confidentiality, integrity, or availability of the electronic protected health information. (3) Protect against any reasonably anticipated uses or disclosures of the electronic protected health information that are not permitted or required under subpart E of this part. (4) Ensure compliance by its workforce with this subpart and all administrative, physical, and technical safeguards implemented in accordance with this subpart. (b) Flexibility of approach. (1) Covered entities and business associates may use any reasonable and appropriate security measures that allow the covered entity or business associate to implement the standards and implementation specifications as specified in this subpart. (2) In deciding which security measures to use, a covered entity or business associate must take into account all of the following factors: (i) The size, complexity, and capabilities of the covered entity or business associate. (ii) The covered entity's or the business associate's technical infrastructure, hardware, and software security capabilities. (iii) The costs of security measures. (iv) The probability and criticality of potential risks to electronic protected health information. (v) The effectiveness of the security measure in supporting the resiliency of the covered entity or business associate. (c) Standards and implementation specifications. A covered entity or business associate must comply with the applicable standards, including their implementation specifications, as provided in this subpart. § 164.308 Administrative safeguards. (a) A covered entity or business associate must, in accordance with §§ 164.306 and 164.316, implement all of the following administrative safeguards to protect the confidentiality, integrity, and availability of all electronic protected health information that it creates, receives, maintains, or transmits: (1) Standard: Technology asset inventory ·(i) General. Conduct and maintain an accurate and thorough written inventory and a network map of the covered entity's or business associate's electronic information systems and all technology assets that may affect the confidentiality, integrity, or availability of electronic protected health information. (ii) Implementation specifications ·(A) Inventory.

e pipeline that is experiencing a shortage, such as in the cybersecurity realm. Further, Cin-Day Cyber sponsored National Cybersecurity Career Awareness Week at area STEM middle and high schools. - d. The Cyber Prep Program developed more technically-focused two-year programs at community colleges that can be linked to bachelor's degree programs at four-year schools. These programs can meet local talent needs for information technology professionals with deep cybersecurity knowledge and curriculum updates can be approved more quickly and graduates are work-ready sooner because community colleges are responsive to employer demand. 4. To provide hands-on training to students and reduce the gap between education and job readiness, cybersecurity labs should be built through industry and academia collaborations. Development costs can be shared across multiple stakeholders, allowing both students and organizational employees to benefit from training in the laboratories. - a. The University at Albany built two cybersecurity and digital forensics teaching laboratories and two research laboratories in which they routinely worked with industry partners for both training and research. - b. The University at Albany also worked with New York State Information Technology Services (NYSITS) to build a cyber range that will help train employees at NYSITS and students in the one-year Master of Science program focused on Cyber Operations. - c. HRCyber assisted Old Dominion University with funding to expand its cybersecurity virtual lab and in opening it up to other educational institutions outside of the university network. This lab was able to provide a secure and user-

DoD has considered this comment and concludes that no further clarification is required in the final rule. The DoD Performance Based Payment Guide contains sufficient direction with regard to identifying PBP events, establishing completion criteria for PBP events, and establishing PBP event values. PBP events are established as representative milestones that may reflect the total effort needed to accomplish not only that particular milestone, but other activities through that timeframe; milestone events or criteria may be either severable or cumulative, and the contract should state which applies (FAR 32.1004(a)(2)). However, care must be taken to ensure that there is reasonable consistency in event valuation and that valuation of events is reflective of their relative value to the successful performance of the contract, so that the contractor's financial focus is in basic alignment with programmatic priorities. 9. Training and Guidance Several respondents recommended additional training and guidance on PBPs to both program managers and contracting officers. a. PBP process. Comment: One respondent recommended training on the PBP milestone process because the respondent has encountered reluctance on the part of the Government due to lack of experience in use of PBPs and concern for administrative burden on the Government. Another respondent noted that establishing proper milestones requires an understanding of what it takes to perform the contract and how much it will cost. However, it also requires understanding of

how (printed page 19686) businesses operate and why they need certain funding when they do. Therefore, the respondent recommended guidance and training to procurement personnel on how to reach the proper balance between DoD and contractor needs. Response: Each DFARS case is reviewed for training requirements/changes to current Defense Acquisition University training. In addition to the Continuing Learning Course (CLC 026), Performance Based Payment Overview, the Performance Based Payment Guide, and Guide for Performance Based Service Acquisitions, courses in the Contracting and Program Management curriculum contain appropriate information on PBPs to align with course goals. The changes in the DFARS will prompt changes in the guides and course to ensure the workforce understands the processes. b. Cash flow. Comment: One respondent recommended guidance to contracting officers that a slightly positive cash flow is acceptable and encouraged, since it further incentivizes performance. Another respondent when addressing training also noted that limiting reasonable cash flow to contractors may result in deferring expenditures, which could result in late delivery. Response:

Investigatory information compiled for law-enforcement purposes by non-law enforcement activities and which is not within the scope of § 310.51(a). If an individual is denied any right, privilege or benefit that he or she is otherwise entitled by federal law or for which he or she would otherwise be eligible as a result of the maintenance of the information, the individual will be provided access to the information except to the extent that disclosure would reveal the identity of a confidential source. This subsection when claimed allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. (3) Exemption (k)(3). Records maintained in connection with providing protective services to the President and other individuals identified under 18 U.S.C. 3506 . (4) Exemption (k)(4). Records maintained solely for statistical research or program evaluation purposes and which are not used to make decisions on the rights, benefits, or entitlement of an individual except for census records which may be disclosed under 13 U.S.C. 8 . (5) Exemption (k)(5). Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information, but only to the extent such material would reveal the identity of a confidential source. This provision allows protection of confidential sources used in background investigations, employment inquiries, and similar inquiries that are for personnel screening to determine suitability, eligibility, or qualifications. (6) Exemption (k)(6). Testing or examination material used solely to determine individual qualifications for appointment or promotion in the federal or military service, if the disclosure would compromise the objectivity or fairness of the test or examination process. (7) Exemption (k)(7). Evaluation material used to determine potential for promotion in the Military Services, but only to the extent that the disclosure of such material would reveal the identity of a confidential source. (c) All systems of records maintained by the NSA/CSS and its components shall be exempt from the requirements of 5 U.S.C. 552a(d) pursuant to 5 U.S.C. 552a(k)(1) to the extent that the system contains any information properly classified under Executive Order 12958 and that is required by Executive Order to be kept secret in the interest of national defense or foreign policy. This exemption is applicable to parts of all systems of records including those not otherwise specifically designated for exemptions herein, which contain isolated items of properly classified information. (1) System identifier and name. GNSA 01, Access, Authority and Release of Information File. (i) Exemption.

DCMA DIBCAC will perform a Level 3 certification assessment in accordance with NIST SP 800-171A Jun2018 (incorporated by reference, see § 170.2) and NIST SP 800-172A Mar2022 (incorporated by reference, see § 170.2) and the CMMC Level 3 scoping requirements set forth in § 170.19(d) for the information systems within the CMMC Assessment Scope. The Level 3 certification assessment will be scored in accordance with the CMMC Scoring Methodology set forth in § 170.24 and DCMA DIBCAC will upload the results into the CMMC instantiation of eMASS. Final results are communicated to the OSC through a CMMC Assessment Findings Report. For assets that changed asset category (i.e., CRMA to CUI Asset) or assessment requirements (i.e., Specialized Assets) between the Level 2 and Level 3 certification assessments, DCMA DIBCAC will perform limited checks of Level 2 security requirements. If the OSC had these upgraded asset categories included in their Level 2 certification assessment, then DCMA DIBCAC may still perform limited checks for compliance. If DCMA DIBCAC identifies that a Level 2 security requirement is NOT MET, the Level 3 assessment process may be paused to allow for remediation, placed on hold, or immediately terminated. (2) Security requirement re-evaluation. A security requirement that is NOT MET (as defined in § 170.24) may be re-evaluated during the course of the Level 3 certification assessment and for 10 business days following the active assessment

period if all of the following conditions exist: (i) Additional evidence is available to demonstrate the security requirement has been MET; (ii) The additional evidence does not materially impact previously assessed security requirements; and (iii) The CMMC Assessment Findings Report has not been delivered. (3) POA&M. If a POA&M exists, a POA&M closeout certification assessment will be performed by DCMA DIBCAC within 180-days of the Conditional CMMC Status Date. Additional guidance is located in §.170.21 and in the guidance document listed in paragraph (d) of appendix A to this part. (4) Artifact retention and integrity. The hashed artifacts used as evidence for the assessment must be retained by the OSC for six (6) years from the CMMC Status Date. The hashed artifacts used as evidence for the assessment must be retained by the OSC for six (6) years from the CMMC Status Date. To ensure that the artifacts have not been altered, the OSC must hash the artifact files using a NIST-approved hashing algorithm. Assessors will collect the list of the artifact names, the return value of the hashing algorithm, and the hashing algorithm used and upload that data into the CMMC instantiation of eMASS. Additional guidance for hashing artifacts can be found in the guidance document listed in paragraph (h) of appendix A to this part. (5) Level 3 certification assessment with the use of Cloud Service Provider (CSP).

(a) Protection of FCI and CUI on contractor information systems is of paramount importance to the DoD and can directly impact its ability to successfully conduct essential missions and functions. It is DoD policy that defense contractors and subcontractors shall be required to safeguard FCI and CUI that is processed, stored, or transmitted on contractor information systems by applying specified security requirements. In addition, defense contractors and subcontractors may be required to implement additional safeguards defined in NIST SP 800-172 Feb2021 (incorporated by reference, see §.170.2), implementing DoD specified parameters to meet CMMC Level 3 security requirements (see table 1 to §.170.14(c)(4)). These additional requirements are necessary to protect CUI being processed, stored, or transmitted in contractor information systems, when designated by a requirement for CMMC Status of Level 3 (DIBCAC) as defined by a DoD program manager or requiring activity. In general, the Department will identify a requirement for a CMMC Status of Level 3 (DIBCAC) for solicitations and resulting contracts supporting its most critical programs and technologies. (b) Program managers and requiring activities are responsible for identifying the CMMC Status that will apply to a procurement. Selection of the applicable CMMC Status will be based on factors including but not limited to: (1) Criticality of the associated mission capability; (2) Type of acquisition program or technology; (3) Threat of loss of the FCI or CUI to be shared or generated in relation to the effort; (4) Impacts from exploitation of information security deficiencies; and (5) Other relevant policies and factors, including Milestone Decision Authority guidance. (c) In accordance with the implementation plan described in §.170.3, CMMC Program requirements will apply to new DoD solicitations and contracts, and shall flow down to subcontractors who will process, store, or transmit FCI or CUI in performance of the subcontract, as described in §.170.23. (d) In very limited circumstances, and in accordance with all applicable policies, procedures, and requirements, a Service Acquisition Executive or Component Acquisition Executive in the DoD, or as delegated, may elect to waive inclusion of CMMC Program requirements in a solicitation or contract. In such cases, contractors and subcontractors will remain obligated to comply with all applicable cybersecurity and information security requirements. (e) The CMMC Program does not alter any separately applicable requirements to protect FCI or CUI, including those requirements in accordance with 48 CFR 52.204-21 , Basic Safeguarding of Covered Contractor Information Systems, or covered defense information in accordance with 48 CFR 252.204-7012 , Safeguarding Covered Defense Information and Cyber Incident Reporting,

----- | Maturity Level 1: Policy.

Does documented policy require controls such as separation of duties, least privilege, and individual accountability incorporated into all business operations? | Yes - Policy Document , Chapter 6 part 5.2 shall provide access to Organization's information systems according to individual accountability, separation of duties, and the least privilege practice. | Compliant | | Maturity Level 2: Procedures. Are procedures documented for incorporating controls such as separation of duties, least privilege, and individual accountability incorporated into all business operations? | Yes - Chapter 2 part 1.2 The Internet Posting Process provides instruction as to where, how, when, and who incorporates controls for separation of duties, least privilege, and individual accountability for posting to the Internet. This document provides a partial compliance since other functions need such procedures. | Partially Compliant | This procedure applies only to Internet posting; other events are necessary to provide complete compliance. | | Maturity Level 3:

Implementation. Are controls such as separation of duties, least privilege, and individual accountability incorporated into all business operations? | Yes, Section 3.3.1.1 provides general assignment of information security responsibilities based on principles of separation of duties, least privilege and individual accountability. Section 3.3.6.1 states System "X" separated users into two primary categories: superusers and users. Superusers are subdivided into 4 types: AAs, EC Reviewers, SAs, and DBAs.

(iii) Establish a continuous receipt system for the transmittal of TOP SECRET information within and outside the contractor location. (iv) Number each item of TOP SECRET material in a series. Place the copy number on TOP SECRET documents, regardless of media, and on all associated transactions documents. (v) Establish a record of TOP SECRET material when the material is: (A) Completed as a finished document. (B) Retained for more than 180 days after creation, regardless of the stage of development. (C) Transmitted outside the contractor location. (vi) Establish procedures for destruction of TOP SECRET material by two authorized persons. (vii) Establish destruction records for TOP SECRET material and maintain the records for two years in accordance with § 117.13(d)(5) or in accordance with GCA requirements. (3) Working papers. Contractors will establish procedures for the control of classified working papers generated in the preparation of a finished document. The contractor will: (i) Date working papers when they are created. (ii) Mark each page of the working papers with the highest classification level of any information contained in them and with the annotation "WORKING PAPERS." (iii) Destroy working papers when no longer needed. (iv) Mark in the same manner prescribed for a finished document at the same classification level if released outside the contractor location or retained for more than 180 days from the date of origin. (4) Combinations to locks. Contractors will follow the guidance in 32 CFR 2001.45(a)(1) and 2001.43(c) to address thresholds when combinations will be changed. Combinations to locks used to secure vaults, open storage areas, and security containers that are approved for the safeguarding of classified information will be protected in the same manner as the highest level of classified information that the vault, open storage area, or security container is used to protect. (5) Information system passwords. Contractors will follow the guidance established in 32 CFR 2001.45(a)(2) for the protection of passwords to information systems authorized to process and store classified information at the highest level of classification to which the information system is authorized. (6) Reproduction of classified information. Contractors will follow the guidance established in 32 CFR 2001.45(b) for the reproduction of classified information. (f) Transmission of classified information. Contractors will establish procedures for transmitting and receiving classified information and material in accordance with 32 CFR 2001.46. (1) Top secret. The contractor must have written authorization from the GCA to transmit TOP SECRET material outside the contractor location. (2) Transmission outside the United States and its Territorial Areas. The contractor may transmit classified material to a USG activity outside the United States or a U.S. territorial area only under the provisions of a classified contract or with written authorization from the GCA. (3) Commercial delivery entities.

(3) Inspects and monitors contractor, licensee, certificate holder, and grantee programs and facilities that involve access to information under NRC programs classified pursuant to the AEA, other federal statutes, and executive orders where appropriate. (e) DNI. In addition to the responsibilities in paragraph (h) of this section, the DNI: (1) Prescribes procedures for the portions of this rule pertaining to intelligence sources, methods, and activities, including, but not limited to, SCI. (2) Retains authority over access to intelligence sources, methods, and activities, including SCI. (3) Provides guidance on the security requirements for intelligence sources and methods of information, including, but not limited to, SCI. (f) Secretary of Homeland Security. In accordance with E.O. 12829, E.O. 13691, and in addition to the responsibilities in paragraph (h) of this section, the Secretary of Homeland Security: (1) Prescribes procedures for the portions of this rule that pertain to the CCIPP. (2) Retains authority over access to information under the CCIPP. (3) Inspects and monitors contractor, licensee, certificate holder, and grantee programs and facilities that involve access to CCIPP. (g) All the CSA heads. The CSA heads: (1) Oversee the security of classified contracts and activities under their purview. (2) Provide oversight of contractors under their security cognizance. (3) Minimize redundant and duplicative security review and audit activities of contractors, including such activities conducted at contractor locations where multiple CSAs have equities. (4) Execute appropriate intra-agency and inter-agency agreements to avoid redundant and duplicate reviews. (5) Designate one or more CSOs for security administration. (6) Designate subordinate officials, in accordance with governing policies, to act as the authorizing official. Authorizing officials will: (i) Assess and authorize

contractors to process classified information on information systems. (ii) Conduct oversight of such information system processing and provide information system security guidelines in accordance with Federal information system security control policies, standards, and procedures. Minimize redundant and duplicative security review and audit activity of contractors, including such activity conducted at contractor locations where multiple CSAs have equities. (h) Heads of component agencies. In accordance with applicable CSA direction, the component agency heads: (1) Oversee compliance with procedures identified by the applicable CSA or designated CSO. (2) Provide oversight of contractor personnel visiting or working on USG installations. (3) Promptly apprise the CSO of information received or developed that could adversely affect a cleared contractor, licensee, or grantee, and their employees, to hold an FCL or PCL, or that otherwise raises substantive doubt about their ability to safeguard classified information entrusted to them.

The Army's rules for accessing records and for contesting contents and appealing initial agency determinations are contained in Army Regulation 340-21; 32 CFR part 505 ; or may be obtained from the system manager. Record source categories: From individuals. Exemptions claimed for the system: None. Deletion of System Notice DEPARTMENT OF DEFENSE Office of the Secretary Privacy Act of 1974; System of Records AGENCY: Office of the Secretary, DoD. ACTION: Notice to delete systems of records. SUMMARY: The Office of the Secretary of Defense is deleting a system of records notice from its existing inventory of records systems subject to the Privacy Act of 1974, (5 U.S.C. 552a), as amended. DATES: This proposed action will be effective without further notice on (insert date thirty days after publication in Federal Register) unless comments are received which result in a contrary determination. ADDRESSES: OSD Privacy Act Coordinator, Records Management Section, Washington Headquarters Services, 1155 Defense Pentagon, Washington, DC 20301-1155. FOR FURTHER INFORMATION CONTACT: Ms. Mary Smith at (703) 000-0000. SUPPLEMENTARY INFORMATION: The Office of the Secretary of Defense systems of records notices subject to the Privacy Act of 1974, (5 U.S.C. 552a), as amended, have been published in the Federal Register and are available from the address above. The specific changes to the records system being amended are set forth below followed by the notice, as amended, published in its entirety. The proposed amendments are not within the purview of subsection (r) of the Privacy Act of 1974, (5 U.S.C. 552a), as amended, which requires the submission of a new or altered system report. Dated: April 2, 2006. John Miller, OSD Federal Register Liaison Officer, Department of Defense. (printed page 18790) DODDS 27 System name: DoD Domestic and Elementary School Employee File (May 9, 2003, 68 FR 24935). Reason: The records contained in this system of records are covered by OPM/GOVT-1 (General Personnel Records), a government-wide system notice. Appendix H to Part 310-Litigation Status Sheet (See §-310.49) Litigation Status Sheet 1. Case Number [1] 2. Requester 3. Document Title or Description [2] 4. Litigation a. Date Complaint Filed b. An organization's training program should be an ongoing, evolving process and flexible enough to educate workforce members on new cybersecurity threats and how to respond to them. As such, regulated entities should consider how often to train workforce members on security issues, given the risks and threats to their enterprises, and how often to send security updates to their workforce members. Many regulated entities have determined that twice-annual training and monthly security updates are necessary, given their risks analyses. Regulated entities should apply security updates and reminders to quickly communicate new and emerging cybersecurity threats to workforce members such as new social engineering ploys (e.g., fake tech support requests and new phishing scams) and malicious software attacks including new ransomware variants. Entities need to address what type of training to provide to workforce members on security issues, given the risks and threats to their enterprises. Computer-based training, classroom training, monthly newsletters, posters, email alerts, and team discussions are all tools that different organizations use to fulfill their training requirements. Entities must also address how to document that training to workforce members was provided, including dates and types of training, training materials, and

evidence of workforce participation. HHS has issued many types of training materials on securing PHI. [581] NIST has also provided detailed guidance for developing and implementing workforce training programs. [582] Despite this existing guidance, regulated entities often fail to provide appropriate training to adequately safeguard ePHI. For example, in one investigation, OCR investigators found evidence that not only had an ambulance company potentially failed to conduct a risk analysis, it also potentially failed to implement a security training program or to train any of its employees. [583] Such failures can contribute to breaches of individuals' unsecured ePHI. To ensure security awareness training compliance, a regulated entity needs to regularly educate its workforce members on the evolving technological threats to ePHI, how to use the technology that the regulated entity has adopted and implemented, and the specific procedures workforce members must follow to ensure that the ePHI remains protected. Additionally, while many educational programs for clinicians provide general training on the HIPAA Rules, the curriculums vary widely. Without providing its own training on the Security Rule, a regulated entity cannot ensure that the training its workforce received elsewhere meets the required standards.

H. Comments on What Information is Required in the Records You Must Establish and Maintain to Identify the Nontransporter and Transporter Immediate Previous Sources and Immediate Subsequent Recipients? (Proposed §§ 1.337 and 1.345) 1. General Comments (Comment 87) Several comments state that the information required by the recordkeeping regulations exceeds the information required by the Bioterrorism Act, thereby exceeding FDA's statutory authority. Some of these comments state that according to the Bioterrorism Act, the regulations need to provide that those persons subject to the recordkeeping requirement maintain the 'one-up and one-back' information in a records maintenance system in which the information is reasonably accessible to FDA upon request. The comments ask that FDA consider the diversity and complexity of the food industry and allow for more flexibility. They contend that the name and address of the person from whom an article of food was received or to whom it was shipped and a description of the article of food should be sufficient. The comments further suggest that not all companies require or need the same type of identification as other members in the food chain, e.g., lot numbers and identity preserved ingredients. They request that, because of this diversity in the supply chain, the agency not define rigid identification requirements. The comments contend that this flexibility is in keeping with the intent of the Bioterrorism Act and will avoid dramatic changes to what are currently efficient and effective business practices. (Response) FDA disagrees that the information required by the rule exceeds FDA's authority under the Bioterrorism Act. The Bioterrorism Act authorizes FDA to require records needed to 'allow the Secretary to identify the immediate previous sources and immediate subsequent recipients of food, including its packaging, in order to address credible threats of serious adverse health consequences or death in humans or animals.' FDA believes the information it is requiring to be (printed page 71596) established and maintained meets this standard.

dent [13] information are currently being developed in the IETF Managed Incident Lightweight Exchange (MILE) [14] and the IETF Security Automation and Continuous Monitoring (SACM) [15] working groups. A ROLIE repository discovery mechanism [16] and a JSON-based version of ROLIE are also being developed in IETF MILE. Once completed, these solutions will be implemented in the NVD, and can be implemented by vendors to support SCAP content discovery and exchange. - NIST IR 8085: In support of the transition from CPE to SWID, an automated method is needed to support the generation of a CPE Name from a SWID tag to support legacy SCAP v1 tools. Draft NISTIR 8085 [17] is a start to support generation of CPE names from SWIDs, but more work is needed to complete this specification.

By limiting these exceptions to devices that have been updated and/or patched while they were supported by their manufacturer, we believe that this proposal would balance the interest in encouraging regulated entities to dispense with legacy devices with the cost of replacing such devices. Additionally, the Department believes that regulated entities should already have plans to replace legacy devices that cannot be made cybersecure because of their existing Security Rule obligations. As discussed above, we also recognize that at some point, most, if not all, devices will likely become legacy devices and that there may be legitimate reasons not to immediately replace them when the manufacturer ceases to provide support. In such cases, it will continue to be important for regulated entities to plan for how to address their ongoing Security Rule obligations. The third proposed exception to MFA at 45 CFR 164.312(f)(2)(iii)(C) (3) for devices authorized by the FDA for marketing would be available for those devices authorized for marketing by the FDA pursuant to a submission received on or after March 29, 2023, where they are supported by their manufacturer. We understand that the FDA considers security during the review of medical device

marketing submissions and works with device manufacturers to ensure that appropriate cybersecurity protections are built into such devices, pursuant to FDA's authority under the Consolidated Appropriations Act, 2023. [784] Thus, we do not believe it would be necessary or appropriate for the Security Rule to require MFA for an FDA-authorized medical device that has been authorized by FDA for marketing pursuant to a submission received on or after March 29, 2023, where the device continues to be supported by its manufacturer. However, these devices may continue to be used by a regulated entity when they are no longer supported, consistent with the proposed exception for legacy devices that were approved pursuant to a submission received on or after March 29, 2023, as described above. Where a proposed exception would apply to the proposed MFA requirement, the Department proposes to require that a regulated entity implement alternative measures and compensating controls. [785] Specifically, when a regulated entity seeks to comply with the Security Rule by meeting one of the proposed exceptions to the proposed MFA requirement, the Department proposes to require a regulated entity to document both the existence of the criteria demonstrating that the proposed exception would apply and the rationale for why the proposed exception would apply. (printed page 976) Additionally, the proposal would require a regulated entity to implement reasonable and appropriate compensating controls, as described at proposed paragraph (f)(2)(iv)(B). The proposed requirements for reasonable and appropriate compensating controls are explained under proposed 45 CFR 164.312(f)(2)(iv)(B)

The Department makes the determination that such modifications may be needed using information it receives on an ongoing basis from the Department's Federal advisory committee on HIPAA, the public, regulated entities, media reports, and its own analysis of the state of privacy and security for IIHI. As referenced above, and discussed in greater detail below, while the Department believes that the Security Rule generally continues to accomplish the goals of HIPAA, [20] we believe that it would be appropriate to consider modifying the Security Rule to address the following:

Significant changes in technology. Changes in breach trends and cyberattacks. HHS' Office for Civil Rights' (OCR's) enforcement experience. Other guidelines, best practices, methodologies, procedures, and processes for protecting ePHI. Court decisions that affect enforcement of the Security Rule.

B. Applicability The effective date of a final rule would be 60 days after publication. [21] Regulated entities would have until the compliance date to establish and implement policies, procedures, and practices to achieve compliance with any new or modified standards. (printed page 901) Regulated entities would be permitted to comply earlier than the compliance date, but the Department would not take action against them for noncompliance with the proposed changes that occurs before the compliance date. Except as otherwise provided, 45 CFR 160.105 provides that regulated entities must comply with the applicable new or modified standards or implementation specifications no later than 180 days from the effective date of any such change. The Department has previously noted that the 180-day general compliance period for new or modified standards would not apply where a different compliance period is provided in the regulation for one or more provisions. [22] However, the compliance period cannot be less than the statutory minimum of 180 days. [23]

(i) That the Secretary of Defense, in coordination with the Secretary of State, shall prescribe regulations on the selection, training, equipping, and conduct of personnel performing private security functions under a covered contract in an area of combat operations or other significant military operations; and (ii) That the FAR shall be revised to require the insertion into each covered contract (or, in the case of a task order, the contract under which the task order is issued) of a contract clause addressing the selection, training, equipping, and conduct of personnel performing private security functions under such contract. This Final Rule meets requirement (i). There will be a separate and subsequent Federal Register action to meet requirement (ii) to update the FAR. On July 17, 2009, an Interim Final Rule (32 CFR Part 159 DOD-2008-OS-125/RIN 0790-AI38) was published and public comments were solicited. At the end of the comment period, we received comments from 9 respondents, including the American Bar Association, IPOA, NGO groups and members of the public. These comments are discussed below by topic. Comment: Extent of Delegation of Implementation Authority to Each Geographic Combatant Commander Response: We believe that it is appropriate for DoD to provide the Geographic Combatant Commanders with the requirements to be included in their respective guidance and procedures. Situations change significantly from one geographic region to another. The Geographic Combatant Commanders (GCC) must have the flexibility to apply the overarching policy, tailoring their guidance and procedures as necessary to meet the particular circumstances within their respective areas of responsibility at any particular time. This is consistent with the approach that we are currently taking in the CENTCOM Area Of

Responsibility (AOR) without significant issue. We do not believe that differing or conflicting regulations will be adopted within a single AOR. The GCC will establish the overarching guidance and Subordinate Commanders (down to Joint Task Force level) will develop implementing instructions. Specific requirements will be made available to Private Security Contractors through the GCC Web site. Comment: Absence of Department-Wide Guidance Response: We believe that a de-centralized approach is the most appropriate way to implement the requirements of Section 862 of the FY08 NDAA. There is sufficient uniformity of guidance provided through policy, including this Rule and existing acquisition regulations. The intent of the policy is that all PSC personnel operating within the designated area are required to have the required training, not only those who are deploying. A FAR case has been opened to incorporate the required revisions based upon the publication of this Final Rule. Comment: Lack of Uniformity Across Organizations Response:

DoD internal policies, procedures, and approval requirements will govern the process for DoD to waive inclusion of the CMMC requirement in the solicitation. Once applicable to a solicitation, there is no process for OSAs to seek waivers of CMMC requirements from the DoD CIO. In accordance with § 170.5(d), a limited waiver authority is provided to the Acquisition Executive with acquisition oversight for the program in question. These officials may issue supplemental guidance dictating specific coordination requirements for waiver requests. Recommended administrative changes have been incorporated into § 170.5(d) to add clarity. 11. Determination of Applicable Assessment Type a. Process for Level Determination Comment: Multiple comments asked how DoD will determine the CMMC level to include in solicitations. Multiple comments inquired about the criteria DoD will use to determine when to require a CMMC Level 2 self-assessment, CMMC Level 2 certification, or CMMC Level 3 certification assessment. Multiple comments asked specifically about when CMMC Level 2 self-assessment will be required versus CMMC Level 2 Certification. One comment requested more information on which companies may self-attest. One comment requested § 170.5(a) be modified to prevent CMMC level 2 or 3 being assigned for contracts where only FCI is exchanged. One comment emphasized that requirement(s) for Contractor certification levels must be the same as stated throughout this proposed ruling. Two comments recommended providing contracting officers with interim guidance to ensure consistency in applying CMMC requirements. One comment requested the detailed guidance ensure CMMC requirements are selected based on risk, and that certification is not required by default. Some commenters objected to the wording of one criterion for level selection as potential for and impacts from exploitation of information security deficiencies. One asserted this equates to a sub-CONFIDENTIAL security classification. One comment expressed that all information systems that process CUI should have the same level of program criticality, information sensitivity, and the severity of cyber threat since CUI is Unclassified Information which is a handling caveat. Multiple comments requested a clearer description of what contracts require CMMC Level 3 Certification, one of which requested a definition of what constitutes a priority program that might require CMMC Level 3. One comment requested that acquisition processes first analyze the CUI for a proposed effort using published factors for aligning CUI to high value assets before setting CMMC levels. They asserted use of such published factors would improve accuracy of CUI marking. (printed page 83115) Response: Pre-award contracting procedures and processes for CMMC assessment requirements will be addressed in the 48 CFR part 204

DFARS 252.204-7020 (NIST SP 800-171 DoD Assessment Requirements) Requires contractors to have current NIST SP 800-171 DoD Assessment for Medium and High assessment levels. Non-compliance with 252.204-7020 can result in: loss of contract eligibility, termination for cause, False Claims Act liability (if contractor misrepresented compliance status), suspension or debarment from future DoD contracting, and in cases involving CUI spillage or breach, potential civil or criminal penalties.

functionality) - The human aspect (social engineering) - Theft of intell property - Theft of IP - Treats to RF spectrum - wireless is increasing the comms component of choice on factory floor. 802.3, 802.11ad etc - Understanding 3D printer, direct digital in the context of 3D phenomenon [i.e. same files could be used for manufacturing or decision support - Uneducated workforce

Cryptography is foundational to our security and data protection needs. The standards, guidelines, recommendations, and tools provided by NIST's Cryptography priority area enable the trustworthy assurance of integrity and confidentiality in all types of information and technology - now and in the future. - NIST launched the hardware security program to identify existing and emerging cybersecurity threats and develop mitigation techniques for semiconductors, including cybersecurity

(D) From subsection (e)(1) because the nature of the criminal and/or civil investigative function creates unique problems in prescribing a specific parameter in a particular case with respect to what information is relevant or necessary. Also, information may be received which may relate to a case under the investigative jurisdiction of another agency. The maintenance of this information may be necessary to provide leads for appropriate law enforcement purposes and to establish patterns of activity that may relate to the jurisdiction of other cooperating agencies. (E) From subsection (e)(2) because in a criminal investigation, the requirement that information be collected to the greatest extent possible from the subject individual would present a serious impediment to law enforcement in that the subject of the investigation would be placed on notice of the existence of the investigation and would therefore be able to avoid detection. (F) From subsection (e)(3) because the requirement that individuals supplying information be provided with a form stating the requirements of subsection (e)(3) would constitute a serious impediment to law enforcement in that it could compromise the existence of a confidential investigation, reveal the identity of confidential sources of information and endanger the life and physical safety of confidential informants. (G) From subsections (e)(4)(G) and (e)(4)(H) because the requirements in those subsections are inapplicable to the extent that portions of this system of records may be exempt from subsection (d), concerning individual access. (H) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (I) From subsection (e)(5) because in the collection of information for law enforcement purposes, it is impossible to determine in advance what information is accurate, relevant, timely, and complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light and the accuracy of such information can only be determined in a court of law. The restrictions of subsection (e)(5) would restrict the ability of trained investigators and intelligence analysts to exercise their judgment in reporting on investigations and impede the development of intelligence necessary for effective law enforcement. (J) From subsection (e)(8) because the individual notice requirements of subsection (e)(8) could present a serious impediment to law enforcement as this could interfere with the ability to issue search authorizations and could reveal investigative techniques and procedures. (K) From subsection (f) because portions of this system of records have been exempted from the access provisions of subsection (d).

BGP origin validation relies on a global RPKI system (e.g., certificate authorities, publication repositories, etc.) as the source of trusted information about internet address holders and their route origin authorization statements. Each RIR operates a trusted root certificate authority (CA) in the RPKI system and publishes a Certificate Practice Statement [RFC7382] describing the security and robustness properties of each implementation. Each RPKI CA has integrity and authentication mechanisms for data creation, storage, and transmission. Nevertheless, compromise of the underlying servers and/or registry services is still a potential, if low probability, threat. Making security recommendations for mitigating against such threats is outside of the scope of this document. DDoS threats involving vulnerable applications using various UDP/TCP ports and IoT devices are continually evolving and varied (e.g., memcached DDoS reflection attacks and SSDP diffraction, etc. [Bjarnason] [Arbor2]). Hence, traffic filtering methods mentioned in this section are not meant to be exhaustive. | References | |-----|-----

Because each organization has unique security needs, security products have been applied on a case by case basis to meet individual security threats and concerns. Products should be flexible enough to serve a broad spectrum of security needs at the operating system level, the application level, the organizational level, and the site level. Organizational security requirements also change over time and cannot be totally specified at the time of product acquisition. Protecting the privacy of personal information was also relevant to commercial sector organizations. The need to protect sensitive data from unauthorized access resulted from operational environment (including threats) and data sensitivity factors. These factors include legal obligations and self-imposed requirements including confidentiality of salary, performance, and health (mental, drug, and alcohol related illness) , as well as data involving legal incidents. The study team found that a computerized hospital support system, whether in a VA or commercial hospital, also imposes stringent integrity controls. The integrity controls of such a system must provide for the ethics and laws associated with the clinical treatment of patients. Prior diagnoses can never be destroyed or altered; only doctors can perform a diagnosis and prescribe medicine. Protecting the accuracy of patients medical records may be critical if there is an accident where the patient becomes unconscious. The correctness of information including the patient's reaction to medications, pre-existing ailments, blood type, or medication currently being prescribed can all prove to be healththreatening or even life-threatening.

(ii) The System Manager shall include the summary of the NGB's reasons for not making a correction when disclosing disputed information. (5) Copies of the statement summarizing the reasons for the NGB refusing to amend the records will be treated as part of the individual's record; however, it will not be subject to the amendment procedure outlined in 5 U.S.C. 552 and 32 CFR part 310, subpart D . (h) Penalties. (1) Civil Action. An individual may file a civil suit against the NGB or its employees if the individual feels certain provisions of 5 U.S.C. 552a have been violated. (2) Criminal Action. (i) Criminal penalties may be imposed against any officer or employee for the offenses listed in subsection I of 5 U.S.C. 552a . (ii) An officer or employee of NGB may be found guilty of a misdemeanor and fined up to \$5,000 for a violation of the offenses listed in subsection I of 5 U.S.C. 552a . (i) Litigation Status Sheet. Whenever a complaint citing 5 U.S.C. 552a is filed in a U.S. District Court against the NGB, or any employee of NGB, the Chief of Litigation and Employment Law shall: (1) Promptly notify the Chief of the OIP of the complaint using the litigation status sheet in 32 CFR part 310, Appendix H . This status sheet will be provided to the DPCLO, or the respective service(s) involved in the litigation. (2) Provide a revised litigation status sheet to the Chief of the OIP at each stage of the litigation for submission to the DPCLO, or the respective service(s) involved. (3) When a court renders a formal opinion or judgment, copies of the judgment or opinion shall be provided to the Chief of the OIP who will provide them to DPCLO, or the respective service(s) involved, along with the litigation status sheet reporting the judgment or opinion. (j) Computer Matching Programs. All requests for participation in a matching program (either as a matching agency, or a source agency) shall be submitted directly to the DPCLO for review and compliance, following procedures in 32 CFR part 310, subpart L . The Directorate shall submit a courtesy copy of such requests to the Chief of the OIP. §329.7 Exemptions. (a) General Information. There are two types of exemptions, general and specific. The general exemption authorizes the exemption of a SOR from all but a few requirements of 5 U.S.C. 552a . The specific exemption authorizes exemption of a SOR or portion thereof, from only a few specific requirements. If a new SOR originates for which an exemption is proposed, or an additional or new exemption for an existing SOR is proposed, the exemption shall be submitted with the SORN. No exemption of a SOR shall be considered automatic for all records in the system. The System Manager shall review each requested records and apply the exemptions only when this will serve significant and legitimate purpose of the Federal Government. (b) Exemption for Classified Material. All SOR maintained by the NGB shall be exempt under section (k)(1) of 5 U.S.C. 552a

- · Automatically checking for and acquiring updates of signature or data definition files at least daily; - · Scanning critical OS components, such as startup files, system basic input/output system (BIOS), and boot records; - · Monitoring the behavior of common applications, such as email clients, web browsers, file transfer and file sharing programs, and instant messaging software; - ·

Performing real-time scans of each file as it is downloaded, opened, or executed; - · Scanning all hard drives regularly to identify any file system infections, and optionally scanning removable media as well; - · Handling files that are infected by attempting to disinfect them, which refers to removing malware from within a file, and quarantining them, which means that files containing malware are stored in isolation for future disinfection or examination; and - · Logging all significant events, such as the results of scans, the startup and shutdown of antivirus software, the installation of updates, and the discovery and handling of any instances of malware.

NIST is selecting public-key cryptographic algorithms through a public, competition-like process to specify additional digital signature, public-key encryption, and key-establishment algorithms to supplement FIPS 186-5, SP 800-56Ar3, and SP 800-56Br2. These algorithms are intended to protect sensitive information well into the foreseeable future, including after the advent of quantum computers. In the fourth round of the Post-Quantum Cryptography Standardization Process, NIST selected four candidate algorithms for key establishment to be studied: BIKE, Classic McEliece, HQC, and SIKE. This report describes the evaluation and selection process of these fourth-round candidates based on public feedback and internal review. The report summarizes each of the candidate algorithms and identifies those selected for standardization. The only key-establishment algorithm that will be standardized is HQC, and NIST will develop a standard based on HQC to augment its key-establishment portfolio. | 1. Introduction | . . . |

CIS Safeguard 3.7 · Establish and Maintain a Data Classification Scheme Establish and maintain an overall data classification scheme for the enterprise. Enterprises may use labels, such as ·Sensitive·, ·Confidential· and ·Public·, and classify their data according to those labels. Review and update the classification scheme annually, or when significant enterprise changes occur that could impact this Safeguard. Implementation Groups: 2,3 Asset Type: data Security Function: identify Parent Control: Data Protection

(ii) Provide copies of any such communication to the agency and to other participating parties when they become known. However, if the protester has identified controlled unclassified information and requests a protective order, then the contracting officer shall obtain a redacted version from the protester to furnish to other interested parties, if one has not already been provided. * * * *

* PART 42·CONTRACT ADMINISTRATION AND AUDIT SERVICES 42.302 [Amended] 35. Amend section 42.302 by removing from paragraph (a)(21) the phrase ·Subpart 4.4· and adding ·4.402· in its place. PART 52·SOLICITATION PROVISIONS AND CONTRACT CLAUSES 36. Amend section 52.204-2 by revising the section heading, the introductory text, the clause heading, and the date of the clause to read as follows: 52.204-2 Security Requirements for Classified Information. As prescribed in 4.402-3(a), insert the following clause: Security Requirements for Classified Information (DATE) * * * * * 37. Amend section 52.204-9 by: a. Revising the date of the clause; b. Removing from paragraph (a) the phrase ·(FIPS PUB) Number· and adding ·(FIPS)· in its place; and c. Removing from paragraph (d) the phrase ·Federally-controlled information· and adding ·Federal information· in its place. The revision reads as follows: 52.204-9 Personal Identity Verification of Contractor Personnel. * * * * * Personal Identity Verification of Contractor Personnel (DATE) * * * * * 38. Amend section 52.204-16 by: a. Revising the date of the clause; and b. Removing from paragraph (g) the phrase ·Security Requirements· and adding ·Security Requirements for Classified Information· in its place. The revision reads as follows: 52.204-16 Commercial and Government Entity Code Reporting. * * * * * Commercial and Government Entity Code Reporting (DATE) * * * * * 39. Amend section 52.204-18 by: a. Revising the date of the clause; and b. Removing from paragraph (f) the phrase ·Security Requirements· and adding ·Security Requirements for Classified Information· in its place. The revision reads as follows: 52.204-18 Commercial and Government Entity Code Maintenance. * * * * * Commercial and Government Entity Code Maintenance (DATE) * * * * * 40. Amend section 52.204-21 by: a. Revising the introductory text and date of the clause; b. In paragraph (a): i. Revising the definition of ·Covered contractor information system·; ii. Adding in alphabetical order the definition for ·Covered Federal information·; iii. Removing the

definition for ·Federal contract information·; iv. Revising the definition of ·Information·; c. Removing from paragraph (b)(1)(vii) the phrase ·Federal Contract Information· and adding ·covered Federal information· in its place. d. Removing from paragraph (b)(2) the phrase ·controlled unclassified information (CUI)· and adding ·CUI· in its place; e. Adding paragraph (b)(3); and f. Removing from paragraph (c) the phrase ·Federal contract information· and adding ·covered Federal information· in its place. The revisions and additions read as follows: 52.204-21

(d) Privacy Act Statements. (1) When an individual is requested to furnish personal information about himself or herself for inclusion in a system of records, a Privacy Act Statement is required regardless of the medium used to collect the information (forms, personal interviews, telephonic interviews, or other methods). The Privacy Act Statement consists of the elements set forth in paragraph (d)(2) of this section. The statement enables the individual to make an informed decision whether to provide the information requested. If the personal information solicited is not to be incorporated into a system of records, the statement need not be given. However, personal information obtained without a Privacy Act Statement shall not be incorporated into any system of records. When soliciting SSNs for any purpose, see paragraph (b)(2) of this section. (2) The Privacy Act Statement shall include: (i) The Federal statute or Executive Order that authorizes collection of the requested information (See § 310.10(d)). (ii) The principal purpose or purposes for which the information is to be used; (iii) The routine uses that will be made of the information (See § 310.22(d)); (iv) Whether providing the information is voluntary or mandatory (See paragraph (e) of this section); and (v) The effects on the individual if he or she chooses not to provide the requested information. (3) The Privacy Act Statement shall be concise, current, and easily understood. (4) The Privacy Act statement may appear as a public notice (sign or poster), conspicuously displayed in the area where the information is collected, such as at check-cashing facilities or identification photograph facilities (but see § 310.16(a)). (5) The individual normally is not required to sign the Privacy Act Statement. (6) The individual shall be provided a written copy of the Privacy Act Statement upon request. This must be done regardless of the method chosen to furnish the initial advisement. (e) Mandatory as opposed to voluntary disclosures. Include in the Privacy Act Statement specifically whether furnishing the requested personal data is mandatory or voluntary. A requirement to furnish personal data is mandatory only when the DoD Component is authorized to impose a penalty on the individual for failure to provide the requested information. If a penalty cannot be imposed, disclosing the information is always voluntary. § 310.16 Forms. (a) DoD Forms. (1) DoD Instruction 7750.7 [8] provides guidance for preparing Privacy Act Statements for use with forms (see also paragraph (b) of this section). (2) When forms are used to collect personal information, the Privacy Act Statement shall appear as follows (listed in the order of preference): (i) In the body of the form, preferably just below the title so that the reader will be advised of the contents of the statement before he or she begins to complete the form; (ii) On the reverse side of the form with an appropriate annotation under the title giving its location;

DFARS clause 252.204-7002 is included in solicitations and contracts when the value of a NSP contract line or subline item is included in the price of another contract line or subline item, and it is necessary to withhold payment (printed page 58363) on the priced contract line or subline item until the related NSP item has been delivered. The clause prohibits contractors from billing the Government for a priced item that contains the value of a NSP item until the related NSP items have also been delivered to and accepted by the Government. While use of the clause is discretionary, it is beneficial to DoD in situations when NSP items are individual deliverables on a contract, even though the NSP items are a part or component of a priced item on another contract line or subline item. Currently, the clause text can be read as prohibiting the contractor from billing for any portion of a contract line or subline item that is associated with an NSP item until all of the NSP items have also been delivered to and accepted by the Government. It is not the intent of the Government to prohibit any and all payment on such contract line or subline items until all deliveries have been made and accepted for both the priced and NSP items. This rule simplifies the clause text to clarify that a contractor can bill the Government for the individual unit price of a delivered item, once the NSP item associated with the individually priced item has also been delivered and accepted by the Government. The rule also conforms the text of the clause to the current contract line item structure terminology by replacing ·contract line item· with ·contract line or subline item· and adds a prescription for the DFARS clause in the applicable section of DFARS 204.71. The modification of this DFARS text implements a recommendation from the DoD Regulatory Reform Task Force. On February 24, 2017, the President signed Executive Order (E.O.)

13777, ·Enforcing the Regulatory Reform Agenda,· which established a Federal policy ·to alleviate unnecessary regulatory burdens· on the American people. In accordance with E.O. 13777 , DoD established a Regulatory Reform Task Force to review and validate DoD regulations, including the DFARS. A public notice of the establishment of the DFARS Subgroup to the DoD Regulatory Reform Task Force, for the purpose of reviewing DFARS provisions and clauses, was published in the Federal Register at 82 FR 35741 on August 1, 2017, and requested public input. No public comments were received on these clauses. Subsequently, the DoD Task Force reviewed the requirements of DFARS clause 252.204-7002 and determined that the clause should be revised. III. Applicability to Contracts at or Below the Simplified Acquisition Threshold and for Commercial Items, Including Commercially Available Off-the-Shelf Items

means a discrete set of information resources organized for the collection, processing, maintenance, use, sharing, dissemination, or disposition of information (44 U.S.C. 3502(8)). Lawful Government purpose means any activity, mission, function, operation, or endeavor that the Government authorizes or recognizes as within the scope of its legal authorities or the legal authorities of non-executive branch entities such as state and local law enforcement. Limited dissemination control means any control identified on the CUI Registry that agencies may use to limit or specify CUI dissemination. On behalf of an agency means a Contractor uses or operates an information system or maintains or collects information for the purpose of processing, storing, or transmitting Federal information, and those activities (printed page 4298) are not incidental to providing a service or product to the Government. (c) Identifying and reporting information the Contractor believes or has reason to know is potentially CUI. (1) The Contractor shall notify the Contracting Officer within 8 hours of discovery if· (i) The Contractor discovers any information that the Contractor believes is CUI that is not identified in the SF XXX or is not marked or properly marked as required in the SF XXX; or (ii) There is any inconsistency between this clause and an SF XXX incorporated into the contract. (2) The Contractor shall take action to appropriately safeguard any information the Contractor believes is CUI that is not identified in the SF XXX or is not marked or properly marked as required in the SF XXX until a Contracting Officer makes a determination. (3) If the Contractor discovers any information that the contractor believes is CUI that is not identified in the SF XXX that is involved in a suspected or confirmed CUI incident, the Contractor shall notify the Contracting Officer and comply with paragraph (g) of this clause. (4) The Contractor is not entitled to use Government-provided information for its own purposes, whether or not the information is marked as CUI, unless the information is in the public domain, or unless the information was lawfully made available to the Contractor by someone other than the Government. (5) The Contractor shall appropriately identify information the Contractor owns and provides to the Government (e.g., contractor bid or proposal information, contractor-attributational information, or contractor proprietary business information). The Government will determine in accordance with agency procedures whether the information provided by the Contractor is CUI or entitled to other protections (e.g., contractor-attributational information associated with a CUI incident). (d) Safeguarding CUI. (1) The Contractor shall safeguard CUI that the Government identifies in the SF XXX and ensure handling consistent with 32 CFR 2002.14 .

Some commenters expressed concern that CMMC implementation would result in increased litigation by DIB companies or pursuit of False Claims Act penalties by DoD against DIB companies. One commenter erroneously believed that Mexico would participate in oversight of the CMMC ecosystem, and that ·a flood of litigation· may result from DIB companies losing contracts due to non-compliance with CMMC requirements. One commenter suggested that DoD should absolve contractors from False Claims Act prosecution when differences are found between C3PAO assessment results and a previously submitted contractor self-assessment, due to potentially valid reasons for the differing outcomes. Another suggested that DoD establish protections from regulatory and legal liability related to cyber incidents when the affected contractor has complied with relevant CMMC Program requirements. Response: The DoD lacks the authority to change the False Claims Act, which is a Federal law that imposes liability persons and companies who defraud or knowingly submit false claims to the government. Comments related to Safe Harbor provisions are outside the scope of this rule. Comments about potential industry litigation are also beyond the scope of the final rule and the recommendations provided were not appropriate for inclusion in this rule. Nothing in the rule prevents frivolous private lawsuits, but the rule does provide that the CMMC AB maintain an appeals process. The DoD has faithfully followed the formal rulemaking process, to include completion of the public comment period. Implementation of the CMMC program will be carried out objectively and in accordance with the tenets of the (printed page 83110) final rule. No foreign actors have any

role in DoD's administration of the program. 6. DoD Metrics Comment: Several commenters inquired about the types of metrics the DoD plans to use to monitor progress toward the DIB cybersecurity objectives that the CMMC program was designed to meet. One asked whether DoD's metrics would include testing, and another recommended they capture changes in the population of DoD contractors caused by cost impacts of CMMC implementation. Others referenced a December 2021 GAO Report that critiqued DoD's earlier attempts to implement the CMMC program. Specifically, they cited the GAO's finding that, at that time, DoD had not defined how it would analyze data to measure performance. A comment recommended the DoD identify responses to other GAO findings, which dealt with improvements to communications with industry and metrics for program management. Another comment asked whether management alignment within OSD, budget, and staffing of the CMMC program office are adequate.

Purpose The purpose of the Assess step is to determine if the controls selected for implementation are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security and privacy requirements for the system and the organization. NIST SP 800-37, REVISION 2 RISK MANAGEMENT FRAMEWORK FOR INFORMATION SYSTEMS AND ORGANIZATIONS A System Life Cycle Approach for Security and Privacy

CHAPTER THREE PAGE 62 This publication is available free of charge from: <https://doi.org/10.6028/NIST.SP.800-37r2>

ASSESSOR SELECTION TASK A-1 Select the appropriate assessor or assessment team for the type of control assessment to be conducted. Potential Inputs: Security, privacy, and SCRM plans; program management control information; common control documentation; organizational security and privacy program plans; SCRM strategy; system design documentation; enterprise, security, and privacy architecture information; security, privacy, and SCRM policies and procedures applicable to the system. Expected Outputs: Selection of assessor or assessment team responsible for conducting the control assessment. Primary Responsibility: Authorizing Official or Authorizing Official Designated Representative. Supporting Roles: Chief Information Officer; Senior Agency Information Security Officer; Senior Agency Official for Privacy. System Development Life Cycle Phase: New · Development/Acquisition; Implementation/Assessment. Existing · Operations/Maintenance. Discussion: Organizations consider both the technical expertise and level of independence⁸⁷ required in selecting control assessors.⁸⁸ Organizations ensure that control assessors possess the required skills and technical expertise to develop effective assessment plans and to conduct assessments of program management, system-specific, hybrid, and common controls, as appropriate. This includes general knowledge of risk management concepts and approaches as well as comprehensive knowledge of and experience with the hardware, software, and firmware components implemented. In organizations where the assessment capability is centrally managed, the senior agency information security officer may have the responsibility of selecting and managing the security control assessors or assessment teams for organizational systems. As controls may be implemented to achieve security and privacy objectives, organizations consider the degree of collaboration between security control and privacy control assessors that is necessary. Organizations can conduct self-assessments of controls or obtain the services of an independent control assessor. An independent assessor is an individual or group that can conduct an impartial assessment. Impartiality means that assessors are free from perceived or actual conflicts of interest with respect to the determination of control effectiveness or the development, operation, or management of the system, common controls, or program management controls. The authorizing official determines the level of assessor independence based on applicable laws, executive orders, directives, regulations, policies, or standards. The authorizing official consults with the Office of the Inspector General, chief information officer, senior agency official for privacy, and senior agency information security officer to help guide and inform decisions regarding assessor independence. The system privacy officer is responsible for identifying assessment methodologies and metrics to determine if privacy controls are implemented correctly, operating as intended, and sufficient to ensure compliance with applicable privacy requirements and manage privacy risks. The senior agency official for privacy is responsible for conducting assessments of privacy controls and documenting the results of the assessments. At the discretion of the organization, privacy controls may be assessed by an independent assessor. However, in all cases, the senior agency official for privacy is responsible and accountable for

⁸⁷ In accordance with [OMB A-130], an independent evaluation of privacy program and practices is not required. However, an organization may choose to employ independent privacy assessments at the organization's discretion. ⁸⁸ Some organizations may select control assessors prior to the RMF Assess step to support control assessments at the earliest opportunity during the system life cycle. Early identification and selection of assessors allows organizations to plan for the

assessment activities, including agreeing on the scope of the assessment. Organizations implementing a systems security engineering approach may also benefit from early selection of assessors to support verification and validation activities that occur throughout the system life cycle.

requires that a procurement policy, regulation, procedure or form (including an amendment or modification thereof) must be published for public comment if it relates to the expenditure of appropriated funds, and has either a significant effect beyond the internal operating procedures of the agency issuing the policy, regulation, procedure, or form, or has a significant cost or administrative impact on contractors or offerors. This final rule is not required to be published for public comment, because DoD is not issuing a new regulation; rather, this rule is merely removing an unnecessary provision from the DFARS. V. Executive Orders 12866 and 13563 Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804. VI. Executive Order 13771 This rule is not subject to E.O. 13771, because this rule is not a significant regulatory action under E.O. 12866. VI. Regulatory Flexibility Act Because a notice of proposed rulemaking and an opportunity for public comment are not required to be given for this rule under 41 U.S.C. (printed page 58332) 1707(a)(1) (see section IV. of this preamble), the analytical requirements of the Regulatory Flexibility Act (5 U.S.C. 601 et seq.) are not applicable. Accordingly, no regulatory flexibility analysis is required, and none has been prepared. VII. Paperwork Reduction Act The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). List of Subjects in 48 CFR Parts 204, 209, 212, and 252 Government procurement Jennifer Lee Hawes, Regulatory Control Officer, Defense Acquisition Regulations System. Therefore, 48 CFR parts 204, 209, 212, and 252 are amended as follows: 1. The authority citation for 48 CFR parts 204, 209, 212, and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1. PART 204-ADMINISTRATIVE AND INFORMATION MATTERS 204.7403 [Amended] 2. Amend section 204.7403 by: a. In the section heading, removing 'Solicitation provision and contract' and adding 'Contract' in its place; b. Removing paragraph (a); and c. Redesignating paragraphs (b) and (c) as paragraphs (a) and (b), respectively. PART 209-CONTRACTOR QUALIFICATIONS 3. Revise section 209.505-4(b)(ii) to read as follows: 209.505-4 Obtaining access to proprietary information. (b) ***

means prevention of damage to, protection of, and restoration of computers, electronic communications systems, electronic communications services, wire communication, and electronic communication, including information contained therein, to ensure its availability, integrity, authentication, confidentiality, and nonrepudiation. Cyber incident means actions taken through the use of computer networks that result in an actual or potentially adverse effect on an information system or the information residing therein. Declassification means a date or event which coincides with the lapse of the information's national security sensitivity, as determined by the OCA. Declassification occurs when the OCA has determined that the classified information no longer requires, in the interest of national security, any degree of protection against unauthorized disclosure, and the information has had its classification designation removed or cancelled. Defense articles means those articles, services, and related technical data, including software, in tangible or intangible form, which are listed on the United States Munitions List (USML) of the International Traffic in Arms Regulations (ITAR), as modified or amended. Defense articles exempt from the scope of ITAR section 126.17 are identified in Supplement No. 1 to Part 126 of the ITAR. Defense services means: (1) Furnishing assistance (including training) to foreign persons, whether in the United States or abroad, in the design, development, engineering, manufacture, production, assembly, testing, repair, maintenance, modification, operation, demilitarization, destruction, processing or use of defense articles; (2) Furnishing to foreign persons any controlled technical data, whether in the United States or abroad; or (3) Providing military training of foreign units and forces, regular and irregular, including formal or informal instruction of foreign persons in the United States or abroad or by correspondence courses, technical, educational, or information publications and media of all kinds, training aid, orientation, training exercise, and military advice. Derivative classification means the incorporating, paraphrasing, restating, or generating

in new form information that is already classified, and marking the newly developed material consistent with the classification markings that apply to the source information. Derivative classification includes classifying information based on classification guidance. Duplicating or reproducing existing classified information is not derivative classification. Document means any recorded information, regardless of the nature of the medium, or the method or circumstances of recording. Downgrade means a determination by a declassification authority that information classified and safeguarded at a specified level will be classified and safeguarded at a lower level. Embedded system

9. Implementation Schedule. This Standard became effective on May 26, 2002. 10. Patents. Implementations of the algorithm specified in this Standard may be covered by U.S. and foreign patents. 11. Export Control. Certain cryptographic devices and technical data regarding them are subject to federal export controls. Exports of cryptographic modules implementing this Standard and technical data regarding them must comply with all federal laws and regulations and must be licensed by the Bureau of Industry and Security of the U.S. Department of Commerce. Information about export regulations is available at <https://www.bis.doc.gov>. 12. Qualifications. NIST will continue to follow developments in the analysis of the AES algorithm. As with its other cryptographic algorithm standards, NIST will formally reevaluate this Standard every five years. In 1997, NIST initiated the Advanced Encryption Standard (AES) development effort [1] and called for the public to submit candidate algorithms for block ciphers. Block ciphers are the foundation for many cryptographic services, especially those that provide assurance of the confidentiality of data. In 2000, NIST announced the selection of Rijndael [2, 3] for the AES. - [1] James Nechvatal, Elaine Barker, Lawrence Bassham, William Burr, Morris Dworkin, James Foti, and Edward Roback. Report on the Development of the Advanced Encryption Standard (AES). Journal of Research of NIST (NIST JRES) , May 2001. <https://doi.org/10.6028/jres.106.023>. - [2] Joan Daemen and Vincent Rijmen. AES Proposal: Rijndael Document Version 2. AES Algorithm Submission, September 1999. Available at <https://csrc.nist.gov/csrc/media/projects/cryptographic-standards-and-guidelines/documents/aes-development/rijndael-ammended.pdf>. - [3] Joan Daemen and Vincent Rijmen. The Design of Rijndael - The Advanced Encryption Standard (AES), Second Edition . Information Security and Cryptography. Springer, 2020. <https://doi.org/10.1007/978-3-662-60769-5>.

n. Whether the Department should specify how much time regulated entities have to implement encryption for technology assets that do not support encryption. If so, please explain. o. Whether the Department should provide more detailed requirements for network segmentation, such as the type(s) of technologies that should be segmented and how to determine whether certain technologies should be segmented. If so, please explain. p. Whether the exceptions the Department has proposed to the implementation specification for MFA are appropriate. If not, please explain. q. Whether the Department should provide additional exceptions to the implementation specification for MFA. If so, please explain. r. Whether the Department should require a regulated entity to review its compensating controls adopted to comply with the exceptions to the implementation specification for MFA more frequently than once every 12 months. s. The costs and burdens for regulated entities to implement MFA. t. Whether the Department should require regulated entities to deploy an endpoint detection and response (EDR), security information and event management (SIEM), or other specific solution. u. Whether once every six months is the appropriate frequency for the automated vulnerability scans required under the implementation specification for vulnerability management. If not, please explain. v. Whether the Department should define in regulation or guidance what constitutes an authoritative source of known vulnerabilities. If so, please explain. w. Whether once every 12 months is the appropriate frequency for the penetration testing required under the implementation specification for vulnerability management. If not, please explain. x. For regulated entities that have conducted penetration tests, the amount of time and costs of such tests. G. Section 164.314-Organizational Requirements 1. Section 164.314(a)(1)-Standard: Business Associate Contracts or Other Arrangements a. Current Provisions The first standard in 45 CFR 164.314 contains the requirements for business associate agreements and other arrangements. The associated implementation specifications at 45 CFR 164.314(a)(2) require that a business associate agreement include provisions compelling a business associate to do all of the following: (1) comply with the requirements of the Security Rule; [818] (2) ensure that any subcontractors that create, receive, maintain, or transmit ePHI on behalf of the business associate agree to comply with the applicable requirements of the Security Rule by also entering into a business associate agreement; [819] and (3) report to the covered entity any security incident of which it becomes aware, including breaches of unsecured PHI as required by the Breach Notification Rule. [820] Under

Finally, the changes to the costs and benefits of the final rule due to the expanded coverage to include persons that export food for consumption outside of the United States are estimated to be small. We assume that the export of food and feed occurs at the manufacturing and wholesaling levels, with retailers unlikely to engage in export. The U.S. Census Bureau's 1997 Economic Census (Ref.17) indicates that approximately 4 percent of wholesale trade in all grocery and related products (NAICS code 4224) was from export sales. We assume that the same percent also applies to exports in the manufacturing sector and also to the numbers of facilities in those sectors. An estimate of 4 percent likely overstates the true incremental cost of covering exported food and feed since most, if not all of the establishments engaged in export are also likely to be engaged in domestic commerce and consequently would not incur additional learning and records redesign costs. Moreover, firms that export and also engage in domestic commerce are unlikely to incur additional maintenance costs because it is unlikely that they would follow two sets of recordkeeping practices. Consequently, only firms that are exclusively exporters will incur incremental recordkeeping costs as a result of expanded coverage. We assume that half of all wholesale and manufacturing establishments estimated to engage in export, or 2,736 facilities, are exclusively exporters and will incur recordkeeping costs as a result of expanded coverage to include export of food and feed. The incremental benefits from expanding the coverage to include exported food and feed are from the possibility that some of these shipments may be diverted for domestic consumption, and their coverage may enhance traceback investigations should they be necessary. The food safety (but not food security) benefits from expanded coverage are likely to be negligible since the likelihood of diversion is small, and the likelihood that a diverted shipment is accidentally contaminated is also small. However, the food security benefits, while not quantifiable, include classified scenarios that could include diversion of food and feed. Further, FDA is concerned that exempting foods intended for export from the recordkeeping regulations could lead to such foods being targeted for tampering by terrorists and reintroduction into domestic commerce as they would prove more intractable to tracing investigations. Including the revisions described previously, we estimate that a total of 707,672 facilities will be covered by this final rule. This represents a reduction of 96,642 facilities compared with the number estimated in the analysis of the proposed rule. 2.

High Cost of Tracking by Lot Code

DoD considered many alternatives before deciding upon the current CMMC structure. The DoD has established requirements for a CMMC Accreditation Body, and this accreditation body will administer the CMMC Ecosystem. The appeals process is defined in §§ 170.8(b)(16) and 170.9(b)(9), (14), (20), and (21). The DoD will not assume the workload of directly managing the CMMC ecosystem or the other alternatives suggested. DoD must treat all potential defense contractors and subcontractors fairly. DoD cannot inadvertently create a pathway to a free assessment for an organization by virtue of its dual-purpose as a C3PAO and separately as a defense contractor. Therefore, DoD assesses C3PAOs free of charge, but the assessment does not result in a Certificate of CMMC Status. The C3PAOs determine the people, processes, and technologies that are in-scope for their DIBCAC assessment to become a C3PAO. The need to protect the assessment information is independent of its status as FCI or CUI. Assessment information, such as which requirements are MET or not, as well as the evidence and analysis leading to that result, would provide valuable insights to an adversary if not protected. A C3PAO is not a CSP and therefore would not require a FedRAMP moderate assessment to be a C3PAO. However, if they use a CSP to process, store, or transmit assessment information, then the CSP would require a FedRAMP Moderate, or equivalent, assessment. The CSP assessment results and CRM would be in scope for the C3PAO assessment. The requirements in § 170.9 apply to both authorized and accredited C3PAOs. The only difference between authorization and accreditation is the status of the CMMC Accreditation Body. Prior to the CMMC AB achieving its full ISO/IEC 17011:2017(E) compliance, the interim term "authorized" is used for C3PAOs. As stated in §§ 170.8(b)(3)(i) and 170.9(b)(1) and (2), currently authorized C3PAOs must achieve and maintain compliance with ISO/IEC 17020:2012(E) within 27 months of authorization. As stated in § 170.9(b)(6), C3PAOs must obtain a Level 2 certification assessment, but this does not result in a CMMC Level 2 certificate. The DoD declines to modify the rule text related to C3PAO requirements as it does not make a substantive change. Requirements are specified in the rule for each entity within the CMMC ecosystem. A C3PAO may start preparing for compliance with ISO/IEC 17020:2012(E) before the Accreditation Body achieves compliance with ISO/IEC 17011:2017(E). The 27-month timeline for a C3PAO to achieve and maintain compliance with ISO/IEC 17020:2012(E) begins on the date that the C3PAO is authorized by the Accreditation Body, as addressed in § 170.9(b)(2) C3PAOs authorized by the CMMC AB prior to becoming

compliant with ISO/IEC 17020:2012(E) must be accredited by the CMMC AB within 27 months of the C3PAO's initial authorization to meet CMMC program requirements. The accreditation process is not tied to, nor is it impacted by, the DoD's appropriations period.

Level 2 (Self) is a self-assessment to secure CUI processed, stored, or transmitted in the course of fulfilling the contract. The OSA must comply with the 110 Level 2 security requirements derived from NIST SP 800-171 R2. Level 2 (C3PAO) differs from Level 2 (Self) in the method of verifying compliance. OSAs must hire a C3PAO to conduct an assessment of the OSA's compliance with the 110 security requirements of NIST SP 800-171 R2. OSAs can shop for C3PAOs on the CMMC Accreditation Body (AB) Marketplace. Level 3 (DIBCAC) is a government assessment of 24 additional requirements derived from NIST SP 800-172, titled "Enhanced Security Requirements for Protecting Controlled Unclassified Information: A Supplement to NIST Special Publication 800-171," February 2021 (NIST SP 800-172 Feb2021). The OSA must ensure that they have already achieved a CMMC Status of Final Level 2 (C3PAO) before seeking CMMC Status of Final Level 3 (DIBCAC). Once this is done, an OSA should then initiate a Level 3 certification assessment by emailing a request to Defense Contract Management Agency (DCMA) Defense Industrial Base Cybersecurity Assessment Center (DIBCAC) point of contact found at www.dcma.mil/DIBCAC, being sure to include the Level 2 (C3PAO) certification unique identifier in the email. Scoping In order to achieve a specified CMMC Status, OSAs must first identify which information systems, including systems or services provided by External Service Providers (ESPs), will process, store, or transmit FCI, for Level 1 (Self), and CUI for all other CMMC Statuses. These information systems constitute the scope of the assessment. Within these information systems, for Level 2 and Level 3 the assets should be further broken down into asset categories: Contractor Risk Managed Assets (Level 2), Security Protection Assets (Level 2 and 3), and Specialized Assets (Level 2 and 3). For Level 1 all assets, with the exclusion of Specialized Assets, are simply identified as either in-scope or out-of-scope based on whether they process, store, or transmit FCI. Definitions and treatment of these categories as they relate to assessment scoping, treatment of ESPs, and treatment of assets which cannot be secured due to their inherent design, can be found at §170.19. Assessment and Affirmation a. OSAs that meet all 15 Level 1 requirements have achieved CMMC Status of Final Level 1 (Self). The OSA (printed page 83096) must submit an affirmation of compliance with FAR clause 52.204-21 requirements in SPRS. At this point, OSAs have satisfied the CMMC requirements needed for award of contracts requiring a CMMC Status of Final Level 1 (Self). To maintain a CMMC Status of Final Level 1 (Self), this entire process must be repeated in full on an annual basis, including both self-assessment and affirmation.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Health and Human Services Food and Drug Administration [Docket No. FDA-2011-D-0916] AGENCY: Food and Drug Administration, HHS. ACTION: Notice. SUMMARY: The Food and Drug Administration (FDA) is announcing the availability of the guidance entitled "Medical Device Classification Product Codes." This document describes how device product codes are used in a variety of FDA program areas to regulate and track medical devices regulated by the Center for Devices and Radiological Health (CDRH) and the Center for Biologics Evaluation and Research (CBER). DATES: Submit either electronic or written comments on this guidance at any time. General comments on Agency guidance documents are welcome at any time. ADDRESSES: Submit written requests for single copies of the guidance document entitled "Medical Device Classification Product Codes" to the Division of Small Manufacturers, International, and Consumer Assistance, Center for Devices and Radiological Health, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 66, Rm. 4613, Silver Spring, MD 20993-0002 or the Office of Communication, Outreach and Development (HFM-40), 1401 Rockville Pike, suite 200N, Rockville, MD 20852. Send one self-addressed adhesive label to assist that office in processing your request, or fax your request to CDRH at 301-847-8149. See the SUPPLEMENTARY INFORMATION section for information on electronic access to the guidance. Submit electronic comments on the guidance to <http://www.regulations.gov>. Submit written comments to the Division of Dockets Management (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852. Identify comments with the docket number found in brackets in the heading of this document. FOR FURTHER INFORMATION CONTACT: Diane Garcia, Center for Devices and Radiological Health, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 66, Rm. 1644, Silver Spring, MD 20993-0002, 301-796-6559; or Stephen Ripley, Center for Biologics Evaluation and Research

(HFM-17), Food and Drug Administration, 1401 Rockville Pike, suite 200N, Rockville, MD 20852, 301-827-6210. SUPPLEMENTARY INFORMATION: I. Background Since the May 28, 1976, Medical Device Amendments were passed, the Classification Regulation Panels (parts 862 through 892 (21 CFR parts 862 through 892

Offerors will also need to be familiar with these requirements before submitting a proposal to provide such services. For each of the 84 contractors that receive a contract annually for these services, the Government estimates that, on average, two other offerors, or a total of 168 offerors (84 contractor awards * 2 unsuccessful offerors) will familiarize themselves with the clause requirements, submit a proposal, but will not receive a contract award. As a result, it is expected that all 252 (84 contractors + 168 offerors) of these contractors and offerors will be required to become familiar with the various compliance requirements of the rule. It is estimated that it will take each offeror or contractor eight hours, on average, to review the rule and gain a basic understanding these new requirements. The average wage rate of a contractor employee is estimated to be \$57.28 per hour, which is the average of the mean wages reported by the Bureau of Labor Statistics (BLS) for various occupational categories that design, analyze, maintain, and oversee information systems for an organization. A factor of 42 percent, based on the BLS Employer Costs for Employee Compensation Summary dated March 17, 2023 (<https://www.bls.gov/news.release/ecec.nr0.htm>), is applied to the average wage rate to account for total employee benefits paid for by the employer ($\$57.28 * 1.42 = \81.34), and a factor of 12 percent is then applied to the rate of \$81.34 to account for employer overhead, which results in a loaded rate of \$91.10 ($\$81.34 * 1.12$) for FIS occupations. Therefore, the estimated cost for 252 contractors and offerors to familiarize themselves with the rule in year one is approximately \$183,700 (252 contractors and offerors * 8 hours/entity * \$91.10/hour). The cost accounts for the time needed to comprehend the text of the rule, as well as locate and generally review the requirements within each of the cited documents in the rule.

2. Compliance With NIST Guidelines

All 28 contractors that develop, implement, operate, or maintain a FIS using non-cloud computing services are required by paragraphs (e) and (f) of the new clause 52.239-YY to use or apply various NIST SP guidelines for managing risk, security, and privacy, as applicable. The extent to which each of these guidance documents needs to be implemented by a contractor depends (printed page 68407) on many variables, including: the extent to which the guidance is already implemented in the contractor's existing practices; the scope and requirements of each contract; the knowledge and expertise of the contractor's employees; the manner in which a contractor chooses to implement a requirement; and the resources and tools available to the contractor in performing the contract.

(2) Do not claim specifically an exemption under section 552a(k)(1) of the Privacy Act for any system of records. The blanket exemption affords protection to all classified material in all system of records maintained. (d) Provisions from which exemptions may be claimed. The Head of a DoD Component may claim an exemption from any provision of the Act from which an exemption is allowed (see Appendix D). (e) Use of exemptions. (1) Use exemptions only for the specific purposes set forth in the exemption rules (see paragraph (b) of § 310.31). (2) Use exemptions only when they are in the best interest of the Government and limit them to the specific portions of the records requiring protection. (3) Do not use an exemption to deny an individual access to any record to which he or she would have access under 32 CFR part 286 . (f) Exempt records in non-exempt systems. (1) Exempt records temporarily in the custody of another Component are considered the property of the originating Component. Access to these records is controlled by the system (printed page 18775) notices and rules of the originating Component. (2) Exempt records that have been incorporated into a nonexempt system of records are still exempt but only to the extent to which the provisions of the Act for which an exemption has been claimed are identified and an exemption claimed for the system of records from which the record is obtained and only when the purposes underlying the exemption for the record are still valid and necessary to protect the contents of the record. (3) If a record is accidentally misfiled into a system of records, the system notice and rules for the system in which it should actually be filed shall govern. § 310.27

Access exemption. (a) An individual is not entitled to access information that is compiled in reasonable anticipation of a civil action or proceeding. (b) The term 'civil action or proceeding' is intended to include court proceedings, preliminary judicial steps, and quasi-judicial administrative hearings or proceedings (i.e., adversarial proceedings that are subject to rules of evidence). (c) Any information prepared in anticipation of such actions or proceedings, to include information prepared to advise the DoD Component officials of the possible legal or other consequences of a given course of action, is protected. (d) The exemption is similar to the

attorney work-product privilege except that it applies even when the information is prepared by nonattorneys. (e) The exemption does not apply to information compiled in anticipation of criminal actions or proceedings. § 310.28 General exemption. (a) Use of specific exemptions. A DoD Component is not authorized to claim the exemption for records maintained by the Central Intelligence Agency established by 5 U.S.C. 552a(j)(1) of the Privacy Act. (b) The general exemption established by 5 U.S.C. 552a(j)(2) of the Privacy Act may be claimed to protect investigative records created and maintained by law-enforcement activities of a DoD Component.

means an administrative determination that an individual is eligible, from a security point of view, for access to classified information of the same or lower category as the level of the personnel clearance being granted. Prime contract means a contract awarded by a GCA to a contractor for a legitimate USG purpose. Prime contractor means the contractor who receives a prime contract from a GCA. Privileged user means a user that is authorized (and, therefore, trusted) to perform security-relevant functions that ordinary users are not authorized to perform. Proscribed information means: (1) TOP SECRET information; (2) COMSEC information or material, excluding controlled cryptographic items when unkeyed or utilized with unclassified keys. (3) RD; (4) SAP information; or. (5) SCI. Protective security service means a transportation protective service provided by a cleared commercial carrier qualified by DoD's Surface Deployment and Distribution Command to transport SECRET shipments. Q access authorization means an access determination that is granted by DOE or NRC based on a Tier 5 or successor background investigation as set forth in applicable national-level requirements and DOE directives. Within DOE and the NRC, a ·Q· access authorization permits an individual with an official ·need to know· to access Top Secret, Secret and Confidential Restricted Data, Formerly Restricted Data, Transclassified Foreign (printed page 83318) Nuclear Information, National Security Information, or special nuclear material in Category I or II quantities, as required in the performance of official duties. A ·Q· access authorization is required for individuals with a need to know outside of DOE, NRC, DoD, and in a limited case NASA, to access Top Secret and Secret Restricted Data. Remote terminal means a device communicating with an automated information system from a location that is not within the central computer facility. Restricted area means a controlled access area established to safeguard classified material that, because of its size or nature, cannot be adequately protected during working hours by the usual safeguards, but is capable of being stored during non-working hours in an approved repository or secured by other methods approved by the CSA. RD means all data concerning (1) design, manufacture, or utilization of atomic weapons; (2) the production of special nuclear material; or (3) the use of special nuclear material in the production of energy, but does not include data declassified or removed from the RD category pursuant to section 142 of the AEA. SAP means any program that is established to control access and distribution and to provide protection for particularly sensitive classified information beyond that normally required for TOP SECRET, SECRET, or CONFIDENTIAL information. A SAP can be created or continued only as authorized by a senior agency official delegated such authority pursuant to E.O. 13526 . Schedule 13D

g Critical Infrastructure Cybersecurity 19 referred to how few technical standards or best practices exist to mitigate the impact of cybersecurity activities on individual privacy and civil liberties. It is in the best interests of the USG to support the development and use of cybersecurity standards that minimize risks to privacy, promote information-sharing relating to cybersecurity, and allow the USG to combat cyber-enabled threats. Greater understanding of how to identify privacy risks and integrate mitigations into cybersecurity standards or their deployment in information systems will require further research.

putting the subject of an investigation, study, or analysis on notice of that fact, thereby permitting the subject to engage in conduct intended to frustrate or impede the activity. (G) From subsection (e)(4)(G), (e)(4)(H), and (e)(4)(I) (Agency Requirements) because portions of this system are exempt from the access and amendment provisions of subsection (d). (H) From subsection (e)(5) because the requirement that records be maintained with attention to accuracy, relevance, timeliness, and completeness could unfairly hamper law enforcement processes. It is the nature of law enforcement to uncover the commission of illegal acts at diverse stages. It is often impossible to determine initially what information is accurate, relevant, timely, and least of all complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further details are brought to light. (I) From subsection (e)(8) because the requirement to serve notice on an individual when a record is disclosed under compulsory legal process could unfairly hamper law enforcement processes. It is the nature of law enforcement that there are

instances where compliance with these provisions could alert the subject of an investigation of the fact and nature of the investigation, and/or the investigative interest of intelligence or law enforcement agencies; compromise sensitive information related to national security; interfere with the overall law enforcement process by leading to the destruction of evidence, improper influencing of witnesses, fabrication of testimony, and/or flight of the subject; reveal a sensitive investigative or intelligence technique; or constitute a potential danger to the health or safety of law enforcement personnel, confidential informants, and witnesses. (J) From subsection (f) because requiring the Agency to grant access to records and establishing agency rules for amendment of records would unfairly impede the agency's law enforcement mission. To require the confirmation or denial of the existence of a record pertaining to a requesting individual may in itself provide an answer to that individual relating to the existence of an on-going investigation. The investigation of possible unlawful activities would be jeopardized by agency rules requiring verification of the record, disclosure of the record to the subject, and record amendment procedures. (K) From subsection (g) to the extent that the system is exempt from other specific subsections of the Privacy Act. (27) System identifier and name. DMDC 24 DoD, Defense Information System for Security (DISS). (i) Exemption. Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, military service, Federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. (ii)

Section 170.4 includes acronyms and definitions used in the rule text and can be used as a reference while reading the text and tables. CMMC introduces new terms and associated definitions, and customizes definitions for existing terms, as applied to the CMMC Program. CMMC-custom terms and definitions are clearly marked to distinguish from terms sourced externally. CMMC also utilizes terms created by other authoritative sources, including NIST. Terms from other authoritative sources are also listed in § 170.4 and are properly sourced. The Department developed the following CMMC-custom terms to enhance understanding of the requirements and elements of the CMMC Program: Accreditation Accreditation Body Affirming Official Assessment Level 1 self-assessment Level 2 self-assessment Level 2 certification assessment Level 3 certification assessment POA&M closeout self-assessment POA&M closeout certification assessment Assessment Findings Report Assessment Team Asset Categories Authorized Cloud Service Provider CMMC Assessment and Certification Ecosystem CMMC Assessment Scope CMMC Assessor and Instructor Certification Organization (CAICO) CMMC instantiation of eMASS CMMC Status Final Level 1 (Self) Conditional Level 2 (Self) Final Level 2 (Self) Conditional Level 2 (C3PAO) Final Level 2 (C3PAO) Conditional Level 3 (DIBCAC) Final Level 3 (DIBCAC) CMMC Status Date CMMC Third-Party Assessment Organization (C3PAO) Contractor Risk Managed Assets Controlled Unclassified Information (CUI) Assets Enduring Exception External Service Provider (ESP) Operational plan of action Organization-defined Organization Seeking Assessment (OSA) Organization Seeking Certification (OSC) Out-of-Scope Assets Periodically Process, store, or transmit Restricted Information Systems Security Protection Assets Security Protection Data Specialized Assets Temporary Deficiency Test Equipment. Section 170.5-Policy Section 170.5 addresses the policy underlying the rule. The protection of FCI and CUI on defense contractor information systems is crucial to the continuity of the missions and functions of the DoD. To that end, this rule requires that contractors and subcontractors implement the specified security requirements for the applicable (printed page 83100) CMMC Level. For CMMC Level 3, the selected security requirements are defined in NIST SP 800-172 Feb2021 with the applicable DoD Organization-Defined Parameters (ODPs) defined in table 1 to § 170.14(c)(4). Program Managers and requiring activities identify the applicable CMMC Level and assessment type. Factors used to determine which CMMC Level and assessment type will be applied are included but not limited to the list found in § 170.5(b)(1-5). CMMC Program requirements will flow down to subcontractors, as applicable (see § 170.23). A DoD Service Acquisition Executive or a Component Acquisition Executive may elect to waive inclusion of CMMC Program requirements in a solicitation or contract.

According to Considerations for Identity Management in Public Safety Mobile Networks, Appendix C-Summary of Identity Proofing and Credential Issuance Requirements: | | In-person | A current biometric (e.g., photograph or fingerprints) is recorded to ensure that Applicant cannot repudiate application | A current biometric (e.g., photograph or fingerprints) is recorded to ensure that Applicant cannot repudiate application | A current biometric (e.g., photograph or fingerprints) is recorded to ensure that Applicant cannot repudiate application | A current biometric (e.g., photograph or fingerprints) is recorded to ensure that Applicant cannot repudiate application | |

There are a total of 4,415 of such facilities listed in the County Business Pattern data. In the NES statistics, there are 4,700 reported for the aggregate NAICS code of 4931. To estimate the number of warehousing facilities that would be included in NAICS code 49311 in the NES statistics, we scaled the aggregate number in the NES statistics by the ratio of the numbers reported for code 49311 to the total of those reported under code 3931 in the County Business Pattern. When the imputed NES numbers for code 49311 are added to the reported County Business Pattern numbers for code 49311, the total number of facilities in the NAICS code is 7,328 facilities. We adjust the total number of warehouses by one half of the total number of facilities reported for code 49311 by assuming that half of the total number of facilities included in that code handle food items. The number of warehouse facilities is revised upward to 6,089 from the 2,425 in the PRIA. The facilities-to-firm adjustment factor used for the facilities listed in NAICS code 49311 is the average of that used for the (printed page 71634) other two warehouse codes in the analysis. (Comment 186) One comment requests clarification as to whether all members of the International Bottled Water Association were included in the number of facilities covered by the regulation. (Response) The NAICS code 3121 used in the PRIA includes all beverage manufacturers and specifically includes bottled water manufacturers. All other bottled water suppliers are included in the various NAICS codes used to count wholesalers and retailers, and other food suppliers.

e. Remediation Comment: Two respondents commented on the need to provide equitable adjustments, a means of remedy, and/or a pathway to reinstatement once a supplier is excluded. One of the respondents commented that while DFARS 239.7305 allows DoD to exclude sources, it does not provide a pathway to reinstatement or for inclusion once a supplier is excluded, proposing that DoD establish a separate rulemaking and coordinate a unified policy with an industry-Government working group to gain insight into how remediation and rejoining the defense industrial base can be accomplished in a responsible manner. This respondent further commented that DoD should provide equitable adjustments and other remedies for prime contractors whose subcontractors are excluded, stating that the new regulations fail to provide relief for prime contractors who must exclude a source through no fault of its own. Another respondent suggested that a periodic review of excluded contractors should be required for ongoing contracts with new task orders, adding that if a vendor has been excluded without notice, the interim rule should require the agency to review that decision on no less than an annual basis for as long as the contract is in place. This respondent also commented that the regulation should specifically afford remedies, including equitable adjustments, whenever the authority at DFARS 239.7305(c) is exercised and a prime must exclude a subcontractor. Response: Risk will be evaluated on case-by-case basis, and any exclusion will be for a particular source selection and not a blanket exclusion. Offerors are eligible to compete for future solicitations even after section 806 has excluded them from a particular source selection. Consistent with national security, i.e., with proper clearances and in a manner that will not put the warfighter, the system, or intelligence operations at risk, DoD will discuss risks to the trust of critical systems or components with its industrial base as well as potential remedies. This is particularly true in the system integration context where the program office and the prime contractors are more likely to have the time and clearances to develop tailored mitigations. Where appropriate, DoD will partner with its contractors to mitigate supply chain risk in lieu of executing section 806 authorities. In most cases, non-806 mitigations will sufficiently manage the risk; when that is not the case and exclusion of a source is required, DoD does not intend to provide equitable adjustments or other remedies. 6. Impact of Rule a. Economic/Cost Impact Comment:

3.4.3 | Kerberos Authentication... 3.4.3 Kerberos Authentication Kerberos (usually together with an LDAP-based directory, such as Active Directory) implements single sign-on within a Windows domain or Kerberos realm, and allows user accounts and credentials to be stored in a centralized directory.

(iv) For acquisitions that may require covered Federal information to reside in or transit through contractor information systems, discuss compliance with 4.404. (v) For acquisitions that may require a contractor to have access to, create, collect, use, process, store, maintain, disseminate, disclose, or dispose of CUI, discuss the security, marking, training, incident reporting, and other requirements (e.g., destruction) applicable to CUI (see 4.403-5 and 4.403-6). * * * * * 20.
Amend section 7.503 by revising paragraph (d)(11) to read as follows: 7.503 Policy. * * * * *

(d) * * * (11) Contractors working in any situation that permits or might permit them to gain access to controlled unclassified information (CUI). See 4.403. * * * * * PART 9-CONTRACTOR QUALIFICATIONS 9.505 [Amended] 21. Amend section 9.505 by removing from paragraph (b)(1) the phrase ·Proprietary information· and adding the phrase ·Contractor proprietary business information· in its place. 22. Amend section 9.505-4 by: a. Removing from paragraph (a) introductory text the phrase ·proprietary information from others· and adding ·another contractor's proprietary business information· in its place; and b. Revising paragraph (b). The revision reads as follows: 9.505-4 Obtaining access to proprietary information. * * * * * (b) A contractor that gains access to another contractor's proprietary business information in performing advisory and assistance services for the Government must agree with the other company to protect its information from unauthorized use or disclosure for as long as it remains proprietary and refrain from using the information for any purpose other than that for which it was furnished. The contracting officer shall obtain copies of these agreements and ensure that they are properly executed. * * * * * 9.508 [Amended] 23. Amend section 9.508 by removing from paragraph (h) introductory text and paragraph (h)(1) the phrase ·proprietary information· and adding ·contractor proprietary business information· in their places, respectively. * * * * * PART 11-DESCRIBING AGENCY NEEDS 24. Amend section 11.002 by adding paragraph (i) to read as follows: 11.002 Policy. * * * * * (i) When agencies acquire products and services subject to 32 CFR part 2002 , Controlled Unclassified Information (CUI) (see 4.403), the SF XXX, Controlled Unclassified Information (CUI) Requirements, must be incorporated in the contract and must identify, at a minimum: (1) The CUI the contractor will handle in performance of the contract; (printed page 4295) (2) Any CUI access and dissemination requirements placed on the contractor during performance of the contract; (3) Federal and non-Federal information systems the contractor will use to handle CUI in the performance of the contract; (4) System security and privacy requirements for each information system, as appropriate, and any additional security and privacy measures required by the agency; (5) Any instructions for handling CUI during performance of the contract;

Begins one calendar year following the start date of Phase 2. In addition to Phase 1 and 2 requirements, DoD intends to include CMMC Level 2 Certification Assessment for all applicable DoD solicitations and contracts as a condition of contract award and as a condition to exercise an option period on a contract awarded prior to the effective date. DoD intends to include CMMC Level 3 Certification Assessment for all applicable DoD solicitations and contracts as a condition of contract award. DoD may, at its discretion, delay the inclusion of CMMC Level 3 Certification Assessment to an option period instead of as a condition of contract award. (4) Phase 4, Full Implementation. Begins one calendar year following the start date of Phase 3. DoD will include CMMC Program requirements in all applicable DoD solicitations and contracts including option periods on contracts awarded prior to the beginning of Phase 4. §170.4 Acronyms and definitions. (a) Acronyms. Unless otherwise noted, these acronyms and their terms are for the purposes of this part. In addition to the procedures described above, requesters should reasonably identify the record, specify the information they are contesting, state the corrective action sought and the reasons for the correction, and provide information justifying why the record is not accurate, complete, timely, or relevant to an FDA purpose. Rules and procedures regarding amendment of Privacy Act records appear in 21 CFR part 21, subpart E . P. Record Source Categories Information in this system is obtained from the following sources: Directly from a commissioned individual or individual under consideration for commissioning; FDA employee; FDA contractor; sponsoring State, local or Federal agency; former sponsoring, employing or commissioning agency; other State, local or Federal agencies; contract employer; and the subject individual's former employer. Q. Records Exempted from Certain Provisions of the Privacy Act None. III. Comments Interested persons may submit either electronic comments regarding this document to <http://www.regulations.gov> or written comments to the Division of Dockets Management (see ADDRESSES). It is only necessary to send one set of comments. Identify comments with the docket number found in brackets in the (printed page 72690) heading of this document. Received comments may be seen in the Division of Dockets Management between 9 a.m. and 4 p.m., Monday through Friday, and will be posted to the docket at <http://www.regulations.gov> . Dated: December 1, 2014. Leslie Kux, Associate Commissioner for Policy. [FR Doc. 2014-28634 Filed 12-5-14; 8:45 am] BILLING CODE 4164-01-P

(Comment 146) Many foreign governments express concern that FDA does not have authority regarding recordkeeping and record access when a firm is located in a foreign country. One foreign government urges FDA to recognize the role of another competent authority with respect to records access as provided for under the World Trade Organization Agreement on Sanitary and Phytosanitary Measures. Foreign governments request that FDA operate under agreements with these governments so that FDA will convey its request to the competent authority in that country. The competent authority can then carry out investigations on behalf of FDA and provide FDA with any resulting relevant information. (Response) Foreign persons, except those who transport food in the United States, are not subject to these final recordkeeping regulations. If FDA needs to access food records that are established and maintained by foreign persons, FDA will work with the relevant competent authorities in those countries to do so. (Comment 147) One comment notes that the proposed rule does not take into account the time required to translate into English records in other languages that are obtained from firms located in foreign countries. (Response) Foreign persons, except those who transport food in the United States, are not subject to these final recordkeeping regulations. In the event FDA needs to access records kept by foreign persons, FDA intends to work (printed page 71607) with the relevant competent authorities in those countries to do so. (Comment 148) One comment states that, for rurally-located industry, it is difficult for primary agricultural dealers from any location to meet the proposed requirements, because, in some of these small businesses, one person assumes many responsibilities. (Response) FDA has considered this and other comments and has changed the record availability requirement from the proposed rule. Under this final regulation, records shall be made available as soon as possible, but not to exceed 24 hours after FDA has made the request. In the circumstances in which FDA would access the records, it is critical for FDA to move as quickly as possible to trace backwards to identify the source of any such adulteration and trace forward from that source to remove all similarly adulterated food from commerce to protect the public health. FDA notes that, although the rule sets an outer limit of 24 hours to provide records, it requires that records be provided as soon as possible. (Comment 149) One comment states that the proposed time for records access is problematic for small-scale exporters that do not have any representation in the United States; hence, they need special treatment. (Response) Foreign persons are not subject to these final recordkeeping regulations, except to the extent they transport food in the United States.

The issue of confidentiality is the most difficult analytically. On the one hand, the business community has accepted the relatively low level of confidentiality provided by the postal system as adequate and the risk of their information being improperly divulged as adequately low. Therefore, it must be demonstrated that the risk of such disclosure on electronic networks is also acceptably low. On the other hand, only cryptographic techniques can provide high confidence of confidentiality. While the installation costs of encryption may be low, the maintenance costs (especially at the administrative level) is an impediment to the use of this technology. Moreover, data encryption is not now in wide use for commercial transactions, even those that are considered sensitive. The Health Care Financing Administration (HCFA) is automating the receipt of financial information from Health Maintenance Organizations (HMOs) . The information is financially sensitive.

HCFA expects to receive about 1900 such reports per year, but each form is currently about 25 to 30 pages of data, on both sides of the page. 2. Evidence --The Federal Rules of Evidence do not address specifically electronic digital data security mechanisms.^ The scope of proof of trustworthiness (and, arguably, security) as an evidentiary foundation requires closer scrutiny. "[B]ecause electronic files are particularly susceptible to purposeful or accidental alteration, or incorrect processing, laying a foundation for their admission must be done with particular care. Proper control over creation and maintenance of these files can be crucial in overcoming inevitable objections that will be raised in the courtroom. The implications of burgeoning, open, interconnected, and highly diverse computer systems utilizing expert system components, which may change frequently and considerably, may call for strong evidentiary foundations.

- Activity 5: Define approaches for communicating to customers. Many customers will benefit from manufacturers communicating to them more clearly about cybersecurity risks involving the IoT devices the manufacturers are currently selling or have already sold. This communication could be targeted at the customer directly or others acting on the customers' behalf, such as an internet service provider or a managed security services provider, depending on context and roles. - Activity 6: Decide what to communicate to customers and how to communicate it. There are many potential considerations for what information a manufacturer communicates to customers for a particular IoT product and how that information will be communicated. Examples of topics are: - o Cybersecurity risk-related assumptions that the manufacturer made when designing and developing the device - o Support and lifespan expectations, such as expected term of support, what process will guide end-of-life, will any functions of the device remain after its end-of-life, how customers can communicate with the manufacturer about suspected vulnerabilities during and even after the end of device support, and how customers may be able to maintain securability after support ends and at end-of-life - o Device composition and capabilities, such as information about the device's software, hardware, services, functions, and data types - o Software updates, such as if updates will be available, when, how and by whom they will be distributed, and how customers can verify source and content of a software update - o Device retirement options, such as if and how a customer can securely transfer ownership of the device, and whether the customer can render the device inoperable for disposal - o Device cybersecurity capabilities that the device provides, as well as cybersecurity functions that can be provided by a related device or a manufacturer service or system 1.

(Response) Both the proposed and final rules require incoming ingredients to be linked specifically to outgoing food products only if that information is reasonably available (as discussed previously). What is reasonably available is determined on a case-by-case basis and depends on the operating practices of a specific facility. FDA does not intend the rule to require covered entities to reconfigure their operations. If cherries from many growers are typically mixed (i.e., commingled), then full information linking ingredient source to final product may not be reasonably available. If, however, the cherries are in separate bins based on supplier or easily can be separated and identified, then full information linking source to final product may be reasonably available. In the PRIA, FDA acknowledged the prohibitive cost of a policy option requiring producers to be able to link specific ingredients to specific food products (option 13 in the proposal). That option was ultimately rejected, in part, because of the high cost of identifying the producers of traditionally commingled raw commodities. Instead, both the proposed and final rules required linkage only when the linkage is reasonably available. 7. Labor Cost Estimates (Comment 202) Several comments suggest that the wage rate used by FDA in the PRIA of \$25.10 is too low. One comment suggests that an hourly wage of \$33 would be more appropriate for the analysis, because it would reflect the need for higher-level personnel involvement due to complexities in the proposed rule. Another comment suggests that the \$25.10 wage is reasonable, but that the hour estimates are too low. (Response) FDA disagrees with the suggestion to increase the wage rate used in the analysis because the implied annual wage and overhead cost of more than \$52,000 seems more than reasonable, as suggested in another comment. (Comment 203) One comment argues that there is no evidence that the wage of \$25.10 used in the analysis has been doubled to account for overhead in any of the calculations. (Response) The hourly wage of an administrative worker reported by the Bureau of Labor Statistics of about \$12.55 was doubled in the computations to account for overhead costs. FDA acknowledges that this was not clearly stated in the PRIA. 8. Learning Costs (Comment 204) Some comments state that FDA's estimate of 3 hours for learning costs is low. The comments state that access to the Internet and lack of fluency in English are not the only costs. The comments maintain that learning cost estimates did not include the time for an FDA explanatory video

and did not include adequate time for evaluating the information in the rule.

(4) The IDA should consult with public affairs officers (PAOs) to become familiar with subject matter considered to be newsworthy at the local or national level, and advise PAOs of all requests from news media representatives. In addition, the IDA should inform PAOs in advance when they intend to withhold or partially (printed page 71860) withhold a record if it appears the withholding action may be a media issue. (b) Reasons for not releasing a record. The following are reasons for not complying with a request for a record pursuant to 5 U.S.C. 552(a)(3) . These reasons are data items that should be maintained in the control system database for ease of retrieval and reporting in the Annual FOIA Report. (1) No records. A reasonable search of files failed to identify responsive records. (2) Referrals. The request is transferred to another DoD Component or Federal agency. (3) Request withdrawn. The request is withdrawn by the requester. (4) Fee-related reason. The requester is unwilling to pay fees associated with a request; the requester is past due in the payment of fees from a previous FOIA request; or the requester disagrees with the fee estimate. (5) Records not reasonably described. A record has not been described with sufficient particularity to enable the DoD Component to locate it by conducting a reasonable search. (6) Not a proper FOIA request for some other reason. The requester has failed to comply with procedural requirements, other than fee-related requirements, imposed by this part or by DoD Component supplementing regulations. (7) Not an agency record. The information requested is not a record within the meaning of the FOIA and this part. (8) Duplicate request. The request is a duplicate request (e.g., a requester asks for the same information more than once). This includes identical requests received through different means (e.g., electronic mail, facsimile, mail, courier) at the same or different times. (9) Other (Specify). Any other reason a requester does not comply with published rules other than those outlined in paragraph (b) of this section. (10) Partial or total denial. The record is denied in whole or in part in accordance with procedures set forth in the FOIA. (c) Reasonably segregable portions.

It is estimated that approximately 160 contractors may be subject to the enhanced security requirements. Of these 160 contractors, 100 are categorized as small businesses with 25-50 end-point systems. The estimated cost of initial implementation of NIST SP 800-172 for each of these contractors is \$202,500. Twenty contractors are estimated to have 50-100 end-point systems (medium businesses) and 40 are expected to have 750-1500 end-point systems (large businesses). The estimated costs of initial implementation for these contractors are approximately \$1,000,000 per medium business and \$2,315,000 per large business. Therefore, the total estimated cost for 160 contractors to implement NIST SP 800-172 is \$132,850,000, of which \$20,250,000 is attributed to 100 small businesses. Annual recurring costs are estimated to be 20 percent of the cost of initial implementation. f. Submit Supporting Documentation To Verify Compliance A contractor may also be required to submit to the Government a description of the system security plan required by NIST SP 800-171 Revision 2 to demonstrate their implementation of the security requirements in NIST SP 800-171 Revision 2. Requests for access to review the system security plan are expected to be rare, such as in response to a reported CUI incident. It is estimated that the system security plan may be requested 1,430 times and that it would take a contractor 30 minutes to submit the plan. The total estimated annual cost is \$67,925 (1 request * 1,430 contractors * 0.5 hours/response * \$95/hour), of which \$46,294 is attributed to 975 small businesses. Note, the cost to develop and maintain a system security plan in accordance with NIST SP 800-171 Revision 2 is attributed only to non-defense contractors (see sections IV.C.2.a. and IV.C.2.d. of this preamble) since defense contractors are subject to NIST SP 800-171 Revision 2 pursuant to DFARS clause 252.204-7012 and should already maintain system security plans. g. Comply With Additional Security Requirements Identified in the Solicitation or Requirements Document In addition to the security requirements outlined in the SF XXX and the new FAR clause at 52.204-XX, the requirements document may require the contractor to comply with controls beyond NIST SP 800-171 Revision 2 to address unique requirements to protect CUI Basic at higher than the moderate confidentiality level in accordance with 32 CFR 2002.14(h)(2) . Similarly, if offerors require access to CUI, the Government will provide agency procedures on handling the CUI to ensure compliance with the requirements in 32 CFR 2002 . The contractor shall also implement additional information security requirements it reasonably determines necessary to provide adequate security in a dynamic environment. Given that agencies have discretion in developing their contract-specific requirements, the Government does not attempt to quantify these costs. h. Comply With Additional Notification and Marking Requirements

3.3.4 Security Capabilities and ISCM To facilitate the implementation of automated security control

assessments, an ISCM program defines specific security capabilities to guide and focus implementation.

· Evaluate the ESP's CRM where the provider identifies security requirement objectives that are the provider's responsibility and security requirement objectives that are the OSA's responsibility. Additional Guidance on Level 2 Scoping CMMC Assessment Scope · Level 2 | Version 2.13 10 · Consider the agreements in place with the ESP, such as service-level agreements, memoranda of understanding, and contracts that support the OSA's information security objectives. · ESPs that are CSPs, o and store, process, or transmit CUI, must meet the FedRAMP requirements in DFARS clause 252.204-7012. o and do NOT store, process, or transmit CUI, are not required to meet FedRAMP requirements in DFARS clause 252.204-7012. Services provided by an ESP are in the OSA's assessment scope. · ESPs that are not a CSP, o and store, process, or transmit CUI, require assessment. The ESP services used to meet OSA requirements are within the scope of the OSA's CMMC assessment. o and do NOT store, process, or transmit CUI, do not require their own CMMC assessment. Services provided by an ESP are in the OSA's assessment scope. o may voluntarily request a C3PAO assessment, and a C3PAO may conduct such an assessment, if the ESP makes that business decision. · OSAs shall also be assessed at Level 2, as applicable, against their on-premise infrastructure connecting to the CSP. As part of the CMMC Assessment Scope, the security requirements from the CRM must be documented or referred to in the OSA's SSP, which will also be assessed. · ESPs can be part of the same corporate/organizational structure but still be external to the OSA such as a centralized SOC or NOC which supports multiple business units. The same requirements apply and are based on whether or not the ESP provides cloud services and whether or not the ESP processes, stores, or transmits CUI on their systems. · An ESP that is used as staff augmentation and the OSA provides all processes, technology, and facilities does not need CMMC assessment. · When ESPs are assessed as part of an OSAs assessment, the type of the assessment is dictated by the OSA's DoD solicitation and contract requirement. Cloud Service Provider (CSP) means an external company that provides cloud services based on cloud computing. Cloud computing is a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction. An ESP would be considered a CSP when it provides its own cloud services based on a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing that can be rapidly provisioned and released with minimal management effort or service provider interaction. An ESP (not a CSP) that provides technical support services to its clients would be considered a Managed Service Provider. It does not host its own cloud platform offering. An ESP may utilize cloud offerings to deliver services to clients without being a CSP. An ESP that manages a third-party cloud service on behalf of an OSA would not be considered a CSP.

No exclusions, subject to record establishment, maintenance, and access (See § 1.327(k)) Finished container that contacts food All other activities with respect to finished container Excluded from all provisions of the rule, except §§ 1.361 and 1.363 (record access) (See § 1.329(k)) E. Comments on What Definitions Apply to This Subpart? (Proposed § 1.328) 1. General Comments (Comment 63) One comment states that FDA should clarify the meaning of ·responsible individual·. The meaning of the term ·responsible individual· is the same as other terms mentioned in other sections, such as ·emergency contact·. Moreover, it is not clear what responsibilities are included in this term. (Response) FDA agrees with the comment that there is little utility for the record of each commercial transaction involving the distribution of food to contain the name of a responsible individual given that individuals change jobs within and among companies very often, making it unlikely that the person in the record will have responsibility for the food at issue when FDA seeks to effect a traceback. Therefore, FDA deleted the requirement that a name of a ·responsible individual· be included in each record. To the extent this information is available, FDA will use the registration contact information for (printed page 71587) facilities subject to registration requirements under § 1.232. FDA believes that, for facilities not subject to the registration interim final rule, an independent requirement to provide this emergency contact information with the records being kept will not be useful. The stated purpose of having such a contact name is to obtain help in accessing the records. However, to find that information, FDA would have already obtained the records without this emergency contact information. (Comment 64) One comment states that FDA should clarify the meaning of ·Adequate description·. FDA must establish and publish the minimum parameters of the products description. (Response) An adequate description of the food would include the brand name and specific variety (e.g., brand x cheddar cheese, not just cheese; or

romaine lettuce, not just lettuce). This type of description saves time and resources during a tracing investigation because it allows FDA to narrow its focus to the appropriate product during the investigation. (Comment 65) One comment requests that FDA clarify the meaning of 'Holding.' (Response) FDA has defined 'holding' in § 1.328 of this final rule to mean 'storage of food. Holding facilities include warehouses, cold storage facilities, storage silos, grain elevators, and liquid storage tanks.' (Comment 66) One comment states that FDA uses the word 'Importer' but does not define it. (Response) The word 'importer' does not appear in the final regulation. FDA will not define it for purposes of this regulation. 2. The FD&C Act There were no comments on this issue. 3. Domestic Person

published by the Office of the Director of National Intelligence. Commenters were concerned with the lack of guidance on how information systems will be used to report foreign travel and when foreign travel reporting should be accomplished by contractors. Also, commenters requested more details as to who approves foreign travel requests: the contractor security staff, the government customer, or CSA. DoD also received comments from regulated parties stating it would be burdensome for contractors under DoD security cognizance to submit individual foreign travel reports. Regulated parties recommended DoD modify its information technology (IT) system so a contractor may submit multiple or batched foreign travel reports in a single submission. As discussed earlier, to allow time for the completion of modifications to DoD's IT system, DoD published an amendment on August 19, 2021, to extend until August 24, 2022, the implementation date for contractors under DoD security cognizance to report and obtain pre-approval of unofficial foreign travel to DoD. The IT system was modified prior to the August 2022 implementation date and can now receive multiple foreign travel reports at a time. Additionally, one commenter opined the cost to contractors to implement SEAD 3 was underestimated both in (printed page 86290) the time it will take to report and the number of reports that will be generated. We agree with this assessment and the corrected numbers can be found in the cost analysis section of the preamble. Further, commenters asked how the CSA will analyze the reported data and if the analysis will be shared with the contractor or the cleared employee going on foreign travel. For those contractors under DoD cognizance, guidance was provided via an ISL (https://www.dcsa.mil/Portals/128/Documents/CTP/tools/ISL2021-02_SEAD-3.pdf) to provide supplementary procedures and inform industry how compliance with SEAD 3 will be accomplished for unique DoD mission needs. Controlled Unclassified Information DoD received seven comments on CUI as it relates to the paragraphs on security reviews (§ 117.7), training (§ 117.12), and safeguarding CUI (§ 117.15). DoD did not make any changes to the rule as compliance with CUI is outside the scope of the NISP. For the purposes of this rule, if a contractor has a classified contract that also includes provisions for CUI, then, under certain circumstances, CUI assessments may be conducted by the CSA in conjunction with NISP USG reviews. The contractor must follow the requirements as stated in their contract concerning the safeguarding of CUI. Security Reviews

However, OCR has learned through its enforcement experience that many covered entities have entrusted ePHI to business associates that are not employing appropriate safeguards. Some business associates have such market power that covered entities may believe they have no alternative to using their services, even if they have concerns about the safeguards employed by the business associate. The Department is concerned by the breaches experienced by business associates and the effects of such breaches on the confidentiality, integrity, and availability of ePHI. [446] 3. Proposals a. Section 164.308-Administrative Safeguards Throughout this section, the Department proposes to add explicit maintenance requirements to certain standards to address concerns that regulated entities may be misinterpreting the regulatory text that connects the maintenance provision at 45 CFR 164.306(e) with the administrative safeguards. These proposals would clarify that a regulated entity is required to maintain certain security measures, and that where a regulated entity is required to maintain a particular security measure, it is required to review and test such measure on a specified cadence, and to modify the measure as reasonable and appropriate. Testing of particular security measures, such as technical controls or policies and procedures, would include verifying that the security measures work as designed and that workforce members know how to implement them. For example, written policies and procedures can be tested through various methods including, but not limited to: simulating security events that mimic real-world attacks to assess how effectively employees follow incident response and security procedures; conducting knowledge assessments after training on policies and procedures; and reviewing system logs and access records to evaluate whether policies and procedures governing access to ePHI are being followed. We would expect a regulated entity to take the results of the required tests into

consideration when determining whether it is reasonable and appropriate to modify its security measures, as well as the actions that would be expected of a regulated entity that is similarly situated based on the results of such tests. We also propose to modify certain administrative safeguards to clarify the obligations of a regulated entity to ensure the confidentiality, integrity, and availability of ePHI by securing its relevant electronic information systems—that is, its electronic information systems that create, receive, maintain, or transmit ePHI and those that otherwise affect its confidentiality, integrity, or availability—and the technology assets in its relevant electronic information systems. b. Section 164.308(a) The Department proposes to modify the general language at 45 CFR 164.308(a) to clarify the connection between the general rules for security standards at 45 CFR 164.306 , the standards for policies and procedures and documentation requirements at 45 CFR 164.316

<https://www.hhs.gov/hipaa/for-professionals/security/guidance/index.html?language=es> . Back to Citation 491. · See ·Defending Against Common Cyber-Attacks,· supra note 396. Back to Citation 492. ·It may not be reasonable and appropriate for a regulated entity to patch software or update a system configuration where the risk of introducing a change is greater than the status quo risk or where the regulated entity does not own or manage a networked device. For example, instances where it might not be reasonable and appropriate to patch or update an information system include: (1) where a system needs to run continuously for mission critical support and is not patched or updated during its lifetime; and (2) where the regulated entity's testing of such patch or update indicates potential adverse impacts or where industry is reporting adverse impacts of such patch or update. This does not negate the regulated entity's need to address the vulnerability with a compensating control. For example, where a hospital discovers a vulnerability on a device that is connected to its network but owned and managed by a business associate, the hospital may not have access to install a patch, but it should employ a compensating control, such as disabling or limiting that device's access to the hospital's network. Contractors will reproduce paper copies, electronic files, and other material containing classified information only when necessary for accomplishing operational needs or for complying with contractual requirements. Use of technology that prevents, discourages, or detects unauthorized reproduction of classified information is encouraged. (i) Unless restricted by the GCA on behalf of the originating agency, TOP SECRET, SECRET, and CONFIDENTIAL information may be reproduced,

including by emailing, scanning, and copying, to the extent operational needs require on authorized systems and equipment approved at the level of the classified material and in support of a contractual requirement. (ii) Contractors shall establish procedures that facilitate oversight and control of the reproduction of classified information and the use of equipment for such reproduction, including controls that ensure: (A) Reproduction is kept to a minimum consistent with contractual requirements. (B) Contractor personnel reproducing classified information are knowledgeable of the procedures for classified reproduction and aware of the risks involved with the specific reproduction equipment being used and the appropriate countermeasures they are required to take. (C) Reproduction limitations the GCA places on documents and special controls applicable to special categories of information are fully and carefully observed. (D) Reproduced material is placed under the same accountability and control requirements as applied to the original material. Extracts of documents will be marked according to content and may be treated as working papers if appropriate. (E) Reproduced material is conspicuously identified as classified at the applicable level and copies of classified material are reviewed after the reproduction process to ensure that the required markings exist. (F) Waste products generated during reproduction are protected and destroyed as required. * * * * * 9. Amend § 117.17 by: a. Revising paragraphs (a)(3) introductory text; b. Removing paragraphs (a)(3)(i) through (iii); and (printed page 86295) c. Redesignating paragraphs (a)(3)(iv) introductory text and (a)(3)(iv)(A) and (B) as paragraphs (a)(4) introductory text and (a)(4)(i) and (ii). The revisions read as follows: § 117.17 Subcontracting. (a) * * * (1) * * * (2) * * * (3) Lead time for entity eligibility determination when awarding to an uncleared subcontractor. Requesting contractors will allow sufficient lead time in connection with the award of a classified subcontract to enable an uncleared bidder to be processed for the necessary entity eligibility determination. * * * * * § 117.19 [Amended] 10. Amend § 117.19 in paragraph (b)(5)(iv) by adding the words ·(e.g., a security aspects letter)· at the end of the paragraph. Dated: December 6, 2023. Patricia L. Toppings, OSD Federal Register Liaison Officer, Department of Defense. [FR Doc. 2023-27171 Filed 12-12-23; 8:45 am] BILLING CODE 5001-06-P

(D) Require CMMC Ecosystem members to actively avoid participating in any activity, practice, or transaction that could result in an actual or perceived conflict of interest. (E) Require CMMC Ecosystem members to disclose to Accreditation Body leadership, in writing, any actual or potential conflict of interest as soon as it is known, or reasonably should be known. (ii) Code of Professional Conduct (CoPC) policy. The CoPC policy shall: (A) Describe the performance standards by which the members of the CMMC ecosystem will be held accountable and the procedures for addressing violations of those performance standards. (B) Require the Accreditation Body to investigate and resolve any potential (printed page 89125) violations that are reported or as identified by the DoD. (C) Require the Accreditation Body to inform the DoD in writing of new investigations within 72 hours. (D) Require the Accreditation Body to report to the DoD in writing the outcome of completed investigations within 15 business days. (E) Require CMMC Ecosystem members to represent themselves and their companies accurately; to include not misrepresenting any professional credentials or status, including CMMC authorization or certification status, nor exaggerating the services that they or their company are capable or authorized to deliver. (F) Require CMMC Ecosystem members to be honest and factual in all CMMC-related activities with colleagues, clients, trainees, and others with whom they interact. (G) Prohibit CMMC Ecosystem members from participating in the CMMC assessment process for a CMMC assessment in which they previously served as a consultant to prepare the organization for any CMMC assessment. (H) Require CMMC Ecosystem members to maintain the confidentiality of customer and government data to preclude unauthorized disclosure. (I) Require CMMC Ecosystem members to report results and data from assessments and training objectively, completely, clearly, and accurately. (J) Prohibit CMMC Ecosystem members from cheating, assisting another in cheating, or allowing cheating on CMMC examinations. (K) Require CMMC Ecosystem members to utilize official training content developed by a CMMC training organization approved by the CAICO in all CMMC certification courses. (iii) Ethics policy. The Ethics policy shall: (A) Require CMMC Ecosystem members to report to the Accreditation Body within 30 days of convictions, guilty pleas, or no contest pleas to crimes of fraud, larceny, embezzlement, misappropriation of funds, misrepresentation, perjury, false swearing, conspiracy to conceal, or a similar offense in any legal proceeding, civil or criminal, whether or not in connection with activities that relate to carrying out their role in the CMMC ecosystem. (B) Prohibit harassment or discrimination by CMMC Ecosystem members in all interactions with individuals whom they encounter in connection with their roles in the CMMC ecosystem.

ially be used for identity services and Near Field Communication (NFC). If these mitigations are

important to a user(s), they may need to request these security protections from the appropriate party. Many of the listed mitigations may simply be modifying certain configurations of already implemented features, something that would be feasible in the near term. Others would require software updates to mobile operating systems, and/or baseband processors, or modifications to 3GPP standards, which will take much more time to implement.

(z) For service acquisitions that will require a contractor to develop, implement, operate, or maintain a Federal information system, ensuring that acquisition planners (see 2.101(b)), in consultation with the agency's authorizing official (see 39.X01), develop requirements in accordance with the procedures at 39.X02-1 and 39.X02-2. 8. Amend section 7.105 by removing from paragraph (b)(18)(iii) ~~·Federally-controlled information·~~ and adding ~~·Federal information·~~ in its place and adding paragraph (b)(18)(v) to read as follows: 7.105 Contents of written acquisition plans. * * * (b) *** (18) *** (v) For service acquisitions that will require a contractor to develop, implement, operate, or maintain a Federal information system, discuss compliance with 39.X02-1 and 39.X02-2. * * * * * PART 10·MARKET RESEARCH 10.001 [Amended] 9. Amend section 10.001 by removing from paragraph (a)(3)(ix) ~~·information and communication technology·~~ and adding ~~·information and communications technology·~~ in its place. PART 11·DESCRIBING AGENCY NEEDS 11.002 [Amended] 10. Amend section 11.002 by removing from paragraph (f)(1)(i) ~~·information and communication technology·~~ and adding ~~·information and communications technology·~~ in its place. PART 12·ACQUISITION OF COMMERCIAL PRODUCTS AND COMMERCIAL SERVICES 12.202 [Amended] 11. Amend section 12.202 by removing from paragraph (d) ~~·information and communication technology·~~ and adding ~~·information and communications technology·~~ in its place. PART 37·SERVICE CONTRACTING 37.000 [Amended] 12. Amend section 37.000 by removing from the text ~~·information technology·~~ and adding ~~·information and communications technology·~~ in its place. PART 39·ACQUISITION OF INFORMATION AND COMMUNICATIONS TECHNOLOGY 13. Revise the heading for part 39 to read as set forth above. 14. Amend section 39.000 by removing from paragraph (a) ~~·Management of Federal Information Resources·~~ and adding ~~·Managing Information as a Strategic Resource·~~ in its place; and revising paragraph (b) to read as follows: 39.000 Scope of part. * * * * * (b) Information and communications technology (ICT), as well as supplies and services that use ICT (see 2.101(b)). 15. Amend section 39.001 by revising the first sentence of paragraph (a) and revising paragraph (b) to read as follows: 39.001 Applicability. * * * * * (a) ICT, as well as supplies and services that use ICT, which includes information technology, Internet of Things (IoT) devices (e.g., connected appliances, wearables), and operational technology, by or for the use of agencies except for acquisitions of information technology for national security systems. *** (b) ICT by or for the use of agencies or for the use of the public. When applying the policy in subpart 39.2, see the exceptions at 39.204 and exemptions at 39.205. 16. Revise subpart 39.2 heading to read as follows: Subpart 39.2·Information and Communications Technology Accessibility * * * * * 39.201 [Amended] 17.

The data center threat landscape has evolved in recent years to encompass more advanced attack surfaces with more persistent attack mechanisms. With increased attention being applied to highlevel software security, attackers are pushing lower in the platform stack, forcing security administrators to address a variety of attacks that threaten the platform firmware and hardware. These threats can result in: Existing mitigations of threats against cloud servers are often rooted in firmware or software, making them vulnerable to the same attack strategies. For example, if the firmware can be successfully exploited, the firmware-based security controls can most likely be circumvented in the same fashion. Hardware-enabled security techniques can help mitigate these threats by establishing and maintaining platform trust -an assurance in the integrity of the underlying platform configuration, including hardware, firmware, and software. By providing this assurance, security administrators can gain a level of visibility and control over where access to sensitive workloads and data is permitted. Platform security technologies that establish platform trust can provide notification or even self-correction of detected integrity failures. Platform configurations can automatically be reverted back to a trusted state and give the platform resilience against attack. In addition, there are other hardware platform security technologies that can protect data at rest, in transit, and in use by providing hardware-accelerated disk encryption or encryption-based memory isolation. Many of these capabilities can help mitigate threats from speculative execution and side-channel attacks. By using hardware to perform these tasks, the attack surface is mitigated, preventing direct access or modification of the required firmware. Isolating these encryption mechanisms to dedicated hardware can allow performance to be addressed and enhanced separately from other system processes as well.

According to Guidelines for Access Control System Evaluation Metrics, Executive Summary: Executive Summary Adequate security of information and information systems is a fundamental management responsibility. Nearly all applications include some form of access control (AC). AC is concerned with determining the allowed activities of legitimate users, mediating every attempt by a user to access a resource in the system. AC is concerned with how authorizations are structured; in some systems, complete access is granted after successful authentication of the user, but most systems require more sophisticated and complex control. There are three primary abstractions used in AC system planning: AC policies, models, and mechanisms. AC policies are high-level requirements that specify how access is managed and who may access information under what circumstances. At a high level, AC policies are enforced through a mechanism that translates a user's access request, often in terms of a structure that a system provides. AC models bridge the gap in abstraction between policy and mechanism. Rather than attempting to evaluate and analyze AC systems exclusively at the mechanism level, AC models are usually written to describe the security properties of an AC system. AC systems come with a wide variety of features and administrative capabilities, and their operational impact can be significant. In particular, this impact can pertain to administrative and user productivity, as well as to the organization's ability to perform its mission. Therefore, it is reasonable to use quality metrics to verify the mechanical properties of AC systems.

a CMMC Status of Conditional/Final Level 2 (Self-), then the Level 2 self-assessment score with a current affirmation is valid for that contract but not for a contract with a Level 2 certification assessment requirement. The DoD does not consider it realistic or likely that C3PAOs will purposefully slow roll completion of assessments for which they have been engaged by an OSC. However, the OSA's CMMC Status is based on final results of an assessment and a valid affirmation. A POA&M Close-out assessment need only re-assess those requirements that were assessed as NOT MET in the original assessment as addressed in § 170.21(b). The OSA status is based on the results of this POA&M Close-out assessment with a valid affirmation. If the subcontractor will process, store, or transmit CUI, then the flow down requirement for a Prime contract that specifies CMMC Level 3 certification assessment is, at a minimum, CMMC Level 2 certification assessment (i.e., a CMMC Status of Conditional/Final Level 2 (C3PAO)). A POA&M closeout applies to all NOT-MET requirements so if one practice is not remediated within the 180-day time limit, the conditional certification will expire. Scope cannot be changed in the middle of an assessment, so the conditional certification will expire. If the scope is changed, a new assessment is required. The assessment is performed based on the defined CMMC Assessment Scope. The OSA is only approved to process, store, or transmit FCI and CUI within the CMMC Assessment Scope defined. If the conditional assessment certification expires due to exceeding the 180-day limit, a new full certification assessment is required. Contracting officers can utilize standard contract remedies during any period under which the OSA is not in compliance with CMMC requirements. If an OSC closed out their POA&M 32 months ago, that Level 2 Conditional certification assessment would have closed and the OSC would have received a Level 2 Final certification assessment for the remainder of the 3-year validity period. If after completing the Level 2 Final certification assessment, the OSC is reassessed and does not achieve a score of 110, then the OSC will either get a new Conditional Level 2 (C3PAO) CMMC Status certificate (if they meet the associated POA&M requirements), or the OSC will not receive a new certificate. c. Level 3 Comment: Several comments addressed CMMC Level 3 assessment requirements and the relationship of Level 3 assessments to Level 2 assessments. One comment noted that a final version of the Level 3 assessment guidance was not available at the same time as other CMMC assessment guides. Another recommended the DoD first pilot implementation of CMMC Level 3 security requirements and clearly identify (in advance) the data or programs that will be subject to them. One commenter asked how DoD will maintain Level 3 requirements to align with NIST's guidance since Level 3 includes only a subset of NIST's SP 800-172 Feb2021 requirements.

Also, retail food establishments that employ 10 or fewer full-time equivalent employees are now excluded from all of the requirements in this subpart, except §§ 1.361 and 1.363. (See response to comment 38 of this document for a further discussion of FDA's rationale underlying this exclusion.) (Comment 139) A few comments state that the requirement to maintain records for 2 years is very burdensome for those who obtain a variety of fresh produce from a large number of small farmers and commingle lots of produce for distribution. (Response) FDA notes that these foods for the most part would fall into the category of foods for which a significant risk of spoilage or significant loss of value occurs if held longer than 60 days under normal shipping and storage conditions for the food. As stated previously, the record retention period for this category of foods in this final

rule is 6 months. (Comment 140) A few comments state that, for alcoholic beverages and distilled spirits, retention of records for a period of only 2 years would be inadequate to trace a matured product back to the source. They suggest that FDA should rely on alcoholic beverage importers' and producers' own existing record systems to facilitate tracebacks. (Response) Although retaining records for 2 years may not be enough for products with long shelflives, the agency notes that the Bioterrorism Act sets the maximum time the agency can mandate record retention at 2 years. FDA further notes, however, that when FDA has a reasonable belief that an article of food is adulterated and presents a threat of serious adverse health consequences or death to humans or animals, any records and other information accessible to FDA under section 414 or 704(a) of the FD&C Act must be readily available for inspection and photocopying or other means of reproduction. Therefore, as a practical matter, FDA may be able to access additional information about food products after the 2-year retention period required by subpart J of this final rule has elapsed.

SC.L2-3.13.3 · Role Separation CMMC Assessment Guide · Level 2 | Version 2.13 218 FURTHER DISCUSSION Prevent users and user services from accessing system management functionality on IT components (e.g., databases, network components, workstations, servers). This reduces the attack surface to those critical interfaces by limiting who can access and how they can be accessed. By separating the user functionality from system management functionality, the administrator or privileged functions are not available to the general user. The intent of this requirement is to ensure: · general users are not permitted to perform system administration functions; and · system administrators only perform system administration functions from their privileged account. This can be accomplished using separation like VLANs or logical separation using strong access control methods. Example As a system administrator, you are responsible for managing a number of core systems. Policy prevents you from conducting any administration from the computer or system account you use for day-to-day work [a,b]. The servers you manage also are isolated from the main corporate network. To work with them you use a special unique account to connect to a ·jump· server that has access to the systems you routinely administer. Potential Assessment Considerations · Are physical or logical controls used to separate user functionality from system management-related functionality (e.g., to ensure that administration (e.g., privilege) options are not available to general users) [c]? KEY REFERENCES · NIST SP 800-171 Rev. 2 3.13.3

Guidelines (VVSG) 1.1. The security guidelines were updated in FY 2012 to improve the auditability of voting systems, to provide greater software integrity protections, to expand and improve access control requirements, and to help ensure cryptographic security mechanisms are implemented properly. In addition, CSD supported the efforts of the EAC and Federal Voting Assistance Program (FVAP) of DoD to improve the voting process for citizens under the Uniformed and Overseas Citizens Voting Act (UOCAVA) by leveraging electronic technologies. The team worked with the TDCG's UOCAVA Working Group to develop a risk analysis on technologies used in current UOCAVA voting processes, including vote-by-mail, online voter registration, electronic ballot delivery, and online ballot marking. - — Updates on the OCR privacy, security, and breach notification audit program - — Patient and provider identity management, HIPAA requirements in cloud and mobile environments - — HIPAA rule changes affecting breach notification and HIPAA security - — Cybersecurity Framework for improving critical infrastructure cybersecurity - — Health IT activities at the National Cybersecurity Center of Excellence - — Methods for managing insider threat - — Tools available to manage security settings on end-user devices This year's annual 2-day offsite meeting featured updates on the computer security activities of the Government Accountability Office (GAO), General Services Administration (GSA), Bureau of the Fiscal Service, and NIST. Recent administration guidance directing federal agencies to reduce travel and conference budgets significantly reduced attendance.

FDA plans similar outreach directed to stakeholders following publication of the final rule implementing the recordkeeping provisions of the Bioterrorism Act. Our outreach will include the following: Materials and events for the media; Domestic outreach meetings to States and industry; International outreach to U.S. trading partners; Presentations by FDA officials and exhibits at

professional and trade conferences and meetings to inform industry and State and local government representatives of the new regulations and their requirements; and Cooperative arrangements with other Federal agencies to ensure that information on the final regulations and their requirements is disseminated to affected companies and individuals. More specifics regarding each of these will be included on FDA's Web site at <http://www.fda.gov/oc/bioterrorism/bioact.html>. (Comment 10) Several comments suggest that, to lessen the burden to the food industry, FDA needs to coordinate with other local, Federal, and State government security programs in establishing the final recordkeeping regulations. (Response) In issuing these recordkeeping regulations, FDA has stated that records established and maintained as a result of local, State, or other Federal regulations, or as a matter of routine business practice, need not be duplicated if the records contain all the information required by these regulations. Further, if existing records contain some, but not all, of the required information, persons may supplement existing records with the additional information required under this final rule. (Comment 11) One comment asks that the final rule require that upstream entities provide all the required information to downstream entities in the food distribution system. The comment states that distribution centers that receive and store food and retail outlets that hold and sell food do not know and should not be required to determine many of the information items required under the proposed regulation. The comment states that requiring that any information be passed through the system from the first point of distribution, preferably through electronic means, would alleviate some of the burden of the recordkeeping requirements on downstream entities.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. CJI is commonly accessed using computer-aided dispatch (CAD) and record management system (RMS) software, which communicate with a state-level message switch application. CJI MFA architectures will likely need to integrate with one or both of these technologies. As agencies around the country begin to implement MFA solutions, the approaches they use require careful consideration and planning. This document provides a general overview of MFA, outlines design principles and architecture considerations for implementing MFA to protect CJI, and offers specific examples of use cases that agencies face today. It also outlines how CAD/RMS and message switch technologies can support standards and best practices that provide agencies with maximum optionality to implement MFA in a way that promotes security, interoperability, usability, and cost savings. As agencies around the country begin to implement this requirement, they face several challenges that require careful consideration and planning. The purpose of this document is to help agencies identify and address their MFA implementation needs by providing insight into MFA architectures and how they can be used to meet law enforcement-specific use cases.

3.3.1 Intel Trust Domain Extensions (Intel TDX) Intel Trust Domain Extensions (Intel TDX) introduces new architectural elements to deploy hardware-isolated VMs called trust domains (TDs).

(I) From subsection (e)(5) because in the collection of information for law enforcement purposes it is impossible to determine in advance what information is accurate, relevant, timely, and complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light and the accuracy of such information can only be determined in a court of law. The restrictions of subsection (e)(5) would restrict the ability of trained investigators and intelligence analysts to exercise their judgment in reporting on investigations and impede the development of intelligence necessary for effective law enforcement. (J) From subsection (e)(8) because the individual notice requirements of subsection (e)(8) could present a serious impediment to law enforcement as this could interfere with the ability to issue search authorizations and could reveal investigative techniques and procedures. (K) From subsection (f) because this system of records has been exempted from the access provisions of subsection (d). (L) From subsection (g) because this system of records is compiled for law enforcement purposes and has been exempted from the access provisions of subsections (d) and (f). (8) System identifier and name. F071 JTF A, Computer Network Crime Case System. (i) Exemption. (A) Parts of this system may be exempt pursuant to 5 U.S.C. 552a(j)(2) if the information is compiled and maintained by a component of the agency, which performs as its principle function any activity pertaining to the

enforcement of criminal laws. Any portion of this system of records which falls within the provisions of 5 U.S.C. 552a(j)(2) may be exempt from the following subsections of 5 U.S.C. 552a(c)(3), (c)(4), (d), (e)(1), (e)(2), (e)(3), (e)(4)(G), (H), and (I), (e)(5), (e)(8), (f), and (g). (B) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2), may be exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (e)(8)(i)(B). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. Any portion of this system of records which falls within the provisions of 5 U.S.C. 552a(k)(2) may be exempt from the following subsections of 5 U.S.C. 552a(c)(3), (d), (e)(1), (e)(4)(G), (H) and (I), and (f). (ii) Authority. 5 U.S.C. 552a(j)(2) and (k)(2). (iii) Reasons.

Physical access controls to support infrastructure include locked wiring closets; disconnected or locked spare jacks; protection of cabling by conduit or cable trays; and wiretapping sensors. PE.L2-3.10.2 · Monitor Facility CMMC Assessment Guide · Level 2 | Version 2.13 183 FURTHER DISCUSSION The infrastructure inside of a facility, such as power and network cables, is protected so that visitors and unauthorized employees cannot access it. The protection is also monitored by security guards, video cameras, sensors, or alarms. Example You are responsible for protecting your IT facilities. You install video cameras at each entrance and exit, connect them to a video recorder, and show the camera feeds on a display at the reception desk [c,d]. You also make sure there are secure locks on all entrances, exits, and windows to the facilities [a,b]. Potential Assessment Considerations · Is physical access monitored to detect and respond to physical security incidents [c, d]? KEY REFERENCES · NIST SP 800-171 Rev 2 3.10.2

Two comments recommended the draft DFARS regulatory initiative on Safeguarding Unclassified DoD Information (Safeguarding Rule) being addressed under DFARS Case 2011-D039 be written to avoid conflicting and duplicative requirements for participants in the DIB CS/IA program. Response: The DoD is committed to using both internal coordination processes, and public review and comment procedures such as those used in rulemaking for this program and for proposed DFARS revisions, to ensure that its cyber security activities are evaluated to avoid conflicting or duplicative elements. No change is made to the rule. Comment: Two comments recommended specific word changes to the program requirements relating to each party conducting a legal review of its policies and practices that support the program, including deletion of the requirement for a determination of compliance with law because it may be interpreted as requiring the company to retain outside counsel for such a determination, limiting the compliance only to U.S. law, and deleting the second sentence of § 236.6(c) to avoid threatening the attorney-client privilege. Response: The requirement at § 236.6(c) for a determination of legal compliance is expressly stated as a requirement that the DIB participant shall perform a legal review . . . and shall make a determination that it is compliant. There is neither an express nor implied requirement that the DIB participant retain outside counsel for such a determination, and thus no change to that language is warranted. In § 236.6, the rule retains applicable laws and regulations as an accurate description of the requirement. Finally, the second sentence of § 236.6(c) was intended merely to provide notice that the Government may request additional information from the DIB company, and was not intended to imply that there was a requirement to provide such information as a condition of the program, regardless of whether such information were protected by the attorney-client privilege. To avoid any unnecessary confusion or unintended implications, the second sentence is deleted. Comment: One comment expressed full support for the Defense Industrial Base Voluntary Cyber Security and Information Assurance Activities. Response: Government evaluation of the program concurs that the voluntary DIB CS/IA program contributes to the safeguarding of DoD information. No change is made to the rule. Comment: One comment urged a renewed look at how classification schemes are balanced with disclosure schemes. Response: In accordance with the rule (§ 236.4(f)), handling and safeguarding of classified GFI shall be in compliance with the National Industrial Security Program Operating Manual (NISPOM) (DoD 5220.22-M). No change is made to the rule. Comment: One comment recommended that the DIB CS/IA program have a more robust role in industry engagement. Response:

(d) The Chairman of the Joint Chiefs of Staff shall ensure that joint doctrine is consistent with

the principles established by DoD Directive 3020.49, ·Orchestrating, Synchronizing, and Integrating Program Management of Contingency Acquisition Planning and Its Operational Execution,· [6] DoD Instruction 3020.41, ·Contractor Personnel Authorized to Accompany the U.S. Armed Forces,· and this part. (e) The geographic Combatant Commanders in whose AOR a contingency operation is occurring, and within which PSCs and PSC personnel perform under covered contracts, shall: (1) Provide guidance and procedures, as necessary and consistent with the principles established by DoD Directive 3020.49, ·Orchestrating, Synchronizing, and Integrating Program Management of Contingency Acquisition Planning and Its Operational Execution,· DoD Instruction 3020.41, ·Contractor (printed page 49657) Personnel Authorized to Accompany the U.S. Armed Forces,· [7] and this part, for the selection, training, accountability and equipping of such PSC personnel and the conduct of PSCs and PSC personnel within their AOR. Individual training and qualification standards shall meet, at a minimum, one of the Military Departments' established standards. Within a geographic combatant command, a sub unified commander or JFC shall be responsible for developing and issuing implementing procedures as warranted by the situation, operation, and environment, in consultation with the relevant Chief of Mission in designated areas of combat operations or other significant military operations. (2) Through the Contracting Officer, ensure that PSC personnel acknowledge, through their PSC, their understanding and obligation to comply with the terms and conditions of their covered contracts. (3) Issue written authorization to the PSC identifying individual PSC personnel who are authorized to be armed. Rules for the Use of Force shall be included with the written authorization, if not previously provided to the contractor in the solicitation or during the course of contract administration. Rules for the Use of Force shall conform to the guidance in the Chairman of the Joint Chiefs of Staff Instruction 3121.01B, ·Standing Rules of Engagement/Standing Rules for the Use of Force for U.S. Forces,· Access by offerors and contractors to the rules for the use of force may be controlled in accordance with the terms of FAR 52.204-2 (Aug 1996), DFARS 252.204-7000 (Dec 1991), or both. [8] (4) Ensure that the procedures, orders, directives and instructions prescribed in §.159.6(a) of this part are available through a single location (to include an Internet Web site, consistent with security considerations and requirements). (f) The Heads of the DoD Components shall: (1) Ensure that all private security-related requirement documents are in compliance with the procedures listed in §.159.6 of this part and the guidance and procedures issued by the geographic Combatant Command,

3.2.2 | Resource Access Control | 3-10 | | | 3. 3.2.2. 3.2.2 Resource Access Control Once the user has been granted access to the system as a whole, the question of which resources that authenticated user may access still remains.

- Experimentation is a systematic approach to testing new ideas, methods, or activities that applies principles and techniques at the data collection stage to ensure the generation of valid, defensible, and supportable conclusions. A recognizable use of experimentation to collect information security data is a phishing test, which is a form of internal security testing where organizations send fake phishing emails to determine which users respond to it. The rates of success are then judged against set criteria. - Observational data refers to capturing data through the observation of an activity or behavior without the direct involvement of the subject. Observational data is often gathered as part of routine information security operations, such as log management tools that are used to collect and analyze network activities. Data from these logs is observational and can be used for further analysis. - Sampling is the process of taking samples of something for the purpose of analysis. Sampling may be used when continuous observation and passive data collection are not an option or when random , stratified , or systematic sampling may be preferred. Random sampling is a method of sampling in which each sample has an equal chance of selection in hopes of gathering an unbiased representation. Stratified sampling is the process of segmenting a population across levels of some factors to minimize variability within those segments (e.g., taking a sample from a terminal in each department of an organization). Stratified sampling may help an assessment target organizational units without being overwhelmed by noisy data collection but can provide biased results. Systematic sampling involves taking samples at a regular interval (e.g., once an hour or from every tenth user). Systematic sampling is useful for identifying macro-trends but may not provide enough conclusive measurements for the entire population if an underlying pattern is present. 1.

(g) If an appeal under this section is denied in whole or in part, the individual has the right to file a Statement of Disagreement that states the reason(s) for disagreeing with the DoD Component's denial of the request for amendment or correction. Statements of Disagreement must be concise, must

clearly identify each part of any record that is disputed, and should generally be no longer than one typed page. The Statement of Disagreement must be sent to the DoD Component holding the respective record. The Statement of Disagreement will be filed or notated in the system of records, and an annotation to the record itself will indicate the existence and location of the Statement of Disagreement. (h) Notifications of amendment/correction or statements of disagreement will be made to all persons, organizations, and agencies to which the record was previously disclosed if an accounting of that disclosure was made in accordance with subsection (c) of the Privacy Act and § 310.9. If an individual has filed a Statement of Disagreement, a copy of the statement will be appended to the disputed record whenever the record is disclosed, and a concise statement of the reason(s) for denying the request to amend or correct the record may also be appended. § 310.8 Civil remedies. In addition to the right to judicial review after a denied appeal for access to or amendment of a record, the requester has the right to bring a civil action against the Department if the Department: (a) Fails to maintain a record concerning the individual with such accuracy, relevance, timeliness and completeness as is necessary to assure fairness in any determination relating to the qualifications, character, rights, opportunities of, or benefits to the individual that may be made on the basis of such record, and consequently a determination is made which is adverse to the individual; or (b) Fails to comply with any other provision of the Privacy Act or this rule, in such a way as to have an adverse effect on the individual. § 310.9 Requests for an accounting of record disclosures. (a) An individual may make a request for an accounting of any disclosure that has been made by the Department to another person, organization, or agency of any record about the individual maintained in a system of records. (b) This accounting contains the date, nature, and purpose of each disclosure, as well as the name and address of the person, organization, or agency to which the disclosure was made. Records of disclosure accountings are maintained for five years after the disclosure or for the life of the record, whichever is longer. (c) The request for an accounting should identify each particular record in question and should be made by writing directly to the DoD Component that maintains the record, following the procedures in § 310.3. (d) DoD Components are not required to provide disclosure accountings when related to:

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Parts 204, 209, 212, 225, and 252 RIN 0750-AI34 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Final rule. SUMMARY: DoD is issuing a final rule amending the Defense Federal Acquisition Regulation Supplement (DFARS) to clarify and relocate text relating to state sponsors of terrorism (as identified by the Department of State), add an explicit representation, and conform the terminology. DATES: Effective December 11, 2014. FOR FURTHER INFORMATION CONTACT: Ms. Amy G. Williams, telephone 571-372-6106. SUPPLEMENTARY INFORMATION: I. Background DoD published a proposed rule in the Federal Register at 79 FR 45666 on August 5, 2014, to clarify and relocate coverage relating to state sponsors of terrorism (as identified by the Department of State), add an explicit representation, and conform the terminology. No respondents submitted public comments in response to the proposed rule. This rule is part of DoD's retrospective plan, completed in August 2011, under Executive Order 13563, Improving Regulation and Regulatory Review. DoD's full plan and updates can be accessed at: <http://www.regulations.gov/#!docketDetail;dct=FR+PR+N+O+SR;rpp=10;po=0;D=DOD-2011-OS-0036>. II. Discussion and Analysis No public comments were received. The final rule is the same as the proposed rule, except for minor edits. III. Executive Orders 12866 and 13563 Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804. IV. Regulatory Flexibility Act DoD certifies that this rule will not have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601, et seq.,

) From subsection (e)(5) because many of the records in this system coming from other system of records are derived from other agency record systems and therefore it is not possible for NGA to ensure their compliance with this provision, however, NGA has implemented internal quality assurance procedures to ensure that data used in the matching process is as thorough, accurate, and current as possible. In addition, in the collection of information for law enforcement, counterterrorism, and intelligence purposes, it is impossible to determine in advance what information is accurate, relevant, timely, and complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light. The restrictions imposed by (e)(5) would limit the ability of those agencies' trained investigators and intelligence analysts to exercise their judgment in conducting investigations and impede the development of intelligence necessary for effective law enforcement and counterterrorism efforts. However, NGA has implemented internal quality assurance procedures to ensure that the data used in the matching process is as thorough, accurate, and current as possible. (9) From subsection (e)(8) because to require individual notice of disclosure of information due to compulsory legal process would pose an impossible administrative burden on NGA and other agencies and could alert the subjects of counterterrorism, law enforcement, or intelligence investigations to the fact of those investigations when not previously known. (10) From subsection (f) (Agency Rules) because portions of this system are exempt from the access and amendment provisions of subsection (d). (11) From subsection (g) to the extent that the system is exempt from other specific subsections of the Privacy Act. (3) System identifier and name. NGA-003, National Geospatial-Intelligence Agency Enterprise Workforce System. (i) Exemption. Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (a)(3)(i). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. (ii) Authority. 5 U.S.C. 552a (k)(2). (iii) Reasons. Pursuant to 5 U.S.C. 552a(k)(2) , the Director of NGA has exempted this system from the following provisions of the Privacy Act, subject to the limitation set forth in 5 U.S.C. 552a(c)(3)

The Department proposes to expand the list of activities that should be considered under the term by adding the activities of ·deleting· and ·transmitting·. The Department also proposes to replace ·system resource· with ·component of an information system· to rely on an already defined term, ·information system·. The proposed modification would clarify that the term includes any and all components of an information system and an information system as a whole. Additionally, the Department believes that a component of an information system better describes how the term access applies today because it is inclusive of hardware, software, and people, as opposed to only the inherent capabilities that contribute to performance, such as system memory and hard disk space. 2. Clarifying the Definition of ·Administrative Safeguards· a. Current Provision and Issues To Address Administrative safeguards are administrative actions, policies, and procedures to manage the selection, development, implementation, and maintenance (including reviewing and modifying) of security measures to protect ePHI. [350] Administrative safeguards also manage the conduct of the regulated entity's workforce in relation to the protection of ePHI. Under the Security Rule, there are minor inconsistencies in language between the definitions of the types of safeguards, which might lead to uncertainty about how to interpret the terms and lead to unintended consequences. For example, the definitions of ·administrative safeguards· and ·physical safeguards· use ·are,· while the definition of technical safeguards uses ·means·. [351] In addition, the existing definition of ·administrative safeguards· does not expressly relate the administrative actions to the policies and procedures addressing the activities covered by the definition, nor does it make clear that the policies and procedures are in addition to the administrative actions. The same is true for the definitions of physical and technical safeguards. Further, the definition of ·administrative safeguards· does not expressly mention managing updates and modifications to safeguards. b. Proposal

Transmission of CNWDI outside the contractor's facility is authorized only to the GCA, or to a subcontractor as described in paragraph (d) of this section. Any other transmission must be approved by the GCA. (1) Prior to transmission to another cleared facility, the contractor will verify from the CSA that the facility has been authorized access to CNWDI. When CNWDI is transmitted to another

facility, the inner wrapping will be addressed to the personal attention of the FSO or his or her alternate, and in addition to any other prescribed markings, the inner wrapping will be marked: Critical Nuclear Weapon Design Information-DoD Instruction 5210.02 Applies. (printed page 83359) (2) The same marking will be used on the inner wrapping of transmissions addressed to the GCA or other USG. (f) Records. Contractors will annotate CNWDI access in the CSA-designated database for all employees who have been authorized access to CNWDI. (g) Nuclear weapon data. Some nuclear weapon data is divided into Sigma categories, the protection of which is prescribed by DOE Order 452.8 (available at: <https://www.directives.doe.gov/directives-documents/400-series/0452.8-border/@images/file>). However, certain nuclear weapon data has been re-categorized as CNWDI and is protected as described in this section. §.117.21 COMSEC. (a) General. The procedures in this section pertaining to classified COMSEC information will apply to contractors when the contractor: (1) Requires the use of COMSEC systems in the performance of a contract. (2) Is required to install, maintain, or operate COMSEC equipment for the USG. (3) Is required to accomplish research, development, or production of COMSEC systems, COMSEC equipment, or related COMSEC material. (b) Instructions. Specific requirements for the management and safeguarding of COMSEC material in industry are established in the COMSEC material control and operating procedures provided to the account manager of each industrial COMSEC account by the agency central office of record (COR) responsible for establishing the account. Such procedures that are above the baseline requirements detailed in the other sections of this rule will be contractually mandated. (c) Clearance and access requirements. (1) Before a COMSEC account can be established and a contractor may receive or possess COMSEC material accountable to a COR, individuals occupying the positions of FSO, COMSEC account manager, and alternate COMSEC account manager must have a final PCL appropriate for the material to be held in the account. (i) COMSEC account managers and alternate COMSEC account managers having access to operational TOP SECRET keying material marked as CRYPTO must have a final TOP SECRET security clearance based upon a current investigation of a scope that meets or exceeds that necessary for the access required. (ii) This requirement does not apply to contractors using only data transfer devices and seed key.

Revising the section heading; b. Redesignating paragraph (2)(xv) as (2)(xvi); and c. Adding a new paragraph (2)(xv). The revision and addition read as follows: 204.1202 Solicitation provision and contract clause. * * * * * (2) * * * (xv) 252.232-7015, Performance-Based Payments-Representation. * * * * * (printed page 19688) PART 212-ACQUISITION OF COMMERCIAL ITEMS 212.001 [Amended] 4. Amend section 212.001 by removing the definition of Nontraditional defense contractor. PART 232-CONTRACT FINANCING 5. In section 232.1001, revise paragraph (a) to read as follows: 232.1001 Policy. (a) As with all contract financing, the purpose of performance-based payments is to assist the contractor in the payment of costs incurred during the performance of the contract. See PGI 232.1001(a) for additional information on use of performance-based payments. However, in accordance with 10 U.S.C. 2307(b)(2) , performance-based payments shall not be conditioned upon costs incurred in contract performance, but on the achievement of performance outcomes. Subject to the criteria in 232.1003-70, all companies, including nontraditional defense contractors, are eligible for performance-based payments, consistent with best commercial practices. * * * * * 6. Revise section 232.1003-70 to read as follows: 232.1003-70 Criteria for use. In accordance with 10 U.S.C. 2307(b)(4)(A) , a contractor's financial statements shall be in compliance with Generally Accepted Accounting Principles in order to receive performance-based payments. 10 U.S.C. 2307(b)(4)(B) specifies that it does not grant the Defense Contract Audit Agency the authority to audit compliance with Generally Accepted Accounting Principles. 7. In section 232.1004, revise paragraph (b) to read as follows: 232.1004 Procedures. (b) Establishing performance-based finance payment amounts. (i) The contracting officer should include in a solicitation both the progress payments and performance-based payments provisions and clauses prescribed in this part, when considering both types of payment methods. Only one type of financing will be included in the resultant contract, except as may be authorized on separate orders subject to FAR 32.1003(c)). (ii) The contracting officer shall analyze the performance-based payment schedule using the performance-based payments (PBP) analysis tool. The PBP analysis tool is on the DPC website in the Cost, Pricing & Finance section, Performance Based Payments-Guide Book & Analysis Tool tab, at http://www.acq.osd.mil/dpap/cpic/cp/Performance_based_payments.html .

The contractor will contact the appropriate air carrier in advance to explain the particular circumstances and obtain instructions on the special screening procedures to follow when: (A) Routine processing would subject the classified material to compromise or damage. (B) Visual examination is or may be required to successfully screen a classified package. (C) Classified

material is in specialized containers, which due to its size, weight, or other physical characteristics cannot be routinely processed. (iii) Authorization letter. Contractors will provide employees with written authorization to hand carry classified material on commercial aircraft that includes: (printed page 83343) (A) Full name, date of birth, height, weight, and signature of the traveler and statement that he or she is authorized to transmit classified material. (B) Description of the type of identification the traveler will present on request. (C) Description of the material being hand carried, with a request that it be exempt from opening. (D) Identification of the points of departure, destination, and known transfer points. (E) Name, telephone number, and signature of the FSO, and the location and telephone number of the CSA. (6) Escorts. If an escort is necessary to ensure the protection of the classified information being transported, the contractor will assign a sufficient number to each classified shipment to ensure continuous surveillance and control over the shipment while in transit. The contractor will furnish escorts with specific written instructions and operating procedures prior to shipping that include: (i) Name and address of persons, including alternates, to whom the classified material is to be delivered. (ii) Receipting procedures. (iii) Means of transportation and the route to be used. (iv) Duties of each escort during movement, during stops en route, and during loading and unloading operations. (v) Emergency and communication procedures. (g) Destruction. Contractors will: (1) Destroy classified material in their possession based on the disposition instructions in the contract security classification specification or equivalent. (2) Follow the guidance for destruction of classified material in accordance with 32 CFR 2001.47 and the destruction equipment standards in accordance with 32 CFR 2001.42(b) . See <https://www.nsa.gov/resources/everyone/media-destruction/> and any CSA provided guidance for additional information. (h) Disclosure. Contractors will establish processes by which classified information is disclosed only to authorized persons. (1) Disclosure to employees. Contractors are authorized to disclose classified information to their cleared employees with the appropriate eligibility for access to classified information and need to know as necessary, including cleared employees across the MFO, when applicable, for the performance of tasks or services essential to the fulfillment of a classified contract or subcontract. (2) Disclosure to subcontractors. (i) Contractors:

Given the records access requirement, the records retention requirement in both the proposed and final rules may create a perverse incentive for entities to destroy records, even though we estimate that this incentive will lead to the actual destruction of very few records, and very small reductions in investigative speed. Private firms are quite reluctant to share their private records with outsiders such as federal regulatory agencies. Facilities may choose to destroy records once legal retention requirements have been met rather than risk the possibility of sharing them with FDA. Consequently, there is a nonzero probability that facilities will destroy records subject to the retention requirements shortly after the legal retention requirement has been met, and that those records would not exist in the event of an FDA records access request. The incentive to destroy records due to the access requirement will likely result in the destruction of a very small fraction of records because of the private utility from retaining records, and also the costs of destroying them. Because of the perverse nature of this incentive, it is informative to estimate its impact on the benefits from final rule-especially since the costs of the 1 and 2 years records retention provisions were estimated to be zero because the retention time periods are the same as or shorter than current business practices. We used outbreak investigation data to estimate the

reduction in benefits when retention requirements are redefined to be 6, 12, and 24 months based on NIST definitions of shelf lives. Investigations that remained open 6 months after initial exposure were considered possible candidates for continued investigative visits. From FDA investigation information, we estimated that about 20 percent of all FDA investigations from 2000 to 2003 remained open 6 months after initial exposure to the pathogen. However, it is likely that most of these investigations did not require access to a firm's records after 6 months. We assume that a maximum of 20 percent of all traceback investigations are candidates for a records access request 6 months after initial exposure to the pathogen. We assume that half of the investigative visits in one of these candidate investigations requires access to records after 6 months, and that 1/3 of these access requests are for records subject to the 6 month retention period (i.e., a 1/3 probability for 6 months, a 1/3 probability for 12 months and a 1/3 probability for 24 months). Consequently, 3.3 percent of records requests for records subject to the 6 month retention time are estimated to be made after 6 months (20 percent x 1/2 x 1/3).

3.1.13 Protocol Errors (CWE-254, CWE-573, CWE-668) Description Protocols are rules of communication.

capabilities required from IoT devices and their manufacturers, respectively, as well as associated documentation to round out the guidance provided by the program. The documents are complemented by an online catalog [CATALOG] of detailed technical capabilities and supporting non-technical capabilities, updates that were published in March of 2021. - Smart Door Lock: Federal organizations may utilize connected door locks that can scan PIV cards and manage access to and within facilities. - Unmanned Aircraft System (UAS): Federal organizations could use UAS to inspect facilities as part of monitoring and maintenance of the facility. - Water Sensors: Some federal organizations may use connected IoT environment sensors to monitor various aspects of facilities. Mr. Fagan concluded by briefly reviewing updates to the online IoT device cybersecurity capabilities catalog and encouraging workshop participants to provide input and feedback on the catalog's contents and utility.

any liability arising out of the performance of this contract, including costs and expenses, incurred as the result of the Contractor's potential or actual unauthorized disclosure of trade secrets, copyrighted materials, contractor bid or proposal information, source selection information, classified information, material marked as 'Controlled Unclassified Information', information subject to a right of privacy or publicity, personally identifiable information as defined by OMB Circular A-130 (2016) or successor thereof, or any record as defined in 5 U.S.C. 552a . (3) In the event of any claim or suit against the Government on account of any alleged unauthorized disclosure or introduction of data or information arising out of the performance of this contract or services performed under this contract, the Contractor shall furnish to the Government, when requested by the Contracting Officer, all evidence and information in the Contractor's possession pertaining to such claim or suit. (4) The provisions of this paragraph (h) do not apply unless the Government provides notice to the Contractor as soon as practicable of any

claim or suit, affords the Contractor an opportunity under applicable laws, rules, or regulations to participate in the defense of the claim or suit, and these provisions do not apply to any libelous or other unlawful matter contained in such data furnished to the Contractor by the Government and incorporated in data to which this clause applies. Further, this indemnity shall not apply to-

- (i) A disclosure or inclusion of data or information upon specific written instructions of the Contracting Officer directing the disclosure or inclusion of such information or data;
- (ii) A third-party claim that is unreasonably settled without the consent of the Contractor, unless required by final decree of a court of competent jurisdiction.

(i) Subcontracts. The Contractor shall include the substance of this clause, including this paragraph (i), in all subcontracts under this contract for services to develop, implement, operate, or maintain a FIS using cloud computing services. (End of clause) 52.239-YY Federal Information Systems Using Non-Cloud Computing Services. As prescribed in 39.X04(a) insert the following clause: Federal Information Systems Using Non-Cloud Computing Services (DATE) (a) Definitions. As used in this clause-

Cloud computing means a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction. Cloud computing is characterized by on-demand self-service, broad network access, resource pooling, rapid elasticity, and measured service; and includes service models such as software-as-a-service, infrastructure-as-a-service, and platform-as-a-service (NIST SP 800-145).
Component

Inventors, reviewers, evaluators, officials of U.S. and foreign patent offices, and other persons having a direct interest in the file. Exemptions claimed for the system: None. Appendix F to Part 310-Format for New or Altered System Report (See paragraph (c) of §-310.33) The report on a new or altered system shall consist of a transmittal letter, a narrative statement, and include supporting documentation.

A. Transmittal Letter The transmittal letter shall be prepared by the Defense Privacy Office and shall contain assurances that the new or altered system does not duplicate any existing Component systems, DoD-wide systems or government-wide systems. The narrative statement, and the system notice, shall be attached thereto.

B. Narrative Statement The statement shall include information on the following:

1. System Identifier and name;
2. Responsible official;
3. Purpose of establishing the system [for a new system only] or Nature of the changes proposed for the system [for altered system only];
4. Authority for maintenance of the System;
5. Probable or potential effects on the privacy of individuals;
6. Is the system, in whole or part, being maintained by a contractor;
7. Steps taken to minimize risk of unauthorized access;
8. Routine use compatibility;
9. OMB information collection requirements; and
10. Supporting documentation.

Attachment 1-Sample Format for Narrative Statement DEPARTMENT OF DEFENSE [Component Name]
Narrative Statement on a [New/Altered] System of Records Under the Privacy Act of 1974

1. System Identifier and Name. This caption sets forth the identification and name of the system (see subparagraphs (b)((c) of §-310.32).
2. Responsible Official. The name, title, address, and telephone number of the official responsible for the report and to whom inquiries and comments about the report may be directed by Congress, the Office of Management and Budget, or the Defense Privacy Office.
3. Purpose of establishing the system or nature of the changes proposed for the system: Describe the purpose of the new system or how an existing system is being changed.
4. Authority for maintenance of the system. See paragraph (g) of §-310.32.
5. Probable or potential effects on the privacy of individuals. What effect, if any, will the new or altered system impact the personal privacy of the affected individuals.
6. Is the system, in whole or in part, being maintained by a contractor. If yes, Components shall ensure that the contract has incorporated the Federal Acquisition privacy clause (see paragraph (a)(1) of §-310.12).
7. Steps taken to minimize risk of unauthorized access. Describe actions taken to reduce the vulnerability of the system to potential threats. See Appendix A to this part.
8. Routine use compatibility. Provide assurances that any records contained in the system that are disclosed outside the DoD shall be for a use that is compatible with the purpose for which the record was collected. Advise whether or not the blanket routine uses apply to this system.
- 9.

emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under section 6(b) of E.O. 12866 , Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804 . V. Executive Order 13771 This rule is not subject to E.O. 13771 , Reducing Regulation and Controlling Regulatory Costs, because this rule is not a significant regulatory action under E.O. 12866 . VI. Regulatory

Flexibility Act DoD, GSA, and NASA have prepared a Final Regulatory Flexibility Analysis (FRFA) consistent with the Regulatory Flexibility Act, 5 U.S.C. 601 , et seq. The FRFA is summarized as follows: This final rule is to revise the FAR to update and clarify the requirements for using the DD Form 254, Contract Security Classification Specification. The Government uses the DD Form 254 to convey security requirements to contractors when contract performance requires access to classified information. Prime contractors also use the DD Form 254 to convey security requirements to subcontractors that require access to classified information to perform on a subcontract. Subcontractors may also use the DD Form 254 if access to classified information is required to convey security requirements to additional subcontractors. There were no significant issues raised by the public comments in response to the initial regulatory flexibility analysis. The final rule will apply to small businesses awarded contracts or subcontracts by Executive agencies covered by the National Industrial Security Program that require access to classified information. Currently, the Defense Security Service monitors approximately 13,500 contractor facilities that are cleared for access to classified information. Approximately 9,000 facilities are considered less-complex, which includes small businesses and smaller security operations. Subject matter experts estimate that 5,400 (60 percent) of the 9,000 less-complex facilities are small businesses. The final rule does not impose any Paperwork Reduction Act reporting, recordkeeping, or other compliance requirements on any small entities. The rule does not impose any new reporting, recordkeeping or other compliance requirements. The rule does not duplicate, overlap, or conflict with any other Federal rules. DoD, GSA, and NASA were unable to identify any alternatives to the rule which would reduce the impact on small entities and still meet the requirements of the rule. Interested parties may obtain a copy of the FRFA from the Regulatory Secretariat Division. The Regulatory Secretariat Division has submitted a copy of the FRFA to the Chief Counsel for Advocacy of the Small Business Administration. VII. Paperwork Reduction Act The Paperwork Reduction Act (44 U.S.C. chapter 35) applies; however, the changes to the FAR do not impose (printed page 40063)

(viii)(A) When procuring supplies or services, the contracting officer shall ensure Supplier Performance Risk System (SPRS) assessments of price risk and supplier risk are considered as a part of the award decision. See 204.7603. (B) When procuring an end product identified by a material identifier that is available as described at PGI 204.7603, the contracting officer shall also consider SPRS assessments of item risk in the award decision. 10. Amend section 215.404-1 by adding paragraph (b)(viii) to read as follows: 215.404-1 Proposal analysis techniques. * * * * *

* (b) * * * (viii) When procuring a service or an end product identified by a material identifier that is available as described at PGI 204.7603, the contracting officer shall consider the Supplier Performance Risk System price risk assessments in determining if a proposed price is consistent with historical prices paid for an item or otherwise creates a risk to the Government. See also 215.403-3(a)(1). * * * * *

PART 216. TYPES OF CONTRACTS 11. Amend section 216.505 by adding paragraph (a)(S-71) to read as follows: 216.505 Ordering. (a) * * * (S-71) See 204.7603 for procedures on the required use of the Supplier Performance Risk System (SPRS) risk assessments. (i) The contracting officer shall ensure SPRS assessments of price risk and supplier risk are considered as a part of the award decision. (ii) When placing an order for an end product identified by a material identifier that is available as described at PGI 204.7603, and item risk was not previously considered during award of the contract, the contracting officer shall also consider SPRS assessments of item risk in the award decision. (iii) Use the provision at 252.204-7024, Notice on the Use of the Supplier Performance Risk System, as prescribed in 204.7604 to the extent permitted by the contract. * * * * *

PART 252. SOLICITATION PROVISIONS AND CONTRACT CLAUSES 12. Add section 252.204-7024 to read as follows: 252.204-7024 Notice on the Use of the Supplier Performance Risk System. As prescribed in 204.7604, use the following provision: Notice on the Use of the Supplier Performance Risk System (Mar 2023) (a) Definitions. As used in this provision-

Item risk means the probability that a product, based on intended use, will introduce performance risk resulting in safety issues, mission degradation, or monetary loss. Price risk means a measure of whether a proposed price for a product or service is consistent with historical prices paid for that item or service. Supplier risk means the probability that an award may subject the procurement to the risk of unsuccessful performance or to supply chain risk (see Defense Federal Acquisition Regulation Supplement 239.7301). (b) The Supplier Performance Risk System (SPRS), available at <https://piee.eb.mil/> , will be used in the evaluation of the Quoter or Offeror's performance. SPRS retrieves item, price, quality, delivery, and contractor information on contracts from Government (printed page 17340)

(Comment 1) Some comments state that it would be beneficial for the agency to provide the food

industry with a model form that could be used to record all the required information, with the option for the industry to use this form or established recordkeeping systems. One comment requests that the agency develop and provide respective freeware that could be available as a compact disc (CD) or downloaded from the FDA Web site well in advance of the compliance date of the final rule. A few comments request that the regulations make clear that the model form is guidance and is not mandatory. One comment suggests that as a way to show that the model form is guidance, the agency should place the model form in an appendix to the regulations. Several comments object to the inclusion of a model form in the regulations. The comments oppose using any one-size fits all generic form as an example or requirement. The comments suggest that affected businesses should decide the format in which the required records should be kept as dictated by specific business practices. The comments express concern that example forms might become informal requirements out in the field even though originally only meant as guidance. One comment recommends that the agency provide further examples of (printed page 71566) scenarios, rather than model forms, where records would be in compliance and noncompliance with the final regulations. In addition, several comments state that most food companies currently maintain the chain-of-distribution information that is required by these regulations. However, the diversity and complexity of the food industry means that the information is maintained in many different ways and formats, ranging from computerized records systems to file folders of paper records. The recordkeeping systems are designed to provide the necessary information to remove food from the market and prevent more food presenting the same risk from entering the market. The comments state that the regulations should not prescribe any specific manner or form of maintaining the information.

- Collaboration with JTF partners and other federal organizations: CSD staff worked closely with JTF partners on continued cooperation and planning to ensure that the five JTF publications remain current, and on the designation of additional special publications as JTF guidance. The CSD FISMA implementation project staff also collaborated with DOD, IC, the Department of Homeland Security (DHS), the Federal Emergency Management Agency (FEMA), the Government Accountability Office (GAO), OMB, GSA, the Small Business Administration (SBA), and the Inspector Generals (IGs) on multiple projects to ensure consistency with FISMA-related guidance and to protect information in a way that is commensurate with risk. In the past year, NIST continued to support the EAC in finalizing changes to the Voluntary Voting System Guidelines (VVSG) 1.1. These changes sought to improve the auditability of voting systems, provide greater software integrity protections, expand and improve access-control requirements, and help ensure that cryptographic security mechanisms are implemented properly. The EAC approved these updates to the VVSG in March 2015. In addition, NIST completed a set of draft test assertions for the security requirements in the VVSG. This included test assertions in the Services' (DHHS) Office for Civil Rights (OCR) co-hosted the eighth annual Health Insurance Portability and Accountability Act (HIPAA) Security Rule conference, Safeguarding Health Information: Building Assurance through HIPAA Security, in September 2015 in Washington, D.C. The conference offered important sessions that focused on broad topics of interest to the healthcare and health IT security community.

(Comment 48) One comment states it appears that rather than exempting convenience stores that sell food for immediate consumption, FDA has proposed a partial exemption such that records need be kept only for the nonexempt activities, but that is not clear in the proposed rule. FDA should either take a functional approach that allows facilities that sell food to consumers for immediate consumption to have a full exemption, or FDA should clarify that convenience stores and other facilities that make sales for immediate consumption need not maintain records for that part of their operation. (Response) Convenience stores and other covered facilities that sell to consumers are an example of a mixed-type facility. Food that the convenience store prepares and sells directly to consumers for immediate consumption (i.e., hot dogs, hot pretzels), is exempt from subpart J of this final rule under the restaurant exemption. Under § 1.337 of this final rule, the facility is required to keep records of the nontransporter and transporter immediate previous sources for all other food. The facility is not required to establish and maintain records to identify the nontransporter and transporter immediate subsequent recipients for sales of food to consumers, but must establish and maintain records to identify immediate subsequent recipients of food who are not consumers, as required by § 1.345 of this final rule, when such information is reasonably available, as discussed in response to comment 38. In addition, retail food establishments that employ 10 or fewer full-time equivalent employees are excluded from all of the requirements of subpart J in this final rule, except the record access provisions for existing records under §§ 1.361 and 1.363. (See response to comment 38 of this document for a further discussion of FDA's rationale underlying this

exclusion.) (Comment 49) Some comments state they are engaged in marketing products directly to the consumer through direct sales, mail order, Internet sales, and/or retail sales and urge FDA to clarify the scope of 'retail facilities' to include independent distributors in direct sales forces, mail order companies, or Internet sales operations, because it is apparent that neither Congress nor FDA intended for the recordkeeping requirement to encompass records of individual sales to consumers.

One commenter objected to CMMC level 1 annual affirmation, which they considered an unwarranted expansion of CUI safeguarding requirements to information systems that process only FCI. One commenter recommended revisions to explicitly indicate that OSAs may choose to engage the services of a C3PAO to inform the OSA's Level 1 self-assessment submission. Another commenter recommended editorial revisions to avoid use of the term 'CMMC security requirements' based on the observation that CMMC requirements are aligned directly to those identified in FAR clause 52.204-21 or NIST publications. One commenter asked for explanation of perceived differences between tables in the published rule that map CMMC Level 1 Security Requirements to NIST SP 800-171A Jun2018, as compared with prior versions of the document. One commenter asked for the rationale associated with mapping 15 requirements for CMMC level 1 to 17 requirements in CMMC level 2. Two commenters asked if systems that process FCI (and require CMMC level 1) are considered within scope for CMMC level 2 or 3 assessments, and if so, how they should be documented. Response: When applicable, the DoD does require an annual CMMC Level 1 self-assessment against the 15 safeguarding requirements aligned with FAR clause 52.204-21. Annual affirmations are required at every CMMC level. There are no explicit documentation requirements for a CMMC Level 1 Self-Assessment. The DoD modified the Level 1 Scoping Guide to provide clarity. An OSA may complete as many self-assessments as desired, and there is no required timeframe between Level 1 self-assessments and updating CMMC Status in SPRS. The entry in SPRS for CMMC Level 1 is a binary selection between Yes and No based on meeting all Level 1 security requirements. The CMMC Program verifies implementation of security requirements for FCI in accordance with FAR clause 52.204-21. The DoD has elected to use the CMMC Status postings and attestations in SPRS as the mechanism to verify compliance with applicable CMMC requirements. An OSA engaging an authorized C3PAO to perform the Level 1 self-assessment and then using the resulting CMMC Status when 'self-assessing' is permissible. The OSA however retains all the responsibilities and liabilities of the affirmation. No revisions to the rule were necessary. Writing style recommendations were not incorporated and no responses were provided to those comments based on comparison of pre-publication draft versions with those officially published for public comment. DoD aligned the security requirements for Level 1 exactly with those in FAR clause 52.204-21 and aligned the security requirements in Level 2 exactly with those in NIST SP 800-171 R2. The 15 security requirements in FAR clause 52.204-21, which make up CMMC Level 1, were mapped by NIST into 17 security requirements in NIST SP 800-171 R2. This was accomplished by splitting 1 requirement into 3 parts, while the other 14 align. Table 2 to § 170.15(c)(1)(ii) provides a mapping.

From the NIST SP 800-172 Rev 3 Final Public Draft: Platforms include operating systems, the NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 underlying computer architectures, or both. Platform-independent applications are 1874

ory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. Organizations are encouraged to review all draft publications during public comment periods and provide feedback to NIST. Many NIST cybersecurity publications, other than the ones noted above, are available at <https://csrc.nist.gov/publications>.
Comments on this publication may be submitted to: National Institute of Standards and Technology Attn: Applied Cybersecurity Division, Information Technology Laboratory 100 Bureau Drive (Mail Stop 2000) Gaithersburg, MD 20899-2000 Email: iotsecurity@nist.gov All comments are subject to release under the Freedom of Information Act (FOIA). ## Reports on Computer Systems Technology The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and

privacy of other than national security-related information in federal information systems. ##
Abstract This report provides a summary of the discussion and findings from the NIST Cybersecurity
Risks in Consumer Home Internet of Things (IoT) Devices virtual workshop in October 2020.

21 CFR part 123) should be sufficient and deemed adequate to meet the requirements under the Bioterrorism Act and that FDA should not introduce additional, stand alone, recordkeeping systems. (Response) As discussed in response to comment 79, § 1.330 of the final regulation states that duplication of existing records is not required if those records contain all of the information required by subpart J of this final rule. That includes records kept under the regulations identified in the comment. (Comment 85) One comment states that it would be beneficial if FDA announced the suitability of records kept under existing requirements well ahead of the implementation deadline under the Bioterrorism Act. (Response) FDA is not able to determine what records currently exist throughout the entire food industry that satisfy these regulations due to the diversity and complexity of the food industry and the various existing Federal, State, and local regulations that require recordkeeping, as well as varying business practices. The person subject to these regulations is responsible for ensuring that it keeps all applicable records and that those records are available to FDA under the record availability requirements in § 1.361 of this final rule. FDA points out that the earliest compliance date of this final rule is December 9, 2005, and that many persons are not required to comply with this final rule for up to 2 years after publication. Therefore, FDA believes that it has provided sufficient time for persons to determine what, if any, additional information must be kept to comply with these provisions well ahead of the compliance date of this final rule. (Comment 86) A few comments note that most food companies currently maintain the chain of distribution information that FDA proposed, but the diversity and complexity of the food industry means that the information is maintained in many different ways and formats, ranging from computerized records systems to file folders of paper records. The comments state that it should be of no concern to FDA and, therefore, not the subject of the regulations to prescribe any specific manner or form of maintaining the information. (Response) As discussed in response to comments 1 and 83 of this document and in the proposed rule, FDA's intent is to have as little impact as possible on current recordkeeping practices if those records can meet the requirements of these regulations. FDA is requiring specific information be kept by a covered person, but not specifying the form or type of system in which those records must be maintained. The person subject to these regulations is responsible for ensuring that it keeps all applicable records and that those records be made available to FDA under the record availability requirements in § 1.361 of this final rule. To satisfy the requirements in this final rule, paper or electronic records or a combination of the two may be used.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense General Services Administration National Aeronautics and Space Administration 48 CFR Parts 1, 2, 3, 4, 5, 7, 9, 11, 12, 15, 27, 33, 42, 52, and 53 [FAR Case 2017-016, Docket No. 2017-0016, Sequence No. 1] RIN 9000-AN56 AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA). ACTION: Proposed rule. SUMMARY: DoD, GSA, and NASA are proposing to amend the Federal Acquisition Regulation (FAR) to implement the National Archives and Records Administration's Controlled Unclassified Information Program enacted under an Executive Order entitled Controlled Unclassified Information. DATES: Interested parties should submit written comments to the Regulatory Secretariat Division at the address shown below on or before March 17, 2025 to be considered in the formation of the final rule. ADDRESSES: Submit comments in response to FAR Case 2017-016 to the Federal eRulemaking portal at <https://www.regulations.gov> by searching for 'FAR Case 2017-016'. Select the link 'Comment Now' that corresponds with 'FAR Case 2017-016'. Follow the instructions provided on the 'Comment Now' screen. Please include your name, company name (if any), and 'FAR Case 2017-016' on your attached document. If your comment cannot be submitted using <https://www.regulations.gov>, call or email the points of contact in the FOR FURTHER INFORMATION CONTACT section of this document for alternate instructions. Instructions: Please submit comments only and cite 'FAR Case 2017-016' in all correspondence related to this case. Public comments may be submitted as an individual, as an organization, or anonymously (see frequently asked questions at <https://www.regulations.gov/faq>). Comments submitted in response to this rule will be made

publicly available and are subject to disclosure under the Freedom of Information Act. For this reason, please do not include in your comments information of a confidential nature, such as sensitive personal information or proprietary information, or any information that you would not want publicly disclosed unless you follow the instructions below for confidential comments. Summary information of the public comments received, including any specific comments, will be posted on <https://www.regulations.gov>.

Classified sessions will be held only at a USG installation or a cleared contractor facility where adequate physical security and procedural controls have been approved. The authorizing USG agency is responsible for evaluating and approving the location proposed for the meeting. (4) Security arrangements for meetings. The contractor will develop the security measures and procedures to be used and obtain the authorizing agency's approval. The security arrangements must provide: (i) Announcements. Approval of the authorizing agency will be obtained for all announcements of the meeting. (A) Announcements will be unclassified and will be limited to a general description of topics expected to be presented, names of speakers, and administrative instructions for requesting invitations or participation. Classified presentations will not be solicited in the announcement. (B) When the meeting has been approved, announcements may only state that the USG agency has authorized the conduct of classified sessions and will provide necessary security assistance. (C) The announcement will further specify that security clearances and justification to attend classified sessions are to be forwarded to the authorizing agency or its designee. (D) Invitations to foreign persons will be sent by the authorizing USG agency. (ii) Clearance and need-to-know. All persons in attendance at classified sessions will possess the requisite clearance and need-to-know for the information to be disclosed. (A) Need-to-know will be determined by the authorizing agency or its designee based on the justification provided. (B) Attendance will be authorized only to those persons whose security clearance and justification for attendance have been verified by the security officer of the organization represented. (C) The names of all authorized attendees or participants must appear on an access list with entry permitted to the classified session only after verification of the attendee's identity based on presentation of official photographic identification such as a passport, contractor or USG identification card. (iii) Presentations. Classified information must be authorized for disclosure in advance by the USG agency having jurisdiction over the information to be presented. (A) Individuals making presentations at meetings will provide sufficient classification guidance to enable attendees to identify what information is classified and the level of classification. (B) Classified presentations will be delivered orally or visually. (C) Copies of classified presentation materials will not be distributed at the classified meeting, and any classified notes or electronic recordings of classified presentations will be classified, safeguarded, and transmitted as required by this rule. (iv) Physical security.

) on behalf of the DoD. The OSC must complete and achieve a MET result for all security requirements specified in table 1 to § 170.14(c)(4) to achieve the CMMC Status of Level 3 (DIBCAC). DCMA DIBCAC will submit the Level 3 certification assessment results into the CMMC instantiation of eMASS, which then provides automated transmission to SPRS. To maintain compliance with the requirements for a CMMC Status of Level 3 (DIBCAC), the Level 3 certification assessment must be performed every three years for all information systems within the Level 3 CMMC Assessment Scope. In addition, given that compliance with Level 2 requirements is a prerequisite for applying for CMMC Level 3, a Level 2 (C3PAO) certification assessment must also be conducted every three years to maintain CMMC Level 3 (DIBCAC) status. Level 3 certification assessment must be completed within three years of the CMMC Status Date associated with the Final Level 3 (DIBCAC) or, if there was a POA&M, then within three years of the CMMC Status Date associated with the Conditional Level 3 (DIBCAC). (i) Inputs into the CMMC instantiation of eMASS. The Level 3 certification assessment results input into the CMMC instantiation of eMASS shall include, at minimum, the following items: (A) Date and level of the assessment. (B) For each Assessor(s) conducting the assessment, name and government organization information. (C) All industry CAGE code(s) associated with the information system(s) addressed by the CMMC Assessment Scope. (D) The name, date, and version of the system security plan(s) (SSP). (E) CMMC Status Date. (F) Result for each security requirement objective. (G) POA&M usage and compliance, as applicable. (H) List of the artifact names, the return value of the hashing algorithm, and the hashing algorithm used. (ii) Conditional Level 3 (DIBCAC). The OSC has achieved the CMMC Status of Conditional Level 3 (DIBCAC) if the Level 3 certification assessment results in a POA&M and the POA&M meets all CMMC Level 3 POA&M requirements listed in § 170.21(a)(3). (A) Plan of Action and Milestones. A Level 3 POA&M is allowed only in accordance with the CMMC POA&M requirements listed in § 170.21. (B) POA&M closeout. The OSC must remediate any NOT MET

requirements, must undergo a POA&M closeout certification assessment from DCMA DIBCAC, and DCMA DIBCAC must post compliance results into the CMMC instantiation of eMASS within 180 days of the CMMC Status Date associated with the Conditional Level 3 (DIBCAC). If the POA&M is not successfully closed out within the 180-day timeframe, the Conditional Level 3 (DIBCAC) CMMC Status for the information system will expire. If Conditional Level 3 (DIBCAC) CMMC Status expires within the period of performance of a contract, standard contractual remedies will apply, and the OSC will be ineligible for additional awards with a requirement for the CMMC Status of Level 3 (DIBCAC) for the information system within the CMMC Assessment Scope until such time as a new CMMC Status is achieved.

DoD does not agree with a commentor's statement that Specialized Assets are not actually assessed against CMMC security requirements. As documented in § 170.19, Specialized Assets are identified by the OSC. Assessment requirements of Specialized Assets differ between CMMC Level 2 and CMMC Level 3. If Specialized Assets are part of a CMMC Level 2 assessment, the OSA must document them in the asset inventory, document them in the SSP, and show how these assets are managed using the contractor's risk-based security policies, procedures, and practices. If Specialized Assets are part of a CMMC Level 3 assessment, they must be assessed against all CMMC Level 2 security requirements and CMMC Level 3 security requirements, identified in § 170.14(c)(4). DoD agrees with one comment that even if NIST SP 800-171 R2 cannot be implemented, that does not mean the Specialized Assets cannot be secured. CMMC requirements are defined to align directly to NIST SP 800-171 R2 and NIST SP 800-172 Feb2021 requirements. For additional ease of burden, at Level 1, IoT and OT are not in scope, at Level 2 there are reduced requirements, but they become in-scope at Level 3, unless they are physically or logically isolated. DoD has reviewed the text and declines to change the definition of Out-of-scope assets because CUI should not (printed page 83140) be transmitted via clear-text per NIST SP 800-171 R2. The DoD has reviewed the suggested changes to asset categories and scoping tables and declines to make an update. The asset categories in the rule help the OSA understand the requirements of various asset types that might be found within the assessment boundary. OSAs determine the asset categories and assessment scope based on how and where they will process, store, and transmit FCI and CUI. DoD cannot comment on the suitability of any specific approach or technology to successfully implement CMMC security requirements.

b. Virtual Desktop Infrastructure
Comment: Several comments requested clarification on the use of Virtual Desktop Infrastructures and how to scope its components. Response: The rule has been updated in table 3 to § 170.19(c)(1) and table 5 to § 170.19(d)(1) to state that an endpoint hosting a VDI client configured to not allow any processing, storage, or transmission of FCI and CUI beyond the Keyboard/Video/Mouse sent to the VDI client is considered out of scope.

c. Contractor Risk Managed Assets
Comment:

(2) In all orders and blanket purchase agreements involving the development or delivery of any information technology, whether acquired as a service or as a supply, consider the need for an evaluation factor regarding supply chain risk (see subpart 239.73). PART 212-ACQUISITION OF COMMERCIAL ITEMS 4. Amend section 212.301 by:

a. Revising paragraph (f)(xiv);

b. Redesignating:

i. Paragraphs (f)(liii) through (f)(lxv) as (f)(lvi) through (f)(lxvii); and

ii. Paragraphs (f)(lxv) through (f)(liii) as (f)(lxvi) through (f)(liii).

c. Adding new paragraphs (f)(xv), (f)(liv), and (f)(lv). Revision and additions to read as follows:

212.301 Solicitation provisions and contract clauses for the acquisition of commercial items.

(f) * * * (xiv) Use the provision 252.215-7008, Only One Offer, as prescribed at 215.408(4); (xv) Use the clause at 252.219-7003, Small Business Subcontracting Plan (DoD Contracts), as prescribed in 219.708(b)(1)(A)(1), to comply with 15 U.S.C. 637 . Use the clause with its Alternate I when prescribed in 219.708(b)(1)(A)(2). * * *

* * * (liv) Use the provision at 252.239-7017, Notice of Supply Chain Risk, as prescribed in 239.7306(a), to comply with section 806 of Public Law 111-383 , in all solicitations for contracts involving the development or delivery of any information technology, whether acquired as a service or as a supply. (lv) Use the clause at 252.239-7018, Supply Chain Risk, as prescribed in 239.7306(b), to comply with section 806 of Public Law 111-383 , in all solicitations and contracts involving the development or delivery of any information technology, whether acquired as a service or as a supply. * * * * *

PART 215-CONTRACTING BY NEGOTIATION 5. Amend section 215.304 by adding new paragraph (c)(v) to read as follows:

215.304 Evaluation factors and significant subfactors. (c) * * * (v) In all solicitations and contracts involving the development or delivery of any information technology, whether acquired as a service or as a supply, consider the need for an evaluation factor regarding supply chain risk (see subpart 239.73).

6. Add new subpart 215.5 to read as follows:

Subpart 215.5-Preaward, Award, and Postaward Notifications, Protests, and Mistakes

215.503 Notifications to unsuccessful offerors. 215.506 Postaward debriefing of offerors.

Subpart 215.5-Preaward, Award, and Postaward Notifications, Protests, and Mistakes 215.503 Notifications to unsuccessful offerors. If the Government exercises the authority provided in 239.7305(d), the notifications to unsuccessful offerors, either preaward or postaward, shall not reveal any information that is determined to be withheld from disclosure in accordance with section 806 of the National Defense Authorization Act for Fiscal Year 2011, as amended by section 806 of the (printed page 69271) National Defense Authorization Act for Fiscal Year 2013 (see subpart 239.73). 215.506 Postaward debriefing of offerors.

| 3.11.6e | ENHANCED SECURITY REQUIREMENT Assess, respond to, and monitor supply chain risks associated with organizational systems and system components. | ENHANCED SECURITY REQUIREMENT Assess, respond to, and monitor supply chain risks associated with organizational systems and system components.

- What processes and assets require PNT data (direct recipients of PNT services)? - What processes and assets are dependent on other assets that require PNT data (i.e., what are the secondary effects)? - What processes and assets are vulnerable to the disruption or manipulation of PNT services? - What are the integrity and availability thresholds of PNT to avoid mission impact? - What safeguards are available? - What is the impact to the organization should a process or asset be lost or degraded? - What techniques can be used to detect events of concern? - What techniques can be used to respond to events of concern? - What techniques can be used to recover pre-event capabilities?

(A) To protect ongoing investigations and to protect from access criminal investigation information contained in this record system, so as not to jeopardize any subsequent judicial or administrative process taken as a result of information contained in the file. (B) From subsection (c)(3) because the release of the disclosure accounting, for disclosures pursuant to the routine uses published for this system, would permit the subject criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (C) From subsection (c)(4) because an exemption is being claimed for subsection this subsection will not be applicable. (D) From subsection (d) because access the records contained in this system would inform the subject of an investigation of existence of that investigation, provide subject of the investigation with information that might enable him to avoid detection, and would present a serious impediment to law enforcement. (E) From subsection (e)(4)(H) because system of records is exempt from individual access pursuant to subsection (j) of the Privacy Act of 1974. (F) From subsection (f) because this system of records has been exempted from access provisions of subsection (d). (5) System identifier and name. F031 AF SF A, Correction and Rehabilitation Records. (i) Exemption. Parts of this system may be exempt pursuant to 5 U.S.C. 552a(j)(2) if information is compiled and maintained by a component of the agency which performs as its principle function any activity pertaining to the enforcement of criminal laws. Portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(j) (2) from the following subsections of 5 U.S.C. 552a(c)(3) , (c)(4), (d), (e)(3), (e)(4)(G), (H) and (I), (e)(5), (e)(8), (f), and (g). (ii) Authority. 5 U.S.C. 552a(j)(2) . (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting, for disclosures pursuant to the routine uses published for this system, would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (c)(4) because an exemption is being claimed for subsection (d), this subsection will not be applicable. (C) From subsection (d) because access to the records contained in this system would inform the subject of a criminal investigation of the existence (printed page 14737) of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement.

IBM Secure Execution for Linux is a hardware-based security technology that is built into the IBM z15T and LinuxONE III generation systems. It is designed to provide scalable isolation for individual workloads to help protect them from not only external attacks but also insider threats. Secure Execution provides isolation between a kernel-based VM (KVM) hypervisor host and guests in virtual environments. This level of vertical isolation is designed to remove the ability for administrators to have total visibility into the sensitive workloads being hosted on VMs and individual containers. Secure Execution provides hardened access restrictions to protect intellectual property and proprietary secrets while allowing administrators to manage and deploy

workloads as black boxes and continue normal job functions. Secure Execution also helps enterprises provide isolation between individual multi-tenant workloads running on a shared logical partition. Details of IBM Secure Execution for Linux can be found in [81].

The CMMC Assessment Process (CAP) v2.0, published by the Cyber AB in December 2024, is the official procedural guide for C3PAOs conducting CMMC Level 2 certification assessments. The CAP defines: 1. **Pre-assessment activities**: Scoping, scheduling, assessment team composition 2. **Assessment execution**: Evidence collection, interviews, technical testing across all 110 requirements 3. **Scoring methodology**: MET, NOT MET, NOT APPLICABLE for each requirement 4. **Reporting**: Assessment report format, findings documentation 5. **Certification recommendation**: Conditional or final certification criteria 6. **Closeout**: POA&M remediation verification within 180 days The CAP ensures consistency across all C3PAO assessments and provides organizations with a clear understanding of what to expect during a CMMC Level 2 assessment.

Paragraph (d) of the new clause 52.239-YY requires a contractor that develops, implements, operates, or maintains a FIS using non-cloud computing services and that FIS is designated as a moderate or high FIPS Publication 199 impact, to perform an annual, independent assessment of the security of each FIS, which includes an architectural review and penetration testing of the FIS. The contractor must also conduct, at least annually, cyber threat hunting and vulnerability assessment to search for cybersecurity risks, vulnerabilities, and indicators of compromise. Contractors are required to provide the contracting officer with the results of both assessments, including any recommended improvements or risk mitigations identified for the FIS. If the Government chooses not to require the contractor to implement a recommended improvement or risk mitigation and provides the contractor with a rationale for not implementing the recommendation, the contractor is required to document the Government's rationale for not implementing the recommendation in the contractor's system security plan. Of the 140 non-cloud FISs currently being operated or maintained by contractors on behalf of the Government, the Government estimates that approximately 95 percent of those systems are designated as moderate or high FIPS 199 impacts. Applying that percentage to the estimated number of contractors annually awarded a contract to develop, implement, operate, or maintain a non-cloud FIS, it is estimated that 27 contractors (95 percent * 28 contractors) will be subject to the annual assessment requirements. Based on the discussion in paragraphs IV.B.3.i. through IV.B.3.iii. below, the total annual estimated cost for 27 contractors that operate or maintain a non-cloud FIS designated as a moderate or high FIPS 199 impact to comply with the annual assessment requirements of the rule is approximately \$6.6 million (27 contractors * (\$112,000 + \$132,000 + \$182)). The cost of the annual assessments accounts for the time it takes contractors to prepare for, conduct, document, review, and submit an assessment. i. Annual Independent Architectural Review and Penetration Test. This annual assessment includes an architectural review of the FIS, as well as penetration testing of the system. Based on the input of subject matter experts, the Government estimates the annual cost for a contractor to obtain an independent security assessment and architectural review of a FIS is approximately \$52,000. The Government estimates that four senior level employees will expend a total of 320 hours (4 individuals * 8 hours * 10 days) to complete the penetration testing of a FIS. According to subject matter experts, the average loaded wage rate of for a penetration tester is \$250.00. The Government estimates the annual cost for a contractor to obtain independent penetration testing of a FIS is \$80,000 (320 hours * \$250).

MA.L2-3.7.5 · Nonlocal Maintenance CMMC Assessment Guide · Level 2 | Version 2.13 153 FURTHER DISCUSSION Nonlocal maintenance activities must use multifactor authentication. Multifactor authentication requires at least two factors, such as: · something you know (e.g., password, personal identification number [PIN]); · something you have (e.g., cryptographic identification device, token); or · something you are (e.g., biometric fingerprint or facial scan). Requiring two or more factors to prove your identity increases the security of the connection. Nonlocal maintenance activities are activities conducted from external network connections such as over the internet. After nonlocal maintenance activities are complete, shut down the external network connection. This requirement, MA.L2-3.7.5 specifies the addition of multifactor authentication for remote maintenance sessions and complements five other requirements dealing with remote access (AC.L2-3.1.12, AC.L2-3.1.14, AC.L2-3.1.13, AC.L2-3.1.15, and IA.L2-3.5.3): · AC.L2-3.1.12 requires the control of remote access sessions. · AC.L2-3.1.14 limits remote access to specific access control points. · AC.L2-3.1.13 requires the use of cryptographic mechanisms when enabling remote sessions. · AC.L2-3.1.15 requires authorization for privileged commands executed during a remote session. · Finally, IA.L2-3.5.3 requires multifactor authentication for network access to non-

privileged accounts. Example You are responsible for maintaining your company's firewall. In order to conduct maintenance while working remotely, you connect to the firewall's management interface and log in using administrator credentials. The firewall then sends a verification request to the multifactor authentication app on your smartphone [a]. You need both of these things to prove your identity [a]. After you respond to the multifactor challenge, you have access to the maintenance interface. When you finish your activities, you shut down the remote connection by logging out and quitting your web browser [b]. Potential Assessment Considerations · Is multifactor authentication required prior to maintenance of a system when connecting remotely from outside the system boundary [a]? · Are personnel required to manually terminate remote maintenance sessions established via external network connections when maintenance is complete, or are connections terminated automatically through system session management mechanisms [b]?

labor hour estimates for authorized or certified assessors to work with the business to conduct the actual assessment Assessment Costs broken down into phases Phase 1: Planning and preparing for the assessment Phase 2: Conducting the assessment (self or C3PAO) Phase 3: Reporting of Assessment Results Phase 4: POA&M Closeout (for CMMC Level 3 only, if applicable and allowed) CMMC allows a limited open Plan of Action and Milestones (POA&M) for a period of 180 days to remediate the POA&M, see §.170.21. 4. Affirmations: Estimates consist of costs for an OSA to submit to SPRS an initial and, as applicable, any subsequent affirmations of compliance that the contractor information system is compliant with and will maintain compliance with the security requirements of the applicable CMMC Level. If POA&Ms are allowed, an affirmation must be submitted with the POA&M closeout. With the exception of Small Entities for Level 1 and Level 2, it is assumed the task requires the same labor categories and estimated hours as the final reporting phase of the assessment. The categories and rates used for estimating purposes were compiled by subject matter experts based on current data available from within the DoD contractor database for comparable labor categories. A factor estimate of 30 percent was added to the labor rate per hour to include but are not limited to company-sponsored benefits (fringe) and limited employee-related expenses such as training and certifications. This estimate is based on labor performed by indirect personnel (i.e., personnel who are part of overhead expense); therefore, the 30 percent factor represents an estimate for fringe expense and G&A expenses versus full overhead expense. The categories and rates inclusive of the labor cost plus the additional factor are defined in the table. (printed page 83181) CMMC Level 1 Self-Assessment and Affirmation Costs Other Than Small Entities Nonrecurring and recurring engineering costs: There are no nonrecurring or recurring engineering costs associated with CMMC Level 1, since it is assumed that the contractor or subcontractor has already implemented the applicable security requirements. [46] Assessments Costs: It is estimated that the cost to support a CMMC Level 1 self-assessment and affirmation is *\$4,042 (as summarized in 4.1.2, table 9). A Level 1 self-assessment is conducted annually, and is based on the assumptions detailed: Phase 1: Planning and preparing for the self-assessment: \$1,146 A director (MGMT5) for 4 hours (\$190.52/hr × 4hrs = \$762) A manager (MGMT2) for 4 hours (\$95.96/hr × 4hrs = \$384) Phase 2: Conducting the self-assessment: \$1,728 A director (MGMT5) for 6 hours (\$190.52/hr × 6hrs = \$1,143) A staff IT specialist (IT4) for 6 hours (\$97.49/hrs × 6hrs = \$585) Phase 3: Reporting of self-assessment results into SPRS: \$584 A director (MGMT5) for 2 hours (\$190.52/hr × 2hrs = \$381) A staff IT specialist (IT4) for 2.08 hours (\$97.49/hrs × 2.08hrs = \$203) Affirmations:

The Department of the Army is proposing to amend a system of records notice in its existing inventory of records systems subject to the Privacy Act of 1974, (5 U.S.C. 552a), as amended. DATES: This proposed action will be effective without further notice on (insert date thirty days after publication in Federal Register) unless comments are received which result in a contrary determination. ADDRESSES: Department of the Army, Freedom of Information/Privacy Division, U.S. Army Records Management and Declassification Agency, ATTN: AHRC-PDD-FPZ, 7701 Telegraph Road, Casey Building, Suite 144, Alexandria, VA 22325-3905. FOR FURTHER INFORMATION CONTACT: Ms. Mary Smith at (703) 000-0000. SUPPLEMENTARY INFORMATION: The Department of the Army systems of records notices subject to the Privacy Act of 1974, (5 U.S.C. 552a), as amended, have been published in the Federal Register and are available from the address above. The specific changes to the records systems being amended are set forth below followed by the notices, as amended, published in their entirety. The proposed amendments are not within the purview of subsection (r) of the Privacy Act of 1974, (5 U.S.C. 552a), as amended, which requires the submission of a new or altered system report. Dated: February 3, 2006. John Miller, OSD Federal Register Liaison Officer, Department of Defense. A0055 USEUCOM System name: Europe Command Travel Clearance Records (August 23, 2004, 69 FR 51817). Changes: * * * * * System name: Delete system identifier and replace with:

·A0055 USEUCOM DoD·. * * * * * A0055 USEUCOM DoD System name: Europe Command Travel Clearance Records. System location: Headquarters, United States European Command, Computer Network Operations Center, Building 2324, P.O. Box 1000, APO AE 09131-1000. Categories of individuals covered by the system: Military, DoD civilians, and non-DoD personnel traveling under DoD sponsorship (e.g., contractors, foreign nationals and dependents) and includes temporary travelers within the United States European Command's (USEUCOM) area of responsibility as defined by the DoD Foreign Clearance Guide Program. Categories of records in the system: Travel requests, which contain the individual's name; rank/pay grade; Social Security Number; military branch or department; passport number; Visa Number; office address and telephone number, official and personal email address, detailed information on sites to be visited, visitation dates and purpose of visit. Authority for the maintenance of the system: 10 U.S.C. 3013 , Secretary of the Army; 10 U.S.C. 5013 , Secretary of the Navy; 10 U.S.C. 8013 , Secretary of the Air Force; DoD 4500.54-G, Department of Defense Foreign Clearance Guide; Public Law 99-399, Omnibus Diplomatic Security and Antiterrorism Act of 1986; 22 U.S.C. 4801 , 4802 , and 4805 , Foreign Relations and Intercourse; E.O. 12333 , United States Intelligence Activities; Army Regulation 55-46, Travel Overseas; and E.O. 9397 (SSN). Purpose(s):

) require the specification of a revision to a standard. Specifying a revision benefits the CMMC Ecosystem by ensuring it moves forward from one NIST standard to the next in an organized manner. The DoD cites NIST SP 800-171 R2 in this final rule for a variety of reasons, including the time needed for industry preparation to implement and time needed to prepare the CMMC Ecosystem to perform assessments against subsequent revisions. DoD is unable to incorporate suggestions that CMMC assessments be aligned to whichever NIST revision is current at the time of solicitation. Comments on the specifics on NIST SP 800-171 Revision 3 should be directed to NIST. 8. Affirmation. Commenters expressed confusion regarding the definition of the Affirming Official as well as how the affirmation process works i.e., is the affirmation for each company or the whole supply chain. One commenter also expressed confusion regarding whether an affirmation was required at each certification level annually. DoD Response. The rule was modified to include a definition for Affirming Official in § 170.4. The DoD considered the recommended text revisions and modified the text for added clarity about affirmations. DoD's use of the term OSA within the affirmations section is deliberate and conveys that each organization is responsible for affirmations pertaining to their own assessments. To help clarify the point in question, § 170.22(a)(1) addresses Affirming Official and has been revised to clarify that CMMC affirmations shall be submitted by the OSA and apply only to the information systems of that organization. The DoD deems that the requirement to annually affirm continuing compliance with the CMMC requirements at the designated CMMC Level and following the procedures in § 170.22 is not a significant additional burden. The requirement for annual affirmations takes the place of an annual recertification and ensures the Affirming Official responsible for CMMC requirements is monitoring compliance. 9. Alternatives. Several commenters provided suggestions for alternative means to implement verification of compliance with cybersecurity standards. These suggestions included the following: Provide flexibility for the CMMC AB to allow a C3PAO partial assessment of perspective Managed Service Providers. Allow small businesses to continue performing self-assessments and self-certify along with increasing the support provided to small business from DC3 to expand paying for consultants to assist with compliance as well as paying for small businesses assessments, Integrate cybersecurity and traditional counterintelligence measures, establishing a secure software development environment in a cloud that DoD hosts, as well as providing a secure environment in which small businesses could operate. Require Prime contractors to assume the cost of CMMC for their supply chain. Only assess a sampling of the Defense Industrial Base. Increase the Certification validity time period from 3 to 10 years.

The FTC urges that you immediately place an initial fraud alert on your credit file. The Fraud alert is for a period of 90 days, during which, creditors are required to contact you before a new credit card is issued or an existing card changed. The site also provides other valuable information that can be taken now or in the future if problems should develop. The DoD takes this loss very seriously and is reviewing its current policies and practices with a view of determining what must be changed to preclude a similar occurrence in the future. At a minimum, we will be providing additional training to personnel to ensure that they understand that personally identifiable information must at all times be treated in a manner that preserves and protects the confidentiality of the data. We deeply regret and apologize for any inconvenience and concern this theft may cause you. Should you have any questions, please call _____. Sincerely, Signature Block (Directorate

level or higher) Appendix C to Part 310-DoD Blanket Routine Uses (See paragraph (c) of § 310.22 of subpart E)

A. Routine Use-Law Enforcement If a system of records maintained by a DoD Component to carry out its functions indicates a violation or potential violation of law, whether civil, criminal, or regulatory in nature, and whether arising by general statute or by regulation, rule, or order issued pursuant thereto, the relevant records in the system of records may be referred, as a routine use, to the agency concerned, whether Federal, State, local, or foreign, charged with the responsibility of investigating or prosecuting such violation or charged with enforcing or implementing the statute, rule, regulation, or order issued pursuant thereto.

B. Routine Use-Disclosure When Requesting Information A record from a system of records maintained by a Component may be disclosed as a routine use to a Federal, State, or local agency maintaining civil, criminal, or other relevant enforcement information or other pertinent information, such as current licenses, if necessary to obtain information relevant to a Component decision concerning the hiring or retention of an employee, the issuance of a security clearance, the letting of a contract, or the issuance of a license, grant, or other benefit.

C. Routine Use-Disclosure Of Requested Information A record from a system of records maintained by a Component may be disclosed to a Federal agency, in response to its request, in connection with the hiring or retention of an employee, the issuance of a security clearance, the reporting of an investigation of an employee, the letting of a contract, or the issuance of a license, grant, or other benefit by the requesting agency, to the extent that the information is relevant and necessary to the requesting agency's decision on the matter.

D. Routine Use-Congressional Inquiries

Establishing uniform requirements for the Government and contractors regarding FISs will significantly assist the Government in protecting Federal information and systems from malicious cyber campaigns that threaten the public and private sectors' security and (printed page 68406) privacy. Currently, contract requirements for the cybersecurity standards of unclassified FISs are largely based on agency-specific policies and regulations, which can lead to inconsistent security requirements across contracts and unclear, inconsistent, or overly restrictive guidance to contractors. This rule will provide a more consistent and streamlined implementation of cybersecurity standards across the Federal Government.

A. Affected Entities This rule proposes two new contract clauses for use when acquiring services to develop, implement, operate, or maintain a FIS. Specifically, the contracting officer will include-

- The clause at FAR 52.239-YY, Federal Information Systems Using Non-Cloud Computing Services, in solicitations and contracts that use or may use non-cloud computing services in performance of the contract; and
- The clause at FAR 52.239-XX, Federal Information Systems Using Cloud Computing Services, in solicitations and contracts that use or may use cloud computing services in performance of the contract.

According to subject matter experts, there are approximately 140 non-cloud FISs currently being operated or maintained by contractors on behalf of the Government. For this estimate, the Government conservatively assumes that the services for each of these non-cloud FISs are awarded on individual contracts and that each contract is awarded to a unique entity. It is assumed that each of these contracts have a five-year period of performance, and that the Government evenly awards the estimated 140 contracts over a five-year period (20 percent each year). Therefore, the Government estimates it awards 28 contracts ((20 percent * 140 non-cloud FISs) * 1 contract/FIS) to 28 unique contractors (28 contracts = 28 unique entities) annually for the development, implementation, operation, or maintenance of a non-cloud FIS on behalf of the Government.

, but only to the extent that such material would reveal the identity of a confidential source. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k) (5) from the following subsections of 5 U.S.C. 552a(c)(3) , (d), (e)(4)(G), (H), and (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons. To protect the identity of those who give information in confidence for personnel security and related investigations. Fear of harassment could cause them to refuse to give this information in the frank and open way needed to pinpoint areas in an investigation that should be expanded to resolve charges of questionable conduct. (16) System identifier and name. F036 AF PC P, Applications for Appointment and Extended Active Duty Files. (i) Exemption. Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for federal civilian employment, military service, federal contracts, or access to classified information may be exempt pursuant to 5 U.S.C. 552a(k)(5) , but only to the extent that such material would reveal the identity of a confidential source. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k) (5) from the following subsection of 5 U.S.C. 552a(d) . (ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons. To protect the identity of confidential sources who furnish information necessary

to make determinations about the qualifications, eligibility, and suitability of health care professionals who apply for Reserve of the Air Force appointment or inter-service transfer to the Air Force. (17) System identifier and name. F036 AF DPG, Military Equal Opportunity and Treatment. (i) Exemption. Investigative material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2), may be exempt pursuant to 5 U.S.C. 552a(k)(2). However, if an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance (printed page 14742) of the information, the individual will be provided access to the information exempt to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (f)(17)(i). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(2) from the following subsections of 5 U.S.C. 552a(d), (e)(4)(H), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2). (iii) Reasons.

At that time, the Security Rule applied directly only to covered entities. As discussed above, Congress later extended the application of the Security Rule directly to business associates. Take measures to provide assurance that available inventory is in accordance with quantities listed on the inventory schedules. Quantities may be verified by actual item count, acceptance of labeled quantities in unopened/sealed packages, scale counts, or other appropriate methods. (c) Condition. Ensure that the physical condition of the property is reasonably consistent with the Federal Condition Code supplied by the contractor. 245.602-3 Screening. Property will be screened DoD-wide, including the contracting agency, requiring agency, and, as appropriate, the General Services Administration. The requiring agency shall have priority for retention of listed items. All required screening must be completed before any sale of contractor inventory, including contractor inventory in overseas locations (foreign excess personal property) can take place. Upon request of the prospective reutilization, transfer, donation, or sales customer, the plant clearance officer shall arrange for inspection of property at the contractor's plant in such a manner as to avoid interruption of the contractor's operations, and consistent with any security requirements. (

printed page 52143) 245.602-70 Plant clearance procedures. Follow the procedures at PGI 245.602-70 for establishing and processing a plant clearance case. 245.604 Disposal of surplus property. 245.604-3 Sale of surplus property. (a) Plant clearance officers shall determine a best value sales approach (formal or informal sales), to include due consideration for costs, risks, and benefits, e.g., potential sales proceeds. (b) Informal bid procedures. The plant clearance officer may direct the contractor to issue informal invitations for bid (orally, telephonically, or by other informal media), provided: (1) Maximum practical competition is obtained; (2) Sources solicited are recorded; and (3) Informal bids are confirmed in writing. (c) Sale approval and award. Plant clearance officers shall: (1) Evaluate bids to establish that the sale price is fair and reasonable, taking into consideration: (i) Knowledge or tests of the market; (ii) Current published prices for the property; (iii) The nature, condition, quantity, and location of the property; and (iv) Past sale history for like or similar items; (2) Approve award to the responsible bidder whose bid is most advantageous to the Government. The plant clearance officer shall not approve award to any bidder who is an ineligible transferee, as defined in 252.245-7004, Reporting, Reutilization, and Disposal; and (3) Notify the contractor of the bidder to whom an award will be made within five working days from receipt of bids. (d) Noncompetitive sales. (1) Noncompetitive sales include purchases or retention at less than cost by the contractor. Noncompetitive sales may be made when: (i) The plant clearance officer determines that this method is essential to expeditious plant clearance; and (ii) The Government's interests are adequately protected.

Because a notice of proposed rulemaking and an opportunity for public comment are not required to be given for this rule under 41 U.S.C. 1707(a)(1) (see section III. of this preamble), the analytical requirements of the Regulatory Flexibility Act (5 (printed page 24895) U.S.C. 601 et seq.) are not applicable. Accordingly, no regulatory flexibility analysis is required and none has been prepared. VII. Paperwork Reduction Act The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). List of Subjects in 48 CFR Parts 204 and 252 Government procurement Amy G. Williams, Deputy, Defense Acquisition Regulations System. Therefore, 48 CFR parts 204 and 252 are amended as follows: 1. The authority citation for parts 204 and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1 . PART 204-ADMINISTRATIVE MATTERS 204.1105 [Removed] 2. Remove section 204.1105. PART 252-SOLICITATION PROVISIONS AND CONTRACT CLAUSES 252.204-7004 [Removed and Reserved] 3. Remove and reserve section 252.204-7004. [FR Doc. 2018-11347 Filed 5-29-18; 8:45 am] BILLING CODE 5001-06-P

Two comments stated that the interim final rule lacks sufficient safeguards to limit the sharing and use of personally identifiable information and content of private communications. Response: The program utilizes significant handling and sharing restrictions to ensure appropriate protections for any and all sensitive information managed by the program, including but not limited to PII. These safeguards are addressed in more detail in the PIA, which will be updated appropriately as the program evolves. No change is made to the rule. Comment: Three comments recommended that the rule should require companies to remove sensitive information (e.g., PII), and to anonymize as much information as possible (printed page 62433) without hindering cyber security efforts, and that the Government should immediately dispose of inadvertently collected PII that is not directly relevant to the cyber incident. Response: DoD agrees with the underlying premise of the comment, and the DIB CS/IA program uses procedures to minimize the collection and sharing of PII. The DIB participants remove unnecessary sensitive information (e.g., PII), and only share information if it is relevant to a cyber incident (e.g., for forensics or cyber intrusion damage assessment). All PII received by DoD is provided voluntarily by authorized DIB company representatives and is subject to mutually agreed upon restrictions for cyber security purposes. In addition, the DIB participants are required, prior to sharing any information with the Government under this program, to review and determine that their activities under the program are in compliance with all applicable laws and regulations, including restrictions on the interception, monitoring, access, use, and disclosure of electronic communications (see § 236.6(b) and (c)). Information determined to be relevant is maintained, controlled, and disposed of when no longer reasonably necessary for forensics analysis, and damage assessment activities (or other legal, audit or operational purposes). Companies are required to abide by all sharing restrictions. The PIA for the DIB CS/IA program addresses the handling safeguards in more detail. No change is made to the rule. Comment: Two comments stated that the PII the Government obtains through the DIB CS/IA program should be used only for cyber

security operations and not general law enforcement or intelligence fact gathering. The rule should also limit Government use of information shared for cyber security purposes. Response:

3 11 18 Vibrio P. 2 2 3 Chemical Ammonia 3 5 7 Methomyl 3 5 7 Sodium nitrite 3 5
7 Parasitic Cryptosporidium 17 22 60 Cyclospora 17 22 60 Toxin Ciguatera or Ciguatoxin 2
5 19 Histamine 2 5 19 Saxotoxin 2 5 19 Scromboid 2 5 19 Star Anise 2 5 19 Toxin 2
5 19 Viral Hepatitis A 22 22 28 Norovirus 2 2 6 Viral or Vitrio 2 2 6 The
distributions over mild, moderate, and severe cases for most of the illnesses were estimated from
the CDC (Ref. 3), and a CFSAN report entitled "Modeling the Effects of Food Handling Practices on
the Incidence of Foodborne Illness" (Ref. 9). The case distributions over mild, moderate, and severe
cases were estimated for chemical and marine toxin poisoning from a study by Brevard et al. (Ref.
10), and a study reported by CDC (Ref. 11). The indirect costs of an illness are the loss in
welfare measured as a loss in life quality or, in the extreme case, death from the illness. This
loss in quality of life also includes lost worker productivity while ill. Estimates of the indirect
costs will vary depending on the symptoms of the illness and their severity. We use a quality of
well-being scale for a typical gastrointestinal illness to adjust the well-being of a person with
mild, moderate, or severe symptoms (Ref. 12). The well-being scale assumes a value of 1 for a person
in good health, and is reduced according to the (printed page 71622) symptoms and impaired
mobility, reduced physical activity, and reduced social activity that result from the illness. We
compute an index of lost quality adjusted life days (QALD) by subtracting the individual's health
status when ill from one and then multiplying that fraction by the number of days the illness lasts.
The result represents the number of health days lost from an illness; we estimate the loss for
varying severities for each illness. The QALD losses for an average foodborne illness are reported
in the following table 6 of this document. Table 6. Lost QALDs Due to an Average Case of Foodborne
Illness

Severity of Illness	Symptom	Mobility	Physical	Social	Quality Adjustment	QALDs Lost
Mild	-0.29 -0.062 -0.077 -0.061	0.51	0.49	Moderate	-0.29 -0.062 -0.077 -0.061	0.51 0.49
Severe	-0.29 -0.090 -0.077 -0.061	0.48	0.52	To reflect uncertainty in the literature, FDA		

uses a range to estimate the values of the health days lost. We use a low estimate of \$100,000 for
the value of a life year. This is consistent with that proposed by Garber and Phelps, who suggest a
value of approximately twice the annual income (Ref. 13). U.S. Census data reports that the median
family income in 2001 was approximately \$51,000 (Ref. 14).

5 U.S.C. 552a(k) (5) from the following subsections of 5 U.S.C. 552a(c)(3) , (d), and (e)(1).
(ii) Authority. 5 U.S.C. 552a(k)(5) . (iii) Reasons. (A) From subsection (c)(3) and (d) when
access to accounting disclosures and access to or amendment of records would cause the identity of a
confidential sources to be revealed. Disclosure of the source's identity not only will result in the
Department breaching the promise of confidentiality made to the source but it will impair the
Department's future ability to compile investigatory material for the purpose of determining
suitability, eligibility, or qualifications for Federal civilian employment, Federal contracts, or
access to classified information. Unless sources can be assured that a promise of confidentiality
will be honored, they will be less likely to provide information considered essential to the
Department in making the required determinations. (B) From (e)(1) because in the collection of
information for investigatory purposes, it is not always possible to determine the relevance and
necessity of particular information in the early stages of the investigation. In some cases, it is
only after the information is evaluated in light of other information that its relevance and
necessity becomes clear. Such information permits more informed decision-making by the Department
when making required suitability, eligibility, and qualification determinations. (5) System
identifier and name. GNSA 05, Equal Employment Opportunity Data. (i) Exemption. (A)
Investigatory material compiled for law enforcement purposes, other than material within the scope
of subsection 5 U.S.C. 552a(j)(2) , may be exempt pursuant to 5 U.S.C. 552a(k)(2) . However, if
an individual is denied any right, privilege, or benefit for which he would otherwise be entitled by
Federal law or for which he would otherwise be eligible, as a result of the maintenance of the
information, the individual will be provided access to the information exempt to the extent that
disclosure would reveal the identity of a confidential source. Note 1 to paragraph (c)(5)(i)(A).
When claimed, this exemption allows limited protection of investigative reports maintained in a
system of records used in personnel or administrative actions. (B) Records maintained solely for
statistical research or program evaluation purposes and which are not used to make decisions on the
rights, benefits, or entitlement of an individual except for census records which may be disclosed
under 13 U.S.C. 8 , may be exempt pursuant to 5 U.S.C. 552a(k)(4) . (C) All portions of this
system of records which fall within the scope of 5 U.S.C. 552a(k)(2) and (k)(4) may be exempt

from the provisions of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I) and (f).
(ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(4) . (iii) Reasons.

From the NIST SP 800-172 Rev 3 Final Public Draft: use of removable systems in non-secure settings, and the potential targeting of 772 individuals at home. Personnel are also trained on what constitutes suspicious communications and how to respond to such communications. Training personnel on how to recognize anomalous behaviors in systems can provide organizations with early warning of the presence of malicious code. Recognizing anomalous behavior in systems can supplement the malicious code detection and protection tools and systems used by organizations. Since threats continue to change over time, threat literacy training is dynamic. Moreover, threat literacy training is not performed in isolation from the system operations that support organizational missions and business functions. This requirement enhances SP 800-171 require

Security zone-based architecture provides a standardized way of designing a scalable and consistent security architecture. It offers increased network resiliency, meaning it helps keep communications working in the face of misconfiguration and faults. Security segmentation can help mitigate the vulnerabilities listed above and should be part of a comprehensive cybersecurity plan. For example, consider the primary operational function of an asset. Some potential operational functions are real-time monitoring, controlling a machine or process, planning, scheduling of machines, business operation, administrative systems, and communication devices. Based on these criteria, assets identified in step 1 during the asset inventory can be classified into the operational function zones. An example grouping is below. This zone consists of applications and devices used for day-to-day business operation. Examples include financial applications, office applications (Word®, Excel®), manufacturing resource planning (MRP), enterprise resource planning (ERP), AutoCAD, printers, plotters, and scanners.

The following is a summary from the Regulatory Impact Analysis (RIA) of the specific compliance requirements and the estimated costs of compliance. The new FAR clause is modeled after the most recent version of the clause at DFARS 252.204-7012, which introduced many of these compliance requirements on defense contractors and subcontractors in 2015 and required compliance not later than December 31, 2017. Therefore, the estimated costs of compliance have been segregated into those that are new for Federal offerors, contractors, and subcontractors (see section IV.C.1 of this preamble) and those that are new only for non-defense contractors and subcontractors (see section IV.C.2 of this preamble). The RIA includes a detailed discussion and explanation about the assumptions and methodology used to estimate the cost of this regulatory action, including the specific impact and costs for small businesses. Public comment is requested on the RIA, which is available at <https://www.regulations.gov> (search for 'FAR Case 2017-016,' click 'Open Docket,' and view 'Supporting Documents').

1. Federal Offerors, Contractors, and Subcontractors

The following compliance requirements are considered new for Federal offerors, contractors, and subcontractors required to safeguard CUI:

a. Regulatory Familiarization

Familiarization accounts for the time to read and understand the rule. It is expected that most contractors will be required to become familiar with the various compliance requirements of the FAR, in order to be prepared to handle or receive CUI in performance of a Federal contract. According to award data in the Federal Procurement Data System (FPDS) for fiscal year (FY) 2021 through FY 2023, on average per year the Government awards contracts and orders for supplies and services to 67,547 unique contractors, all of whom are expected to become familiar with this rule. It is estimated that on average it will take two hours per contractor and subcontractor that handle CUI to review the rule. The estimated cost for regulatory familiarization in the first year of implementation is \$10,267,144 (67,547 contractors and subcontractors * 2 hours/entity * \$76/hour), of which \$6,711,104 is attributed to 44,152 small businesses.

b. Review the SF XXX

Offerors, contractors, or subcontractors will need to review the SF XXX to determine the information under the contract or subcontract that is considered CUI and how to properly safeguard the CUI. It is estimated that approximately 22,680 offerors, contractors, and subcontractors may review 2,092,918 forms for information on how to protect CUI each year. On average, it is estimated that it will take an offeror, contractor, or subcontractor two hours to review the SF XXX. The estimated annual cost to review standard forms is \$334,866,880 (2,092,918 forms * 2 hours/form * \$80), of which \$5,058,880 is attributed to 15,809 small businesses.

c. Prepare and Distribute the SF XXX

authentication; mobile devices; onscreen keyboards; password entry; password generation; password permutation; security-usability balance; text entry; usable security

Passwords are rarely lauded as

an effective authentication mechanism, yet their use is widespread. Since their inception, passwords have been a bane to the individuals using them. Users constantly forget and reset passwords. Organizations attempt to ensure that users' passwords meet minimum complexity requirements and are periodically changed as often as deemed necessary. Building upon these problems, scores of password databases have been exfiltrated from various websites since electronic commerce became commonplace. These leaked password datasets, combined with specialized hardware, provide an optimum environment to make modern password cracking software effective and efficient. We argue that only by empirically quantifying the security-usability tradeoff can we hope to measure and understand effects of changing passwords along either or both dimensions. Although alternative-and arguably better-mobile authentication mechanisms exist [2], the unfortunate reality is that passwords are too deeply ingrained in our current digital world to be fully replaced in the near term. In the longer term, research efforts such as the National Strategy for Trusted Identities in Cyberspace (NSTIC) aim to ultimately replace passwords as a primary authentication mechanism [3]. In the interim, however, our work is focused on evaluating ways to improve password usability for mobile devices without an unacceptably large sacrifice to security.

. Section 164.310(c), the standard for workstation security, also is not accompanied by standalone addressable or required implementation specifications, but it does require a regulated entity to implement physical safeguards that restrict all workstations, such as a laptop or desktop computer or any other device that performs similar functions, that access ePHI to authorized users. [636] Device and media controls can help regulated entities respond to and recover from security incidents and breaches. [637] Proper understanding of and implementation of such controls may enable regulated entities to quickly determine which devices and electronic media may be implicated in an actual or suspected security incident, or breach, and respond accordingly. [638] For example, if cybercriminals gained access to an organization's network by exploiting a vulnerability

present in a particular electronic device, a robust and accurate inventory and tracking process could identify how many devices are affected and where they are located. With this information, a regulated entity should be able to make more effective use of its resources and respond more effectively to an actual or suspected security incident or breach involving such devices. Thus, it is important for regulated entities to implement the device and media controls required under 45 CFR 164.310(d). Accordingly, the standard for device and media controls at 45 CFR 164.310(d), requires a regulated entity to implement policies and procedures to govern how hardware and electronic media containing ePHI are received or removed from a facility and within a facility. Section 164.310(d)(2) includes two required and two addressable implementation specifications. Paragraphs (d)(2)(i) and (ii) on disposal and media re-use, respectively require a regulated entity to implement policies and procedures that address the final disposition of ePHI and the hardware or electronic media on which it is stored, and the removal of ePHI before the electronic media is re-used. Section 164.308(d)(2)(iii) addresses the (printed page 959) maintenance of a record of the movement of hardware and electronic media and any person responsible for such hardware or electronic media, while the provision on data backup and storage at 45 CFR 164.310(d)(2)(iv) addresses the creation of a retrievable, exact copy of ePHI before moving the equipment.

2. Issues To Address

The Department has concerns regarding the effectiveness of the language used in the physical safeguards in 45 CFR 164.310 for the same reasons discussed in the context of 45 CFR 164.306 and 164.316. For example, while 45 CFR 164.310 contemplates that a regulated entity must implement the standards and implementation specifications required under 45 CFR 164.310 in accordance with the general documentation and maintenance requirements found in 45 CFR 164.306 and 164.316

- b. The centralized team operates as a service for the rest of the business, which includes researching and recommending specific vendors when business owners require a specific product or service. This team owns most aspects of the supplier relationship for the entire lifecycle, including developing requests for proposals, contract negotiations, and managing compliance checks.
- c. Business unit owners are responsible for selecting and requesting their own suppliers and serving as the principal manager for those relationships.

Comments also note that the proposed rule does not consider the time required to verify the completeness and accuracy of records, transmission of data to appropriate authorities and the availability of knowledgeable personnel to access specific records. They suggest that FDA should focus on the information contained in the records, rather than on the records themselves. Comments suggest FDA change the proposed language to include: As soon as possible within 24 hours from the time the request is made. Other comments state that the proposed time is not enough, particularly if the request for record is made late during the day, or on Friday, or on a day (Sunday) when the location where records are maintained is closed and insufficient staff is available to retrieve the requested records. Comments urge FDA to allow companies to provide records as quickly as is practicable, given the nature of the recordkeeper's operations. (Response) FDA agrees with these comments in part and has amended the proposed records availability requirements in this final rule. Section 1.361(a) of this final rule states: * * * Such records and other information must be made available as soon as possible, not to exceed 24 hours from the time of receipt of an official request * * *. FDA notes that, although the rule sets an outer limit of 24 hours to provide

records, it requires that records be provided as soon as possible. (Comment 143) Other comments suggest that records be available within 12 hours regardless of what time of day the FDA request is made or the next business day, in the event the next day falls on a weekend or a holiday. Some suggest a timeframe within 24 hours if the request is made during a working week and within 72 hours if a request is made during a weekend. Several comments state that the majority of businesses, especially small businesses, store records that are older than 3 weeks offsite where many storage facilities are not open on weekends and holiday. Comments also state that more than 24 hours is needed to retrieve such records and to impose criminal liability for noncompliance is unworkable and unfair. Comments urge FDA to allow companies to provide records within a reasonable period of time or that the final rule gives companies 24 hours to make records available to FDA from the time of receipt of an official request.

Control PD-12: 800-79-2. Derived PIV Credentials are optional PIV credentials introduced in FIPS 201-2 and detailed in SP 800-157 Guidelines for Derived Personal Identity Verification (PIV) Credentials [SP 800157]. The timeline for their use on mobile devices depends on Department and Agencies to achieve the ATO to issue Derived PIV Credential based on this document and on the availability of validated Derived PIV Credential tokens. No Derived PIV Credentials shall be issued unless the issuer has met the requirements of and is operating in accordance to the guidelines of SP 80079-2. 4 Re-Authorization using the revised guidelines (SP 800-79-2) is required within three (3) years of current Authorization to Operate (ATO). ## 1.4 Key Related NIST Publications The following NIST publications were utilized as the basis for the requirements listed in this document. - FIPS 201-2, Personal Identity Verification (PIV) of Federal Employees and Contractors [FIPS201-2]; - SP 800-37-1 Rev. 1, Guide for Applying the Risk Management Framework to Federal Information Systems: A Security Life Cycle Approach, or as amended [SP800-37]; - SP 800-73-4, Interfaces for Personal Identity Verification (3 Parts), or as amended [SP800-73-4] Pt. 1- End Point PIV Card Application Namespace, Data Model & Representation Pt. 2- PIV Card Application Card Command Interface Pt. 3- PIV Client Application Programming Interface ; - SP 800-76-2, Biometric Data Specification for Personal Identity Verification, or as amended [SP800-76-2]; - SP 800-78-4, Cryptographic Algorithms and Key Sizes for Personal Identification Verification (PIV), or as amended; - SP 800-85 A-4, PIV Card Application and Middleware Interface Test Guidelines (SP80073-4 Compliance), or as amended; - SP 800-85 B-4, PIV Data Model Conformance Test Guidelines, or as amended; and - SP 800-157 Guidelines for Derived Personal Identity Verification (PIV) Credentials, or as amended [SP800-157].

(B) Contractors will promptly report to the CSA any emergency situation that renders them incapable of safeguarding classified material. (b) Standards for Security Equipment. Contractors will follow guidelines established in 32 CFR part 2001, when procuring storage and destruction equipment. Authorized repairs for GSA-approved security containers and vaults must be in accordance with Federal Standard 809. (c) Storage. Contractors will store classified information and material in General Services Administration (GSA)-approved security containers, vaults built to Federal Standard 832, or an open storage area constructed in accordance with 32 CFR 2001.53. In the instance that an open storage area has a false ceiling or raised floor, contractors shall develop and implement procedures to ensure their structural integrity. Nothing in 32 CFR part 2001, should be construed to contradict or inhibit compliance with local laws or building codes, but the contractor will notify the applicable CSA if there are any conflicting issues that would inhibit compliance. Contractors will store classified material in accordance with the specific sections of 32 CFR 2001.43 : (1) CONFIDENTIAL. See 32 CFR 2001.43(b)(3). (2) SECRET. See 32 CFR 2001.43(b)(2). (3) TOP SECRET Documents. See 32 CFR 2001.43(b)(1). (d) Intrusion Detection Systems (IDS). This paragraph specifies the minimum standards for an approved IDS when used for supplemental protection of TOP SECRET and SECRET material. The CSA will provide additional guidance for contingency protection procedures in the event of IDS malfunction, including contractors located in USG owned contractor operated facilities. (1) CSA approval. (i) CSA approval is required before installing an IDS. The CSA will base approval of a new IDS on the criteria of Intelligence Community Directive 705 (available at: https://www.dni.gov/files/documents/ICD/ICD_705_SCIFs.pdf) and any applicable intelligence community standard, Underwriters Laboratories (UL) Standard 2050 (Government agencies with a role as a CSA or CSO may obtain this reference without charge; available at: www.ul.com/contact), or the CSA may base approval on written CSA-specific standards for the information to be protected. (ii) Installation will be performed by an alarm services company certified by a NRTL that meets the requirements in 29 CFR 1910.7 to perform testing and certification. The NRTL-approved alarm

service company is responsible for completing the appropriate alarm system description form approved by the NRTL. (iii) All the intrusion detection equipment (IDE) used in the IDS installation will be tested and approved (or listed) by a NRTL, ensuring its proper operation and resistance from tampering. Any IDE that has not been tested and approved by a NRTL will require CSA approval. (2) Central monitoring station.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System [Docket Number DARS-2025-0006; OMB Control Number 0704-0478] AGENCY: Defense Acquisition Regulations System; Department of Defense (DoD). ACTION: Notice. SUMMARY: The Defense Acquisition Regulations System has submitted to OMB for clearance the following proposal for collection of information under the provisions of the Paperwork Reduction Act. DATES: DoD will consider all comments received by February 4, 2026. SUPPLEMENTARY INFORMATION: Title and OMB Number: Safeguarding Covered Defense Information, Cyber Incident Reporting, and Cloud Computing; OMB Control Number 0704-0478. Affected Public: Businesses or other for-profit and not-for-profit institutions. Respondent's Obligation: Required to obtain or retain benefits. Reporting Frequency: On occasion. Number of Respondents: 1,971. Responses per Respondent: 8.2, approximately. Annual Responses: 16,223. Average Burden per Response: 0.42 hours. Annual Burden Hours: 6,770. Needs and Uses: Offerors and contractors must report cyber incidents on unclassified networks or information systems, within cloud computing services, and when they affect contractors designated as providing operationally critical support, as required by statute. a. The clause at DFARS 252.204-7012, Safeguarding Covered Defense Information and Cyber Incident Reporting, covers cyber incident reporting requirements for incidents that affect a covered contractor information system or the covered defense information residing therein, or that affects the contractor's ability to perform the requirements of the contract that are designated as operationally critical support and identified in the contract. b. The provision at DFARS 252.204-7008, Compliance with Safeguarding Covered Defense Information Controls, requires an offeror that proposes to vary from any of the security controls of National Institute of Standards and Technology (NIST) Special Publication (SP) 800-171 in effect at the time the solicitation is issued to submit to the contracting officer a written explanation of how the specified security control is not applicable or an alternative control or protective measure is used to achieve equivalent protection.

From the NIST SP 800-172 Rev 3 Final Public Draft: PROTECTION STRATEGY PRA, CRS ADVERSARY EFFECTS Preclude (Preempt), Impede (Exert), Limit (Reduce) NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 REFERENCES 1907

CeFi stablecoins have corresponding off-blockchain businesses that are usually accessible (e.g., to regulator and auditors) like any other business. DeFi stablecoins may or may not have an associated off-blockchain business or owner. The rest of this section explores each type in greater detail. The prose descriptions of fiat currency, cryptocurrency, and algorithmic-backed stablecoins follow the ordering of the characteristics list from Section 3.3. The description of the non-currency asset-backed stablecoins does not since its characteristics are almost identical to the fiat currency-backed. Private institutional stablecoins are issued for the execution of 'internal account transactions, liquidity management, and transactions between user accounts' between the financial customers of the issuer [1]. Such a stablecoin is implemented on a private blockchain (i.e., the public does not have access). The issuer thus knows all network participants and acts as the custodian of the participants' financial accounts. Stability is achieved by the issuer guaranteeing a specific redemption price for the coins backed by the deposits of the customers and issuer. Only the issuer has visibility into the customer accounts that act together as a reserve for the coin (although periodic attestations or audits could confirm this).

(l) 52.204-YY, Identifying and Reporting Information That Is Potentially Controlled Unclassified Information (DATE). 43. Amend section 52.213-4 by: a. Revising the date of the clause; b. Removing from paragraph (a)(2)(vii) ·NOV 2024· and adding ·(DATE)· in its place; and c. Revising paragraph (b)(2)(i); d. Redesignating paragraphs (b)(2)(ii) through (v) as paragraphs (b)(2)(iv) through (vii); and e. Adding new paragraphs (b)(2)(ii) and (b)(2)(iii). The revisions and addition

read as follows: 52.213-4 Terms and Conditions-Simplified Acquisitions (Other Than Commercial Products and Commercial Services). * * * * * Terms and Conditions-Simplified Acquisitions (Other Than Commercial Products and Commercial Services) (DATE) (b) * * * (2) * * * (i) 52.204-21, Basic Safeguarding of Covered Contractor Information Systems (DATE) (Applies to solicitations and contracts, except acquisitions solely for commercially available off-the-shelf items or Federally-funded basic and applied research in science, technology, and engineering at colleges, universities, and laboratories in accordance with National Security Decision Directive 189 when the agency does not provide any covered Federal information to the Contractor.) (ii) 52.204-XX, Controlled Unclassified Information (DATE) (Applies to solicitations and contracts, except acquisitions solely for commercially available off-the-shelf items). (iii) 52.204-YY, Identifying and Reporting Information That Is Potentially Controlled Unclassified Information (DATE). * * * * * 52.227-10 [Amended] 44. Amend section 52.227-10 by removing from the introductory text the phrase ·27.203-2· and adding ·27.203-3· in its place. 45. Amend section 52.244-6 by· a. Revising the date of the clause; b. Removing from paragraph (c)(1)(v) ·NOV 2021· and ·FAR clause 52.204-21· and adding ·DATE· and ·clause 52.204-21· in their places, respectively; and c. Redesignating paragraphs (c)(1)(x) through (xxiv) as paragraphs (c)(1)(xii) through (xxvi) and adding new paragraphs (c)(1)(x) through (xi). The revision and additions reads as follows: 52.244-6 Subcontracts for Commercial Products and Commercial Services. * * * * * Subcontracts for Commercial Products and Commercial Services (DATE) * * * * * (c)(1) * * * (x) 52.204-XX, Controlled Unclassified Information (DATE), if flow down is required in accordance with paragraph (e) of clause 52.204-XX. (xi) 52.204-YY, Identifying and Reporting Information That Is Potentially Controlled Unclassified Information (DATE), if flow down is required in accordance with paragraph (e) of clause 52.204-YY. * * * * * PART 53-FORMS 46. Revise the heading of section 53.204 to read as follows: 53.204 Administrative and information matters. * * * * * 47. Amend section 53.204-1 by· a. Revising the section heading; b. Removing from the introductory text the phrase ·subpart 4.4· and adding ·4.402· in its place; c. Removing from paragraph (a) the phrase ·See 4.403 (c)(1).· and adding ·See 4.402-2 (c)(1).· in its place. The revision reads as follows: 53.204-1

(iii) All changes under this criterion require a change to the ·Categories of Records in the System· caption of the notice. (see § 310.32(f)). (3) An alteration of how the records are organized or the manner in which the records are indexed and retrieved. (i) The change must alter the nature of use or scope of the records involved (for example, combining records systems in a reorganization). (ii) Any change under this criteria requires a change in the ·Retrievability· caption of the system notice. (see § 310.32(j)(2)). (iii) If the records are no longer retrieved by name or personal identifier cancel the system notice. (see § 310.10(b)). (4) A change in the purpose for which the information in the system is used. (i) The new purpose must not be compatible with the existing purposes for which the system is maintained. (ii) If the use is compatible and reasonably expected, there is no change in purpose and no alteration occurs. (iii) Any change under this criterion requires a change in the ·Purpose(s)· caption (see § 310.32(h)) and may require a change in the ·Authority for maintenance of the system· caption (see § 310.32). (5) Changes that alter the computer environment (such as changes to equipment configuration, software, or procedures) so as to create the potential for greater or easier access. (i) Increasing the number of offices with direct access is an alteration. (ii) Software applications, such as operating systems and system utilities, that provide for easier access are considered alterations. (iii) The addition of an on-line capability to a previously batch-oriented system is an alteration. (iv) The addition of peripheral devices such as tape devices, disk devices, card readers, printers, and similar devices to an existing IT system constitute an amendment if system security is preserved. (see § 310.34). (v) Changes to existing equipment configuration with on-line capability need not be considered alterations to the system if: (A) The change does not alter the present security posture; or (B) The addition of terminals does not extend the capacity of the current operating system and existing security is preserved. (vi) The connecting of two or more formerly independent automated systems or networks together creating a potential for greater access is an alteration. (vii) Any change under this caption requires a change to the ·Storage· caption element of the systems notice. (see § 310.32(j)(i)). (c) Reports of new and altered systems. (1) Components shall submit a report for all new or altered systems to the DPO consistent with the requirements of this subpart and in the format prescribed at Appendix F of this part. (i) Components shall include the following when submitting an alteration for a system notice for publication in the Federal Register : (A) The system identifier and name. (see § 310.32(b) and (c)). (B) A description of the nature and specific changes proposed.

3.4.2 Tracing Sub-Capabilities to Attack Steps ... 3.4.2 Tracing Sub-Capabilities to Attack Steps

By tracing the sub-capabilities of a security capability to attack steps, it is clearer how the security capability addresses the attack step.

Persons who manufacture, process, pack, distribute, receive, hold, or import food in the United States must establish and maintain the following records to identify the immediate previous sources and immediate subsequent recipients for all food they receive and release, unless otherwise excluded from the requirements of subpart J of this final rule: Name, address, telephone number and, if available, fax number, and e-mail address of the immediate previous source and subsequent recipient; Adequate description; Date received or released; For persons who manufacturer, process, or pack food, the lot or code number or other identifier; Quantity and how the food is packaged; and Name, address, telephone number and, if available, fax number, and e-mail (printed page 71564) address of the transporter who transported the food to and from you. Persons who have possession, custody, or control of food in the United States for the sole purpose of transporting the food, or foreign persons who transport food in the United States, regardless of whether they have possession, custody, or control of the food for the sole purpose of transporting that food (transporters), can meet the requirements of subpart J of this final rule by: (1) Establishing and maintaining the records listed in § 1.352(a); or (2) Establishing and maintaining specified information that is in the records required of roadway interstate transporters by the Department of Transportation's (DOT's) Federal Motor Carrier Safety Administration (FMCSA) contained in 49 CFR 373.101 and 373.103 as of the date of publication of this final rule; or (3) Establishing and maintaining specified information that is in the records required of rail and water interstate transporters by the DOT's Surface Transportation Board (STB) contained in 49 CFR 1035.1 and 1035.2 as of the date of publication of this rule; or (4) Establishing and maintaining specified information that is in the records required of international air transporters on air waybills by the Warsaw Convention as Amended at the Hague, 1995 and by Protocol No. 4 of Montreal, 1975 (Warsaw Convention); or (5) Entering into an agreement with a nontransporter immediate previous source (if located in the United States) or immediate subsequent recipient (if located in the United States) to establish, maintain, or establish and maintain, the required records in options 1 or 2 of the previous paragraphs. The agreement must contain certain elements specified in § 1.352(e). If you are a nontransporter, you must retain for 6 months after the dates you receive and release the food all required records for any food for which a significant risk of spoilage, loss of value, or loss of palatability occurs within 60 days after the date you receive or release the food.

At the completion of a Level 3 certification assessment and annually following a Final CMMC Status Date, the Affirming Official shall submit a CMMC affirmation attesting to continuing compliance with all requirements of the CMMC Status Level 3 (DIBCAC). Because C3PAOs and DCMA DIBCAC check for compliance with different requirements in their respective assessments, OSCs must annually affirm their CMMC Status of Level 2 (C3PAO) in addition to their CMMC Status of Level 3 (DIBCAC) to maintain eligibility for contracts requiring compliance with Level 3. An affirmation shall also be submitted at the completion of a POA&M closeout certification assessment. § 170.23 Application to subcontractors. (a) CMMC requirements apply to prime contractors and subcontractors throughout the supply chain at all tiers that will process, store, or transmit any FCI or CUI on contractor information systems in the performance of the DoD contract or subcontract. Prime contractors shall comply and shall require subcontractors to comply with and to flow down CMMC requirements, such that compliance will be required throughout the supply chain at all tiers with the applicable CMMC level and assessment type for each subcontract as follows: (1) If a subcontractor will only process, store, or transmit FCI (and not CUI) in performance of the subcontract, (printed page 83236) then a CMMC Status of Level 1 (Self) is required for the subcontractor. (2) If a subcontractor will process, store, or transmit CUI in performance of the subcontract, then a CMMC Status of Level 2 (Self) is the minimum requirement for the subcontractor. (3) If a subcontractor will process, store, or transmit CUI in performance of the subcontract and the associated prime contract has a requirement for a CMMC Status of Level 2 (C3PAO), then the CMMC Status of Level 2 (C3PAO) is the minimum requirement for the subcontractor. (4) If a subcontractor will process, store, or transmit CUI in performance of the subcontract and the associated prime contract has a requirement for the CMMC Status of Level 3 (DIBCAC), then the CMMC Status of Level 2 (C3PAO) is the minimum requirement for the subcontractor. (b) As with any solicitation or contract, the DoD may provide specific guidance pertaining to flow-down. § 170.24 CMMC Scoring Methodology. (a) General. This scoring methodology is designed to provide a measurement of an OSA's implementation status of the NIST SP

800-171 R2 security requirements (incorporated by reference elsewhere in this part, see § 170.2) and the selected NIST SP 800-172 Feb2021 security requirements (incorporated by reference elsewhere in this part, see § 170.2). The CMMC Scoring Methodology is designed to credit partial implementation only in limited cases (e.g., multi-factor authentication IA.L2-3.5.3). (b) Assessment findings. Each security requirement assessed under the CMMC Scoring Methodology must result in one of three possible assessment findings, as follows: (1) Met.

(ii) The full text of the system notice need not be submitted if the master registry contains a current system notice for the system. (see § 310.32(q)). (2) The DPO coordinates all reports of new and altered systems with the Office of the Assistant Secretary of Defense (Legislative Affairs), Department of Defense. (3) The DPO prepares and sends a transmittal letter that forwards the report, as well as the new or altered system notice, to OMB and Congress. (4) The DPO shall publish in the Federal Register a system notice for new or altered systems. (d) Time restrictions on the operation of a new or altered system. (1) The reports, and the new or altered system notice, must be provided OMB and Congress at least 40 days prior to the operation of the new or altered system. The 40 day review period begins on the date the transmittal letters are signed and dated. (2) The system notice must be published in the Federal Register before a Component begins to operate the system (i.e., collect and use the information). If the new system has routine uses or the altered system adds a new routine use, no records may be disclosed pursuant to the routine use until the public has had 30 days to comment on the proposed use. (3) The time periods run concurrently. (e) Exemptions for new systems. See § 310.30(e) for the procedures to follow in submitting exemption rules for a new system of records or for submitting an exemption rule for an existing system of records. § 310.34 Amendment and deletion of system notices. (a) Criteria for an amended system notice. (1) Certain minor changes to published systems notices are considered amendments and not alterations. (see § 310.33(b)). (2) Amendments do not require a report of an altered system (see § 310.33(c)), but must be published in the Federal Register . (b) System notices for amended systems. Components shall include the following when submitting an amendment for a system notice for publication in the Federal Register : (1) The system identifier and name. (see § 310.32 (b) and (c)). (2) A description of the nature and specific changes proposed. (3) The full text of the system notice need not be submitted if the master registry contains a current system notice for the system. (see § 310.32(q)). (c) Deletion of system notices. (1) Whenever a system is discontinued, combined into another system, or determined no longer to be subject to this part, a deletion notice is required. (2) The notice of deletion shall include: (i) The system identification and name. (ii) The reason for the deletion. (3) When the system is eliminated through combination or merger, identify the successor system or systems in the deletion notice. (d) Submission of amendments and deletions for publication. (1) Submit amendments and deletions to the DPO for transmittal to the Federal Register for publication. (2) Multiple deletions and amendments may be combined into a single submission. Subpart H Training Requirements § 310.35 Statutory training requirements. The Privacy Act (5 U.S.C. 552a

From the NIST SP 800-172 Rev 3 Final Public Draft: Department of Commerce Howard Lutnick, Secretary National Institute of Standards and Technology Craig Burkhardt, Acting Under Secretary of Commerce for Standards and Technology and Acting NIST Director NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 Certain equipment, instruments, software, or materials, commercial or non-commercial, are identified in this paper in order to specify the experimental procedure adequately. Such identification does not imply recommendation or endorsement of any product or service by NIST, nor does it imply that the materials or equipment identified are necessarily the best available for the purpose. There may be references in this publication to other publications currently under development

Increased total time for the contractor to prepare for the assessment, including limited time for learning the reporting and affirmation processes Allowance for use of consulting firms to assist with the assessment process Time for a senior level manager to review the assessment and affirmation before submitting the results in SPRS Updated government and contractor labor rates that include applicable burden costs As a result, some costs of the revised CMMC Program may be higher than those included in the initial CMMC Program. The revised CMMC Program impact analysis includes estimated costs for implementation of the revised CMMC Program requirements across Level 1, Level 2, and Level 3 for the Public (small and other than small entities, including the CMMC Ecosystem as set forth in 32 CFR subpart C) and the Government. In summary, the total estimated Public and Government costs associated with this rule, calculated for a 20-year horizon in 2023

dollars at a 7 percent discount rate and a 3 percent discount rate are provided as follows:

Estimating the number of CMMC assessments for unique entities per level per year is complicated by the fact that companies may serve as a prime contractor on one effort but a subcontractor on others, and may also enter into subcontract agreements with more than one prime contractor for various opportunities. In addition, the CMMC Program relies upon free market influences of supply and demand to propel implementation. Specifically, the Department does not control which defense contractors aspire to compete for which business opportunities, nor does it control access to the assessment services offered by C3PAOs. OSAs may elect to complete a self-assessment or pursue a certification assessment at any time after issuance of the rule, in an effort to distinguish themselves as competitive for efforts that require an ability to adequately protect CUI. For that reason, the number of CMMC assessments for unique entities per level per year may vary significantly from the assumptions used in generating the cost estimate. The estimates represent the best estimates at this time based on internal expertise and public feedback. DoD utilized historical metrics gathered for the initial CMMC Program and subject matter expertise from Defense Pricing and Contracting (DPC) and DCMA DIBCAC to estimate the number of entities by type and by assessment level for this analysis. The following table summarizes the estimated profile used in this analysis. (printed page 83177)

Section 170.5 addresses that the CMMC Program does not alter the requirements imposed on contractors and subcontractors in FAR 52.204-21, DFARS subpart 204.73, or any other applicable safeguarding of information requirement. The CMMC Program verifies implementation of security requirements in FAR 52.204-21, NIST SP 800-171 Rev 2, and NIST SP 800-172, as applicable. Section 170.6-CMMC PMO Section 170.6 addresses the CMMC Program Management Office (PMO) functions that are performed within the (printed page 89064) Department of Defense Chief Information Officer (DoD CIO). Section 170.7-DCMA DIBCAC Section 170.7 addresses how DCMA DIBCAC will support the CMMC Program by conducting CMMC Level 2 assessments of the Accreditation Body and C3PAOs; conducting CMMC Level 3 assessments for OSCs; and recording results, issuing certificates, tracking appeals, and retaining records as required. Section 170.8-Accreditation Body Section 170.8 addresses the roles and responsibilities of the Accreditation Body, as well as requirements that the Accreditation Body must meet. The Accreditation Body must be a member in good standing with the Inter-American Accreditation Cooperation (IAAC) and become an International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA) signatory, with a signatory status scope of ISO/IEC 17020:2012 and be compliant with ISO/IEC 17011:2017. [13] There is only one Accreditation Body for the DoD CMMC Program at any given time, and its primary mission is to authorize and accredit the C3PAOs. Prior to the Accreditation Body being compliant with ISO/IEC 17011:2017 and completing a peer assessment of conformity with the IAAC in accordance with the ISO Committee on Conformity Assessment, [14] the Accreditation Body may authorize but not accredit C3PAOs. After the Accreditation Body has achieved compliance with ISO/IEC 17011:2017 and completed a peer assessment of conformity with the IAAC in accordance with the ISO Committee on Conformity Assessment, the Accreditation Body may accredit C3PAOs. The Accreditation Body also oversees the CAICO to ensure compliance with ISO/IEC 17024:2012 [15] and to ensure all training products, instruction, and testing materials are of high quality. Section 170.8 addresses specific requirements for the Accreditation Body with regards to national security background checks, foreign ownership, reporting, information protection, and appeals. The Accreditation Body will also develop policies for Conflict of Interest (Col), Code of Professional Conduct (CoPC), and Ethics that comply with all ISO/IEC 17011:2017 and DoD requirements. These policies will apply to the Accreditation Body as well as to all other individuals, entities, and groups within the CMMC Ecosystem. The information systems used by the Accreditation Body to process CMMC information have to meet all of the security requirements for CMMC Level 2 and will be assessed by DCMA's Defense Industrial Base Cybersecurity Assessment Center (DIBCAC).

(iv) In the case where a contractor is cleared to the SECRET level under an SSA, and also has a subsidiary with a TS FCL based on an approved NID, some or all of the outside directors of the cleared parent contractor may be sponsored for eligibility for access to TS information with their TS PCLs held by the subsidiary. Access will be at the level necessary for the outside directors to carry out their security or business responsibilities for oversight of the subsidiary company in accordance with DoD 5220.22-M. If the subsidiary has an approved NID for access to SAP or SCI, the applicable GCA may determine that an outside director at the parent contractor requires approved access at the subsidiary. (7) Technology Control Plans (TCPs). Under a VTA, PA, SSA, SCA, or Limited FCL, DSS will require the contractor to develop and implement a TCP as required in DoD

5220.22-M. DSS will evaluate and, if the plan is adequate, approve the TCP. The TCP must include a description of all security measures required to prevent the unauthorized disclosure of classified or export-controlled information. Although TCPs must be tailored to the specific circumstances of the contractor or corporate family to be effective, DSS may provide examples of TCPs to the contractor to assist plan creation. (8) Electronic Communication Plan (ECP). Under a VTA, PA, or SSA, DSS will require the contractor to develop and implement an ECP tailored to the contractor's operations. DSS will determine the extent of the ECP and review the plan for adequacy. The ECP must include a detailed network description and configuration diagram that clearly delineates which networks will be shared and which will be protected from access by the foreign parent or its affiliates. The network description will address firewalls, remote administration, monitoring, maintenance, and separate email servers, as appropriate. (9) Administrative Support Agreement (ASA). There may be circumstances when the parties to a transaction propose in the FOCI action plan that the U.S. contractor provides certain services to the foreign interest, or the foreign interest provides services to the U.S. contractor. The services to be provided must be such that there is no violation of the applicable FOCI mitigation or negation agreement. If approved, the extent of such support and limitations on the support will be fully documented in an ASA. (10) Annual Review and Certification (i) Annual Meeting. DSS will meet at least annually with the GSCs of contractor's operating under a VTA, PA, SSA, or SCA to review and discuss the purpose and effectiveness of the FOCI mitigation or negation agreement; establish a common understanding of the operating requirements and their implementation; answer questions from the GSC members; and provide guidance on matters related to FOCI mitigation and industrial security. These meetings will also include an examination by DSS, with the participation of the (FSO) and the GSC members, of:

Company has the "Touche Ross Audit Process." Generally, these are available from the CPA firms. Auditors should inquire of the firms auditing governmental agencies as to what audit guides they have available, and request them if the firms make them available to their clients or other interested parties. 12. STANDARDS FOR AUDIT OF GOVERNMENT ORGANIZATIONS, PROGRAMS, ACTIVITIES, AND FUNCTIONS.

This year also brought additional security challenges along with the everadvancing improvements in technology, improvements in citizens' access to government systems and information, faster communications, reduced paperwork, and streamlined processes. Our work this year met those security challenges with a breadth and depth of security areas intended to allow our customers to accomplish their missions while providing for confidentiality of their information, maintaining the availability of their resources and ensuring the integrity of their data. High priority was given to initiating a competitive program for replacement of current secure hashing algorithms employed in data source and content integrity protection mechanisms. Develop and improve mechanisms to protect the integrity, confidentiality, and authenticity of Federal agency information by developing security mechanisms, standards, testing methods, and supporting infrastructure requirements and methods. An important step that Federal organizations should take to securely manage their information and media is to categorize their information in accordance with FIPS 199, Standards for Security Categorization of Federal Information and Information Systems. FIPS 199 requires Federal agencies to categorize their information systems as low-impact, moderate impact, or high-impact for the security objectives of confidentiality, integrity, and availability. Based on the results of categorization for confidentiality, organizations should then select appropriate sanitization methods to protect their information.

All assets within an OSA defined CMMC Level 2 or 3 assessment boundary have access to CUI and can process, store, or transmit CUI. They are therefore subject to DFARS clause 252.204-7012 and required to meet NIST SP 800-171 requirements. This is the authority for including Contractor Risk Managed Assets (CRMAs) within CMMC assessments. For Level 2, DoD has decided to assume some risk and lessen the assurance burden for a class of these assets called Contractor Risk Managed Assets, as specified in table 3 to § 170.19(c)(1). DoD does not assume this risk at Level 3. CRMAs are subject to assessment against all CMMC requirements as specified in table 5 to § 170.19(d)(1). 19. CMMC Assessment Scope and FedRAMP Moderate Equivalency Requirements Comment: Several commenters identified inconsistencies between rule content and a separate DoD policy memo that defines requirements Cloud Service Providers (CSPs) must meet to be considered FedRAMP moderate equivalent in the context of DFARS clause 252.204-7012. One commenter requested administrative changes to the rule for consistency, while others requested more substantive changes to deconflict the rule with DoD's policies. Differences between the two documents left some commenters unclear about when a CSP

would be considered within a CMMC assessment scope or required to meet CMMC requirements. They also noted that some CSPs refuse to provide clients with Customer Responsibility Matrices (CRMs), which could impede an OSAs ability to meet CMMC requirements. One commenter asked for specific instances when a FedRAMP-moderate-authorized CSP would not be accepted as meeting CMMC requirements or which requirements such a CSP could not meet. Another commenter stated the FedRAMP moderate equivalency requirements for CSPs in this rule will create confusion because they address only the NIST SP 800-171 requirements and do not include the additional cyber incident reporting requirements (printed page 83139) identified in DFARS clause 252.204-7012. One comment suggested that any expectation for CSPs to meet the DFARS clause 252.204-7012 requirements for cyber incident reporting or completion of a System Security Plan should be referenced in this CMMC rule. Another commenter suggested that all DoD contracts with CUI should include clauses and provisions for CSPs to meet Federal requirements, including a self-assessment and certification of their systems. One commenter asked whether it is sufficient for MSP/MSSPs to have FedRAMP certification instead of CMMC certification. Another interpreted the rule's wording related to security protection assets and data as expanding requirements levied on CSPs.

Organization-Defined Parameters 3161 T his appendix lists the ODPs that are included in the enhanced security requirements in Sec. 3. The ODPs are listed sequentially by requirement family, beginning with the first requirement containing an ODP in the Access Control family and ending with the last requirement containing an ODP in the Supply Chain Risk Management family. Embedded ODPs are listed as a single entry in the table. Table 4. Organization-defined parameters

ENHANCED SECURITY REQUIREMENT	ORGANIZATION-DEFINED PARAMETER
03.01.01E	[Assignment: organization-defined privileged commands and/or other organization-defined actions]
03.01.02E	[Assignment: organization-defined restrictions]
03.01.04E	[Assignment: organization-defined account and/or account type]
03.01.04E	[Assignment: organization-defined number]
03.01.08E	[Assignment: organization-defined atypical usage]
03.01.08E	[Assignment: organization-defined personnel or roles]
03.01.09E	[Assignment: organization-defined attributes to assume access permissions]
03.01.10E	[Assignment: organization-defined security attributes]
03.01.10E	[Assignment: organization-defined information, source, and destination objects]
03.01.10E	[Assignment: organization-defined information flow control policies]
03.01.11E	[Assignment: organization-defined roles and users authorized to assume such roles]
03.01.12E	[Assignment: organization-defined mechanisms and/or techniques]
03.01.13E	[Assignment: organization-defined metadata]
03.01.14E	[Assignment: organization-defined security policy filters]
03.01.14E	[Assignment: organization-defined information flows]
03.01.14E	[Selection (one or more): Block; Strip; Modify; Quarantine]
03.01.14E	[Assignment: organization-defined security policy]
03.01.15E	[Assignment: organization-defined data type identifiers]
03.01.16E	[Assignment: organization-defined policy-relevant subcomponents]
03.01.17E	[Assignment: organization-defined unsanctioned information]
03.01.17E	[Assignment: organization-defined security policy]
03.02.01E	[Assignment: organization-defined indicators of malicious code]
03.02.01E	[Assignment: organization-defined frequency]
03.02.01E	[Assignment: organization-defined events]
03.02.03E	[Assignment: organization-defined personnel]
03.02.04E	[Assignment: organization-defined personnel or roles]
03.03.02E	[Assignment: organization-defined real-time period]
03.03.02E	[Assignment: organization-defined personnel, roles, and/or locations]
03.03.02E	[Assignment: organization-defined audit logging failure events requiring real-time alerts]
03.03.03E	[Selection (one or more): movement; deletion]

Medical identity fraud also enables thieves to obtain medical treatment using the victim's stolen ePHI. This can lead to the thief's medical conditions being incorporated into the victim's medical records and impacting the victim's ability to receive appropriate medical treatment based on accurate records in the future, or any care at all depending on whether the thief has exhausted the victim's insurance benefits. [973] Overall, recovering compromised ePHI and addressing the consequences of breached information can be a long and arduous process that can cost victims large amounts of time, energy, and money. [974] Breaches of ePHI maintained by health care systems can also pose a threat to the medical well-being of affected individuals. Cyberattacks on health care organizations can include the deployment of malware that compromises the function of both internal and external medical devices. Such software can alter the dosages of sensitive medicines or shut down devices while they are in use, thus affecting patient care. [975] Some of the medical devices that are vulnerable to malicious software attacks include insulin pumps and cardiac implant devices. [976] The consequences of a cyberattack on such a medical device can be fatal. Cyberattacks on relevant electronic information systems also hinder the efficiency of hospitals and limit the quality of care provided to patients. Breaches of relevant electronic

information systems negatively affect the routine functions of health care organizations. They can affect the availability of ePHI and relevant electronic information systems and redirect critical resources from patient care to addressing the cybersecurity attack. A 2020 cyberattack on a large covered entity disrupted communication and clinician access to medical records, including to individualized chemotherapy plan templates and tools for communicating during treatment preparation and delivery. [977] In the first week following the attack, the hospital's ability to provide critical outpatient care was reduced by 40 percent and infusion visit volume decreased by 52 percent. Many patients had to be transferred to other sites to minimize delays in receiving critical medications. The effects of this data breach are not unique to this provider. There is evidence that cyberattacks on health care organizations decrease the number of patients they are able to treat in a given day and staff utilization. [978] Decreases in efficiency and number of treated patients also cause health care facilities to lose revenue because of their inability to provide care during a cybersecurity event. Similar to the effects of breaches of ePHI on individuals, health care organizations and facilities also experience reputational and financial impacts because of cybersecurity attacks. Hospitals can lose the community's trust and be subject to lawsuits from individuals whose data was compromised. [979]

On November 5, 2010, FISSEA hosted a workshop, Connecting the DOTS - Harmonizing Current Cybersecurity Competency Efforts, at NIH. Chris Kelsall, Director of the Cyber/IT Workforce, Department of the Navy, moderated a panel including Ernest McDuffie, lead for the National Initiative for Cybersecurity Education; Jacque Caldwell, lead Cybersecurity Competencies Efforts, U.S. Office of Personnel Management (OPM); Alan Carswell, Chair of the University of Maryland University College (UMUC) Cybersecurity Master's Program; and Dagne Fulcher, InfoSec Workforce Development Matrix Project. Attendees were able to obtain an overview of several cybersecurity workforce development efforts in order to enhance integration among past, current, and future endeavors. The workshop provided an open forum for discussion about how the efforts support, conflict, and/or overlap; attendees also shared viewpoints on concrete actions to support appropriate standardizing bodies. The 2011 FISSEA conference returned to NIST on March 15-17, 2011, and the theme was 'Bridging to the Future Emerging Trends in Cybersecurity.' The theme was chosen to reflect current projects, trends, and initiatives that will provide pathways to future solutions. Approximately 165 information systems security professionals and trainers attended, primarily from federal agencies, but also from academia and industry. Attendees received an update on the NICE activities, gained new techniques for developing and conducting training, as well as awareness and training ideas, resources, and contacts. Presenters represented NIST, the Department of Homeland Security (DHS), the Defense Intelligence Agency (DIA), the U.S.

Of course, when the integrator has any records or other information available to FDA under sections 414 and 704(a) of the FD&C Act, then FDA would have access to those records if FDA has a reasonable belief that the food is adulterated and presents a threat of serious adverse health consequences or death to humans or animals. B. Foreign Trade Issues (Comment 14) Several comments representing foreign governments and international associations agree in principle to the recordkeeping requirements provided the requirements are based on a sound risk assessment and do not restrict trade more than necessary to effectively address potential risks. Some comments note that there is no risk assessment provided to justify the proposed measures required by the World Trade Organization Agreement on the Application of Sanitary and Phytosanitary Measures (SPS agreement). Several comments representing foreign governments and businesses request that FDA work with foreign governments to develop common standards and requirements and to facilitate trade flow. Some foreign comments argue that the result of the onerous recordkeeping burden in the regulations will be the elimination of many legitimate and safe food distribution businesses and a serious reduction in global food trade. One comment suggests that the regulations will adversely impact trade, as they are likely to increase uncertainty and costs for foreign exporters. Small and medium sized foreign companies in particular may be prevented from continuing to export to the United States for these reasons. One comment is concerned that the regulations may lead to the unintended consequence of foreign countries imposing the same requirements of U.S. goods in foreign trade. (Response) FDA considers that these foreign trade comments are now moot, given the scope of these final regulations. These final regulations do not apply to foreign persons, except foreign persons transporting food in the United States, who are treated no differently than domestic food transporters under these final regulations. FDA does not believe that foreign persons who transport food in the United States will incur additional costs as a result of these regulations, because FDA assumes that they will choose to comply with § 1.352 of this final rule by establishing and

maintaining the records already required by FMCSA. See the response to comment 82, later in this document. C. Comments on Who is Subject to This Subpart? (Proposed § 1.326) 1. General (Comment 15) Several comments seek clarification on who is covered by the proposed regulation. Comments ask if the provisions of the regulations apply to port facilities, such as warehouses, or storage and inspection facilities in land, sea, or airports that belong to private companies and government bodies for food control in the country of shipping and/or origin.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Office of the Secretary Defense Acquisition Regulations System 32 CFR Chapter I 48 CFR Chapter 2 AGENCY: Office of the Under Secretary of Defense for Acquisition and Sustainment, Department of Defense (DoD). ACTION: Advanced notice of proposed rulemaking. SUMMARY: This document provides updated information on DoD's way forward for the approved Cybersecurity Maturity Model Certification (CMMC) program changes, designated as CMMC 2.0. CMMC 2.0 builds upon the initial CMMC framework to dynamically enhance Defense Industrial Base (DIB) cybersecurity against evolving threats. The CMMC framework is designed to protect sensitive unclassified information that is shared by the Department with its contractors and subcontractors and provide assurance that Federal Contract Information (FCI) and Controlled Unclassified Information (CUI) will be protected at a level commensurate with the risk from cybersecurity threats, including Advanced Persistent Threats. Under the CMMC program, DIB contractors will be required to implement certain cybersecurity protection standards, and, as required, perform self-assessments or obtain third-party certification as a condition of DoD contract award. DATES: November 17, 2021. ADDRESSES: Visit the updated CMMC website for CMMC 2.0 updates: <https://www.acq.osd.mil/cmmc/>. FOR FURTHER INFORMATION CONTACT: Ms. Diane Knight, Office of the Under Secretary of Defense for Acquisition and Sustainment, at 202-770-9100 or diane.l.knight10.civ@mail.mil. SUPPLEMENTARY INFORMATION: Background The CMMC program is designed to enhance DIB cybersecurity to meet evolving threats and safeguard the information that supports and enables the Warfighter. Interim Defense Federal Acquisition Regulation Supplement (DFARS) rule, Assessing Contractor Implementation of Cybersecurity Requirements (DFARS Case 2019-D041), effective November 30, 2020, implemented DFARS clause 252.204-7021, Contractor Compliance with the Cybersecurity Maturity Model Certification Level Requirement. This clause implemented the initial version of CMMC program, hereafter CMMC 1.0. CMMC 1.0 was designed to protect FCI and CUI shared with and handled by DoD contractors and subcontractors on non-federal contractor information systems. CMMC 1.0 involved five progressively advanced levels of cybersecurity standards and required that DIB contractors undergo a certification process to demonstrate compliance with the CMMC cybersecurity standards at a given level.

Guide for Security-Focused Configuration Management of Information Systems ## Guide for Security-Focused Configuration Management of Information Systems Guide for Security-Focused Configuration Management of Information Systems provides guidelines for organizations responsible for managing and administering the security of federal information systems and associated environments of operation. Configuration management concepts and principles described in this publication provide supporting information for NIST SP 800-53, Security and Privacy Controls for Federal Information Systems and Organizations. NIST SP 800-128 assumes that information security is an integral part of an organization's overall configuration management. The focus of this document is on implementation of the information system security aspects of configuration management, and as such the term security-focused configuration management (SecCM) is used to emphasize the concentration on information security. In addition to the fundamental concepts associated with SecCM, the process of applying SecCM practices to information systems is described. The goal of SecCM activities is to manage and monitor the configurations of information systems to achieve adequate security and minimize organizational risk while supporting the desired business functionality and services.

Physical access devices include keys, locks, combinations, and card readers. FURTHER DISCUSSION Identifying and controlling physical access devices (e.g., locks, badges, key cards) is just as important as monitoring and limiting who is able to physically access certain equipment. Physical access devices are only strong protection if you know who has them and what access they allow.

Physical access devices can be managed using manual or automatic processes 167 NIST SP 800-171A, pp. 47-48. 168 NIST SP 800-171 Rev. 2, p. 33.

In order to be eligible for a contract with a requirement for the CMMC Status of Level 2 (Self), the OSA must have achieved the CMMC Status of either Conditional Level 2 (Self) or Final Level 2 (Self) and have submitted an affirmation. The Level 2 self-assessment must be completed every three years and the affirmation must be completed annually following the Final CMMC Status Date. Section 170.17-CMMC Level 2 Certification Assessment and Affirmation Requirements Section 170.17 addresses how an OSC will achieve and maintain compliance with the CMMC Status of Level 2 (C3PAO). The OSC must successfully implement the security requirements listed in § 170.14(c)(3) within its Level 2 CMMC Assessment Scope as described in § 170.19(c). Successful implementation requires meeting all objectives defined in NIST SP 800-171A Jun2018 for the corresponding CMMC Level 2 security requirements. Requirements for ESPs and CSPs that process, store, transmit CUI are provided in § 170.17(c)(5) and (6). After implementation, the OSC must hire a C3PAO to perform an assessment to verify the implementation. The C3PAO will score the OSC using the scoring methodology provided in § 170.24. All objectives must be met in order for a security requirement to be considered fully implemented; in some cases, if not all objectives are met, some security requirements may be placed on a POA&M as defined in § 170.21. If the minimum score has been achieved and some security requirements are in a POA&M, the OSC has achieved the CMMC Status of Conditional Level 2 (C3PAO); if all requirements are MET as defined in § 170.24(b), the OSC has achieved the CMMC Status of Final Level 2 (C3PAO). For Conditional Level 2 (C3PAO), a POA&M closeout must be conducted within 180 days as described (printed page 83102) in § 170.21(b) or the Conditional Level 2 (C3PAO) CMMC Status will expire. After a Level 2 certification assessment, as well as after a POA&M closeout, the C3PAO will input the OSC's results into the CMMC instantiation of eMASS as described in § 170.17(a)(1)(i). After a Level 2 certification assessment, as well as after a POA&M closeout, the OSC must submit an affirmation as described in § 170.22. In order to be eligible for a contract with a requirement for the CMMC Status of Level 2 (C3PAO), the OSC must have achieved the CMMC Status of either Conditional Level 2 (C3PAO) or Final Level 2 (C3PAO) and have submitted an affirmation. The Level 2 certification assessment must be completed every three years and the affirmation must be completed annually following the Final CMMC Status Date. Section 170.18-CMMC Level 3 Certification Assessment and Affirmation Requirements Section 170.18 addresses how an OSC will achieve and maintain compliance with the CMMC Status of Level 3 (DIBCAC). The OSC must have achieved the CMMC Status of Final Level 2 (C3PAO) for information systems within the Level 3 CMMC Assessment Scope as a prerequisite to undergo a Level 3 certification assessment. The OSC must successfully

(B) From subsections (d)(1), (2), (3) and (4) (record subject's right to access and amend records) because affording access and amendment rights could alert the record subject to the investigative interest of law enforcement agencies or compromise sensitive information classified in the interest of national security. In the absence of a national security basis for exemption, records in this system may be exempted from access and amendment to the extent necessary to honor promises of confidentiality to persons providing information concerning a candidate for position. Inability to maintain such confidentiality would restrict the free flow of information vital to a determination of a candidate's qualifications and suitability. (C) From subsection (e)(1) (maintain only relevant and necessary records) because in the collection of information for investigatory purposes, it is not always possible to determine the relevance and necessity of particular information in the early stages of the investigation. It is only after the information is evaluated in light of other information that its relevance and necessity becomes clear. In the absence of a national security basis for exemption under subsection (k)(1), records in this system may be exempted from the relevance requirement pursuant to subsection (k)(5) because it is not possible to determine in advance what exact information may assist in determining the qualifications and suitability of a candidate for position. Seemingly irrelevant details, when combined with other data, can provide a useful composite for determining whether a candidate should be appointed. (D) From subsections (e)(4)(G) and (H) (publication of procedures for notifying subject of the existence of records about them and how they may access records and contest contents) because the system is exempted from subsection (d) provisions regarding access and amendment, and from the subsection (f) requirement to promulgate agency rules. Nevertheless, the Office of the Secretary of Defense has published notice concerning notification, access, and contest procedures because it may, in certain circumstances, determine it appropriate to provide subjects access to all or a portion of the records about them in this system of records. (E) From subsection (e)(4)(I) (identifying sources of records in the system of records) because identifying sources could result in disclosure of properly classified national

defense or foreign policy information, intelligence sources and methods, and investigatory techniques and procedures. Notwithstanding its proposed exemption from this requirement the Office of the Secretary of Defense identifies record sources in broad categories sufficient to provide general notice of the origins of the information it maintains in this system of records.

This document provides high level guidance that refers readers to other NIST SP documents addressed in this rule. Contractors may reference this guidance when their contracts involve IoT devices. As such, the Government assumes that a small percentage of the 28 contractors awarded a contract involving a non-cloud FIS, whose contract also involves IoT devices, may refer to this publication for direction to more detailed policy and guidance regarding the devices; However, the Government does not anticipate contractors expending significant effort reading and familiarizing themselves with the publication and considers these costs to be de minimis. iii. NIST SP 800-39. NIST SP 800-39 identifies the Government's risk management responsibilities related to information systems. All contractors awarded a contract involving a non-cloud FIS will need to be aware of the requirements of the publication to adequately support the non-cloud FIS on behalf of the Government. As such, the Government assumes all 28 contractors awarded a contract involving a non-cloud FIS will expend effort to read and become more familiar with the publication. It is estimated that a contractor will expend approximately 4 hours reading NIST SP 800-39 in year one to become more familiar with its contents. Using an average loaded wage rate of \$91.10 for FIS occupations, the total estimated labor cost for a contractor to comply with NIST SP 800-39 is approximately \$370 (4 hours * \$91.10). iv. NIST SP 800-37. Contractors will reference this guidance to develop a high-level process to manage system risk through preparation, categorization, control selection, control implementation and assessment, system authorizations, and continuous monitoring. This guidance applies to contracts involving a custom-build system. As such, the Government assumes all 6 contractors awarded a contract involving a custom-build, non-cloud FIS will expend effort to comply with this guidance. It is estimated that, in year one, a contractor will expend approximately 8 hours reading and ensuring the processes they develop incorporate the high-level guidance of NIST SP 800-37. Using an average loaded wage rate of \$91.10 for FIS occupations, the total estimated labor cost for a contractor to comply with NIST SP 800-37 is approximately \$730 (8 hours * \$91.10). v. NIST SP 800-207. Contractors will reference this guidance when designing a zero-trust architecture approach for a system. This guidance applies to contracts involving a custom-build system; However, this document is very high level and applies to custom-build requirements in limited circumstances. For these reasons, the Government does not anticipate most contractors needing to read and familiarize themselves with the publication, as its application is unlikely in most custom-build contracts and, in such circumstances, any time spent reviewing the guidance will be very minimal. vi. NIST SP 800-160, Volume 1.

3.2.7 | Unknowns of Data Collection | 17 | | 3. 3.2.7 Unknowns of Data Collection About 40% of participants were concerned that they did not have a good grasp on smart home device data collection and usage, which led to privacy concerns.

Although portions of some records may be denied, the remaining reasonably segregable portions must be released to the requester. Unless disclosing the extent of the deletion would harm an interest protected by an exemption, the amount of deleted information shall be indicated on the released portion of paper records by use of brackets or darkened areas. In no case shall the deleted areas be left white without the use of brackets to show the bounds of deleted information. In the case of electronic deletion or deletion in audiovisual or microfiche records, if technically feasible, the amount of redacted information shall be indicated at the place in the record such deletion was made, unless including the indication would harm an interest protected by the exemption under which the deletion was made. This may be done by use of brackets, shaded areas, or some other identifiable technique that will clearly show the limits of the deleted information. (d) Response to requester. (1) When a decision is made to release a record, a copy should be made available promptly to the requester. (2) When a request for a record is denied in whole or in part, the official designated to respond shall provide the requester a written explanation of the substantive basis for denial including specific citation of the statutory exemption applied under provisions of this part (e.g., 5 U.S.C. 552 (b)(1)) and advise the requester of their appeal rights, including the address to which any appeal should be mailed. The basis for the determination shall be in sufficient detail to permit the requester to make a decision concerning an appeal. If the IDA does not sign the response letter, the name and duty title of the IDA will be specified in the letter. The official also shall advise the requester that any appeal to the adverse determination must be postmarked no later than

60 days after the date of the initial denial letter. (3) The DoD Component shall make a reasonable effort to estimate the volume of the records denied and provide this estimate to the requester, unless providing such an estimate would harm an interest protected by an exemption of the FOIA. This estimate should be in number of pages or in some other reasonable form of estimation. (4) When a denial is based on a statute qualifying as a FOIA Exemption 3 statute, the DoD Components shall state the particular statute relied upon to deny the information. (5) When a requester is assessed fees for processing a request, the requester's fee category shall be specified in the final response letter. The DoD Components also shall provide the requester with a complete cost breakdown (e.g., 15 pages of office reproduction at \$.15 per page; three hours of professional level search at \$53.00 per hour, etc.) in the response letter. (e) File of initial denials.

) (applying privacy provisions and penalties to business associates of covered entities). The Department codified the term "covered entity" and defined it using these three categories of persons. 45 CFR 164.103 . Back to Citation 37. 42 U.S.C. 1320d-2(d)(2) . The DoD disagreed with the commenter's assertion that Assessors are robotic. Assessors will go through CMMC training and will assess each unique CMMC Assessment Scope, as defined by the OSA, against the security requirements. As specified in § 170.13(a) CCPs can participate on CMMC Level 2 certification assessments with CCA oversight where the CCA makes all final decisions. Updates to training are beyond the scope of this rule. Statements made in training materials produced prior to final adoption of the CMMC rule are beyond the scope of CMMC rulemaking. DoD disagrees with the comment that § 170.13 does not provide sufficient detail regarding the role CCPs may play in an assessment. The requirement in the rule that "with CCA oversight where the CCA makes all final determinations" provides sufficient flexibility to adapt to a wide variety of assessments while ensuring the responsibility for assessment findings rests with the CCA and Lead CCA. The rule restates COI and CoPC requirements in each ecosystem section because all CMMC ecosystem members are required to abide by the appropriate ethics and conflicts of interest policies established by the CMMC AB and the CAICO. Rule content pertaining to ethics, quality assurance functions, record keeping, data encryption, security, and other functions across the ecosystem are tailored to reflect the role each entity fills in the ecosystem. DoD CIO, in coordination with OUSD/I&S, evaluated the

requirements for the CMMC Ecosystem. Based on the access to sensitive unclassified information, a Tier 3 background investigation that results in determination of national (printed page 83124) security eligibility is required. § 170.13(a) states that a CCP is eligible to participate in Level 2 certification assessment with CCA oversight and is eligible to become a CCA and will receive additional training and testing per the requirements in § 170.11. The phased implementation plan described in § 170.3(e) is intended to address ramp-up issues and provide time to train the necessary number of assessors. DoD has updated the rule to add an additional six months to the Phase 1 timeline. e. CCI 1. Training and Training Materials Comment: One comment mistook the requirement to ·provide all documentation and records in English· as applying to training materials. Four comments expressed concerns about the requirements for confidentiality surrounding training records. These concerns arose primarily from a misinterpretation of the requirement to ·keep confidential all information obtained during the performance of CMMC training activities· to mean a requirement to keep the training materials themselves confidential, rather than keeping student records confidential. Response:

be reasonable and appropriate for the type of user or technology asset, the electronic information system or technology asset to which access is sought, and the type of information maintained on such information system or technology asset. For example, a regulated entity may determine that any authentication failure of an administrative privileged access account should disable the account because of the level of risk compared to an authentication failure of a non-administrative privileged account. The Department does not propose to define disable or suspend and relies upon the industry understanding that disabling a user's access would require intervention to restore the capability to use the user identity, while a suspension may prevent additional log-in attempts for a temporary, limited period of time. Consistent with NCVHS' recommendation and existing guidance, the Department also proposes to add an implementation specification for network segmentation at 45 CFR 164.312(a)(2)(vi) that would require a regulated entity to deploy technical controls to segment its relevant electronic information systems in a reasonable and appropriate manner. [712] Under this proposal, a regulated entity with multiple, distinct electronic information systems would be required to separate relevant electronic information systems using reasonable and appropriate technical controls. Network segmentation is a physical or virtual division of a network into multiple segments, creating boundaries between the operational and IT networks to reduce risks, such as threats caused by phishing attacks. [713] For example, where a regulated entity operates both a point-of-sale system and an EHR on the same network, the EHR could be compromised through a successful attack by an intruder moving laterally (i.e., within the same network) from a previously compromised point-of-sale system because the intruder's movements were not impeded by network segmentation. Accordingly, we believe that it is appropriate to require regulated entities to deploy technical controls to segment the networks to which their relevant electronic information systems are connected. [714] What constitutes reasonable and appropriate network segmentation depends on the regulated entity's risk analysis and how it has implemented its network(s) and relevant electronic information systems. This proposed new implementation specification aligns with the Department's enhanced CPG for Network Segmentation because where the CPG is implemented, an intruder's ability to freely move within a regulated entity's network and protect ePHI is minimized. [715] The proposed implementation specification for data controls at proposed 45 CFR 164.312(a)(2)(vii) would require a regulated entity to deploy technical controls to allow access to ePHI based on the regulated entity's policies and procedures for granting users and technology assets access relevant electronic information systems as specified in proposed 45 CFR 164.308(a)(10)

To further elaborate the DoD established a review body that evaluated the CMMC Program to ensure it was meeting the programmatic requirements to secure Controlled Unclassified Information within the non-Federal networks of the Defense Industrial Base. A special independent team was established to review and provide recommendations on improving the program. The DoD determined that the CMMC program should only employ the Cybersecurity Standards prescribed by the NIST SP 800-171 that had been required for defense contractors since 2017 as implemented by the DFARS clause 252.204-7012, which resulted in the removal of 20 requirements aligned with cybersecurity maturity. The ESG also recommended simplifying the program structure to require only 3 levels of certification vice the original 5. The program further determined that certifications should not be required at CMMC Level 1 and that self-assessment with an annual affirmation was sufficient for this level. Level 2 CMMC was further evaluated and determined that bifurcation of this level was appropriate, and some CUI would only require a Level 2 self-assessment with annual affirmation, which further reduced the

costs for the program. Further the ESG recommended that Plans of Actions and Milestones (POA&Ms) for lower-level requirements that were not met be allowed for a limited period of time. This rule was updated to allow POA&Ms for no more than 180 days to give contractors the ability to achieve contract award without being fully compliant with all requirements of NIST SP 800-171 R2. And, in another effort to minimize the economic impact the program developed a Phase-in approach to incrementally implement CMMC in four phases over 4 years, with the first year being focused on Self-assessment and compliance with NIST SP 800-171 R2 giving contractors more time to implement the requirements already required in their contracts since 2017. A CMMC waiver process was also included in the program which allows DoD the discretion to waive CMMC Program requirements to a procurement or class of procurements in advance of the solicitation in accordance with all applicable policies, procedures, and approval requirements. This waiver would allow contract award and the contractor would be expected to achieve compliance and certification at a defined time post-award. The DoD is employing a phased approach to the CMMC rollout to reduce implementation risk. DoD expects that the public has utilized the lead-time prior to the publication of this rule to prepare for CMMC implementation. CMMC Program requirements make no changes to existing policies for information security requirements implemented by the DoD.

No changes were made to quotations from sources outside the rule. A definition cited from a source must exactly match the source, it cannot be altered. To address a commenter's misperception that the rule does not reference existing FAR/DFARS, or other DoD authoritative sources, it should be noted that the CMMC proposed rule includes 54 mentions each of FAR clause 52.204-21 and DFARS clause 252.204-7012. The DFARS clause 252.204-7012 is added to DoD contracts to implement the requirements of NIST SP 800-171, which is the authoritative reference for adequate safeguarding of CUI. Contractors complying with CMMC need to be familiar with those documents that are incorporated by reference, which address requirement-related topics. NIST SP 800-53 R5 is incorporated by reference only for applicable definitions because DoD chose to use the latest definitions available. The purpose of a reference listed in § 170.2 should be interpreted based on the context in which it is used. For example, the references provided in § 170.4 specify the source of the definition. The references for the CMMC Assessments Guides listed in Appendix A have been updated. These guides are largely derived from NIST SP 800-171 R2, NIST SP 800-171A Jun2018, NIST SP 800-172 Feb2021, and NIST SP 800-172A Mar2022. The DoD has updated § 170.3 to align with the FAR terminology and now reflects 'Federal Information System' instead of 'Government Information System'. The DoD updated the rule to reference the latest version of 'Cloud Security Technical Reference Architecture' and, where appropriate, to identify a revision number for NIST SP 800-171. Specific details of cybersecurity-related resources and training developed to support the DIB are outside the scope of this rule. As it becomes available, supporting resources and training information will be disseminated. Currently, multiple public resources are available to help educate companies on NIST and CMMC requirements. The DoD declined to respond to comments based on comparison of pre-publication draft versions of the supplemental guidance documents. A commenter's claim that DoD views the CMMC program as only addressing 'basic cybersecurity' is incorrect. Throughout the rule, references to 'basic safeguarding' mean the requirements of CMMC Level 1, which align directly to the requirements of FAR clause 52.204-21. That FAR clause is titled 'Basic Safeguarding of Covered Contractor Information Systems'. Similarly, the CMMC program establishes a CMMC Level 3 requirement to comply with a subset of requirements from NIST SP 800-172 Feb2021, titled, 'Enhanced Security Requirements for Protecting Controlled Unclassified Information'. Section 170.4 includes acronyms and definitions used in the rule text. Terms from other authoritative sources are listed in § 170.4 and are properly sourced. 1 CFR part 51 governs drafting of this rule. The DoD updated the rule throughout to reflect new terminology better differentiating between the activity of (

(7) Ensure policies and administrative processes within their directorates are evaluated to ensure compliance with the procedures in this part. (h) System Managers. System Managers will: (1) Report any changes to their existing SORN(s) to the Chief of the OIP for publishing in the FR at least 90 working days before the intended change to the system. (2) Review their published SORN(s) on a biennial basis and submit updates to the Chief of the OIP as necessary. (3) Ensure appropriate training is provided for all users, to include contractors, which have access to records covered by their published system notice. (4) Ensure safeguards are in place to protect all records containing PII (electronic, paper, etc.) from unauthorized access, use, disclosure, alteration, and/or destruction using guidelines found in 32 CFR part 310, subpart B, 32 CFR part 310, Appendix 1, and DoDM 5200.01, Volume 4. (5) Assist in responding to any complaints and inquiries regarding the collection or maintenance of, or access to information covered by their published SORN(s). (6)

Process all 5 U.S.C. 552a requests for access and amendment, as outlined in section 6 of 32 CFR part 329 . (7) Maintain a record of disclosures for any records covered by a SORN using a method that complies with 32 CFR part 310, subpart E when disclosing records outside of the agency (DoD). Such disclosures will only be made when permitted by a Routine Use published in the SORN. (i) As required by 5 U.S.C. 552a and 32 CFR part 310, subpart E , the disclosure accounting will be maintained for 5 years after the disclosure, or for the life of the record, whichever is longer. The record may be maintained with the record disclosed, or in a separate file within the office's official record keeping system. (ii) Pursuant to 5 U.S.C. 552a and 32 CFR part 310, subpart E , the disclosure accounting will include the release date, a description of the information released, the reason for the release; and, the name and address of the recipient. § 329.6 Procedures. (a) Publication of Notice in the FR. (1) A SORN shall be published in the FR of any record system meeting the definition of a SOR, as defined by 5 U.S.C. 552a . (2) System Managers shall submit notices for new or revised SORNs through their Director to the Chief of the OIP for review at least 90 working days prior to implementation. (3) The Chief of the OIP shall forward complete SORNs to the Defense Privacy and Civil Liberties Office (DPCLO), or the respective service that has the statutory authority to publish the SORN, for review and publication in the FR in accordance with 32 CFR part 310, subpart G . Following the OMB comment period, the public is given 30 days to submit written data, views, or arguments for consideration before a SOR is established or modified. (b) Access to Systems of Records Information. (1) As provided by 5 U.S.C. 552a

From the NIST SP 800-172 Rev 3 Final Public Draft: Audit and Accountability 831 03.0 3.01E Protection of Audit Record Storage in Separate Physical Systems or Components Store audit records in a repository that is part of a physically different system or system component than the system or component being audited. DISCUSSION Storing audit records in a repository that is separate from the audited system or system component helps to ensure that a compromise of the system being audited does not also result in a compromise of the audit records. Storing audit records on separate physical systems or components preserves the confidentiality, integrity, and availability of audit records and facilitates the management of audit records as an organization-wide activity. Storing audit records on separate systems or system components applies

to the extent that such provisions have been identified and an exemption claimed for the original record and the purposes underlying the exemption for the original record still pertain to the record which is now maintained in this system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy; to avoid interference during the conduct of criminal, civil, or administrative actions or investigations; to ensure protective services provided the President and others are not compromised; to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations; to preserve the confidentiality and integrity of Federal testing materials; and to safeguard evaluation materials used for military promotions when furnished by a confidential source. The exemption rule for the original records will identify the specific reasons why the records are exempt from specific provisions of 5 U.S.C. 552a . (24) System identifier and name. DPFPA 06, Internal Affairs Records System. (i) Exemption. Portions of this system that fall within 5 U.S.C. 552a(j)(2) and/or (k)(2) are exempt from the following provisions of 5 U.S.C. 552a , section (c)(3) and (4); (d); (e)(1) through (e)(3); (e)(4)(G) through (I); (e)(5); (f) and (g) of the Act, as applicable. (ii) Authority. 5 U.S.C. 552a(j)(2) and (k)(2) . (iii) Reasons. (A) From subsections (c)(3) and (4) because making available to a record subject the accounting of disclosure of investigations concerning him or her would specifically reveal an investigative interest in the individual. Revealing this information would reasonably be expected to compromise open or closed administrative or civil investigation efforts to a known or suspected offender by notifying the record subject that he or she is under investigation. This information could also permit the record subject to take measures to impede the investigation, e.g. destroy evidence, intimidate potential witnesses, or flee the area to avoid or impede the investigation.

HIPAA Security Rule section 164.310 (Physical Safeguards) addresses workstation use. Covered entities and business associates must implement appropriate safeguards to protect electronic protected health information (ePHI). For workstation use, organizations should: 1. Establish and document policies specific to workstation use 2. Implement technical and procedural controls 3. Train workforce members on their responsibilities 4. Conduct periodic risk assessments addressing workstation use 5. Maintain documentation of compliance efforts Under 45 CFR 164.310, this is a physical safeguards requirement that applies to all covered entities and business associates that

create, receive, maintain, or transmit ePHI.

Removing ·DIB participants' capabilities· and adding in its place ·DIB CS Program participants' capabilities·. §-236.2 [Amended] 4. Amend §-236.2 by: a. Removing the definition of ·Access to media·. b. In the definition of ·DIB participant·: i. Removing ·DIB participant· and adding in its place ·DIB CS Program participant·. ii. Removing ·DIB CS program· and adding in its place ·DIB CS Program·. c. Removing ·DIB CS program· in the definition of ·Government furnished information (GFI)· and adding in its place ·DIB CS Program·. §-236.3 [Amended] 5. Amend §-236.3 by: a. Removing ·program· and adding in its place ·Program participants· in paragraph (b)(1). b. Removing ·DIB CS program· and adding in its place ·DIB CS Program· in paragraph (c). 6. Amend §-236.4 by: a. Removing · http · and adding in its place · https · in paragraphs (b)(2), (c), and (d). b. Removing · http://iase.disa.mil/pki/eca/Pages/index.aspx · and adding in its place · https://public.cyber.mil/eca/ · in paragraph (e). c. Revising paragraph (f). d. Adding a comma after ·as appropriate· in the first sentence in paragraph (g). e. Removing ·paragraph (e)· and adding in its place ·paragraph (i)· in paragraph (k). f. In paragraph (m)(4): i. Removing ·DIB contractors· and adding in its place ·defense contractors·. ii. Removing ·DIB CS program· and adding in its place ·DIB CS Program·. g. Revising paragraph (p). The revisions read as follows: §-236.4 Mandatory cyber incident reporting procedures. * * * * * (f) Third-party service provider support. If the contractor utilizes a third-party service provider (SP) for information system security services, the contractor may authorize the SP to report cyber incidents on behalf of the contractor. * * * * * (p) Freedom of Information Act (FOIA). Agency records, which may include qualifying information received from non-Federal entities, are subject to request under the Freedom of Information Act (5 U.S.C. 552). The Government will notify the non-Government source or submitter (e.g., contractor or DIB CS Program participant) of the information in (printed page 27838) accordance with the procedures in 32 CFR 286.10 . * * * * * 7. Amend §-236.5 by: a. Revising section heading and paragraph (a). b. In paragraph (b): i. Removing ·DIB CS program· and adding in its place ·DIB CS Program·. ii. Removing ·DIB participant· and adding in its place ·DIB CS Program participant·. c. In paragraph (c): i. Removing ·DIB participant· and adding in its place ·DIB CS Program participant·. ii. Removing ·individual DIB participants· and adding in its place ·individual DIB CS Program participants·. d. In paragraph (d): i. Removing ·DoD's DIB CS Program Office· and adding in its place ·DoD's DIB CS Program Management Office·. ii. Removing ·DoD DIB· and adding in its place ·DoD-DIB·. iii. Removing ·DIB CS program· and adding in its place ·DIB CS Program·. e. Removing ·DIB participants· and adding in its place ·DIB CS Program participants· in paragraph (e). f. Redesignating paragraphs (f) through (n) as paragraphs (g) through (o). g. Adding new paragraph (f). h.

CMMC Acquisition rule also partially implements a section of the National Defense Authorization Act for Fiscal Year 2020 directing the Secretary of Defense to develop a consistent, comprehensive framework to enhance cybersecurity for the U.S. defense industrial base. [5] The 48 CFR part 204 CMMC Acquisition rule, when finalized, will allow DoD to require a specific CMMC level in a solicitation or contract. When CMMC requirements are applied to a solicitation, Contracting officers will not make award, exercise an option, or extend the period of performance on a contract, if the offeror or contractor does not have the passing results of a current certification assessment or self-assessment for the required CMMC level, and an affirmation of continuous compliance with the security requirements in the Supplier Performance Risk System (SPRS) [6] for all information systems that process, store, or transmit FCI or CUI during contract performance. Furthermore, the appropriate CMMC certification requirements will flow down to subcontractors at all tiers when (printed page 83093) the subcontractor processes, stores, or transmits FCI or CUI. It should be noted the Department may include CMMC requirements on contracts awarded prior to 48 CFR part 204 CMMC Acquisition rule becoming effective, but doing so will require bilateral contract modification after negotiations. To date, the DoD has relied on offeror representation that the security requirements of National Institute of Standards and Technology (NIST) Special Publication (SP) 800-171, · Protecting Controlled Unclassified Information in Nonfederal Systems and Organizations· have been met, as described by 48 CFR 252.204-7008 . In some instances, the DoD has verified contractor implementation of NIST SP 800-171 through assessment by the Defense Contract Management Agency (DCMA) Defense Industrial Base Cybersecurity Assessment Center (DIBCAC). As part of this responsibility, DCMA DIBCAC assesses DIB companies to ensure they are meeting contractually required cybersecurity standards and to ensure contractors have the ability to protect CUI for government contracts they are awarded. DCMA DIBCAC conducts NIST SP 800-171 assessments in support of 48 CFR 252.204-7012 (DFARS clause 252.204-7012), Safeguarding Covered Defense Information and Cyber

Incident Reporting, [7] and 48 CFR 252.204-7020 (DFARS clause 252.204-7020), NIST SP 800-171 DoD Assessment Requirements. [8] The DCMA DIBCAC prioritization process is designed to adjust as DoD's cyber priorities evolve based on ongoing threats. DCMA DIBCAC collects and analyzes data on DoD contractors to include: Mission critical programs, technologies, and infrastructure and the contractors (prime or lower tier) that support DoD capabilities. Cyber threats, vulnerabilities, or incidents. DoD Leadership requests. To date, DCMA DIBCAC has assessed 357 entities including DoD's major prime contractors. In accordance with NIST SP 800-171, titled ·

to notify its business associate when it has activated its contingency plan. Additionally, the Department proposes conforming changes to the references of 45 CFR 164.308(b) throughout 45 CFR 164.314 consistent with proposals made to modify 45 CFR 164.308(b) . The Department does not intend these to be substantive changes, but rather an alignment with the proposed structural modifications in 45 CFR 164.308(b) . As discussed above, the Department proposes to remove the term ·required· from the implementation specification at 45 CFR 164.314(a)(2) consistent with its proposal to eliminate the distinction between addressable and required implementation specifications. We also propose a few miscellaneous non-substantive corrections to update citations in the standard at 45 CFR 164.314(a)(1)(i) and (a)(2)(iii) . We do not believe that these technical amendments would add or change any regulatory, recordkeeping, or reporting requirements, nor would they change the Department's interpretation of any regulation. 2. Section 164.314(b)(1)-Standard: Requirements for Group Health Plans a. Current Provision The second standard in 45 CFR 164.314 requires that, except when ePHI disclosed to a plan sponsor is summary health information [845] or enrollment or disenrollment information, [846] group health plan [847] documents must provide that the plan sponsor will reasonably and appropriately safeguard ePHI created, received, maintained, or transmitted to or by the plan sponsor on behalf of the group health plan. Section 164.314(b)(2) requires that the plan documents of a group health plan must be amended to incorporate provisions to require the plan sponsor to: Implement reasonable and appropriate administrative, physical, and technical safeguards to protect the confidentiality, integrity, and availability of the ePHI that it creates, receives, maintains, or transmits on behalf of the group health plan. [848] Ensure that the separation between the group health plan and plan sponsor required by the Privacy Rule at 45 CFR 164.504(f)(2)(iii) [849] is supported by reasonable and appropriate security measures. [850] Ensure that any agent to whom it provides ePHI, agrees to implement reasonable and appropriate security measures to protect the information. [851] Report to the group health plan any security incident of which it becomes aware. [852] b. Issues To Address Plan sponsors are not directly liable for compliance with the Security Rule because they are not regulated entities, i.e., covered entities or business associates under HIPAA. Therefore, plan sponsors' obligations to apply safeguards to ensure the confidentiality, integrity, and availability of ePHI are limited to the requirements set forth in the plan documents of its group health plan. While 45 CFR 164.314(b)

One issue related to report and risk analysis stems from the difficulty in collating, normalizing and interpreting different reports and risk assessments due to the wide variety of security-related definitions, semantics, nomenclature and metrics used by different test tools. For example, one test tool may classify the estimated risk for using an app as low, moderate, high or severe risk, while another may classify the estimated risk as pass, warning or fail. While some standards exist for expressing risk assessment 15 and vulnerability reporting 16 the current adoption of these standards by test tools is low. To the extent possible, it is recommended that an organization use test tools that leverage vulnerability reporting and risk assessment standards. If this approach is not possible, it is recommended that the organization provide sufficient training to analysts on the interpretation of reports and risk assessments generated by test tools.

(g) A subcontractor requiring access to classified information under a contract shall be identified with a Commercial and Government Entity (CAGE) code on the DD Form 254. A subcontractor requiring access to classified information shall provide its CAGE code with its name and address or otherwise include it prominently in the proposal. Each location of subcontractor performance listed on the DD Form 254 is required to reflect a corresponding unique CAGE code for each listed location unless the work is being performed at a Government facility, in which case the agency location code shall be used. The CAGE code must be for that name and address. Insert the word ·CAGE· before the number. The CAGE code is required prior to award. * * * * * 10. Amend section 52.204-17 by revising the provision title and date and removing from paragraph (a)(1) ·entity; or· and adding ·entity by unique location; or· in its place. The revision reads as follows: 52.204-17 Ownership or Control

of Offeror. * * * * * Ownership or Control of Offeror ([DATE]) * * * * * 11. Amend section 52.204-18 by: a. Revising the date of the clause; b. Removing from paragraph (a)(1) ·entity; or· and adding ·entity by unique location; or· in its place; c. Removing from paragraph (b) ·DLA· and adding ·Defense Logistics Agency (DLA· in its place, and removing from paragraph (d) ·NSPA· and adding ·North Atlantic Treaty Organization (NATO) Support and Procurement Agency (NSPA)· in its place; and d. Adding Alternate I. The revision and addition read as follows: 52.204-18 Commercial and Government Entity Code Maintenance. * * * * * Commercial and Government Entity Code Maintenance ([DATE]) * * * * * Alternate I ([DATE]). As prescribed at 4.1804(c), add the following additional paragraph (f). (f) Contractors shall ensure that subcontractors maintain their CAGE code(s) throughout the life of the contract. 12. Amend section 52.204-20 by revising the date of the provision and (printed page 33205) removing from paragraph (a)(1) ·entity; or· and adding ·entity by unique location; or· in its place. The revision reads as follows: 52.204-20 Predecessor of Offeror. * * * * * Predecessor of Offeror ([DATE]) * * * * * PART 53-FORMS 13. Amend section 53.204-1 by revising the introductory text to read as follows: 53.204-1 Safeguarding classified information within industry (DD Form 254, DD Form 441). The following forms, which are prescribed by the Department of Defense, shall be used by DoD components and those nondefense agencies with which DoD has agreements to provide industrial security services for the National Industrial Security Program if contractor access to classified information is required, as specified in subpart 4.4 and the clause at 52.204-2: * * * * * [FR Doc. 2019-14379 Filed 7-11-19; 8:45 am] BILLING CODE 6820-EP-P

Because small businesses typically don't have the resources to invest in information security the way larger businesses can, many cyber criminals view them as soft targets. Your small business may have money or information that can be valuable to a criminal; your computer may be compromised and used to launch an attack on somebody else (i.e., a botnet), or your business may provide access to more high-profile targets through your products, services, or role in a supply chain. - Environmental (e.g. fire, water, tornado, earthquake); - Business Resources (e.g. equipment failure, supply chain disruption, employees), and - Hostile Actors (e.g. hackers, hacktivists, criminals, nation-state actors). You should review and update your risk management plan at least annually and whenever you may be considering any changes to the business (e.g. beginning a new project, a change in procedure, or purchasing a new IT system). Also, if you hear that something happened to one of your business partners, suppliers (including makers of any computer equipment or software you may use), customers, or employees, use this exercise to make sure you are still adequately protected.

The relational expression $age > 18$; within the policy can be viewed as a Boolean expression; age has values that will evaluate to true (values greater than 18), and those which will evaluate to false (values less than or equal to 18). The software takes the input policy and replaces the relational expressions with temporary Boolean variables. After the replacement, the software processes the input policy normally. Then the software will solve each relational problem to find values that pass and fail, and updates the results with those values as shown in Figure 32.

5 U.S.C. 601 , et seq., because the rule creates minimal requirements. The initial regulatory flexibility analysis (IRFA) has been prepared and is summarized as follows: DoD, GSA, and NASA are proposing to amend the Federal Acquisition Regulation (FAR) to require electronic submission of the DD Form 254, Contract Security Classification Specification. The objective of this proposed rule is to revise the FAR to update and clarify the requirements for using the DD Form 254, Contract Security Classification Specification. The Government uses the DD Form 254 to convey security requirements to contractors when contract performance requires access to classified information. Prime contractors also use the DD Form 254 to convey security requirements to subcontractors that require access to classified information to perform on a subcontract. Subcontractors may also use the DD Form 254 if access to classified information is required to convey security requirements to additional subcontractors. DoD, GSA, and NASA do not expect that this proposed rule will have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601 , et seq. The proposed rule would apply to small businesses awarded contracts or subcontracts by Executive agencies covered by the National Industrial Security Program that require access to classified information. Currently, the Defense Security Service monitors approximately 13,500 contractor facilities that are cleared for access to classified information. Approximately 9,000 facilities are considered less-complex, which includes small businesses and smaller security operations. Subject matter experts estimate that 5,400 (60 percent) of the 9,000 less-complex facilities are small businesses. The proposed rule does not

impose any Paperwork Reduction Act reporting, recordkeeping, or other compliance requirements on any small entities. The proposed rule does not impose any new reporting, recordkeeping or other compliance requirements. The rule does not duplicate, overlap, or conflict with any other Federal rules. There are no significant alternatives to the rule which accomplish the stated objectives of applicable statutes and which minimize any significant economic impact of the rule on small entities. The Regulatory Secretariat Division has submitted a copy of the IRFA to the Chief Counsel for Advocacy of the Small Business Administration. A copy of the IRFA may be obtained from the Regulatory Secretariat Division. DoD, GSA and NASA invite comments from small business concerns and other interested parties on the expected impact of this rule on small entities. DoD, GSA, and NASA will also consider comments from small entities concerning the existing regulations in subparts affected by this rule consistent with 5 U.S.C. 610 . Interested parties must submit such comments separately and should cite 5 U.S.C. 610 (FAR Case 2015-002) in correspondence. VII. Paperwork Reduction Act

(iii) A contractor may give an employee access to classified information at the same or lower level of classification as the level of the contractor's entity eligibility determination if the employee has: (A) A valid need-to-know for the classified information. (B) A USG favorable eligibility determination for access to classified information at the appropriate level; and (C) Signed a non-disclosure agreement. (2) The CSA will determine eligibility for access to classified information in accordance with SEAD 4 (available at: <https://www.dni.gov/files/NCSC/documents/Regulations/SEAD-4-Adjudicative-Guidelines-U.pdf>) and notify the contractor when eligibility has been granted. (i) The CSA will notify the contractor when an employee's eligibility has been denied, suspended, or revoked. (ii) The contractor will immediately deny access to classified information to any employee when notified of a denial, revocation, or suspension of eligibility regardless of the contractor employee's location. (iii) If the employee's performance is at a USG facility, the contractor will provide notification to the appropriate GCA of any denial, revocation, or suspension of eligibility for access to classified information. (3) Contractors will annotate and maintain the accuracy of their employees' records in the system of record for contractor eligibility and access to classified information, when one has been designated by the CSA. (4) Within an MFO or within the same business organization, contractors may centrally manage eligibility for access to classified information and access to classified information records. (5) The contractor will limit requests for determinations of eligibility for access to classified information to the minimum number of employees and consultants necessary for operational efficiency in accordance with contractual obligations and other requirements of this rule. Requests for determinations of eligibility for access to classified information will not be used to establish a cache of cleared employees. (6) The contractor will not submit a request for an eligibility determination to one CSA if the employee applicant is known to be cleared or in process for eligibility for access to classified information by another CSA. In such cases, reciprocity of eligibility determination in accordance with SEAD 7 (available at: https://www.dni.gov/files/NCSC/documents/Regulations/SEAD-7_BI_ReciprocityU.pdf) shall be used. The contractor will provide the new CSA with the full name, date, and place of birth, social security number, clearing agency, and type of investigation for verification. (7) Contractors will not submit requests for determination of eligibility for access to classified information for individuals who are not their employees or consultants; nor will they submit requests for employees of subcontractors.

The Department proposes to add and define the term 'technical controls' to help regulated entities better understand what we mean by technical safeguards for purposes of complying with the Security Rule. We propose to define technical controls as technical mechanisms contained in the hardware, software, or firmware components of an electronic information system that are primarily implemented and executed by the electronic information system to protect it and the data within the electronic information system. The Department believes that adding this term would better convey the expectation that a regulated entity is (printed page 929) required to deploy technical safeguards across its enterprise by, among other things, configuring and using technical mechanisms in the hardware, software, and firmware components of its relevant electronic information systems to protect ePHI and electronic information systems that create, receive, maintain, or transmit ePHI or that otherwise affect the confidentiality, availability, or integrity of ePHI. 17. Modifying the Definition of 'Technical Safeguards' a. Current Provision and Issues To Address The current definition of 'technical safeguards' includes the technology and policy and procedures for its use that protect ePHI and control access to it. [390] As discussed above, the Department believes

that there is an immediate need to modernize and update the definition to better reflect the role technology plays in protecting ePHI and the technical components of information systems, versus the role of policies and procedures. This would complement our effort to clarify the relationship between technology and the implementation of technical policies and procedures. b. Proposal The Department proposes to modify the definition of technical safeguards to expressly include technical controls. We also propose to add language that would clarify that the technology, technical controls, and related policies and procedures in this category govern the use of the technology to protect and control access to ePHI. The proposed changes also would improve the consistency of language across the safeguard provisions and rule. 18. Adding a Definition of Technology Asset a. Issues To Address Throughout the Security Rule, standards and implementation specifications list the components of electronic information systems to which its requirements apply. Based on the Department's enforcement experience, we believe that it would be beneficial to more clearly distinguish between the requirements that apply to all components of an electronic information system and those that only apply to certain components. Additionally, we believe it would be beneficial to distinguish between requirements that apply specifically to each particular component of an electronic information system and those that apply to the electronic information system as a whole. b. Proposal

IR.L2-3.6.1 Incident Handling CMMC Assessment Guide Level 2 | Version 2.13 138 a filename that looks unusual; and log entries that raise concern. After detecting an incident, an incident response team performs analysis. This requires some knowledge of normal network operations. The incident should be documented including all the log entries associated with the incident. Containment of the incident is a critical step to stop the damage the incident is causing to your network. Containment activities should be based on previously defined organizational priorities and assessment of risk. Recovery activities restore systems to pre-incident functionality and address its underlying causes. Organizations should use recovery activities as a means of improving their overall resilience to future attacks. Example Your manager asks you to set up your company's incident-response capability [a]. First, you create an email address to collect information on possible incidents. Next, you draft a contact list of all the people who need to know when an incident occurs. You document a procedure for how to submit incidents that includes roles and responsibilities when a potential incident is detected or reported. The procedure also explains how to track incidents, from initial creation to closure [b]. Potential Assessment Considerations Is there an incident response policy which specifically outlines requirements for handling of incidents involving CUI [a]? KEY REFERENCES NIST SP 800-171 Rev. 2 3.6.1

If the contractor intends to flow down CUI to a subcontractor, then the contractor must prepare an SF XXX and distribute it to the subcontractor to ensure the subcontractor properly safeguards CUI. It is estimated 517,392 standard forms may be prepared and distributed by contractors and (printed page 4283) subcontractors each year. On average, it is estimated that it will take the contractor or subcontractor two hours to prepare and distribute the SF XXX. The estimated annual cost to prepare and distribute the SF XXX is \$82,782,270 (517,392 forms * 2 hours/form * \$80), of which \$2,529,440 is attributed to 15,809 small business contractors and subcontractors. d. Train Employees on Handling CUI A contractor shall not permit any contractor employee to collect, develop, receive, transmit, use, handle, or store CUI unless the employee has completed training on properly handling CUI as described in the SF XXX. The contractor must provide evidence of employee training upon request by the contracting officer; however, such requests are expected to be limited to, for example, instances in which the Government is dealing with a CUI incident. It is estimated that approximately 2,191,400 contractor and subcontractor employees may be required to take training on handling CUI, which is expected to take one hour to complete. It is anticipated that agencies will provide their support contractors and personnel with CUI standard training aligned with Federal policy. The estimated annual training cost is \$166,546,400 (2,191,400 employees * 1 hour/employee * \$76/hour), of which \$26,440,400 is attributed to 34,790 small business contractors and subcontractors. The estimated annual recordkeeping cost to maintain contractor training records is \$10,003,741 (2,191,400 records * 0.083 hours/record * \$55/hour), of which \$1,588,164 is attributed to the 34,790 small businesses. The estimated annual reporting cost is \$19,664 (1,430 requests * 0.25 hours/response * \$55/hour), of which \$13,401 is attributed to 975 small businesses. e. Comply With NIST SP 800-172 A limited number of contractors may be required to implement NIST SP 800-172, Enhanced Security Requirements for Protecting Controlled Unclassified Information: A Supplement to NIST Special Publication 800-171, for components of non-Federal systems that process, store, or transmit CUI or that provide security protection for such components when the designated CUI is

associated with a critical program or high-value assets. Contractors that are subject to these enhanced security requirements may incur additional process/information technology configuration, network isolation, and security operations center/threat-related costs; however, the impact on any particular contractor may vary considerably, depending on a contractor's current infrastructure and development environment, and the composition of their customer base.

(5) Upon entrance into military service or civilian employment with the Department of Defense, individuals are asked to provide their SSNs. The SSN becomes the service or employment number for the individual and is used to establish personnel, financial, medical, and other official records.

The notification in paragraph (b)(2) of this section shall be provided the individual when originally soliciting his or her SSN. The notification is not required if an individual is requested to furnish his SSN for identification purposes and the SSN is solely used to verify the SSN that is contained in the records. However, if the SSN is solicited and retained for any purposes other than verifying the existing SSN in the records, the requesting official shall provide the individual the notification required by paragraph (b)(2) of this section. (6) Components shall ensure that the SSN is only collected when there is a demonstrated need for collection. If collection is not essential for the purposes for which the record or records are being maintained, it should not be solicited.

(7) DoD Components shall continually review their use of the SSN to determine whether such use can be eliminated, restricted, or concealed in Component business processes, systems and paper and electronic forms. While use of the SSN may be essential for program integrity and national security when information about an individual is disclosed outside the DoD, it may not be as critical when the information is being used for internal Departmental purposes. (c) Collecting personal information from third parties. When information being solicited is of an objective nature and is not subject to being altered, the information should first be collected from the individual. But it may not be practicable to collect personal information first from the individual in all cases. Some examples of this are: (1) Verification of information through third-party sources for security (printed page 18766) or employment suitability determinations; (2) Seeking third-party opinions such as supervisor comments as to job knowledge, duty performance, or other opinion-type evaluations; (3) When obtaining information first from the individual may impede rather than advance an investigative inquiry into the actions of the individual; and (4) Contacting a third party at the request of the individual to furnish certain information such as exact periods of employment, termination dates, copies of records, or similar information.

(4) Ensure that the Accreditation Body's Board of Directors, professional staff, Information Technology (IT) staff, accreditation staff, and independent assessor staff complete a Tier 3 background investigation resulting in a determination of national security eligibility. This Tier 3 background investigation will not result in a security clearance and is not being executed for the purpose of government employment. The Tier 3 background investigation is initiated using the Standard Form (SF) 86 and submitted by DoD CIO Security to Washington Headquarters Services (WHS) for coordination for processing by the Defense Counterintelligence and Security Agency (DCSA). These positions are designated as non-critical sensitive with a risk designation of 'Moderate Risk' in accordance with title 5 CFR 1400.201(b) and (d) and the investigative requirements of title 5 CFR 731.106(c)(2). (5) Comply with Foreign Ownership, Control or Influence (FOCI) by: (i) Completing the Standard Form (SF) 328 Certificate Pertaining to Foreign Interests and submit it directly to Defense Counterintelligence and Security Agency (DCSA) and undergo a National Security Review with regards to the protection of controlled unclassified information based on the factors identified in 32 CFR 117.11(b) using the procedures outlined in 32 CFR 117.11(c) . The Accreditation Body must receive a non-disqualifying eligibility determination by the CMMC PMO to be recognized by the Department of Defense. (ii) Reporting any change to the information provided on its SF 328 by resubmitting the SF 328 to DCSA within 15 business days of the change being effective. A disqualifying eligibility determination, based on the results of the change, will result in the Accreditation Body losing its authorization or accreditation. (iii) Identifying all prospective C3PAOs to the CMMC PMO. The CMMC PMO will sponsor the prospective C3PAO for a FOCI risk assessment conducted by the DCSA using the SF 328 as part of the authorization and accreditation processes. (iv) Notifying prospective C3PAOs of the CMMC PMO's eligibility determination resulting from the FOCI risk assessment. (6) Obtain a CMMC Level 2 Certification Assessment in accordance with the procedures specified in § 170.17(a)(1) and (c). This assessment, conducted by DCMA DIBCAC, shall meet all requirements for a Level 2 Final Certification Assessment and will not result in a CMMC Level 2 certificate. The CMMC Level 2 assessment process must be performed on a triennial basis. (7) Provide all documentation and records in English. (8) Establish, maintain, and manage an up-to-

date list of authorized and accredited C3PAOs on a single publicly accessible website and provide the list of these entities and their status to the DoD through submission in the CMMC instantiation of eMASS.

CMMC Level 2 certification assessment is the minimum requirement for the subcontractor). In addition, the rule has been revised to make clear that the requirement applies in the performance of a subcontract when the relevant prime contract has a CMMC requirement. The rationale for the minimum level 2 certification flow-down requirement is that the DoD made a risk-based decision not to mandate flow down of the level 3 requirement unless explicit guidance is provided to do so. As stated in § 170.23(a)(3), when a Prime contractor has a requirement of Level 2 certification, any CUI that is flowed down for a subcontractor to process, store, or transmit in performance of the subcontract will also carry a minimum requirement of Level 2 certification assessment. CMMC Program requirements will be identified as solicitation and contract requirements, and contractors will be required to meet the stated CMMC requirements, when applicable, at or above the level identified. One commenter misinterpreted a response to a prior public comment. The quoted content says that contractors and subcontractors each must verify (through CMMC assessment) that all applicable security requirements of NIST SP 800-171 required via DFARS clause 252.204-7012 have been implemented. Contractors are not required to assess subcontractor implementation of the requirements of NIST SP 800-171. The prime contractor's responsibility is to flow down CMMC assessment requirements as described in § 170.23 and also to refrain from disseminating FCI or CUI to subcontractors that have not indicated meeting the CMMC level described in that section for the type of information to be shared. Likewise, subcontractors must also flow down CMMC requirements or refrain from disseminating FCI or CUI. The DoD does not provide SPRS access or other tools for contractors to identify the CMMC status or other companies. The DoD expects that defense contractors will share information about CMMC status with other DIB members to facilitate effective teaming arrangements when bidding for DoD contracts. Prime contractors will not be granted access to subcontractor's information in SPRS. However, prime contractors should communicate early and often with prospective subcontractors to confirm current CMMC status, including whether the level matches that required. This interaction does not involve the government and is beyond the scope of this rule. This rule follows the format and includes all sections required in OMB guidelines for formal rulemaking. The DoD lacks authority to modify the template or omit required sections, which results in some repetition. DIB contractors are responsible for submitting their Level 1 and Level 2 self-assessments and will access SPRS to enter the results. DIB contractors do not have access to CMMC eMASS, as that system is used to support certification assessments only.

From the NIST SP 800-172 Rev 3 Final Public Draft: Defense-in-depth architectural approaches include modularity and layering, the separation of system and user functionality, and security function isolation. The coordination of allocated security requirements is essential to help ensure that an attack that involves one requirement does not create adverse, unintended consequences (e.g., system lockout and cascading alarms) by interfering with other requirements. The value of organizational assets and the impacts or consequences of loss are important considerations in providing additional defensive layers. This requirement does not enhance a specific requirement in SP 800-171 but can be used to strengthen the protection of CUI associated with critical programs or high value assets. PROTECTION STRATEGY PRA, CRS ADVERSARY E

et seq.). It also fulfills important elements of DoD's critical infrastructure protection responsibilities, as the sector specific agency for the DIB sector see (Presidential Policy Directive 21 (PPD-21), Critical Infrastructure Security and Resilience-). This program allows eligible DIB companies to receive U.S. Government (USG) threat information and to share information about network intrusions that could compromise DoD programs and missions. In addition, the program permits DIB companies and DoD to assess and reduce damage to DoD programs and missions when DoD information is potentially compromised. Furthermore, the information sharing arrangements between the DoD and each participating DIB company that implement the requirements of this are memorialized in a standardized bilateral agreement, known as a Framework Agreement (FA), signed by the participating DIB company and the Government. The rule also provides the eligibility requirements for a company to participate in the DIB CS/IA program. Costs for DIB participants include obtaining access to DoD's secure voice and data transmission systems supporting the DIB CS/IA program and acquiring DoD approved medium assurance certificates. There also are costs associated with the collection requirements for providing point of contact information and cyber incident reporting. Government costs include onboarding new companies and collecting and analyzing cyber incidents from

DIB participants. A foundational element of this bilateral information sharing model is the recognition that the information being shared between the parties includes extremely sensitive nonpublic information, which must be protected against unauthorized uses and disclosures in order to preserve the integrity of the program. For additional information regarding the Government's safeguarding of information received from the DIB companies, with specific focus on PII, see the Privacy Impact Assessment (PIA) for the DIB CS/IA Program (http://dodcio.defense.gov/Portals/0/Documents/DIB%20CS-IA%20PIA_FINAL_signed_30jun2011_VMSS_GGMR_RC.pdf). In addition, this rule and program are intended to be consistent and coordinated with, and updated as necessary to ensure consistency with and support for, other federal activities related to the handling and safeguarding of controlled unclassified information, such as those that are being led by the National Archives and Records Administration pursuant to Executive Order 13556 ·Controlled Unclassified Information· (November 4, 2010) (see <http://www.archives.gov/cui/>). This rule is not intended to implement the new requirements from section 941 of the National Defense Authorization Act for Fiscal Year 2013. Comments DoD published an interim final rule on May 11, 2012 (77 FR 27615). Fifty comments from twelve respondents were received and reviewed by the USG. Comment:

746. ·The Department does not propose to require that the periodic review include a review of whether the conditions of the exception continue to apply because, when the conditions qualifying for an exception change such that an exception no longer applies, a regulated entity would be expected to resume compliance with the standard for encryption and decryption and the associated implementation specifications without exception. The transfer of any personal information from a Privacy Act system of records by any means of communication (such as oral, written, electronic mechanical, or actual review) to any persons, private entity, or government agency, other than the subject of the record, the subject's designated agent or the subject's legal guardian. Within the context of the Privacy Act and this part, this term applies only to personal information that is a part of a Privacy Act system of records. (i) Deceased Individuals. The Privacy Act confers no rights on deceased persons, nor may their next-of-kin exercise any rights for them. However, family members of deceased individuals have their own privacy right in particularly sensitive, graphic, personal details about the circumstances surrounding an individual's death. This information may be withheld when necessary to protect the

privacy interests of surviving family members. Even information that is not particularly sensitive in and of itself may be withheld to protect the privacy interests of surviving family members if disclosure would rekindle grief, anguish, pain, embarrassment, or cause a disruption of their peace minds. Because surviving family members use the deceased's Social Security Number to obtain benefits, DA personnel should continue to protect the SSN of deceased individuals. (j) Individual. A living person who is a citizen of the United States or an alien lawfully admitted for permanent residence. The parent or legal guardian of a minor also may act on behalf of an individual. Members of the United States Armed Forces are individuals. Corporations, partnerships, sole proprietorships, professional groups, businesses, whether incorporated or unincorporated, and other commercial entities are not individuals. (k) Individual Access. The subject of a Privacy Act file or his or her designated agent or legal guardian has access to information about them contained in the Privacy Act file. The term individual generally does not embrace a person acting on behalf of a commercial entity (for example, sole proprietorship or partnership). (l) Denial Authority (formerly Access and Amendment Refusal Authority). The Army Staff agency head or major Army commander designated authority by this part to deny access to, or refuse amendment of, records in his or her assigned area or functional specialization. (m) Maintain. Includes keep, collect, use or disseminate. (n) Members of the Public. Individuals or parties acting in a private capacity. (o) Minor. An individual under 18 years of age, who is not married and who is not a member of the Department of the Army. (p) Official Use. Within the context of this part, this term is used when Department of the Army officials and employees have demonstrated a need for the use of any record or the information contained therein in the performance of their official duties. (q) Personal Information.

(Comment 109) Several comments state that the requirement to record lot/code number or other identifier would cost the industry millions of dollars in operational changes. They state that more warehouse space would be required to separate food by lot number, expensive computer system upgrades would be needed to handle lot code information, and the industry would incur significant administrative and labor costs to enter lot code information into the system. Comments further state that bar code tracing/scanning or radio frequency identification (RFID) systems are costly, and the RFID technology is new. The food distribution business will be affected every minute of every day compared to the infrequent costs associated with investigating food safety issues as the need arises. RFID is being studied and involves placing tagging chips in packaging. It may not be necessary to invent an elaborate system of paper recordkeeping if RFID proves to be useful in the future. (Response) As discussed in response to comment 108 of this document, FDA recognizes the difficulties in tracking lot/code numbers or other identifiers throughout the entire food distribution chain. This final rule accounts for those difficulties. FDA is aware that technology is developing that will enable lot/code number tracking in the future to be cost efficient for all of the food industry. (Comment 110) One comment states that food is not sorted by lot code identification. One pallet/bin, slot, or stockkeeping unit may contain multiple lot numbers. (Response) The final rule does not require warehouse distribution facilities (printed page 71600) to track lot/code number or other identifiers in these final regulations. (Comment 111) A comment states that lot numbers are not scannable or machine readable, and manual transcription of these numbers would introduce errors. The comment states that small businesses would be buried in a mountain of paperwork and this would make it impossible for them to track products accurately. (Response) As explained in response to comment 108, FDA recognizes the difficulties in tracking lot/code numbers or other identifiers. This final rule reflects those considerations. FDA has balanced the need to provide information that would expedite a traceback in a food-related emergency with the ability to record lot numbers. Because food almost always passes through at least one small business in the distribution chain, FDA cannot exempt small businesses entirely from this important requirement. The final rule, however, does give small and very small businesses more time to comply with its requirements. FDA is aware that technology is developing that will enable lot/code number tracking in the future to be cost efficient for all of the food industry.

3.4.2 | The who and w Commands | 34 | | 3. 3.4.2 The who and w Commands The who command, as mentioned previously, displays the list of users currently logged in on the system.

CASE STUDIES IN CYBER SUPPLY CHAIN RISK MANAGEMENT ## Case Studies in Cyber Supply Chain Risk Management Summary of Findings and Recommendations This Summary of Findings and Recommendations summarizes the Case Studies in Cyber Supply Chain Risk Management series' major findings and recommendations based on expert interviews. The Case Studies in Cyber Supply Chain Risk Management

series engaged information security, supply chain, and risk leaders across a diverse set of organizations. These case studies build on the Best Practices in Cyber Supply Chain Risk Management case studies originally published in 2015 with the goals of covering new organizations in new industries and bringing to light current key practices in cyber supply chain risk management. This document describes trends, correlations, or other information garnered from an analysis of the case studies as a whole and may cover information not reported in the individual case studies. This document also contains recommendations for further research, study, and guidance development.

printed page 89068) to any information system associated with the contract efforts that process, store, or transmit FCI or CUI, and to any information system that provides security protections for such systems; or information systems not logically or physically isolated from all such systems. This includes when a 'Test Environment' processes, stores, or transmits FCI or CUI; provides security protections for such systems; or is not logically or physically isolated from such systems. See § 170.19 and the response to public comment under the heading 3. Internet of Things/Operational Technology in the Discussion of Comments and Changes section of this preamble for additional details on defining the scope of CMMC assessments. If GFE cannot be configured to meet all the NIST SP 800-171 Rev 2 requirements or must be maintained in a specified configuration which does not comply with NIST SP 800-171 Rev 2, additional protections such as physical or logical isolation may be used for risk mitigation in accordance with the treatment of Specialized Assets as defined in table 1 to § 170.19(c)(1) CMMC Level 2 Scoping. 5. Fundamental Research Comment: Multiple commenters requested that DoD clarify the application of CMMC requirements to fundamental research. Commenters described adverse consequences of not explicitly exempting fundamental research from the CMMC requirements, noting that institutions of higher education will have to pull out of research agreements with the Department, may no longer accept DoD funds because the resource burden would be cost prohibitive to both the institution and its partners, and the burdens imposed by even CMMC Level 1 requirements would hinder the progress of fundamental research. These commenters also noted that restrictions on posting of public information would inhibit open collaboration and the exchange of ideas that is critical to the advancement of scientific discovery. Commenters also requested that the Department clarify that subcontracts scoped as fundamental research also be exempt from CMMC requirements. Response: CMMC Program requirements are designed to provide increased assurance to the Department that defense contractors can adequately protect FCI and CUI, in accordance with already applicable regulations and standards. Fundamental research is defined by National Security Defense Directive (NSDD)-189 [17]

Amend section 39.201 by removing from paragraph (a) 'information and communication technology' and adding 'information and communications technology' in its place. 18. Add a new subpart 39.X to read as follows: (printed page 68415) Subpart 39.X Federal Information Systems 39.X00 Scope of subpart. This subpart provides policies and procedures for acquiring services to develop, implement, operate, or maintain a Federal information system (FIS) (E.O. 14028 , Improving the Nation's Cybersecurity, dated May 12, 2021). This subpart does not apply to National security systems (see 39.002). 39.X01 Definitions. As used in this subpart: Administrative account means a user account with full privileges (i.e., with full function and access rights) intended to be used only when performing management tasks, such as installing updates and application software, managing user accounts, and modifying operating system and application settings. Authorization boundary means all components of an information system to be authorized for operation by an authorizing official. This excludes separately authorized systems to which the information system is connected (OMB Circular No. A-130). Authorizing official means a senior Federal official or executive with the authority to authorize (i.e., assume responsibility for) the operation of an information system or the use of a designated set of common controls at an acceptable level of risk to agency operations (including mission, functions, image, or reputation), agency assets, individuals, other organizations, and the Nation (OMB Circular No. A-130). Cloud computing means a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction. Cloud computing is characterized by on-demand self-service, broad network access, resource pooling, rapid elasticity, and measured service; and includes service models such as software-as-a-service, infrastructure-as-a-service, and platform-as-a-service (NIST SP 800-145). Component means a discrete identifiable information and operational technology asset that represents a building block of a system and may include hardware, software, and firmware. Cyber supply chain risk means the potential for harm or compromise that arises as a result of cybersecurity risks from suppliers,

their supply chains, and their products or services. This includes risks that arise from threats exploiting vulnerabilities or exposures within products and services traversing the supply chain as well as threats or exposures within the supply chain itself. The level of risk depends on the likelihood that relevant threats may exploit applicable vulnerabilities and the consequential potential impacts (NIST SP 800-161 and 800-203). Government-related data

direct agencies to assess all costs, benefits, and available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health, safety effects, distributive impacts, and equity). Executive Order 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This proposed rule has been designated significant, under Executive Order 12866. B. Congressional Review Act (5 U.S.C. 801 et seq.) Pursuant to the Congressional Review Act, this proposed rule has not been designated a major rule, as defined by 5 U.S.C. 804(2). This proposed rule will not have an economic effect above the \$100 million threshold defined in 5 U.S.C. 804(2) or spur a major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions; or have significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic and export markets. C. Public Law 96-354, Regulatory Flexibility Act (5 U.S.C. 601) The Office of the DoD Chief Information Officer certifies that this proposed rule is not subject to the Regulatory Flexibility Act (5 U.S.C. 601) because it would not, if promulgated, have a significant economic impact on a substantial number of small entities. This proposed rule will have a significant positive impact on small entities that will become eligible to participate in and receive benefits through the DIB CS Program. For DIB participants, this program provides cyber threat information and technical assistance through analyst-to-analyst exchanges, mitigation and remediation strategies, and cybersecurity best practices in a collaborative environment. The shared threat information is used to bolster a company's cybersecurity posture and mitigate the growing cyber threat. The program's tailored support for small, mid-size, and large companies with varying cybersecurity maturity levels is an asset for participants.

(i) Notify appropriate parties of action taken under paragraphs (a) through (d) of this section and the basis for such action only to the extent necessary to effectuate the action; * * * * 16. Revise section 239.7306 to read as follows: 239.7306 Solicitation provision and contract clause. (a) Insert the provision at 252.239-7017, Notice of Supply Chain Risk, in solicitations, including solicitations using FAR part 12 procedures for the acquisition of commercial items, for information technology, whether acquired as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system, as defined at 239.7301. (b) Insert the clause at 252.239-7018, Supply Chain Risk, in solicitations and contracts, including solicitations and contracts using FAR part 12 procedures for the acquisition of commercial items, for information technology, whether acquired as a service or as a supply, that is a covered system, is a part of a covered system, or is in support of a covered system, as defined at 239.7301. PART 244-SUBCONTRACTING POLICIES AND PROCEDURES 17. Revise section 244.201-1 to read as follows: 244.201-1 Consent requirements. In solicitations and contracts for information technology, whether acquired as a service or as a supply, that is a covered system or covered item of supply as those terms are defined at 239.7301, consider the need for a consent to subcontract requirement regarding supply chain risk (see subpart 239.73). For additional guidance see PGI 244.201-1. PART 252-SOLICITATION PROVISIONS AND CONTRACT CLAUSES 252.239-7018 [Amended] 18. Amend section 252.239-7018 by: a. Removing the clause date (NOV 2013) and adding (OCT 2015) in its place; b. Amending paragraph (b) by removing shall maintain controls and adding shall mitigate supply chain risk in its place, and removing the phrase to minimize supply chain risk before the period; and c. Removing paragraph (e). [FR Doc. 2015-27463 Filed 10-29-15; 8:45 am] BILLING CODE 5001-06-P

ronments than in enterprise environments, additional security controls are recommended, such as encrypting sensitive data stored on the devices, and existing security controls may need to be adjusted. For example, if a personal firewall on a telework client device has a single policy for all environments, then it is likely to be too restrictive in some situations and not restrictive enough in others. Whenever possible, organizations should use personal firewalls capable of supporting multiple policies for their telework client devices and configure the firewalls properly for the enterprise environment and an external environment, at a minimum.

emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is a significant regulatory action and, therefore, was subject to review under section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804. VI. Executive Order 13771 This rule is expected to be an E.O. 13771, Reducing Regulation and Controlling Regulatory Costs, deregulatory action. The total annualized value of the cost savings is \$1,521,836. Details on the estimated cost savings can be found in section IV. of this preamble. VII. Regulatory Flexibility Act DoD expects that this proposed rule may have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601 et seq. Therefore, an initial regulatory flexibility analysis has been prepared and is summarized as follows: This rule proposes to implement section 831 the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2017, which amends 10 U.S.C. 2307 to address the use of performance-based payments. The primary objective of this rule is to remove the restrictions at DFARS 232.1001(a) and the clauses at 252.232-7012(b)(i) and 252.232-7013(b)(i) that limit performance-based payments to amounts not greater than costs incurred up to the time of payment, as required 10 U.S.C. 2307. This rule will apply to approximately 50 small entities per year that submit offers and are awarded contracts that provide performance-based contract payments from DoD, as well as an additional 5 offerors that submit offers in response to solicitations that may result in contracts that provide performance-based payments but do not receive an award. (printed page 18223) This rule adds a reporting requirement that will require an entry in the annual representations and certifications with regard to whether the output of the offeror's accounting system is in compliance with Generally Accepted Accounting Principles, as evidenced by audited financial statements. DoD estimates that the skill necessary for this requirement is at the journeyman level and that each entry will require an average of 6 minutes. The rule does not duplicate, overlap, or conflict with any other Federal rules. This rule will not have a significant economic impact on small entities. The burden imposed by the new representation is minimal. The net impact is likely to benefit small entities, to the extent that the entity may receive an increase in cash flow if the negotiated value of performance-based payment events exceeds the actual costs incurred at the time of event completion. There are no significant alternatives consistent with the stated objectives of the statute. DoD invites comments from small business concerns and other interested parties on the expected impact of this rule on small entities.

This proposed rule does not duplicate, overlap, or conflict with any other Federal rules. This proposed rule implements the requirements of 32 CFR part 2002 to ensure uniform implementation of Federal contractor requirements for managing CUI. While this rule is modeled after DFARS clause 252.204-7012, it does not conflict with the existing clause. It is expected that the DFARS clause will be amended in the future to address DoD-specific requirements that may be in addition to the FAR clause. DoD, GSA, and NASA were unable to identify any alternatives that would reduce the burden on small entities and still meet the objectives of 32 CFR part 2002. It is not possible to establish different compliance standards that take into account the resources available to small entities or exempt small entities from the rule, or any part thereof, that does not increase the risk of CUI incidents. However, by implementing a more standardized set of requirements for contractor information systems and for CUI safeguarding across agencies, small businesses that engage in contracts involving sensitive Government information might find it easier and less costly to meet security requirements for such information under this rule, because the variation of system configurations and requirements will be significantly reduced. This, in turn, may make such businesses more competitive for future Government contracts. The Regulatory Secretariat Division has submitted a copy of the IRFA to the Chief Counsel for Advocacy of the Small Business Administration. A copy of the IRFA may be obtained from the Regulatory Secretariat Division. DoD, GSA, and NASA invite comments from small business concerns and other interested parties on the expected impact of this proposed rule on small entities. DoD, GSA, and NASA will also consider comments from small entities concerning the existing regulations in subparts affected by the rule in accordance with 5 U.S.C. 610. Interested parties must submit such comments separately and should cite 5 U.S.C. 610 (FAR Case 2017-016), in correspondence. VIII. Paperwork Reduction Act The Paperwork Reduction Act (44 U.S.C. 3501-3521) applies because the proposed rule contains information collection requirements. Accordingly, the Regulatory Secretariat Division has submitted a request for approval of a new information collection requirement concerning controlled unclassified information to the Office of Management and Budget. A. Public Burden for This Collection of Information 1. System Security Plan. Public reporting burden for this collection of

information is estimated to average 0.50 hour per response including the time to prepare and submit the plan. The annual reporting burden is estimated as follows: Respondents: 1,430. Total annual responses: 1,430. Total burden hours: 715. This estimate is based on approximately one response per respondent. The annual recordkeeping burden is estimated as follows: Recordkeepers: 10,242. Total annual records: 10,242.

the ratio of the number for code 488510 to the total number for code 488 in the County Business Pattern data, and then applied that ratio to the number of establishments under code 488 in the NES data. We assumed a uniform distribution of food and nonfood carriers under the general freight trucking category and estimated the number of establishments that transport food products under code 4841 to be half of the total for that category. We assumed the number of establishments under code 488510 that arrange freight transportation for food products to be 20 percent of the total for that category. We assumed that the same percentage applies to the total assumed for specialized freight carriers dedicated to the food industry. As a result of these changes, the total number of domestic transportation and packing facilities is revised upward from 16,773 facilities used in the PRIA to 234,980. The numbers of establishments by code are reported in table 12 of this document. Table 12. Number of Transportation Establishments by NAICS Code

NAICS Code	Description	CBP 2000	NES 99
481112	Scheduled freight air transportation	584	2,413
481212	Nonscheduled chartered freight air transportation	217	483111
483111	Deep sea freight transportation	485	4,754
483113	Coastal and Great Lakes freight transportation	546	483211
483211	Inland water freight transportation	402	4841
4841	General freight trucking	27,937	164,242
48422	Specialized freight (exclusively used) trucking, local	6,499	4,946
48423	Specialized freight (exclusively used) trucking, long distance	2,580	8,189
488320	Marine cargo handling	607	2,415
488510	Freight transportation arrangement	3,035	3,814
488991	Packing and crating	1,315	

Foreign transportation carriers that cross the northern and southern U.S. borders are not counted in the County Business Pattern and NES data, because they are foreign based. All of these carriers are subject to DOT regulations, and the costs of compliance for these facilities are assumed to be zero because the final rule allows a transporter to meet its obligations by keeping the records currently required by DOT. However, foreign transportation carriers that cross the northern and southern U.S. borders are assumed to incur learning costs associated with this final rule.

Several other comments state that, because their ingredients are commingled, they are unable to provide FDA with information that ties the specific source of each ingredient to a lot of the finished product. Certain bulk products such as flour, shortening, vegetable oil, fructose syrup, and milk cannot be identified as ingredient lots. Other comments state that the ability to identify specific sources of ingredients will vary based on many factors. One comment states that produce is often commingled to meet marketplace needs. A few comments state that some processors commingle ingredients in their processing operations, which makes it impossible to trace the specific source of ingredients to a lot of finished product. One comment states that most companies would only be able to produce possible sources of ingredients in batches of final products. The comment asserts that companies should only be required to do so in a crisis. (Response) FDA acknowledges that certain business practices are not amenable to linking incoming ingredients with outgoing product and that it may not always be possible to identify the specific source of an ingredient that was used to make a lot of finished product. It is not FDA's intent to mandate reengineering of long-standing existing processes. For this reason, the final rule requires the identification of the specific source of each ingredient that was used to make every lot of finished product only when the food is released and only if this information is reasonably available. With respect to the comment that companies should only be required to produce records during a crisis, the agency notes that FDA will request access to the records under section 306 of the Bioterrorism Act only when it has reasonable belief that an article of food is adulterated and presents a threat of serious adverse health consequences or death to humans or animals. (Comment 95) One comment requests that the agency accept testing of each delivery of incoming product as a substitute for the requirement to tie the specific source of each ingredient to a lot of the finished product. The comment asserts that this testing provides the needed safeguards and would ensure that the ingredient is not contaminated chemically, physically, or biologically.

(13) Implement a quality assurance function that ensures the accuracy and completeness of assessment data prior to upload into the CMMC instantiation of eMASS. Any individual fulfilling the quality assurance function must be a CCA and cannot be a member of an Assessment Team for which they are performing a quality assurance role. A quality assurance individual shall manage the C3PAO's quality

assurance reviews as defined in paragraph (b)(14) of this section and the appeals process as required by paragraphs (b)(19) and (20) of this section and in accordance with ISO/IEC 17020:2012(E) (incorporated by reference, see § 170.2) and ISO/IEC 17011:2017(E) (incorporated by reference, see § 170.2). (14) Conduct quality assurance reviews for each assessment, including observations of the Assessment Team's conduct and management of CMMC assessment processes. (15) Ensure that all Level 2 certification assessment activities are performed on the information system within the CMMC Assessment Scope. (16) Maintain all facilities, personnel, and equipment involved in CMMC activities that are in scope of their Level 2 certification assessment and comply with all security requirements and procedures as prescribed by the Accreditation Body. (17) Ensure that all assessment data and information uploaded into the CMMC instantiation of eMASS assessment data is compliant with the CMMC assessment data standard as set forth in eMASS CMMC Assessment Import Templates on the CMMC eMASS website: <https://cmmc.emass.apps.mil>. This system is accessible only to authorized users. (18) Issue Certificates of CMMC Status to OSCs in accordance with the Level 2 certification assessment requirements set forth in § 170.17, that include, at a minimum, all industry CAGE codes associated with the information systems addressed by the CMMC Assessment Scope, the C3PAO name, assessment unique identifier, the OSC name, and the CMMC Status date and level. (19) Address all OSC appeals arising from Level 2 certification assessment activities. If the OSC or C3PAO is not satisfied with the result of the appeal either the OSC or the C3PAO can elevate the matter to the Accreditation Body for final determination. (20) Submit assessment appeals, review records, and decision results of assessment appeals to DoD using the CMMC instantiation of eMASS.

§ 170.10 CMMC Assessor and Instructor Certification Organization (CAICO). (a) Roles and responsibilities. The CAICO is responsible for training, testing, authorizing, certifying, and recertifying CMMC assessors, instructors, and related professionals. Only the CAICO may make decisions relating to examination certifications, including the granting, maintaining, recertifying, expanding, and reducing the scope of certification, and suspending or withdrawing certification in accordance with current ISO/IEC 17024:2012(E) (incorporated by reference, see § 170.2). At any given point in time, there will be only one CAICO for the DoD CMMC Program. (b) Requirements. The CAICO shall:

DoD agrees that appropriate use of PBPs has benefits. This rule is consistent with the statutory preference for PBP; however, the Government reserves the right to determine the best option for contract financing based on the individual contract action. Due to the evaluation criteria required to determine whether PBP is the best method of contract financing, DoD will not direct that PBP is the default choice for contracts.

b. Eliminate the requirement for two-step negotiation and consideration. Comment: Although not addressed in the proposed rule, many respondents were concerned that the existing procedures at DFARS 232.1004 pose hindrances to the preference for PBPs. Specifically, many respondents were concerned about retention of the procedures at DFARS 232.1004, which require initial agreement on price using customary progress payments before negotiations begin on the usage of performance-based payments. One respondent stated that the two-step negotiation process is unjustifiably unique to DoD. Furthermore, the DFARS currently requires negotiation of consideration to be received by the Government if the performance-based payments payment schedule will be more favorable to the contractor than customary progress payments. Two respondents stated that this process is counter to the system outlined in FAR 32.005(a). One of these respondents stated that performance-based payments are a program management tool, whereas progress payments simply reimburse contractors for costs incurred. Therefore, according to the respondent, comparing the payments schedule of one to the other is not an apples-to-apples comparison. Performance goals required by PBPs serve as additional requirements placed on the contractor that offset the payment schedule difference offered by PBPs compared to progress payments. Requiring additional consideration erodes the potential benefits of PBPs relative to the increased risk accepted by contractors, and undermines the policy objective to incentivize performance. Several respondents stated that DoD added this policy specifically to reverse the preference for PBPs. Response: DoD has removed this requirement in the final rule (see DFARS 232.1004).

c. Eliminate or completely overhaul the PBP analysis tool. Comment: Several respondents specifically recommended eliminating or completely overhauling the PBP analysis tool, which DoD developed to allow the contracting officer and industry to compare the financial cost and benefits of using PBPs versus customary progress payments. While one respondent acknowledged that slight changes have been made to improve the tool, the respondent still finds the conceptual shortcomings of DoD's policy unchanged. One respondent offered the following detailed criticisms of the PBP Tool:

confidentiality, integrity, and availability) and privacy of Government data; or for the purpose of

audits, investigations, inspections, or other similar activities, as authorized by law, regulation, or this contract, the Contractor shall provide the Government's authorized representatives (authorized representatives include CISA, except for contracts with the Department of Defense, the Intelligence Community, or for National Security Systems, and could include other Federal agencies, as specified by the Contracting Officer) with:

- (A) Timely access, including full access, to all Government data and Government-related data;
- (B) Timely access to contractor personnel involved in performance of the contract; and
- (C) Specifically for the purpose of audit, investigation, inspection, or other similar activity, as authorized by law, regulation, or this contract, timely physical access to any Contractor facility with Government data.

(ii) In response to a request for access from CISA, the Contractor shall:

- (A) First confirm the validity of the request by contacting CISA Central by email at report@cisa.gov, or by telephone at 888-282-0870; and
- (B) Immediately notify the Contracting Officer and any other agency official designated in the contract, in writing, of receipt of the request. Provision of information and access to CISA under this clause shall not be delayed by submission of this notification or awaiting acknowledgement of its receipt.

(g) Notification of third-party access requests. The Contractor shall notify the Contracting Officer promptly of any requests from a third-party for access to Government data or Government-related data, including any warrants, seizures, or subpoenas it receives, including those from another Federal, State, or local agency. The Contractor shall comply with applicable clauses, regulations, and laws concerning protection of Government data and Government-related data from any unauthorized disclosure.

(h) Indemnity for potential or actual loss or damage of Government data.

(1) The Contractor shall indemnify the Government and its officers, agents, and employees acting for the Government against any liability arising out of the performance of this contract, including costs and expenses, incurred as the result of the Contractor's unauthorized introduction of copyrighted material to which the Contractor has no rights or license that may infringe on the copyright interest of others, information subject to a right of privacy, and any libelous or other unlawful matter into Government data. The Contractor agrees to waive any and all defenses that may be asserted for its benefit, including (without limitation) the Government Contractors Defense.

(2) The Contractor shall indemnify the Government and its officers, agents, and employees acting for the Government against (printed page 68419)

(E) Testing or examination material used solely to determine individual qualifications for appointment or promotion in the Federal service may be exempt pursuant to 5 U.S.C. 552a(k)(6), if the disclosure would compromise the objectivity or fairness of the test or examination process.

(F) Evaluation material used to determine potential for promotion in the Military Services may be exempt pursuant to 5 U.S.C. 552a(k)(7), but only to the extent that the disclosure of such material would reveal the identity of a confidential source.

(G) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(1), (k)(2), (k)(3), (k)(5), (k)(6), or (k)(7) from subsections 5 U.S.C. 552a(c)(3) and (d).

(ii) Reasons.

(A) Personnel investigations may obtain from another Federal agency, properly classified information which pertains to national defense and foreign policy. Application of exemption (k)(1) may be necessary to preclude the data subject's access to an amendment of such classified information under 5 U.S.C. 552a(d) in order to protect such information.

(B) Personnel investigations may contain investigatory material compiled for law enforcement purposes other than material within the scope of 5 U.S.C. 552a(j)(2), e.g. investigations into the administration of the merit system. Application of exemption (k)(2) may be necessary to preclude the data subject's access to or amendment of such records, under 552a(c)(3) and (d) because otherwise, it would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement.

(C) Personnel investigations may obtain from another Federal agency, information that relates to providing protective services to the President of the United States or other individuals pursuant to section 3056 of title 18. Application of exemption (k)(3) may be necessary to preclude the data subject's access to or amendment of such records (printed page 14763) under 5 U.S.C. 552a(d) to ensure protective services provided to the President and others are not compromised.

(D) All information about individuals in these records that meets the criteria stated in 5 U.S.C. 552a(k)(5) is exempt from the requirements of 5 U.S.C. 552a(c)(3) and (d) in order to protect the identity of confidential sources incident to determinations of suitability, eligibility, or qualifications for Federal employment, military service, contract, and security clearance determinations.

(E) All material and information in the records that meets the criteria stated in 5 U.S.C. 552a(k)(6) is exempt from the requirements of 5 U.S.C. 552a(d), relating to access to and amendment of records by the data subject in order to preserve the confidentiality and integrity

of Federal testing materials. (F) All material and information in the records that meets the criteria stated in 5 U.S.C. 552a(k)(7)

(B) From subsections (d) and (f) because providing access to investigative records and the right to contest the contents of those records and force changes to be made to the information contained therein would seriously interfere with and thwart the orderly and unbiased conduct of the investigation and impede case preparation. Providing access rights normally afforded under the Privacy Act would provide the subject with valuable information that would allow interference with or compromise of witnesses or render witnesses reluctant to cooperate; lead to suppression, alteration, or destruction of evidence; enable individuals to conceal their wrongdoing or mislead the course of the investigation; and result in the secreting of or other disposition of assets that would make them difficult or impossible to reach in order to satisfy any Government claim growing out of the investigation or proceeding. (C) From subsection (e)(1) because it is not always possible to detect the relevance or necessity of each piece of information in the early stages of an investigation. In some cases, it is only after the information is evaluated in light of other evidence that its relevance and necessity will be clear. (D) From subsections (e)(4)(G) and (H) because this system of records is compiled for investigative purposes and is exempt from the access provisions of subsections (d) and (f). (E) From subsection (e)(4)(I) because to the extent that this provision is construed to require more detailed disclosure than the broad, generic information currently published in the system notice, an exemption from this provision is necessary to protect the confidentiality of sources of information and to protect privacy and physical safety of witnesses and informants. NRO will, nevertheless, continue to publish such a notice in broad generic terms as is its current practice. (F) Consistent with the legislative purpose of the Privacy Act of 1974, the NRO will grant access to nonexempt material in the records being maintained. Disclosure will be governed by NRO's Privacy Regulation, but will be limited to the extent that the identity of confidential sources will not be compromised; subjects of an investigation of an actual or potential criminal or civil violation will not be alerted to the investigation; the physical safety of witnesses, informants and law enforcement personnel will not be endangered, the privacy of third parties will not be violated; and that the disclosure would not otherwise impede effective law enforcement. Whenever possible, information of the above nature will be deleted from the requested documents and the balance made available. The controlling principle behind this limited access is to allow disclosures except those indicated above. The decisions to release information from these systems will be made on a case-by-case basis. (4) System identifier and name. QNRO-15, Facility Security Files. (i) Exemption.

(3) System identifier and name. S500.20 (Specific exemption), Defense Logistics Agency (DLA) Criminal Incident Reporting System (DCIRS). (i) Exemption. (A) Investigatory material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2), may be exempt pursuant to 5 U.S.C. 552a(k)(2). If an individual, however, is denied any right, privilege, or benefit for which he would otherwise be entitled by Federal law or for which he would otherwise be eligible, as a result of the maintenance of the information, the individual will be provided access to the information except to the extent that disclosure would reveal the identity of a confidential source. Note 1 to paragraph (c)(3)(i)(A). When claimed, this exemption allows limited protection of investigative reports maintained in a system of records used in personnel or administrative actions. (B) The specific sections of 5 U.S.C. 552a from which the system is to be exempted are 5 U.S.C. 552a(c)(3), (d), (e)(1), (e)(4)(G), (H), (I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2). (iii) Reasons. (A) From subsection (c)(3), as to grant access to an accounting of disclosures as required by the Privacy Act, including the date, nature, and purpose of each disclosure and the identity of the recipient, could alert the subject to the existence of the investigation or prosecutive interest by DLA or other agencies. This could seriously compromise case preparation by: Prematurely revealing its existence and nature; compromising or interfering with witnesses or making witnesses reluctant to cooperate; and leading to suppression, alteration, or destruction of evidence. (B) From 5 U.S.C. 552a(d) and (f), as providing access to this information could result in the concealment, destruction or fabrication of evidence and jeopardize the safety and wellbeing of informants, witnesses and their families, and law enforcement personnel and their families. Disclosure of this information also could reveal and render ineffectual investigative techniques, sources, and methods used by this component and could result in the invasion of privacy of individuals only incidentally related to an investigation. Investigatory material is exempt to the extent that the disclosure of such material would reveal the identity of a source who furnished the information to the Government under an express promise that

the identity of the source would be held in confidence, or prior to September 27, 1975, under an implied promise that the identity of the source would be held in confidence. This exemption will protect the identities of certain sources that would be otherwise unwilling to provide information to the Government. The exemption of the individual's right of access to his/her records and the reasons therefore necessitate the exemptions of this system of records from the requirements of the other cited provisions. (C) From 5 U.S.C. 552a(e)(1)

Additionally, as discussed above, several organizations have published and maintained compilations of voluntary standards, guidelines, best practices, methodologies, procedures, and processes for protecting the security of sensitive and confidential information, including PHI. These compilations and the State regulations discussed above range from granular [161] to high-level [162] and from health care-specific [163] to industry agnostic. [164] Despite these differences, these compilations and regulations have a great deal in common with each other and with the Security Rule, its longevity notwithstanding. In fact, the foundational elements of the Security Rule, promulgated more than 20 years ago, can still be found in cybersecurity compilations published today. They generally either require or recommend administrative, physical, and technical safeguards to identify and mitigate risks and vulnerabilities, implement authentication and access controls, conduct security awareness and training for information system users, and plan for contingencies and incident response. [165] Additionally, these compilations all require or recommend the designation of a specific individual who is accountable for implementing the requirements or recommendations. And, importantly, they all ultimately address how to maintain the (printed page 910) confidentiality, integrity, and availability of sensitive and confidential information, including ePHI. A major distinguishing factor between the content of the Security Rule and these compilations and regulations is the Security Rule's scope. The compilations and regulations are designed to protect various types of data and information systems broadly. In comparison, a defining quality of the Security Rule's requirements is that they focus specifically on the protection of ePHI and the information systems that create, receive, maintain, or transmit ePHI. Thus, while the foundational elements of various cybersecurity compilations and State regulations and the Security Rule may be the same, the Security Rule alone addresses the application of those elements to ePHI and all of the components of information systems that create, receive, maintain, or transmit ePHI. Thus, while the standards of the Security Rule generally align with those of other cybersecurity standards, frameworks, best practices, guidelines, processes, and procedures, the specific implementation specifications of the Security Rule reflect the particular sensitivities of the health care industry, particularly small and rural health care providers, in a way that is necessary to ultimately improve the efficiency and effectiveness of the health care system and avoid imposing unreasonable compliance burdens on regulated entities. B. The Health Care Environment Has Changed Since the Security Rule Was Last Revised and Will Continue To Evolve

(i) DoD personnel and system managers shall conduct themselves consistent with established rules of conduct 310.8 so that personal information to be stored in a system of records only shall be collected, maintained, used, and disseminated as is authorized by this part, 5 U.S.C. 552a and DoD 5400.11-R. (j) DoD personnel, including but not limited to family members, retirees, contractor employees, and volunteers, shall be notified, in a timely manner, consistent with the requirements of DoD 5400.11-R, if their personal information, whether or not included in a system of records, is lost, stolen, or compromised. (k) DoD Field Activities shall receive Privacy Program support from the Director, Washington Headquarters Services. §310.6 Responsibilities. (a) The Director of Administration and Management, Office of the Secretary of Defense, shall: (1) Serve as the Senior Privacy Official for the Department of Defense. (2) Provide policy guidance for, and coordinate and oversee administration of, the DoD Privacy Program to ensure compliance with policies and procedures in 5 U.S.C. 552a and OMB Circular A-130. (3) Publish DoD 5400.11-R and other guidance, including Defense Privacy Board Advisory Opinions, to ensure timely and uniform implementation of the DoD Privacy Program. (4) Serve as the Chair to the Defense Privacy Board and the Defense Data Integrity Board (see §310.9). (5) Supervise and oversee the activities of the Defense Privacy Office (see §310.9). (b) The Director, WHS, under the DA&M, shall provide Privacy Program support for DoD Field Activities. (c) The General Counsel of the Department of Defense shall: (1) Provide advice and assistance on all legal matters arising out of, or incident to, the administration of the DoD Privacy Program. (2) Review and be the final approval authority on all advisory opinions issued by the Defense Privacy Board or the Defense Privacy Board Legal Committee. (3) Serve as a member of the Defense Privacy Board, the Defense Data Integrity Board, and the Defense Privacy Board Legal Committee (310.9). (d) The Secretaries of the Military Departments and the Heads of the Other DoD

Components, except as noted in § 310.5(k), shall: (1) Provide adequate funding and personnel to establish and support an effective DoD Privacy Program, to include the appointment of a senior official to serve as the principal point of contact (POC) for DoD Privacy Program matters. (2) Establish procedures, as well as rules of conduct, necessary to implement this part and DoD 5400.11-R to ensure compliance with the requirements of 5 U.S.C. 552a and OMB Circular A-130. (3) Conduct training, consistent with the requirements of DoD 5400.11-R, on the provisions of this part, 5 U.S.C. 552a, OMB Circular A-130, and DoD 5400.11-R, for assigned, employed and detailed, to include contractor, personnel and individuals having primary responsibility for implementing the DoD Privacy Program.

for regulated entities to revise business associate agreements to comply with the proposed changes to the requirements of the Security Rule. The proposed transition period would allow regulated entities to revise existing agreements by the earlier of the contract renewal date that falls after the compliance date of a final rule, or within one year of the rule's effective date. For a large share of existing agreements, this would allow regulated entities to complete the revisions on a rolling basis according to the dates they are renewed. The Department estimates that 1,822,600 [964] business associate agreements would need to be revised if this NPRM is adopted and that, on average, the portion of this activity that results from the rule's modifications would take an hour of a lawyer's time for each regulated entity. This would result in annual costs of \$309,258,768 [= 1,822,600 regulated entities × 1 hour × \$169.68]. The Department recognizes that this estimate may not fully account for all revised business associate agreements. However, the Department believes that in some instances, one hour of time is more than would be needed. We also believe it is likely that, for some regulated entities, a professional other than a lawyer would be responsible for the revised agreements at a lower hourly wage. For some large business associates, the Department believes that a single agreement is used for most of its customers. The Department's estimates assume that most agreements would be revised within the first year and accounts for all of them within that time period. This would be considered a one-time cost; in other words, it is not carried over into future years. As with all the estimates in this NPRM, the Department invites comments about the assumptions underlying the proposed cost projections.

n. Plan Sponsors' Obligations

Proposed 45 CFR 164.314(b)(2) would mandate that group health plan documents require their health plan sponsors who receive ePHI that is not limited to summary health information or enrollment or disenrollment information to deploy the administrative, physical, and technical safeguards for ePHI required by the Security Rule and notify their group health plans upon activation of the plan sponsors' contingency plan. Currently, plan documents must require such health plan sponsors to have safeguards in place, but not necessarily the safeguards specified in the Security Rule. [965] The Department estimates that an additional 52.42 hours of labor would be needed for each affected health plan sponsor to bring its security safeguards for ePHI into compliance with the Security Rule standards and to notify group health plans when its contingency plan is activated, over and above the actions attributable to safeguards already in place for ePHI and for sponsors' electronic information systems generally. The Security Rule compliance activities attributed to group health plan sponsors are shown in table 7, below.

As discussed above, the Department believes that a group health plan needs to be notified in a timely manner when a plan sponsor activates its contingency plan because of the potential implications on the ability of a group health plan to protect the confidentiality, integrity, and availability of ePHI in its relevant electronic information systems. Accordingly, we believe that 24 hours would provide a plan sponsor sufficient time to do all of the following: determine that there is an emergency or other occurrence adversely affecting the plan sponsor's relevant electronic information systems; determine that it needs to activate its contingency plan; activate its contingency plan; identify any group health plans that need to be notified; and notify such group health plans. Similarly, as discussed above, we propose to permit the group health plan and plan sponsor to negotiate the form, content, or manner of the notice and include them in their plan documents if they so choose. The Department believes that requiring a plan sponsor to provide prompt notice to the group health plan when the plan sponsor activates its contingency plan would enable group health plans and plan sponsors to maintain individuals' confidence in their commitment to protecting the confidentiality, integrity, and availability of ePHI. Additionally, consistent with our proposal to revise 45 CFR 164.306, the Department proposes to remove the term "required" from the implementation specification at 45 CFR 164.314(b)(2) consistent with our overall proposal to eliminate the distinction between "required" and "addressable" implementation specifications. However, a regulated entity would still be required to comply with all standards and implementation

specifications as applicable to its situation, as proposed in 45 CFR 164.306(c) . 3. Request for Comment The Department requests comment on the foregoing proposals, including any benefits, drawbacks, or unintended consequences. We also request comment on the following considerations in particular: a. How group health plans currently ensure that plan sponsors implement reasonable and appropriate administrative, physical, and technical safeguards to protect the confidentiality, integrity, and availability of ePHI. b. Whether it is appropriate for group health plans to require plan sponsors to implement the administrative, physical, and technical safeguards of the Security Rule. If not, please explain and provide alternatives for how the Department should ensure the confidentiality, integrity, and availability of ePHI when it is disclosed to plan sponsors. c. Whether business associates currently notify covered entities (or subcontractors notify business associates) upon activation of their contingency plans, and if so, the manner and timing of such notice. d. Whether plan sponsors currently notify group health plans upon activation of their contingency plans, and if so, the manner and timing of such notice.

enforcement purposes it is impossible to determine in advance what information is accurate, relevant, timely, and complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light and the accuracy of such information can only be determined in a court of law. The restrictions of subsection (e)(5) would restrict the ability of trained investigators and intelligence analysts to exercise their judgment reporting on investigations and impede the development of intelligence necessary for effective law enforcement. (J) From subsection (e)(8) because the individual notice requirements of subsection (e)(8) could present a serious impediment to law enforcement as this could interfere with the ability to issue search authorizations and could reveal investigative techniques and procedures. (K) From subsection (f) because portions of this system of records have been exempted from the access provisions of subsection (d). (L) From subsection (g) because portions of this system of records are compiled for law enforcement purposes and have been exempted from the access provisions of subsections (d) and (f). (9) System identifier and name. A0190-9 OPMG, Absentee Case Files. (i) Exemption. Parts of this system of records may be exempt pursuant to 5 U.S.C. 552a(j)(2) if the information is compiled and maintained by a component of the agency which performs as its principal function any activity pertaining to the enforcement of criminal laws. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(j) (2) from subsections 5 U.S.C. 552a(c)(3) , (c)(4), (d), (e)(1), (e)(2), (e)(3), (e)(4)(G), (e)(4)(H), (e)(4)(I), (e)(8), (f), and (g). (ii) Authority. 5 U.S.C. 552a(j)(2) . (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (c)(4) because an exemption is being claimed for subsection (d), making this subsection not applicable. (C) From subsection (d) because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement.

h communications that describes the manufacturer's third party, contractor, and vendor IoT device security oversight, and for including security and privacy requirements within contractual agreements. Information that may be necessary to provide to explain supply chain risk management include details and actions such as: - a. Communications, detailed descriptions, methods, techniques, and/or policies the manufacturer uses to monitor IoT device activities and associated systems security control compliance by external service providers on an ongoing basis. - b. Providing detailed information describing how the IoT device manufacturer performs oversight activities for their supporting entities, including such information as: - How the manufacturer meets legal and/or regulatory safeguard requirements related to supply chain risk management. - Details about the activities performed by each of the supporting entities to whom the manufacturer outsources IoT device support activities, and how such activities are monitored.

CM.L2-3.4.5 · Access Restrictions for Change CMMC Assessment Guide · Level 2 | Version 2.13 100
 CM.L2-3.4.5 · ACCESS RESTRICTIONS FOR CHANGE Define, document, approve, and enforce physical and logical access restrictions associated with changes to organizational systems. ASSESSMENT OBJECTIVES [NIST SP 800-171A]88 Determine if: [a] physical access restrictions associated with changes to the system are defined; [b] physical access restrictions associated with changes to the system are documented; [c] physical access restrictions associated with changes to the system are

approved; [d] physical access restrictions associated with changes to the system are enforced; [e] logical access restrictions associated with changes to the system are defined; [f] logical access restrictions associated with changes to the system are documented; [g] logical access restrictions associated with changes to the system are approved; and [h] logical access restrictions associated with changes to the system are enforced. POTENTIAL ASSESSMENT METHODS AND OBJECTS [NIST SP 800-171A]88 Examine [SELECT FROM: Configuration management policy; procedures addressing access restrictions for changes to the system; system security plan; configuration management plan; system design documentation; system architecture and configuration documentation; system configuration settings and associated documentation; logical access approvals; physical access approvals; access credentials; change control records; system audit logs and records; other relevant documents or records]. Interview [SELECT FROM: Personnel with logical access control responsibilities; personnel with physical access control responsibilities; personnel with information security responsibilities; system or network administrators]. Test [SELECT FROM: Organizational processes for managing access restrictions associated with changes to the system; mechanisms supporting, implementing, and enforcing access restrictions associated with changes to the system]. 88 NIST SP 800-171A, p. 28.

Vulnerabilities discovered, for example, via the scanning conducted in response to RA.L2 - 3.11.2, are remediated with consideration of the related assessment of risk. The consideration of risk influences the prioritization of remediation efforts and the level of effort to be expended in the remediation for specific vulnerabilities. FURTHER DISCUSSION Not all vulnerabilities captured in a vulnerability scanner may pose the same level of risk to an organization. Prioritize mitigation efforts to close the most critical vulnerabilities first. 176 NIST SP 800-171A, p. 50. 177 NIST SP 800-171 Rev. 2, p. 34.

(D) From subsections (e)(4)(G) and (e)(4)(H) because portions of this system of records have been exempted from the access provisions of subsection (d), making these subsections not applicable. (E) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (F) From subsection (f) because portions of this system of records have been exempted from the access provisions of subsection (d). (2) System identifier and name. A0 025-400-2 OAA, Army Records Information Management System (ARIMS). (i) Exemption. During the course of records management, declassification and claims research, exempt materials from other systems of records may in turn become part of the case record in (printed page 14746) this system. To the extent that copies of exempt records from those other systems of records are entered into this system, the Department of the Army hereby claims the same exemptions for the records from those other systems. (ii) Authority. 5 U.S.C. 552a (j)(2) and (k)(1) through (k)(7). (iii) Reasons. Records are only exempt from pertinent provisions of 5 U.S.C. 552a to the extent such provisions have been identified and an exemption claimed for the original record and the purposes underlying the exemption for the original record still pertain to the record which is now contained in this system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided to the President and others are not compromised, to protect records used solely as statistical records, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, to preserve the confidentiality and integrity of Federal testing materials, and to safeguard evaluation materials used for military promotions when furnished by a confidential source. The exemption rule for the original records will identify the specific reasons why the records may be exempt from specific provisions of 5 U.S.C. 552a . (3) System identifier and name. A0025-55 OAA, Freedom of Information Act Program Files. (i) Exemption. During the processing of Freedom of Information Act (FOIA) requests, exempt materials from other systems of records may in turn become part of the case record in this system. To the extent that copies of exempt records from those other systems of records are entered into this system, the Department of the Army claims the same exemptions for the records from those other systems. (ii) Authority. 5 U.S.C. 552a(j)(2) and (k)(1) through (k)(7) . (iii) Reasons.

Document Headings Document headings vary by document type but may contain the following: the agency or agencies that issued and signed a document the number of the CFR title and the number of

each part the document amends, proposes to amend, or is directly related to the agency docket number / agency internal file number the RIN which identifies each regulatory action listed in the Unified Agenda of Federal Regulatory and Deregulatory Actions See the Document Drafting Handbook for more details. Department of Defense Defense Acquisition Regulations System 48 CFR Part 252 RIN 0750-AF58 AGENCY: Defense Acquisition Regulations System, Department of Defense (DoD). ACTION: Final rule. SUMMARY: DoD has issued a final rule amending the Defense Federal Acquisition Regulation Supplement (DFARS) to address requirements for validation of Taxpayer Identification Numbers as part of the Central Contractor Registration process. The DFARS changes are consistent with changes made to the Federal Acquisition Regulation. EFFECTIVE DATE: September 6, 2007. FOR FURTHER INFORMATION CONTACT: Ms. Felisha Hitt, Defense Acquisition Regulations System, OUSD (AT&L) DPAP (DARS), IMD 3D139, 3062 Defense Pentagon, Washington, DC 20301-3062. Telephone (703) 602-0310; facsimile (703) 602-7887. Please cite DFARS Case 2006-D037. SUPPLEMENTARY INFORMATION: A. Background DFARS 252.204-7004 contains a substitute paragraph for use with the clause at FAR 52.204-7, Central Contractor Registration, to address DoD-unique requirements relating to contractor registration in the Central Contractor Registration (CCR) database. This final rule amends DFARS 252.204-7004 for consistency with changes made to FAR 52.204-7 in Item I of Federal Acquisition Circular 2005-10, published at 71 FR 36923 on June 28, 2006. The changes address requirements for the Government to validate a contractor's Taxpayer Identification Number, and for the contractor to consent to this validation, as part of the CCR registration process. DoD published a proposed rule at 71 FR 2645 on January 22, 2007. DoD received no comments on the proposed rule. Therefore, DoD has adopted the proposed rule as a final rule without change. This rule was not subject to Office of Management and Budget review under Executive Order 12866, dated September 30, 1993. B. Regulatory Flexibility Act DoD certifies that this final rule will not have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601, et seq., because the rule relates to an administrative requirement for TIN validation, which is performed by the Government. Contractors need only provide consent for TIN validation as part of the CCR registration process. C. Paperwork Reduction Act The Paperwork Reduction Act does not apply, because the rule does not impose any information collection requirements that require the approval of the Office of Management and Budget under 44 U.S.C. 3501, et seq. List of Subjects in 48 CFR Part 252

Grants Officer Representatives, and other personnel to review the credentials of individuals requesting the authority to carry weapons (either government furnished or contractor acquired) in the performance of a U.S. government contract or grant; it allows agencies to report to Congress and other oversight organizations on the size of contractor and grantee presence in areas of combat operations or other significant military operations. Congress believes the system is necessary. Section 861 of FY 2008 NDAA provides that the Secretary of Defense, the Secretary of State, and the Administrator of USAID must agree to adopt a common database for contractors in Iraq and Afghanistan. SPOT is not used for intelligence gathering or vetting of personnel. Background checks of PSCs are conducted by the contractor and validated by the contracting officer. This validation is only annotated in SPOT. Comment: Applicable guidelines must be effectively disseminated to NGOs Response: Contracting Officers and Grants Officers will remain the primary point of contact for contractors and grantees on issues affecting performance. Rules impacting contractors across multiple agencies will be promulgated via the FAR with appropriate opportunities for contractor and public comment during the rulemaking process. Rules impacting grantees across multiple agencies will be promulgated by the Office of Management and Budget (OMB) Office of Federal Financial Management (OFFM) as part of its responsibility to issue government-wide grants policy. The DoD will ensure that a single location, readily accessible to both contractors and grantees, exists for the publication and maintenance of all guidance relating to PSC rules. The Department of State and USAID will provide any agency unique implementing guidance to DoD for publication on this same Web site. Areas for Clarification and Definitions Comment: ·Private Security Functions· needs to be better defined Response: The term ·private security functions· is defined by section 864 of the FY 2008 NDAA; the IFR used this definition. The Rule provides requirements for the management and oversight of companies contracted to perform private security functions and certain employees who may be required to carry and use arms in the performance of their duties. Companies and their personnel contracted to provide training, maintenance, or other support functions that are not required to carry a weapon in the performance of their duties are not addressed by this Rule. For clarification, in the Final Rule we have added ·in accordance with the terms of their contract·. Comment: Enforcement and liability pending adoption of FAR clauses Response: A FAR case has been opened to incorporate the required revisions based upon the publication of this Rule. Comment: The Rule

should address foreseeable issue concerning host nation law Response: The Geographic Combatant Commander has legal and political staffs capable of addressing the concerns expressed in this comment.

Periodic scans of organizational systems and real -time scans of files from external sources can detect malicious code. Malicious code can be encoded in various formats (e.g., 227 NIST SP 800-171A, p. 63. 228 NIST SP 800-171 Rev. 2, p. 42.

3.1.2 Virtual Disk Encryption and Volume Encryption ... 3.1.2 Virtual Disk Encryption and Volume Encryption Virtual disk encryption is the process of encrypting a file called a container , which can hold many files and folders, and permitting access to the data within the container only after proper authentication is provided, at which point the container is typically mounted as a virtual disk.

The standard would also require each regulated entity to determine the movement of ePHI through, into, and out of its information systems and to describe such movement in a network map. A regulated entity's network map would reflect where its technology assets are, for example, physically located at the regulated entity's worksite, or accessed through the cloud. As another example, a covered entity might determine that ePHI is created, received, maintained, or transmitted by one or more offshore business associates (i.e., persons that are located outside of the U.S.) for such services as claims processing, call center staffing, and technical support, activities that inherently involve ePHI. The technology assets used by the business associate to create, receive, maintain, or transmit ePHI are not a part of the covered entity's electronic information system, but do affect the confidentiality, integrity, or availability of ePHI and so would be required to be included in the network map of the covered entity. [447] Such assets would be considered part of the business associate's electronic information systems and therefore would need to be included in both its technology asset inventory and network map. Any technology assets used by the covered entity to create, receive, maintain, or transmit ePHI to the business associate would need to be accounted for in both its technology asset inventory and network map. Such technology assets would not be part of the business associate's technology asset inventory, but would need to be included on its network map. This proposed standard aligns with the Department's enhanced CPG for Asset Inventory, which requires that a regulated entity identify assets to more rapidly detect and respond to potential risks and vulnerabilities, [448] and is consistent with NCVHS' recommendation to require regulated entities to identify where all PHI is stored and to collect data on applications and systems used by the organization to create a systems inventory. [449] In 2003, the Department elected not to require regulated entities to conduct an inventory because we believed that regulated entities would understand that such an inventory is a vital component of the risk analysis, making it redundant of other requirements of the Security Rule. [450] The Department and NIST have provided extensive guidance, described below, about how to conduct such inventories as part of compliance with 45 CFR 164.308 . However, nearly 20 years of enforcement experience indicates that regulated entities routinely disregard this part of the process. OCR's investigations frequently find that organizations lack sufficient understanding of where all the ePHI entrusted to their care is located. [451] Understanding one's environment-particularly how ePHI is created and enters an organization, how ePHI flows through an organization, and how ePHI leaves an organization-is crucial to understanding the risks ePHI is exposed to throughout an organization. [452]

Table 9-Break-Even Thresholds by Number of Affected Individuals Baseline Affected individuals Regulated entities NPRM costs Unit cost (per individual record) Break-even threshold (NPRM cost ÷ unit cost) Percent decrease (threshold ÷ affected) × 100 High 64,551,397 \$2,251,258,305 \$498 4,521,423 7 Low 29,006,854 16.4 The analysis in table 9 suggests that this NPRM would break even (cost savings would match monetized costs incurred) if the number of affected individuals is reduced by approximately 4.5 million. In years with a high incidence of breaches, this would be a reduction of approximately 7 percent, and in low-incidence years this would be a decrease of 16.4 percent. Thus, if the proposed changes in the NPRM reduce the number of affected individuals by 7 to 16 percent, the rule would pay for itself. Alternatively, the same cost savings may be achieved by lowering the cost per affected individual's ePHI by 7 percent (\$35) and 16 percent (\$82), respectively. Table 10 analyzes the potential cost savings for regulated entities based on the annual number of large breaches of ePHI and the cost per breach, as shown below. Table 10-Break-Even Thresholds by Number of Large Breaches Baseline Breaches NPRM cost for regulated

entities Unit cost (per breach) Break-even threshold (NPRM cost ÷ unit cost) Percent decrease (threshold ÷ breaches) × 100 High 669 \$2,251,258,305 \$11,136,982 202 30.1 Low 440 58.9 In table 10, the Department assumes that the average cost per breach in industry reports (\$11.1 million, calculated as the average of the three highest values in table 9, adjusted for inflation) refers to large breaches of ePHI. The analysis in table 10 suggests that the NPRM would break even if the annual number of large breaches is reduced by approximately 202. In high-incidence years, this would be a reduction of approximately 30 percent, and in low-incidence years, this would be a decrease of 59 percent. Alternatively, the same cost savings may be achieved by lowering the cost per breach by 30 percent (\$3.4 million) and 9 percent (\$6.6 million), respectively. B. Regulatory Alternatives to the Proposed Rule The Department welcomes public comment on any benefits or drawbacks of the following alternatives it considered, but did not propose, while developing this proposed rule. We also request comment on whether the Department should reconsider any of the alternatives considered, and if so, why. No Changes to the Security Rule

Several days into the investigation of a Hepatitis A outbreak from chicken salad in one city, FDA learned that the chicken was ·cubed· at another facility in another city within the state, and transported to the ·manufacturing facility·. The source of the outbreak was the site where the chicken was ·cubed· by an ill employee; however, there were no records to indicate when the cubed product was shipped or received by the salad manufacturing facility. (printed page 71595) (Comment 83) One comment suggests that the final regulation should clarify that ·transportation record· includes the various documents that may be developed by a company that contain the information specified in the regulation. They do not believe that it would be necessary to include all of this information in one shipping document. The comment notes that industry currently collects much of the data that would be requested by FDA but these data are not found in one document, and in some instances, may be found at various locations within the manufacturing facility. Significant time and expense could be involved in making the modifications to the company's computer and recordkeeping systems to have a system that develops a transportation record that contains all of this information on one form. Such a requirement would be unreasonably onerous, particularly if the company's system is designed to make certain that the company can provide all of this information to the agency within the specified time. The respondent asks the agency to clarify in the final rule that it is not necessary to develop one transportation record that contains all of the information in a single form. (Response) FDA confirms that it is not necessary to develop one record that contains all of the information. FDA's intent is to have as little impact as possible on current recordkeeping practices if those records can meet the requirements of these regulations. The final regulation has been clarified to explicitly provide in § 1.360 that you must create the required records when you receive and release food, except to the extent that the information is contained in existing records. FDA is requiring that specific information be kept by a covered person, but is not specifying the form or type of system in which those records must be maintained. The required information may be contained entirely in one record or spread among many different records. The person subject to these regulations is responsible for ensuring that it keeps all applicable records and that those records are available to FDA under the record availability requirements in § 1.361 of this final rule. (Comment 84) A few comments note that the recordkeeping requirements under existing FDA regulations, such as Substances Prohibited From Use in Animal Food or Feed (21 CFR part 589), Current Good Manufacturing Practice for Medicated Feeds (21 CFR part 225), and Fish and Fishery Products (seafood Hazard Analysis Critical Control Point (HACCP)) (

ion would help security to more effectively compete with other agency objectives. - Need guidance on what to do about the physical distribution of the database (including all the data on PC floppies). - Need guidance on the monitoring of IT resources in light of the potential access by one individual to huge repositories of information from many agencies. - Need guidance on categorization and labelling. - Need guidance on how to administer security in a decentralized environment. - Need guidance on uploading/downloading between PCs and mainframes. - Need guidance and policy for maintaining data integrity In a cooperative processing environment.

). It is any information system, including any telecommunications system, used or operated by an agency or by a contractor of an agency, or other organization on behalf of an agency. (1) The function, operation, or use of which: (i) Involves intelligence activities; (ii) Involves cryptologic activities related to national security; (iii) Involves command and control of military forces; (iv) Involves equipment that is an integral part of a weapon or weapons system; or (v) Is critical to the direct fulfillment of military or intelligence missions but this does not include a

system that is to be used for routine administrative and business applications, including payroll, finance, logistics, and personnel management applications; or (2) Is protected at all times by procedures established for information that have been specifically authorized under criteria established by an Executive order or an Act of Congress to be kept classified in the interest of national defense or foreign policy. Information technology, in lieu of the definition at FAR 2.1, and supply chain risk, are defined in the clause at 252.239-7018, Supply Chain Risk. 239.7303 Authorized individuals. (a) Subject to 239.7304, the following individuals are authorized to take the actions authorized by 239.7305: (1) The Secretary of Defense. (2) The Secretary of the Army. (3) The Secretary of the Navy. (4) The Secretary of the Air Force. (b) The individuals authorized at paragraph (a) may not delegate the authority to take the actions at 239.7305 or the responsibility for making the determination required by 239.7304 to an official below the level of: (1) For the Department of Defense, the Under Secretary of Defense for Acquisition, Technology, and Logistics; and, (2) For the military departments, the senior acquisition executive for the department concerned. 239.7304 Determination and notification. The individuals authorized in 239.7303 may exercise the authority provided in 239.7305 only after: (a) Obtaining a joint recommendation by the Under Secretary of Defense for Acquisition, Technology, and Logistics and the Chief Information Officer of the Department of Defense, on the basis of a risk assessment by the Under Secretary of Defense for Intelligence, that there is a significant supply chain risk to a covered system; (b) Making a determination in writing, in unclassified or classified form, with the concurrence of the Under Secretary of Defense for Acquisition, Technology, and Logistics, that: (1) Use of the authority in 239.7305(a)(b) or (c) is necessary to protect national security by reducing supply chain risk; (2) Less intrusive measures are not reasonably available to reduce such supply chain risk; and (3) In a case where the individual authorized in 239.7303 plans to limit disclosure of information under 239.7305(d), the risk to national security due to the disclosure of such information outweighs the risk due to not disclosing such information; and

(i) If DSS determines that a company is under FOCI, DSS will assess the extent and manner to which the FOCI may result in unauthorized access to classified information or adverse impact on the performance of classified contracts and the type of actions, if any, that would be necessary to mitigate or negate the associated risks to a level deemed acceptable to DSS. An analysis of some of the FOCI factors may clearly identify risk; while others may result in circumstances that would mitigate or negate risks. Therefore, these factors must be considered in the aggregate with regard to the foreign interest that is the source of the FOCI, the country or countries in which the foreign interest is domiciled and has its principal place of business (if not in the country of domicile), and any other foreign country that is identified by DSS because it is a substantial source of the revenue for, or otherwise has significant ties to, the foreign interest. DSS will consider the following FOCI factors and any other relevant information in the context of threat, vulnerability, and sensitivity of the classified information required for current or prospective contract performance when rendering a risk management assessment and determination of the acceptability of a company's FOCI action plan: (A) Record of economic and government espionage against U.S. targets. (B) Record of enforcement and/or engagement in unauthorized technology transfer. (C) Record of compliance with pertinent U.S. laws, regulations, and contracts. (D) The type and sensitivity of the information that will be accessed. (E) The source, nature, and extent of FOCI, including, but not limited to, whether a foreign interest holds a majority or substantial minority position in the company, taking into consideration the immediate, intermediate, and ultimate parent companies of the company or prior relationships between the U.S. company and the foreign interest. (F) The nature of any relevant bilateral and multilateral security and information exchange agreements, (e.g., the political and military relationship between the United States Government (USG) and the government of the foreign interest). (G) Ownership or control, in whole or in part, by a foreign government. (H) Any other factor that indicates or demonstrates a capability on the part of foreign interests to control or influence the operations or management of the business organization concerned. (ii) As part of its FOCI assessment and evaluation of any FOCI action plan, DSS will also request and consider counterintelligence (CI) and technology transfer risk assessments and any available intelligence from all appropriate USG sources. DSS will request these assessments as soon as practicable, for the company itself and for all business entities in the company's ownership chain.

Another asked about validating compliance for assets that changed asset categories when transitioning from Level 2 certification to Level 3 certification. One comment said it was that Level 2 certification is not clearly identified as a prerequisite for Level 3 certification, and

that organizations might try to bypass Level 2. One comment asked whether those entities that would need a CMMC level 3 assessment could seek a combined Level 2 and Level 3 certification from the DIBCAC to reduce cost to the OSC. One comment sought clarification of how long an OSC would be prohibited from seeking additional contract awards if a Level 3 certification expired. Two comments were concerned about the DIBCAC's ability to terminate a Level 3 assessment if the review identifies a Level 2 requirement that is not met. Response: For CMMC Level 3, the DoD selected a subset of NIST SP 800-172 Feb2021 requirements for enhanced safeguarding. The CMMC Level 3 supplemental documents were not finalized prior to publication of the Proposed Rule. DoD's final determination of the specific subset of NIST SP 800-172 Feb2021 requirements is included in this final rule, which defines the ODPs for Level 3 in table 1 to § 170.14(c)(4). DoD will update the rule when required to change the security requirements, to include CMMC Level 3. DoD has reviewed and declined the recommendation to conduct a pilot prior to phasing in CMMC Level 3 requirements. Given the evolving cybersecurity threat, DoD's best interests are served by ensuring that the selected CMMC Level 3 NIST SP 800-172 Feb2021 security requirements are in place to provide enhanced protections for sensitive DoD CUI. In those cases when DCMA DIBCAC identifies that a Level 2 security requirement is NOT MET, DCMA DIBCAC may allow for remediation, place the assessment process on hold, or may immediately terminate the Level 3 assessment, depending on significance of the NOT MET security requirement(s) and the nature of the required remediation. The determination of whether a NOT MET requirement is significant is reserved for the judgment of the DCMA DIBCAC. The rule has been updated to clarify that DCMA DIBCAC has the responsibility to validate compliance of all assets that changed asset category (i.e., CRMA to CUI Asset) or assessment requirements (i.e.,

Several comments expressed disagreement with assumptions supporting the cost estimate, namely that implementation costs to comply with the requirements of FAR clause 52.204-21 and DFARS clause 252.204-7012 predate and are not included as CMMC costs. These comments assert that the cost of CMMC compliance should include those costs, and therefore dwarfs the cost of CMMC certification. They further assert that DoD's position does not account for those contractors who have only recently joined the DIB marketplace or those that aspire to do so. The concern expressed in the comments is that the cost of standing up an infrastructure to achieve and maintain DoD cybersecurity requirements regarding the protection of FCI and CUI, combined with CMMC assessment costs, is prohibitive and will create a lack of diverse suppliers. Two commenters asserted the CMMC Program expanded application of DFARS clause 252.204-7012 requirements due to a perceived extension of those requirements to additional organizations, such as External Service Providers (ESPs). One of the commenters further speculated that CMMC requirements may decrease the availability of ESPs that are available and suitable to support DIB members as needed to comply with CMMC requirements. Another commenter stated that this scope expansion increases direct implementation and compliance costs above and beyond the CMMC Program's estimated assessment costs. The comment cites the introduction of the terms "Security Protection Assets" and "Security Protection Data" as extending applicability of those requirements and incurring the additional direct implementation and compliance costs. Lastly, the comment notes these changes will drive costs to "rip and replace" existing tools and likely purchase more expensive FedRAMP or CMMC-certified tools. One comment indicated that, while compliance with NIST SP 800-171 was required by December 31, 2017, compliance with NIST SP 800-171A Jun2018 increases requirements and cost because NIST SP 800-171A Jun2018 emphasizes process and documentation in addition to the intent of the security requirement. Two comments pointed out that some contractors may need to accelerate remediation efforts and close out POA&Ms under existing DoD contracts that are subject to DFARS clause 252.204-7012 to meet CMMC requirements. These comments requested that since these contractors will now be faced with accelerating close-out of their POA&Ms, which will incur additional costs, that DoD account for those costs in the estimate and potentially allow for recovery of those costs. One comment asserts that CMMC assessment failures, remediation implementation, and subsequent reassessments will be very costly in both time and money. Response: 81 FR 72990

From the NIST SP 800-172 Rev 3 Final Public Draft: Organizations also use automated mechanisms to implement NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 and maintain authoritative (i.e., up-to-date, complete, accurate, and available) 961

From the NIST SP 800-172 Rev 3 Final Public Draft: 40 (PPD-40) National Continuity Policy, within expected timelines without the information or information 2938 system. "Federal Civilian Enterprise Essential (FCEE): The information or information system serves a critical function in

maintaining the security and resilience of the federal civilian enterprise. [10] impact With respect to security, the effect on organizational operations, organizational assets, individuals, other organizations, or the Nation (including the national security interests of the United States) of a loss of confidentiality, integrity, or availability of information or a system. With respect to privacy, the adverse effects that individuals could experience when an information system processes their PII. impact value The assessed worst-case potential impact

(Response) In the final rule, all foreign persons are excluded from all requirements in this rule, except for foreign persons who transport food in the United States. Because all foreign persons who transport food in the United States are currently subject to FMCSA regulations as interstate transporters, and can meet the requirements of transporters in subpart J of this final rule by keeping records already required by FMCSA, the costs of compliance for these facilities, including the costs for the records access requirement, are assumed to be zero. (Comment 213) One comment questions the implied assumption in the PRIA that foreign transporters share the cost burden with other foreign facilities when foreign transporters are not covered by the rule. (Response) Foreign persons who transport food in the United States are covered by this final rule. The revised costs of compliance by these facilities to establish and maintain records are assumed to be zero because they will be in compliance with this final rule if they keep the records currently required by FMCSA for interstate transporters. 10. Compliance Dates Several comments suggest changes in the compliance dates. In the design of the regulation, the compliance dates are used primarily to address regulatory flexibility considerations. Consequently, these comments are treated in the regulatory flexibility section of the final analysis. G. Summary of the Costs and Benefits of the Final Rule and Policy Options Considered The revisions to the cost estimates based on comments to the proposed rule and on changes in records requirements between the proposed and final rule result in estimated costs of approximately \$1.41 billion expressed in present value terms, using a 7-percent discount rate. Using a discount rate of 3 percent, the estimated costs of the final rule expressed in present value terms are approximately \$1.94 billion. Costs for learning, records redesign, and planning for records access requests are one-time costs incurred in the first 2 years following publication of the final rule. Additional records maintenance costs and records retention costs are incurred each year following publication of the final rule, beginning in the second year for large and small firms and in the third year for very small firms. Learning costs and records access planning costs for new entrants are also incurred each year following publication of the final rule beginning after the second year. The details of the assumptions used to estimate the costs are provided in the PRIA. The estimated total cost is computed by summing the costs estimated for learning, records redesign, additional records maintenance, records retention, and planning for a records access request. The annual and total costs of the final rule are reported in table 15 of this document. Table 15. Estimated Annual and Total Recordkeeping Costs 1 21 CFR Section Costs (in dollars) 1.337, 1.345, and 1.352 (learning) \$85,082,000

CIS Safeguard 4.9 · Configure Trusted DNS Servers on Enterprise Assets Configure trusted DNS servers on enterprise assets. Example implementations include: configuring assets to use enterprise-controlled DNS servers and/or reputable externally accessible DNS servers. Implementation Groups: 2,3 Asset Type: devices Security Function: protect Parent Control: Secure Configuration of Enterprise Assets and Software

means authentication of the user's identity through verification of at least two of the following three categories: (1) Information known by the user, including but not limited to a password or personal identification number (PIN). (2) Item possessed by the user, including but not limited to a token or a smart identification card. (3) Personal characteristic of the user, including but not limited to fingerprint, facial recognition, gait, typing cadence, or other biometric or behavioral characteristics. Password means confidential authentication information composed of a string of characters, such as letters, numbers, spaces, and other symbols. Physical safeguards are physical measures and related policies and procedures to protect a covered entity's or business associate's relevant electronic information systems, and related facilities and equipment, from natural and environmental hazards and unauthorized intrusion. Relevant electronic information system means an electronic information system that creates, receives, maintains, or transmits electronic protected health information or that otherwise affects the confidentiality, integrity, or availability of electronic protected health information. Risk means the extent to which the confidentiality, integrity, or availability of electronic protected health information is threatened by a potential circumstance or event. Security or security measures encompass all of the administrative,

physical, and technical safeguards in or applied to an information system. Security incident means any of the following: (1) The attempted or successful unauthorized access, use, disclosure, modification, or destruction of information in an information system. (2) The attempted or successful unauthorized interference with system operations in an information system. Technical controls means the technical mechanisms contained in the hardware, software, or firmware components of an electronic information system that are primarily implemented and executed by the electronic information system to protect the information system and data therein. Technical safeguards means the technology, technical controls, and related policies and procedures governing the use of the technology that protects and controls access to electronic protected health information. Technology asset means the components of an electronic information system, including but not (printed page 1012) limited to hardware, software, electronic media, information, and data. Threat means any circumstance or event with the potential to adversely affect the confidentiality, integrity, or availability of electronic protected health information. User means a person with authorized access. Vulnerability means a flaw or weakness in an information system, information system security procedures, design, implementation, or technical controls that could be intentionally exploited or accidentally triggered by a threat. Workstation

CIS Safeguard 3.2 · Establish and Maintain a Data Inventory Establish and maintain a data inventory, based on the enterprise's data management process. Inventory sensitive data, at a minimum. Review and update inventory annually, at a minimum, with a priority on sensitive data. Implementation Groups: 1,2,3 Asset Type: data Security Function: identify Parent Control: Data Protection

This rule does not duplicate, overlap, or conflict with any other Federal rules. There are no known significant alternative approaches to the proposed rule that would meet the proposed objectives. DoD invites comments from small business concerns and other interested parties on the expected impact of this rule on small entities. DoD will also consider comments from small entities concerning the existing regulations in subparts affected by this rule in accordance with 5 U.S.C. 610 . Interested parties must submit such comments separately and should cite 5 U.S.C. 610 (DFARS Case 2018-D050) in correspondence. VI. Paperwork Reduction Act The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35). List of Subjects in 48 CFR Parts 204 and 252 Government procurement Jennifer Lee Hawes, Regulatory Control Officer, Defense Acquisition Regulations System. Therefore, 48 CFR parts 204 and 252 are proposed to be amended as follows: 1. The authority citation for 48 CFR parts 204 and 252 continues to read as follows: Authority: 41 U.S.C. 1303 and 48 CFR chapter 1 . PART 204·ADMINISTRATIVE MATTERS 2. Amend section 204.7104-1 by· (printed page 58364) a. In paragraph (b)(3)(iii), removing ·subsection· and adding ·section· in its place; b. Revising paragraph (b)(3)(iv). The revision reads as follows: 204.7104-1 Criteria for establishing. * * * * * (b) * * * (3) * * * (iv) When the price for items not separately priced is included in the price of another contract line or subline item, it may be necessary to withhold payment on the priced contract line or subline item until the included line or subline items that are not separately priced have been delivered. See the clause at 252.204-7002, Payment for Contract Line or Subline Items Not Separately Priced. 3. Revise section 204.7109 to read as follows: 204.7109 Contract clauses. (a) Use the clause at 252.204-7002, Payment for Contract Line or Subline Items Not Separately Priced, in solicitations and contracts when the price for items not separately priced is included in the price of another contract line or subline item. (b) Use the clause at 252.204-7006, Billing Instructions, in solicitations and contracts if Section G includes· (1) Any of the standard payment instructions at PGI 204.7108(b)(2); or (2) Other payment instructions, in accordance with PGI 204.7108(d)(12), that require contractor identification of the contract line item(s) on the payment request. PART 252·SOLICITATION PROVISIONS AND CONTRACT CLAUSES 4. Revise section 252.204-7002 to read as follows: 252.204-7002 Payment for Contract Line or Subline Items Not Separately Priced. As prescribed in 204.7109(a), use the following clause: Payment for Contract Line or Subline Items Not Separately Priced (Date)

proposed. The software can be managed by the developers as an open-source project shared publicly using version control platforms, such as Github, or the software can be proprietary and kept private. Development patterns can be leveraged to enable smart contract upgradability (e.g., a registry contract that points to the latest version of the main contract of the system or an interface contract that is inherited by the system and defines a set of key functions and

parameters). Periodic thirdparty audits, automated tests, and reports can also be performed and disclosed to help assess whether the rules are properly enforced.

All information system authorized users will receive training on the security risks associated with their user activities and responsibilities under the NISP. The contractor will determine the appropriate content of the training, taking into consideration assigned roles and responsibilities, specific security requirements, and the information system to which personnel are authorized access.

(j) Temporary help suppliers. A cleared temporary help supplier, or other contractor who employs cleared individuals solely for dispatch elsewhere, will be responsible for ensuring that required briefings (both initial and refresher training) are provided to their cleared personnel. The temporary help supplier or the using contractor may conduct these briefings. (printed page 83336)

(k) Refresher training. The contractor will provide all cleared employees with security education and training every 12 months. Refresher training will reinforce the information provided during the initial security briefing and will keep cleared employees informed of changes in security regulations and should also address issues or concerns identified during contractor self-reviews.

Training methods may include group briefings, interactive videos, dissemination of instructional materials, or other media and methods. Contractors will maintain records about the programs offered and employee participation in them. (l) Debriefings. Contractors will debrief cleared employees and annotate the debriefing in the appropriate contractor records when access to classified information is no longer needed; at the time of termination of employment (discharge, resignation, or retirement); when an employee's eligibility for access to classified information is terminated, suspended, or revoked; and upon termination of the entity eligibility determination. §.117.13

Classification. (a) Original classification. Only a USG official designated or delegated the authority in writing can make an original classification decision. (1) An OCA classifies information pursuant to E.O. 13526 and 32 CFR part 2001 , designates and marks it as TOP SECRET, SECRET, or CONFIDENTIAL, and, except as provided by statute, may use no other terms to identify classified information. (2) The designation UNCLASSIFIED is used to identify information that does not meet the criteria for classification in accordance with E.O. 13526 . In accordance with 32 CFR 2002 , CUI implementing guidance (including the Marking Handbook) and any GCA-provided guidance, CUI commingled with classified information must be marked as CUI to alert users to its presence and sensitivity. The CUI regulation, guidance, and handbook are available at: <https://www.archives.gov/cui> . (b) Derivative classification.

Under CMMC Level 2 (NIST SP 800-171 Rev 3), organizations must implement specific controls addressing this area. Key considerations include: 1. The specific NIST SP 800-171 controls that apply to this scenario 2. Documentation requirements for the SSP 3. Evidence needed for C3PAO assessment 4. Cost-effective implementation options for different organization sizes Organizations should reference the specific control families in NIST SP 800-171 Rev 3 and consult the CMMC Assessment Guide Level 2 for detailed assessment objectives. A Registered Practitioner (RP) can provide organization-specific guidance.

However, several limiting provisions exist before the Government can exercise its authorities under section 806. First, use of section 806 authorities is limited to the procurement of NSS or of covered items of supply used within NSS. Section 806 defines a ·covered item of supply· as ·an item of information technology . . . that is purchased for inclusion in (an NSS), and the loss of integrity of which could result in a supply chain risk· to the entire system. Therefore, though the clause will be inserted in all information-technology contracts, these authorities will not be able to be utilized for all information and communication technology in all systems, but rather only in those meeting the criteria stated above. Second, the decision to exclude a source under section 806 can only be made by the ·head of a covered agency·, limited by definition to the Secretary of Defense and the Secretaries of the military departments with delegation limited to officials at or

above the level of the service acquisition executive for the agency. Third, the head of a covered agency seeking to exercise the authority of section 806 must obtain a joint recommendation from the Under Secretary of Defense for Acquisition, Technology, and Logistics (USD(AT&L)) and the Chief Information Officer of the Department of Defense (DoD CIO), based on a risk assessment from the Under Secretary of Defense for Intelligence (printed page 69269) (USD(I)) that there is significant supply chain risk to a particular NSS. Fourth, the head of a covered agency, with the concurrence of the USD(AT&L), must make a written determination that the use of section 806 authority is necessary to protect national security by reducing supply chain risk and that less intrusive measures are not reasonably available to reduce such supply chain risk. Fifth, notice of each determination to exercise section 806 authorities must be provided in advance to the appropriate congressional committees. Finally, section 806 expires on September 30, 2018 (see section 806 of FY 2013 NDAA, Public Law 112-239). Section 806 also provides that the head of a covered agency may limit, notwithstanding any other provision of law, in whole or in part, the disclosure of information relating to the basis for carrying out a covered procurement action if the head of a covered agency, with the concurrence of the USD (AT&L), determines in writing that the risk to national security due to disclosure of such information outweighs the risk due to not disclosing such information. If the Government exercises the authority provided to limit disclosure of information, no action undertaken by the Government under such authority shall be subject to review in a bid protest before the Government Accountability Office or in any Federal court. III. Executive Orders 12866 and 13563

(1) The request is made by a citizen of the United States or a United States corporation, and such citizen or corporation certifies that the technical data requested is required to enable it to submit an offer, or determine whether it is capable of submitting an offer to provide the product to which the technical data relates to the United States or a contractor with the United States. However, DoD Components may require the citizen or corporation to pay a deposit in an amount equal to not more than the cost of complying with the request, which will be refunded upon submission of an offer by the citizen or corporation; (2) The release of technical data is requested in order to comply with the terms of an international agreement; or, (3) The Component determines in accordance with § 286.24(c)(4)(i)(D) that such a waiver is in the interest of the United States. § 286.27 Fees for research data. Research data described in § 286.2, definition "Agency record" obtained by the DoD Component from a grant recipient solely in response to a request submitted by a FOIA requester, may charge that requester a reasonable fee equaling the full incremental cost of obtaining the research data. The fee should reflect costs incurred by the Component, grant recipient, and sub-recipients. This fee is in addition to any fees the Component may assess under the FOIA. Subpart F-Education and Training § 286.30 Purpose and responsibility. (a) Purpose. The purpose of the Component FOIA educational and training programs is to promote a positive attitude among DoD personnel and raise the level of understanding and appreciation of the DoD FOIA Program. Fulfilling this purpose will improve customer service with members of the public and improve the public trust in the Department of Defense. (b) Responsibility. Each DoD Component shall establish educational and training programs on the provisions and requirements of this part. These should be targeted toward developing in all Component personnel a general understanding and appreciation of the DoD FOIA Program. The training programs should be focused on providing personnel involved in the day-to-day processing of FOIA requests with a thorough understanding of the procedures outlined in this part. (c) Scope and principles. Each DoD Component shall design its FOIA educational and training programs to fit the particular requirements of its personnel, dependent upon their degree of involvement in implementing this part. These programs should be designed for two target audiences; those personnel who are involved in the day-to-day processing of FOIA requests, and those staff personnel who provide search and/or review staff support to the Component FOIA process. The programs should be designed to accomplish the following objectives: (printed page 71867) (1) Familiarize personnel with the requirements of the FOIA and its implementation by this part.

Information about an individual that identifies, relates, or is unique to, or describes him or her, e.g., a social security number, age, military rank, civilian grade, marital status, race, salary, home/office phone numbers, etc. (r) Persistent cookies. Cookies that can be used to track users over time and across different Web sites to collect personal information. (s) Personal Identifier. A name, number, or symbol that is unique to an individual, usually the person's name or SSN. (t) System of Records. A group of records under the control of the DA from which information is filed and retrieved by individuals' names or other personal identifiers assigned to the individuals. System notices for all systems of records must be published in the Federal Register. A grouping of records arranged chronologically or subjectively that are not retrieved by individuals' names or identifiers is not a Privacy Act system of records, even though individual information could be retrieved by individuals' names or personal identifiers, such as through a paper-by-paper search. (u) Privacy Advisory. A statement required when soliciting personally identifying information by a Department of the Army Web site and the information is not maintained in a system of records. The Privacy Advisory informs the individual why the information is being solicited and how it will be used. (v) Privacy Impact Assessment (PIA). An analysis, which considers information sensitivity, vulnerability, and cost to a computer facility or word processing center in safeguarding personal information processed or stored in the facility. (w) Privacy Act (PA) Request. A request from an individual for information about the existence of, access to, or amendment of records pertaining to that individual located in a Privacy Act system of records. The request must cite or implicitly refer to the Privacy Act of 1974. (x) Protected Personal Information. Information about an individual that identifies, relates to, is unique to, or describes him or her (e.g., home address, date of birth, social security number, credit card, or charge card account, etc.). (y) Records. Any item, collection, or grouping of information, whatever the storage media (e.g., paper, electronic, etc), about an individual that is maintained by a DOD Component, including but not limited to, his or her education, financial transactions, medical history, criminal or employment history and that contains his or her name, or the identifying number, symbol, or other identifying particular assigned to the individual, such as a finger or voice print or a photograph. (printed page 46071) (z) Records Maintenance and Use. Any action involving the storage, retrieval, and handling of records kept in offices by or for the agency. (aa) Review Authority.

One comment suggested that audit standards be determined for CMMC assessments. Two comments asked for clarification regarding references provided in the model, whether all references must be reviewed, and if the requirements within the references must also be achieved. Response: The Department has reviewed definitions of audit and assessments and determined 'assessment' best meets the goals of the CMMC Program. The cybersecurity standard requirements for the different CMMC Levels are set forth in §.170.14 and clarify references for the security requirements. Comment: Many commenters were concerned about the lack of waivers or POA&Ms. Several commenters commented that not allowing waivers is impractical and will impact the ability of businesses to qualify for contract award. Commenters asked for clarification on the differences between POA&M that are not allowed by CMMC and the plans of action as required in the CMMC Level 3 control (now CMMC Level 2 under CMMC 2.0), CA.2.159 (now CA.L2-3.12.2 under CMMC 2.0). Many noted that POA&Ms are necessary when managing activities like system upgrades, vendor changes, and company acquisitions to avoid temporarily falling out of compliance. Response: Under certain circumstances, the CMMC Program does permit contract award to organizations that have an approved and time limited POA&M. See §.170.21 for additional information on POA&Ms. There is no process for organizations to request waiver of CMMC

solicitation requirements. DoD internal policies, procedures, and approval requirements will govern the process for DoD to waive inclusion of the CMMC requirement in the solicitation. 22. The Accreditation Body and C3PAOs Comment: Many commenters had questions and concerns about the management of the Accreditation Body and C3PAOs. A few commenters suggested using a government entity instead of the Accreditation Body construct to manage assessments. Commenters asked about the governance, resourcing, and oversight of the Accreditation Body with respect to CMMC training and assessments. Commenters expressed concerns such as who would make final decisions about CMMC issues, the lack of clearly defined roles and responsibilities for CMMC governance, and the long-term effectiveness of the Accreditation Body staffed by an all-volunteer workforce. One comment asked how the Accreditation Body can legally license training when CMMC Program information is available for free. Response: The decision to use a non-governmental Accreditation Body was made because the DoD determined that there was insufficient capacity within the DoD to manage assessor training and assessments for all defense contractors who need to comply with CUI protection policies. The DoD CMMC PMO provides oversight of the Accreditation Body and is also responsible for developing, updating, maintaining, and publishing the CMMC Model, CMMC Assessment Guides, and policies for implementation of the CMMC Program.

atile user data. Storage heaps may also be ROM-based. As part of the cold boot sequence (i.e., a hard reset), in addition to reinitializing the dynamic area of RAM, the storage area is erased [PPC04]. Besides memory, SD cards may also incorporate other types of peripherals such as wireless communications or camera cards.

If an XCCDF component has multiple `<xccdf:check-content-ref>` elements, then check processing SHALL be performed according to [XCCDF:7.2.3.5.1] with the following changes: 6. Regarding the definition and use of `<xccdf:Profile>` elements, reported `<xccdf:setvalue>` elements SHALL include all those values that are exported by the reported rules. The specific settings are those determined by the reported `<xccdf:Profile>`. 7. The `<xccdf:identity>` element SHALL identify the security principal used to access rule evaluation on the target(s). This will include the identity name or username used to perform the evaluation. 8. Each IP address(es) associated with the `<xccdf:target>` SHALL be enumerated using the `<xccdf:target-address>` element. 9. An `<xccdf:target-id-ref>` SHALL be specified with a `@system` attribute of 'http://scap.nist.gov/schema/asset-identification/1.1', an `@href` attribute value of "", and a `@name` attribute value of the ID of the `<ai:asset>` element in the ARF that this `<xccdf:TestResult>` is about. 10. The `<xccdf:rule-result>` elements report the result of the application of each selected rule [XCCDF:6.6.2]. The `@role`, `@severity`, and `@weight` attributes of the `<xccdf:rule-result>` element SHALL be provided to indicate their values used during assessment. The `<xccdf:check/xccdf:check-content-ref>` element SHALL record the reference to the checking system specific result component report ID and check name within the result file using the `@href` and `@name` attributes, respectively. The `@href` attribute SHALL contain '#' + the `@id` of the `<arf:report>` containing the check result. This approach provides traceability between XCCDF and check results. Note that if `@multi-check` is not set to 'true' and the `<xccdf:rule-result>` represents a group of checks, then the `@name` attribute SHALL be omitted. See the example below the next requirement. 11.

Exemption. During the processing of a Freedom of Information Act/Privacy Act request, exempt materials from other systems of records may in turn become part of the case record in this system. To the extent that copies of exempt records from those other systems of records are entered into this system, the NRO hereby claims the same exemptions for the records from those other systems that are entered into this system, as claimed for the original primary system of which they are a part. (ii) Authority. 5 U.S.C. 552a(j)(2), (k)(1), (k)(2), (k)(3), (k)(4), (k)(5), (k)(6), and (k)(7). (iii) Reasons. Records are only exempt from pertinent provisions of 5 U.S.C. 552a to the extent such provisions have been identified and an exemption claimed for the original record and the purposes underlying the exemption for the original record still pertain to the record which is now contained in this system of records. In general, the exemptions were claimed in order to protect properly classified information relating to national defense and foreign policy, to avoid interference during the conduct of criminal, civil, or administrative actions or investigations, to ensure protective services provided the President and others are not compromised, to protect the identity of confidential sources incident to Federal employment, military service, contract, and security clearance determinations, and to preserve the confidentiality and integrity of Federal evaluation materials. The exemption rule for the original records will identify the specific reasons

why the records are exempt from specific provisions of 5 U.S.C. 552a . (8) System identifier and name. QNRO-27, Legal Records. (i) Exemption. Any portion of this system of records which falls within the provisions of 5 U.S.C. 552a(k)(2) and (k)(5) may be exempt from the following subsections of 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (H), and (I), and (f). (ii) Authority. 5 U.S.C. 552a (k)(2) and (k)(5). (iii) Reasons. (A) From subsection (c)(3) because to grant access to the accounting for each disclosure as required by the Privacy Act, including the date, nature, and purpose of each disclosure and the identity of the recipient, could alert the subject to the existence of the investigation. This could seriously compromise case preparation by prematurely revealing its existence and nature; compromise or interfere with witnesses or make witnesses reluctant to cooperate; and lead to suppression, alteration, or destruction of evidence.

. Instead, as discussed in greater detail below, we propose to clearly delineate maintenance implementation specifications for specific standards, when applicable. We believe this approach would clarify how maintenance requirements relate to specific security measures and would remove any ambiguity about the need for regulated entities to regularly review, test, and modify measures as reasonable and appropriate. We further discuss maintenance provisions below for each safeguard. 4. Request for Comment The Department requests comment on the foregoing proposals, including any benefits, drawbacks, or unintended consequences. We also request comment on the following considerations in particular: a. Whether removing the distinction between required and addressable implementation specifications would result in unintended negative consequences for regulated entities. If so, please explain and provide a recommendation for how the Department should clarify how regulated entities are required to implement the security measures described in the proposed rule. b. Whether the Department should include other factors in 45 CFR 164.306(b) for regulated entities to consider when selecting the security measures that they will implement to meet the requirements of the Security Rule. If so, please explain. c. Whether the factor proposed by the Department at proposed 45 CFR 164.306(b)(2)(v) would help regulated entities identify reasonable and appropriate security measures. d. Whether the Department's proposals sufficiently clarify that a regulated entity is expected to modify its security measures in response to changes in the environment in which health care is provided, including, but not limited to, the adoption of new technology, the evolution of existing technology, and the emergence of new threats. e. Whether the proposals sufficiently take into account the needs and capabilities of small health care providers and rural health care providers, as required by the statute. If not, please explain and include a recommendation for ways that the Department could better account for such needs and capabilities while adequately ensuring the confidentiality, integrity, and availability of ePHI that they create, receive, maintain, or transmit. The recommendations should also take into consideration the effect of the actions taken by small and rural health care providers on the ePHI that is created, received, maintained, or transmitted by other regulated entities with whom small and rural health care providers interact. D. Section 164.308-Administrative Safeguards Section 164.308 of title 45 CFR contains the administrative safeguards that a regulated entity must implement, consistent with the general requirements described in 45 CFR 164.306 . All of the standards and implementation specifications found in the Administrative Safeguards section refer to administrative functions, such as policies and procedures that must be in place for the management and execution of security measures.

Today, DoD prime contractors must include DFARS clause 252.204-7012 in subcontracts for which performance will involve covered defense information, but this does not provide the Department with sufficient insights with respect to the cybersecurity posture of all members of a multi-tier supply chain for any given program or technology development effort. The revised CMMC Program requires prime contractors to flow down appropriate CMMC Status requirements, as applicable, to subcontractors throughout their supply chain(s). Given the size and scale of the DIB, the Department cannot scale its existing cybersecurity assessment capability to conduct on-site assessments of approximately 220,000 DoD contractors and subcontractors every three years. The Department's existing assessment capability is best suited for conducting targeted assessments for the relatively small subset of DoD contractors and subcontractors that support designated high-priority programs involving CUI. CMMC addresses the Department's scaling challenges by utilizing a

private-sector accreditation structure. A DoD-authorized Accreditation Body will authorize, accredit, and provide oversight of C3PAOs which in turn will conduct Level 2 certification assessments of actual and prospective DoD contractors and subcontractors. Defense contractors will directly contract with an authorized or accredited C3PAO to obtain a Level 2 (printed page 83175) certification assessment. The cost of Level 2 certification assessment activities is driven by multiple factors, including market forces that govern availability of C3PAOs and the size and complexity of the enterprise or enclave under assessment. The Government will perform Level 3 certification assessments. Government resource limitations may affect schedule availability. Reduces Duplicate or Respective Assessments of Our Industry Partners CMMC assessment results will be posted in SPRS, DoD's authoritative source for supplier and product performance information. Posting CMMC assessment results in SPRS precludes the need to validate CMMC implementation on a contract-by-contract basis. This enables DoD to identify whether the CMMC requirements have been met for relevant contractor information systems, avoids duplicative assessments, and eliminates the need for program level assessments, all of which decreases costs to both DoD and industry. Revised CMMC Program Implementation

(i) Attorneys hired solely to represent the contractor in any civil or criminal case in federal or State courts unless the disclosure is specifically authorized by the agency that has jurisdiction over the information. (ii) Any federal or state court except on specific instructions of the agency, which has jurisdiction over the information or the attorney representing the United States in the case. (8) Disclosure to the public. Contractors will not disclose classified information to the public. Contractors will not disclose unclassified information pertaining to a classified contract to the public without prior review and clearance as specified in the Contract Security Classification Specification, or equivalent, for the contract or as otherwise specified by the GCA. The procedures of this paragraph also apply to information pertaining to classified contracts intended for use in unclassified brochures, promotional sales literature, reports to stockholders, or similar material. (i) The contractor will: (A) Submit requests for approval through the activity specified in the GCA-provided classification guidance for the contract involved. (B) Include in each request the approximate date the contractor intends to release the information for public disclosure and identify the media to be used for the initial release. (C) Retain a copy of each approved request for release for a period of one inspection cycle for review by the CSA. (D) Clear all information developed subsequent to the initial approval through the appropriate office prior to public disclosure. (ii) Unless specifically prohibited by the GCA, the contractor does not need to request approval for disclosure of: (A) The fact that a contract has been received, including the subject of the contract or type of item in general terms (printed page 83344) provided the name or description of the subject is not classified. (B) The method or type of contract. (C) Total dollar amount of the contract unless that information equates to: (1) A level of effort in a sensitive research area. (2) Quantities of stocks of certain weapons and equipment that are classified. (D) Whether the contract will require the hiring or termination of employees. (E) Other information that from time-to-time may be authorized on a case-by-case basis in a specific agreement with the contractor. (F) Information previously officially approved for public disclosure. (iii) Information that has been declassified is not authorized for public disclosure. If the information is comingled with CUI, or qualifies as CUI once declassified, it will be marked and protected as CUI until it is decontrolled pursuant to 32 CFR part 2002 and reviewed for public release. If the information does not qualify as CUI, it will be protected in accordance with the basic safeguarding requirements in 48 CFR 52.204-21

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by organizations even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, organizations may wish to closely follow the development of these new publications by NIST. - [21] Premiere Election Solutions (2008, August 19). CMMC Level 3 scoring does not utilize varying values like the scoring for CMMC Level 2. All CMMC Level 3 security requirements use a value of one (1) point for each security requirement. As a result, the maximum score achievable for a Level 3 certification assessment is equivalent to the total number of the selected subset of NIST SP 800-172 Feb2021 security requirements for CMMC Level 3, see § 170.14(c)(4). The maximum score is reduced by one (1) point for each security requirement NOT MET. The CMMC Level 3 scoring methodology reflects the fact that all CMMC Level 2 security requirements must already be MET (for the Level 3 CMMC Assessment Scope). A maximum score on the Level 2 certification assessment is required to be eligible to initiate a Level 3 certification assessment. The Level 3 certification assessment score is equal to the number of CMMC Level 3 security requirements that are assessed as MET. The Department proposes that the period of inactivity be both predetermined and reasonable and appropriate. When determining the length of the period of inactivity, a regulated entity should consider the access privileges of a given user or technology asset, the system(s) being accessed, the environment in which the system access occurs, and other appropriate factors in determining a reasonable and appropriate time of inactivity before session termination. For example, in an emergency setting, a user may not have time to manually log out of a system. User identities with administrative and other high-level access that present a greater risk to the confidentiality, integrity, and availability of ePHI should have appropriately shorter periods of inactivity because of the increased risk. While many applications have configuration settings for automatic logoff, [708] a regulated entity must determine whether the default automatic logoff is reasonable and appropriate and make modifications if it is not. For example, the adoption of health IT that is certified through the ONC Health IT Certification Program as having the technical capability to automatically stop a user's access to health information after inactivity for a predetermined period and require a user to re-enter their credentials to resume or regain access may contribute to a regulated entity's compliance with the proposed implementation specification for automatic logoff, should the proposal be finalized. [709] Additionally, we propose to add an implementation specification for log-in attempts at proposed 45 CFR 164.312(a)(2)(v) . The proposal would require

a regulated entity to deploy technical controls that disable or suspend the access of a user or technology asset to relevant electronic information systems after a certain number of unsuccessful authentication attempts. Although incorrectly keying in a known password by the intended user may occur infrequently, a repeated and persistent failure is a strong indication of an attempt at unauthorized access. For example, brute force attacks are attempts to gain unauthorized access by guessing the password many times in a row. [710] Technical controls that limit the number of incorrect log-in attempts by disabling or suspending the access of a user or technology asset to relevant electronic information systems are appropriate to address unsuccessful login attempts. [711] The proposal would require a regulated entity to determine the number of unsuccessful authentication attempts that would trigger disabling or suspending access to relevant electronic information system. The number should (printed page 967)

Most surface courier services may carry food items as an incidental part of their business and will incur learning costs as a result of this rule. However, only a small fraction will carry food items as a significant part of their business and will incur additional records maintenance and records redesign costs. We estimate that 10 percent of surface couriers services will ve more than an incidental portion of their business transporting food items and will incur records redesign and additional maintenance costs in addition to learning costs. This is consistent with the fraction of restaurants that report retail sales as a secondary activity of their establishment (Ref. 29). The resulting estimated number of surface transporters of low-value packages of food items that would incur additional records maintenance and records redesign costs is 7,097 facilities. (Comment 206) Several comments suggest that transportation carriers have only a limited knowledge of the contents of the packages that they carry and should not be held liable for much of the information. These comments suggest that transporters have detailed information on sources and recipients of the products that they carry but do not have the capacity to track other details of the contents of the packages, such as lot codes and other details. For example, one comment states that air carriers typically rely on the shippers for information, and shipments may not be identified as containing food. Others comment that because carriers lack knowledge of the contents of packages, the default records retention times for all shipments will be the longer required time of 2 years, even if the contents are perishable products. The comments state that this 2-year default retention time will only add to the records retention burden already faced by many trucking firms.

cluding Nathan Aileo, Ujwala Arikatla, Mark Bunn, Jim Foti, John Groenveld, Susan Hansche, Blair Heiserman, Frank Husson, Mike Ko, Alan McClelland, Susan Pagan, David Waltermire, and Kimberly Watson . The authors also gratefully acknowledge and appreciate the comments and contributions made by government agencies, private organizations, and individuals in providing direction and assistance in the development of this document.

Several comments addressed references to documents outside the rule, or those that are incorporated by reference. One commenter asked how the DoD will recognize when revisions to documents incorporated by reference cause them to be misaligned requirements identified in this rule. Other comments requested that additional documents be incorporated by reference, such as DoD Instructions on CUI and the DISA Cloud Security Technical Reference Architecture. Some commenters complained that the page count of the rule and documents incorporated by reference was too high and asked whether contractors are expected to read them all. Two commenters objected to certain terms in the definitions section pointing to other documents as the source of the (printed page 83160) definition. One further suggested that such definitions be revised to simply point to the URL of the source definition. Some comments recommended moving content from the new 32 CFR part 170 CMMC Program rule to the CMMC supplemental documents or changing citations to reference them rather than the NIST documents that are incorporated by reference. Another asked why the scoring methodology was incorporated into the rule, rather than incorporated by reference. One comment questioned whether the supplemental documents are truly optional, rather than required for compliance with CMMC program requirements. One comment stated a public comment period should be required for all supplemental guidance prior to final publication. One commenter asked what precipitated implementation of the CFR, which the DoD interpreted as a question about codification of the CMMC program in the CFR. One commenter asked whether the rulemaking process had afforded a certain group the opportunity to coordinate or comment on the rule. Another referenced the separate 48 CFR part 204 CMMC Acquisition rulemaking effort needed to implement the content of this rule and urged the DoD to consider public comments of both rules prior to their publication as final. One comment specifically suggested the CMMC program be implemented Government-wide. One commenter simply

submitted a copy of a CMMC-related article from the February 2024 issue of National Defense Magazine and quoted or extracted from it rather than providing any specific comment or question. Response: The process for creating Federal regulations generally has three main phases: initiating rulemaking actions, developing proposed rules, and developing final rules. A proposed rule is published for public comment prior to developing the final rule. A final rule must identify its effective date and be published 60 days prior to that date. The structure and formatting requirements for proposed and final rules and the process for submitting public comments are prescribed by the Office of the Federal Register and OMB, respectively, and are outside of DoD's control.

Establish and implement written policies and procedures that govern the receipt and removal of technology assets that maintain electronic protected health information into and out of a facility, and the movement of these assets within the facility. (2) Implementation specifications ·(i) Disposal. Establish and implement written policies and procedures for disposal of electronic protected health information and the technology assets on which it is maintained based on current standards for disposing of such technology assets. (ii) Media sanitization. Establish and implement written procedures for removal of electronic protected health information from electronic media such that the electronic protected health information cannot be recovered, based on current standards for sanitizing electronic media before the media are made available for re-use. (iii) Maintenance. Review and test the written policies and procedures required by paragraphs (d)(2)(i) and (ii) (printed page 1017) of this section at least once every 12 months or in response to environmental or operational changes, whichever is more frequent, and modify as reasonable and appropriate. §·164.312 Technical safeguards. Each covered entity or business associate must, in accordance with §§·164.306 and 164.316, implement all of the following technical safeguards, including technical controls, to protect the confidentiality, integrity, and availability of all electronic protected health information that it creates, receives, maintains, or transmits: (a) Standard: Access control ·(1) General. Deploy technical controls in relevant electronic information systems to allow access only to users and technology assets that have been granted access rights. (2) Implementation specifications ·(i) Unique identification. Assign a unique name, number, and/or other identifier for tracking each user and technology asset in the covered entity or business associate's relevant electronic information systems. (ii) Administrative and increased access privileges. Separate user identities from identities used for administrative and other increased access privileges. (iii) Emergency access procedure. Establish (and implement as needed) written and technical procedures for obtaining necessary electronic protected health information during an emergency. (iv) Automatic logoff. Deploy technical controls that terminate an electronic session after a predetermined time of inactivity that is reasonable and appropriate. (v) Log-in attempts. Deploy technical controls that disable or suspend the access of a user or technology asset to relevant electronic information systems after a reasonable and appropriate predetermined number of unsuccessful authentication attempts. (vi) Network segmentation. Deploy technical controls to ensure that the covered entity's or business associate's relevant electronic information systems are segmented in a reasonable and appropriate manner. (vii) Data controls.

(D) From subsection (e)(3) would constitute a serious impediment to law enforcement in that it could compromise the existence of a confidential investigation, reveal the identity of confidential sources of information and endanger the life and physical safety of confidential informants. (E) From subsections (e)(4)(G) and (H) because this system of records is exempt from individual access pursuant to subsections (j)(2) of the Privacy Act of 1974. (F) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (G) From subsection (e)(5) because in the collection of information for law enforcement purposes it is impossible to determine in advance what information is accurate, relevant, timely, and complete. With the passage of time, seemingly irrelevant or untimely information may acquire new significance as further investigation brings new details to light and the accuracy of such information can only be determined in a court of law. The restrictions of subsection (e)(5) would restrict the ability of trained investigators and intelligence analysts to exercise their judgment reporting on investigations and impede the development of intelligence necessary for effective law enforcement. (H) From subsection (e)(8) because the individual notice requirements of subsection (e)(8) could present a serious impediment to law enforcement as this could interfere with the ability to issue search authorizations and could reveal investigative techniques and procedures. (I) From subsection (f) because this system of records has been exempted from the access provisions of subsection (d). (J) From subsection (g)

because this system of records compiled for law enforcement purposes and has been exempted from the access provisions of subsections (d) and (f). (6) System identifier and name. F090 AF IG B, Inspector General Records. (i) Exemption. (A) Parts of this system of records may be exempt pursuant to 5 U.S.C. 552a(j)(2) if the information is compiled and maintained by a component of the agency which performs as its principle function any activity pertaining to the enforcement of criminal laws. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(j)(2) from the following subsections of 5 U.S.C. 552a(c)(3), (c)(4), (d), (e)(1), (e)(2), (e)(3), (e)(4)(G), (H), and (I), (e)(5), (e)(8), (f), and (g). (B) Investigative material compiled for law enforcement purposes, other than material within the scope of subsection 5 U.S.C. 552a(j)(2), may be exempt pursuant to 5 U.S.C. 552a(k)(2)

2 A discrete set of information resources organized for the collection, processing, maintenance, use, sharing, dissemination, or disposition of information. (44 U.S.C., Sec. 3502) Mission/Business Owner - The Mission/Business Owner is a high-level official ultimately responsible for the procurement, development, integration, modification, operation, and maintenance of an information system. The Mission/Business Owner may delegate execution of their responsibilities to Program Managers who work closely with the Authorizing Official (AO), Senior Information Security Officer (SISO), Information Systems Security Officer (ISSO), and the CO to ensure that supply chain risk mitigation strategies are selected, implemented, and operating as intended. The Mission/Business Owner is ultimately responsible for ensuring collaboration with various functional experts to identify and implement ICT supply chain practices that are sufficient to mitigate risks. The functional areas that may be involved include: systems engineering, system security engineering, facilities management including physical security, requirements engineering, quality assurance, reliability, compliance, manufacturing, assembly, testing, acceptance, maintenance, system and network administration, shipping and receiving, packaging and labeling, delivery, inventory management, finance, disposal, and waste management.

CMMC Level 5 does not exist under CMMC 2.0. The current framework (32 CFR Part 170) defines three levels: Level 1, Level 2, and Level 3. The original CMMC 1.0 model had five levels, but the 2.0 revision consolidated them into three. If you need the highest level of CMMC compliance, that is Level 3, which requires implementation of NIST SP 800-172 enhanced security requirements and a government-led assessment by DIBCAC.

(2) Any (a)(2) record relied on, used, or cited as precedent by an agency against a party that is issued, promulgated, or adopted after July 4, 1967, must be indexed and either made available or published, or the individual must have actual and timely notice of the contents of such records. Such records issued, promulgated, or adopted before July 4, 1967, need not be indexed, but must be made available upon request if not exempted under § 286.13. (3) Each DoD Component shall promptly publish quarterly or more frequently, and distribute by sale or otherwise, copies of each index of (a)(2) records or supplements thereto, unless it publishes in the Federal Register an order containing a determination that publication is unnecessary and impracticable. A copy of each index or supplement not published shall be provided to a requester at a cost not to exceed the direct cost of duplication as set forth in § 286.24 of this part. (4) Each index of (a)(2) records or supplement thereto shall be arranged by topical or descriptive words, rather than by case name or numbering system, so that the public can readily locate material. Case name and numbering arrangements may also be included for DoD Component convenience. (5) Listing of electronically available (a)(2) documents in a Component's electronic reading room satisfies this requirement. (b) Major information systems. 5 U.S.C. 552(g)(1) and (2) require agencies to make publicly available an index of all major information systems and a description of major information and record locator systems. This requirement will be met for the entire Department of Defense by DFOIPO on its Web site. § 286.10 (a)(1)-records. (a) Although (a)(1) records are not required to be made available in response to FOIA requests or in FOIA reading rooms, they shall be made available when feasible. Examples of (a)(1) records are descriptions of an agency's central and field organization and, to the extent they affect the public, rules of procedures; descriptions of forms available; instructions as to the scope and contents of papers, reports, or examinations; and any amendments, revisions, or reports of the aforementioned records. (b) In accordance with 5 U.S.C. 552(a)(1), each DoD Component shall disclose, through publication in the Federal Register, information describing its organization, functions, procedures, substantive rules, and statements of general policy. Any available index of DoD Component records published in the Federal Register, in addition to (a)(1) records, shall be made available to the public in DoD Component FOIA reading

rooms and electronically. Subpart C-Exemptions § 286.13 General provisions. (a) Records that meet FOIA exemption criteria may be withheld from public disclosure and need not be published in the Federal Register, made available in a reading room, or provided in response to a FOIA request.

3.2.1 | Inventory and Valuation of Assets... 3.2.1 Inventory and Valuation of Assets Since cybersecurity risk reflects, in part, the effect of uncertainty on digital components that support enterprise objectives, practitioners identify the assets that are necessary to achieve those objectives. 3.2.1 through 3.

3. Where Federal Agencies having the power to subpoena other Federal Agencies' records, such as the Internal Revenue Service, issue a subpoena to HHS for records in this system of records, HHS will make such records available, provided however, that in each case, HHS determines that such disclosure is compatible with the purpose for which the records were collected. 4. A record from this system may be disclosed to entities as provided for in the Debt Collection Improvement Act of 1996 (Pub. L. 104-134). 5. A record may be disclosed to banks enrolled in the Treasury Credit Card Network to collect a payment or debt when the person has given his/her credit card number for this purpose. 6. UFS submitter data (name, address, DUNS number) may be provided to Dun and Bradstreet for validation for the purpose of maintaining database integrity. 7. Disclosure may be made to the Department of Justice (DOJ) when: (a) The Agency or any component thereof; (b) any employee of the Agency in his or her official capacity; (c) any employee of the Agency in his or her individual capacity where the DOJ has agreed to represent the employee; or (d) the U.S. Government is a party to litigation or has an interest in such litigation, and by careful review, the Agency determines that the records are both relevant and necessary to the litigation and the use of such records by the DOJ is therefore deemed by the Agency to be for a purpose that is compatible with the purpose for which the Agency collected the records. 8. Disclosure may be made to a court or other tribunal, when: (a) The Agency or any component thereof; (b) any employee of the Agency in his or her official capacity; (c) any employee of the Agency in his or her individual capacity where the DOJ has agreed to represent the employee; or (d) the U.S. Government is a party to the proceeding or has an interest in such proceeding, and by careful review, the Agency determines that the records are both relevant and necessary to the proceeding and the use of such records is therefore deemed by the Agency to be for a purpose that is compatible with the purpose for which the Agency collected the records. 9. Disclosure may be made to contractors and other individuals who perform services for the Agency related to this system of records, and who need access to the records in order to perform such services. Recipients shall be required to comply with the requirements of the Privacy Act of 1974, as amended, 5 U.S.C. 552a . 10. Disclosure may be made to NARA and/or the General Services Administration for the purpose of records management inspections conducted under authority of 44 U.S.C. 2904 and 2906 .

In accordance with the authority in DoD Directive (DoDD) 5143.01, the purpose of the rule is to implement policy, assign responsibilities, establish requirements and provide procedures, consistent with E.O. 12829 , DoD Instruction (DoDI) 5220.22, and E.O. 10865 , 'Safeguarding Classified Information within Industry,' for the protection of classified information that is disclosed to, or developed by contractors. This rule provides NISP policy to the Components and establishes procedures concerning the initial FCL eligibility of U.S. companies that may be subject to FOCI or continued FCL eligibility for contractors subject to FOCI; provides criteria for determining whether contractors are under FOCI; prescribes responsibilities in FOCI matters; and outlines security measures that may be considered to negate or mitigate the effects of FOCI to an acceptable level. This rule does not levy requirements on U.S. contractors. Depending upon the nature and extent of FOCI, DoD mitigates FOCI by putting into place mechanisms such as a voting trust agreement (VTA), proxy agreement (PA), special security agreement (SSA) or security control agreement (SCA). These arrangements require trustees, proxy holders or outside directors to oversee and provide business management of the U.S. contractor. For calendar year (CY) 11, five contractors cleared by DoD were subject to a SCA, of which three required access to SECRET information and two required access to TOP SECRET information. The average number of outside directors for a SCA is two. For CY11, 16 contractors were subject to a SSA, of which 12 required access to SECRET information and four required access to TS information. The average number of outside directors for a SSA is three. In CY 11, there were no VTAs and nine PAs that required access to TS information. The average number of proxy holders for a PA is three. The proxy holders, voting trustees, or outside directors must be eligible for access at the level of the FCL. CY 11 total estimated costs for personnel security investigations of trustees, proxy holders and outside director are as follows: (1) The unit cost

for a SECRET clearance (National Agency Check with Law and Credit NACLC) is \$228. 3 SCA × 2 outside directors × \$228/NACLC = \$1,368 12 SSA × 3 outside directors × \$4005/NACLC = \$8,208 (2) The unit cost for a TS (Single Scope Background Investigation-SSBI) is \$4,005 2 SCAs × 3 outside directors × \$4,005 = \$16,020 4 SSAs × 3 outside directors × \$4,005 = \$48,060 9 PAs × 3 proxy holders × \$4,005 = \$108,135 Therefore, the total estimated investigation cost for outside directors and proxy holders under SCAs, SSAs and PAs for CY 11 is \$181,791. These costs are government costs and not levied on contractors. FOCI measures provide protection from unauthorized transfer of classified information to foreign interests, thus saving billions of dollars.

One respondent inquired whether paragraph (a) of the clause at DFARS 252.232-7002, Progress Payments for Foreign Military Sales Acquisitions, requires separate submission of foreign military sales (FMS) progress payment requests combined with U.S. sales progress payment requests, or rather that the clause requires submission of FMS progress payment requests separate from U.S. ones. Response: The intent is for FMS progress payment requests to be submitted separately from U.S. sales progress payment requests. The language in the clause at DFARS 252.232-7002 has been clarified in the final rule. 3. Prescription for the Clause at DFARS 252.232-70XX Comment: One respondent inquired whether the prescription for the clause at DFARS 252.232-70XX, Progress Payments-Multiple Lots, should explicitly limit application of the clause to fixed price contracts. Response: In accordance with Federal Acquisition Regulation 32.500(a), only fixed-price contracts may provide for progress payments. The prescription limits application of the clause at DFARS 252.232-7018 to contracts that provide for progress payments. DoD therefore declines the suggested change as unnecessary. 4. References to Subcontractor Progress Payments Comment: One respondent recommends changing the term subcontractor progress payments to subcontract financing in the clauses at DFARS 252.232-7002(d) and 252.232-70XX(b)(4) to better align with relevant language in the Federal Acquisition Regulation. Response: In the final rule, the term subcontractor progress payments is changed to subcontract financing in the clauses at DFARS 252.232-7002, paragraph (d), and 252.232-7018, paragraph (b)(4). III. Applicability to Contracts at or Below the Simplified Acquisition Threshold (SAT) and for Commercial Services, and for Commercial Products, Including Commercially Available Off-the-Shelf (COTS) Items This rule clarifies payment instructions for certain contracts based on the type of item acquired and the type of payment by amending DFARS 252.204-7006, Billing Instructions-Cost Vouchers, and 252.232-7002, Progress Payments for Foreign Military Sales Acquisitions. Application of these clauses to contracts at or below the SAT and to commercial services, commercial products, and COTS items is unchanged. This final rule adds a new clause at 252.232-7018, Progress Payments-Multiple Lots. DoD will apply this clause to solicitations and contracts at or below the SAT and will not apply the clause to commercial services or commercial products, including COTS items. IV. Expected Impact of the Rule

DFARS 252.204-7012 (Safeguarding Covered Defense Information and Cyber Incident Reporting) Core CUI protection clause requiring NIST SP 800-171 implementation, cyber incident reporting within 72 hours, and preservation of evidence. Flow-down requirements: DFARS 252.204-7012 includes flow-down provisions requiring prime contractors to include the clause in subcontracts where CUI will be processed, stored, or transmitted. Subcontractors must meet the same security requirements as the prime.

(Response) FDA is requiring an adequate description of the type of food received or released to include brand name where applicable and specific variety where applicable (e.g., brand x cheddar cheese, not just cheese; or romaine lettuce, not just lettuce). FDA agrees that specific variety may not apply in all cases, but should be provided where it applies because it will help narrow the investigation and help FDA identify the immediate previous sources and immediate subsequent recipients of food to address credible threats of serious adverse health consequences or death to humans or animals. (Comment 105) Some comments recommend that the agency allow the use of company specific codes or an existing abbreviation system. One comment states that commercial documents often incorporate code numbers and abbreviations that identify the food products very specifically. The comments add that, as long as these codes and abbreviations can be deciphered readily for FDA in the event of an agency request for records, the product descriptions should be considered sufficient in their present form. (Response) As discussed in response to comment 103 of this document, in keeping with FDA's intention to ensure these regulations are not unnecessarily burdensome, FDA agrees that covered persons may use existing abbreviation or code systems that identify the food very specifically, provided the abbreviations or codes can be readily deciphered at the time the records are made available to FDA following an agency request. (Comment 106) Some comments who

represent warehouses state that they rely on the customer's description of the product as the food comes to them in shrink-wrapped pallets and cartons and the warehouse is not permitted to open the packaging. (Response) It is not clear from the comment what the 'customer's description' entails; however, FDA is requiring an adequate description of the type of food to be able to narrow the scope of the implicated food in the event of a public health emergency. For this reason, each entity within the chain of distribution of the food must establish and maintain records that adequately describe the type of food received and released so that FDA can identify the immediate previous sources and immediate subsequent recipients of food to address credible threats of serious adverse consequences or death to humans or animals. It is the responsibility of the covered entity to revise its recordkeeping system so that it establishes and maintains records containing all required information. In the previous example, the warehouse may need to require its customers to provide it with a more detailed description when food is delivered or released than it currently receives. 5. Date Food Received or Released (Comment 107) One comment agrees with the proposed requirement. Another stated that the term 'released' is ambiguous in a commercial environment and asked for clarification.

3.4.2 REPORT ON SECURITY CONTROL ASSESSMENTS Organizations report on assessments of all implemented security controls for effectiveness in accordance with organizational requirements.

as 'basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.' CMMC Program requirements apply only to defense contractors and subcontractors who handle FCI and CUI on an information system associated with a contract effort or any information system that provides security protections for such systems, or information systems not logically or physically isolated from all such systems. Fundamental research that is 'shared broadly within the scientific community' is not, by definition, FCI or CUI; however, other research-related information that is provided to or handled by contractors as part of contract performance may be FCI or CUI, thus may trigger application of CMMC Level requirements. If DoD determines the information handled by contractors pursuant to the fundamental research contract activities is or will become FCI or CUI, the information would be required to be processed, stored, or transmitted on an information system compliant with the appropriate CMMC Level. 6. International Foreign DIB Partners/Non-U.S. Contractors Comment: Multiple commenters asked if international subcontractors of a U.S. prime will require CMMC certification. Commenters also asked if there is a strategy for legally implementing CMMC requirements beyond the U.S. DIB, and if an enterprise-level resolution has been developed to address foreign DIB sovereignty. One commenter suggested that some foreign governments have issued guidance to their local companies directing them not to accept CMMC flow down requirements. One commenter expressed concern regarding the impact of CMMC to existing bilateral/multilateral security agreements. Another commenter asked if the foreign DIB will be authorized to evaluate U.S. DIB and vice versa. One non-U.S. commenter suggested using the existing Facility Security Clearance process to ensure a company is compliant with CMMC in accordance with national legislation. Response: Contractors are required to comply with all terms and conditions of the contract, to include terms and conditions relating to cybersecurity protections and assessments. In addition, offerors will be required to comply with the pre-award CMMC requirement. This holds true when a contract clause is flowed down to subcontractors. The Facility Security Clearance process does not apply to unclassified information systems owned by, or operated on behalf of, a non-federal entity (e.g., contractors), and, therefore, does not apply to systems/networks that will be subject to CMMC requirements. This rule makes no distinction about which C3PAOs may assess which companies seeking certification. For more details on C3PAO requirements, see §170.9. 7. CUI and FCI

1. Minimize potential impacts to customer satisfaction, brand reputation, and shareholder value. 2. Minimize impact to cost, performance, timing, and availability of goods. 3. Ensure consistency across IT/OT platforms. 4. Meet regulatory responsibilities. 5. Ensure integrity and continuity of accounting processes (e.g., accounts receivable and accounts payable). 6. Mitigate lack of control of documents when sent to the supplier (e.g., IP theft). 7. Minimize impact to product quality. 8. Ensure visibility into how third-party Operations & Maintenance sites are built and used (i.e., no standard build out). This section covers how the organizations determine criticality of a third-party product, component, or service, as well as the type of requirements they put in contracts and service agreements to cover security aspects such as quality, integrity, and confidentiality. 1. Contractual terms and conditions include insurance, access requirements, and background checks. 2. Suppliers are contractually obligated to disclose component vulnerabilities, data loss, and security incidents. 3. The quality and interruption of supply are specifically mentioned in service agreements, though security is not called out. 4. Contractual terms and conditions include a specific section on information security requirements as well as consequences if there is a failure to comply with the requirements for security, quality, and integrity. 5. Contractual requirements include regular site visits, informal touchpoints, and supplier meetings.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST. The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. All organizations rely on acquiring products and services, and most organizations also supply products and services to other organizations. Cyber Supply Chain Risk Management is an organization-wide function that encompasses multiple activities throughout the system development life cycle. The audience for this publication is any organization-regardless of its size, scope, or complexity-that wants to manage the cybersecurity risks stemming from extended supply chains and supply ecosystems.

printed page 83164) undergoing an assessment and the CMMC Status that may result from that activity. An OSA undergoes one of the following: Level 1 self-assessment; Level 2 self-assessment; Level 2 certification assessment; or Level 3 certification assessment. The result of that assessment activity is either failure to meet minimum requirements or one of the following CMMC Statuses: Final Level 1 (Self); Conditional Level 2 (Self); Final Level 2 (Self); Conditional Level 2 (C3PAO); Final Level 2 (C3PAO); Conditional Level 3 (DIBCAC); or Final Level 3 (DIBCAC). The official DoD acronym for CCA is ·CMMC Certified Assessor·, as addressed in § 170.4. All CMMC terms and definitions provided in this 32 CFR part 170 CMMC Program rule are codified and therefore take precedence over definitions and acronym usage from the CMMC website or other sources. To avoid confusion in the ecosystem with the term ·practitioner·, the DoD modified the definition in § 170.4 to replace the word ·practitioners· with ·professionals·. While ·must· is a more commonly used term than ·shall·, both terms impose a requirement as defined in FAR 2.101 Definitions. 33. Rule Text Modifications a. Changes to the Preamble Comment: One commenter recommended that the supplemental Assessment Guides be consolidated with and cross referenced to requirements for the CMMC Levels in the same document. Eighty-three comments requested changes to the preamble section of the rule text. Of those, 17 were incorporated and are summarized below. Writing Style: Multiple commenters wanted shorter, simpler, and more focused wording starting with changes to the first sentence in the

Summary section. Word Choices: In the CMMC 2.0 Overview as Proposed by this Rule section several comments objected to the description of FAR clause 52.204-21 requirements as 'elementary' or 'basic'. One comment asserted that 'may' is not the correct verb for 'Defense contracts . . . may include applicable requirements . . .'. One comment suggested the preamble sentence 'Once CMMC is implemented, the required CMMC level for contractors will be specified in the solicitation,' be revised to use wording that is more consistent with other parts of the preamble and rule text. One commenter proposed edits to remove passive voice from a sentence in the preamble description of Key Changes Incorporated in the Revised CMMC Program. One commenter requested a change to reference the relevant DFARS clause 252.204-7012, rather than the DFARS subpart 204.73. Clarifications:

3.2.6 FINALIZE ASSESSMENT PLAN AND OBTAIN APPROVAL TO EXECUTE PLAN After selecting the assessment procedures (including developing necessary procedures not contained in the SP 800-53A catalog of procedures), tailoring the procedures for system/platform-specific and organization-specific conditions, optimizing the procedures for efficiency, and addressing the potential for unexpected events that may impact the assessment, the assessment plan is finalized and the schedule is established, including key milestones for the assessment process.

CIS Safeguard 17.1 · Designate Personnel to Manage Incident Handling Designate one key person, and at least one backup, who will manage the enterprise's incident handling process. Management personnel are responsible for the coordination and documentation of incident response and recovery efforts and can consist of employees internal to the enterprise, third-party vendors, or a hybrid approach. If using a third-party vendor, designate at least one person internal to the enterprise to oversee any third-party work. Review annually, or when significant enterprise changes occur that could impact this Safeguard. Implementation Groups: 1,2,3 Asset Type: N/A Security Function: respond Parent Control: Incident Response Management

During Fiscal Year 2019 (FY 2019), from October 1, 2018 through September 30, 2019, the NIST Information Technology Laboratory (ITL) Cybersecurity and Privacy Program successfully responded to numerous challenges and opportunities in security and privacy. This annual report highlights the FY 2019 research agenda and activities for the ITL Cybersecurity and Privacy Program, including: the ongoing participation and development of international standards; the enhancement of privacy and security risk management models, including those for the protection of controlled unclassified information (CUI), systems engineering and cyber resiliency, supply chains, and mobile technologies; the continued advancement of cryptographic technologies, including updates to Federal Information Processing Standard (FIPS) Publication 140-3, Security Requirements for Cryptographic Modules, and preparation for post-quantum cryptographic methods; and improved infrastructure protection in areas such as zero trust architectures and advanced networking security. NIST maintained a strong focus on supporting small and medium-sized businesses (SMBs), including updates to the Small Business Cybersecurity Corner website to make resources easier to find and use, and drawing on contributed cybersecurity resources and feedback received from federal partners and the public. initial alignment with the constructs in the NIST Cybersecurity Framework, the integration of privacy risk management processes, an alignment with system life-cycle security engineering processes, and the incorporation of supply chain risk management processes. ## Cyber Supply Chain Risk Management (C-SCRM)

is classified or unclassified information concerning the design, arrangement, development, manufacture, testing, operation, administration, training, maintenance, and repair of the propulsion plants of naval nuclear-powered ships and prototypes, including the associated shipboard and shore-based nuclear support facilities. Non-DoD executive branch agencies means the non-DoD agencies that have entered into agreements with DoD to receive NISP industrial security services from DoD. A list of these agencies is on the Defense Counterintelligence and Security Agency website at <https://www.dcsa.mil>. Non-Federal information system is defined in 32 CFR part 2002. NRTL means a private sector organizations recognized by the Occupational Safety and Health Administration to perform certification for certain products to ensure that they meet the requirements of both the construction and general industry Occupational Safety and Health Administration electrical standards. Each NRTL is recognized for a specific scope of test standards. NSI means information that has been determined pursuant to E.O. 13526 or predecessor order to require protection against unauthorized disclosure and marked to indicate its classified status. NTIB means the industrial bases of the United States and Australia, Canada, and the United Kingdom. NTIB entity means a person that is a subsidiary located in the United States for which the ultimate parent entity and

any intermediate parent entities of such subsidiary are located in a country that is part of the national technology and industrial base (as defined in section 2500 of title 10, United States Code); and that is subject to the foreign ownership, control, or influence requirements of the National Industrial Security Program. Nuclear weapon data means Restricted Data or Formerly Restricted Data concerning the design, manufacture, or utilization (including theory, development, storage, characteristics, performance and effects) of nuclear explosives, nuclear weapons or nuclear weapon components, including information incorporated in or related to nuclear explosive devices. Nuclear weapon data is matter in any combination of documents or material, regardless of physical form or characteristics. OCA means an individual authorized in writing, either by the President, the Vice President, or by agency heads or other officials designated by the President, to classify information in the first instance. Original classification means an initial determination that information requires, in the interest of national security, protection against unauthorized disclosure. Only USG officials who have been designated in writing may apply an original classification to information. Parent means an entity that owns at least a majority of another entity's voting securities. PCL

One commenter recommended mandating DIB use of the DoD CIO's DIB CS Program or other DoD cybersecurity related services as alternatives to the CMMC program. That comment suggested reassigning Government personnel to provide training for all assessors, to reduce training cost and ensure enough assessors to meet demand. Another commenter made similar recommendations about CISA cybersecurity service offerings. Response: Many comments included lengthy proposals for alternate approaches to the CMMC program which would alleviate specific concerns with aspects of CMMC program requirements. In some cases, the suggestions were based on a misreading of the rule's content. The DoD has addressed some valid concerns via rule revisions that differ from commenter recommendations. The DoD notes with interest one commenter's reference to initiatives described in a report to Congress about the breadth of cybersecurity related initiatives within the Department. While the CMMC is an important initiative, it is by no means the Department's only effort to improve DIB cybersecurity. The CMMC Program addresses adequate safeguarding of contractor owned information systems which process, store, or transmit FCI or CUI. Other DoD initiatives related to secure cloud or software development environments are beyond the scope of the CMMC Program. The DoD did not adopt suggested alternatives, such as policy-based solutions that lack a rigorous assessment component. The DoD determined that sharing CUI only through DoD-hosted secure platforms, in lieu of implementing the CMMC Program, was not a scalable or cost-effective solution. Although the DoD expanded the availability of resources through the DIB Collaborative Information Sharing Environment (DCISE) program, the DoD also declines to rely only on training in lieu of assessment. The purpose of CMMC is to require defense contractors and subcontractors to undergo an assessment to verify the implementation of prescribed cybersecurity standards. The security requirements are already specified in existing regulations (32 CFR part 2002 , DFARS clause 252.204-7012, and FAR clause 52.204-21).

(A) Are authorized to disclose classified information to a cleared subcontractor with the appropriate entity eligibility determination (also known as a facility security clearance) and need to know when access to classified information is necessary for the performance of tasks or services essential to the fulfillment of a prime contract or a subcontract. (B) Will convey appropriate classification guidance for the classified information to be disclosed with the subcontract in accordance with §.117.13. (ii) The CSA must have: (A) Made a determination of eligibility for access to classified information for the subcontractor, at the same level, or higher, than the classified information to be disclosed, to allow for such disclosures. (B) Approved storage capability for classified material at the subcontractor location if a physical transfer of classified material occurs. (3) Disclosure between parent and subsidiaries: (i) Contractors: (A) Are authorized to disclose classified information between parent and subsidiary entities with the appropriate entity eligibility determination (also known as a facility security clearance) and need to know when access to classified information is necessary for the performance of tasks or services essential to the fulfillment of a prime or subcontract. (B) Will convey appropriate classification guidance with the agreement or procurement action that necessitates the disclosure. (ii) The CSA must have: (A) Made a determination of eligibility for access to classified information for both the parent and subsidiary, at the same level, or higher, than the classified information to be disclosed, to allow for such disclosures. (B) Approved storage capability for classified material at the parent and the subsidiary if a physical transfer of classified material occurs. (4) Disclosure to federal agencies. Contractors will not disclose classified information

received or generated under a contract from one agency to any other federal agency unless specifically authorized by the agency that has classification jurisdiction over the information. (5) Disclosure of classified information to foreign persons. Contractors will not disclose classified information to foreign persons unless specified by the contract and release of the information is authorized in writing by the government agency having classification jurisdiction over the information involved, i.e. the DOE for RD and FRD (also see §.117.23), the NSA for COMSEC, the DNI for SCI, and all other executive branch departments and agencies for classified information under their respective jurisdictions. (6) Disclosure to other contractors. Contractors will not disclose classified information to another contractor except in furtherance of a contract, subcontract, or other GCA purpose without the authorization of the GCA, if such authorization is required by contract. (7) Disclosure of classified information in connection with litigation. Contractors will not disclose classified information to:

Delete entry and replace with ·Records maintained by Headquarters and field Offices of Counsel are destroyed 26 years after file is closed. Records maintained by field level Offices of Counsel where patent applications are not prepared are destroyed 7 years after closure.· * * * * * Record source categories: Delete entry and replace with ·Inventors, reviewers, evaluators, officials of U.S. and foreign patent offices, and other persons having a direct interest in the file.· * * * * *
* * S100.70 System name: Invention Disclosure. System location: Office of the General Counsel, HQ DLA-DG, 8725 John J. Kingman Road, Stop 2533, Fort Belvoir, VA 22060-6221, and the offices of counsel of the DLA field activities. Official mailing addresses are published as an appendix to DLA's compilation of systems of records notices. Categories of individuals covered by the system: Employees and military personnel assigned to DLA who have submitted invention disclosures to DLA. Categories of records in the system: Inventor's name, Social Security Number, address, and telephone numbers; descriptions of inventions; designs or drawings, as appropriate; evaluations of patentability; recommendations for employee awards; licensing documents; and similar records. Where patent protection is pursued by DLA, the file may also contain copies of applications, Letters Patent, and related materials. Authority for maintenance of the system: 5 U.S.C. 301 , Departmental Regulations; 5 U.S.C. 4502 , General provisions; 10 U.S.C. 2320 , Rights in technical data; 15 U.S.C. 3710b , Rewards for scientific, engineering, and technical personnel of federal agencies; 15 U.S.C. 3711d , Employee activities; 35 U.S.C. 181-185 , Secrecy of Certain Inventions and Filing Applications in Foreign Countries; E.O. 9397 (SSN); and E.O. 10096 (Inventions Made by Government Employees) as amended by E.O. 10930 . Purpose(s): Data is maintained for making determinations regarding and recording DLA interest in the acquisition of patents, for documenting the patent process, and for documenting any rights of the inventor. The records may also be used in conjunction with the employee award program, where appropriate. Routine uses of records maintained in the system, including categories of users and the purposes of such uses: In addition to those disclosures generally permitted under 5 U.S.C. 552a(b) of the Privacy Act, these records or information contained therein may specifically be disclosed outside the DoD as a routine use pursuant to 5 U.S.C. 552a(b)(3) as follows: To the U.S. Patent and Trademark Office for use in processing applications and performing related functions and responsibilities under Title 35 of the U. S. Code. To foreign government patent offices for the purpose of securing foreign patent rights.

·To the National Archives and Records Administration as a record that has sufficient historical or other value to warrant its continued preservation by the U.S. Government, or for evaluation by the Archivist of the United States or the designee of the Archivist to determine whether the record has such value. Note: Records transferred to the Federal Records Centers for storage remain under the control of the DA and no accounting for disclosure is required under the Privacy Act. (7) 5 U.S.C. 552a(b)(7) ·To another agency or instrumentality of any governmental jurisdiction within or under the control of the United States for a civil or criminal law enforcement activity, if the activity is authorized by law, and if the head of the agency or instrumentality has made a written request to the Army or the DOD specifying the particular portion desired and the law enforcement activity for which the record is sought. (8) 5 U.S.C. 552a(b)(8) ·To a person pursuant to a showing of compelling circumstances affecting the health or safety of an individual if upon such disclosure, notification is transmitted to the last known address of such individual. (9) 5 U.S.C. 552a(b)(9) ·To either House of Congress, or, to the extent the matter is within its jurisdiction, any committee or subcommittee thereof, or any joint committee of Congress or subcommittee of any such joint committee. Requests from a Congressional member acting on behalf of a constituent are not included in this exception, but may be covered by a routine use exception to the Privacy Act (See applicable

Army system of records notice). (10) 5 U.S.C. 552a(b)(10) ·To the Comptroller General or authorized representatives, in the course of the performance of the duties of the Government Accountability Office. (11) 5 U.S.C. 552a(b)(11) ·Pursuant to the order of a court of competent jurisdiction. The order must be signed by a judge. (12) 5 U.S.C. 552a(b)(12) ·To a consumer reporting agency in accordance with section 3711(e) of Title 31 of the U.S. Code. The name, address, SSN, and other information identifying the individual; amount, status, and history of the claim; and the agency or program under which the case arose may be disclosed. However, before doing so, agencies must complete a series of steps designed to validate the debt and to offer the individual an opportunity to repay it. (d) DOD Blanket Routine Uses. In addition to specific routine uses which are listed in the applicable Army system of record notices, certain ·Blanket Routine Uses· apply to all DOD maintained systems of records. These are listed on the Defense Privacy Office's Web site <http://www.defenselink.mil/privacy/> . These ·Blanket Routine Uses· are not specifically listed in each system of records notice as the specific routine uses are. The current DOD ·Blanket Routine Uses· are as follows·

The assessment of remote access may fall into several categories and is dependent on the specific architecture used and how the OSA creates its assessment environment. When an ESP is providing staff augmentation to the OSA and the OSA is providing all the systems used for remote access, then the OSA's policies and procedures apply and the ESP is not (printed page 83138) considered to be processing, storing, or transmitting CUI. When the ESP is using a Virtual Desktop solution, then the endpoint client device will be considered out of scope when it is configured to prevent storage, processing, or transmission of CUI on the end client beyond the Keyboard, Video, Mouse input that is part of the Virtual Desktop Infrastructure (VDI) solution. Establishing a VPN connection with MSP equipment brings that equipment into the OSA's assessment scope. The equipment must meet the OSA's requirements for external access and connection to the network. Depending on the processing performed by the ESP with the VPN connection, other requirements may apply. 18. CMMC Assessment Scope for Security Protection Assets and Data a. Scope and Authority Comment: Multiple comments asserted that the use of Security Protection Data and Security Protection Assets increases the scope and cost of CMMC assessments and recommend changes to the costs or removing SPD and SPA from the rule. One comment presented the increased scope as an inconsistency between NARA and NIST SP 800-171A Jun2018. A few comments asked what authority DoD uses to include SPD as part of CMMC assessment. Response: The commenter misread the rule's application to ESPs and SPA/SPD. Security Protection Assets are specified in NIST SP 800-171 R2 Sec 1.1 which states: ·The requirements apply only to components of nonfederal systems that process, store, or transmit CUI, or that provide security protection for such components· The rule has been updated in table 3 to §·170.19(c)(1) and table 5 to §·170.19(d)(1) to change the definition and requirements of Security Protection Assets. The phrase ·irrespective of whether or not these assets process, store, or transmit CUI· has been removed from the SPA description and the CMMC assessment requirements have been changed to read ·Assess against CMMC security requirements that are relevant to the capabilities provided· Similar changes were made to the guidance documents. In order to clarify and address concerns about the perceived ·expansion· of requirements, the rule was revised to reflect that ESPs that only store SPD or provide an SPA and do not process, store, or transmit CUI do not require CMMC assessment or certification. b. Definition and Requirements Comment:

The OSA must conduct a Level 2 self-assessment in accordance with NIST SP 800-171A Jun2018 (incorporated by reference, see §·170.2) and the CMMC Level 2 scoping requirements set forth in §§·170.19(a) and (c) for the information systems within the CMMC Assessment Scope. The Level 2 self-assessment must be scored in accordance with the CMMC Scoring Methodology described in §·170.24 and the OSA must upload the results into SPRS. If a POA&M exists, a POA&M closeout self-assessment must be performed by the OSA when all NOT MET requirements have been remediated. The POA&M closeout self-assessment must be performed within 180-days of the Conditional CMMC Status Date. Additional guidance can be found in the guidance document listed in paragraph (c) of appendix A to this part. (2) Level 2 self-assessment with the use of Cloud Service Provider (CSP). An OSA may use a cloud environment to process, store, or transmit CUI in performance of a contract or subcontract with a requirement for the CMMC Status of Level 2 (Self) under the following circumstances: (i) The CSP product or service offering is FedRAMP Authorized at the FedRAMP Moderate (or higher) baseline in accordance with the FedRAMP Marketplace; or (ii) The CSP product or service offering is not FedRAMP Authorized at the FedRAMP Moderate (or higher) baseline but meets security requirements equivalent to those established by the FedRAMP Moderate (or higher) baseline. FedRAMP Moderate or FedRAMP Moderate equivalent is in accordance with DoD Policy. (iii) In accordance with §·170.19(c)(2), the

OSA's on-premises infrastructure connecting to the CSP's product or service offering is part of the CMMC Assessment Scope, which will also be assessed. As such, the security requirements from the Customer Responsibility Matrix (CRM) must be documented or referred to in the OSA's System Security Plan (SSP). (3) Level 2 self-assessment with the use of an External Service Provider (ESP), not a CSP. An OSA may use an ESP that is not a CSP to process, store, or transmit CUI in performance of a contract or subcontract with a requirement for the CMMC Status of Level 2 (Self) under the following circumstances: (i) The use of the ESP, its relationship to the OSA, and the services provided are documented in the OSA's SSP and described in the ESP's service description and CRM. (ii) The ESP services used to meet OSA requirements are assessed within the scope of the OSA's assessment against all Level 2 security requirements. (iii) In accordance with § 170.19(c)(2), the OSA's on-premises infrastructure connecting to the ESP's product or service offering is part of the CMMC Assessment Scope, which will also be assessed. As such, the security requirements from the CRM must be documented or referred to in the OSA's SSP. (4) Artifact retention. The artifacts used as evidence for the assessment must be retained by the OSA for six (6) years from the CMMC Status Date. § 170.17 CMMC Level 2 certification assessment and affirmation requirements. (a)

(Response) The costs for records storage and retrieval are not zero, but the additional storage costs likely to be incurred by covered entities as a result of this regulation are assumed to be zero. We assume that the private benefits from retaining records for the 1 and 2 years time frames required by this rule exceed the private costs of doing so. The range of comments to the proposal suggests that this assumption is reasonable. The private benefits of retaining records include enhancing a firm's ability to do the following: (1) file claims for shortages in quantities or qualities of products received, (2) respond to claims for shortages in quantities or qualities of products shipped, (3) sue suppliers for damages resulting from products received, and (4) respond to suits filed by downstream users for damages resulting from products shipped. FDA also believes that most firms retain these records for at least two years for income tax purposes. Therefore, FDA is not persuaded by the comment that most firms do not currently retain these records. Evidence gathered from interviews with FDA traceback investigation personnel indicate that current records retention practices in the food industry have not been a major obstacle to successful traceback investigations. In addition, comments suggest that records retention requirements should be linked to the shelf life of the product (which is presumably the current practice), and suggest retention times of 6 months to 2 years, depending on the shelf lives of the products. FDA interprets this evidence to indicate that even in the absence of records retention requirements, the private incentives to retain records would result in records retention times in excess of those required in the regulation. (Comment 190) One comment draws comparisons of the proposed records retention burden on small and large trucking firms. The comment contains a calculation of the number of records that would be required to be retained by a typical owner and operator of a single truck. The comment states that a 2 year retention requirement would obligate an owner and operator of a single truck to have on hand approximately 598 sets of load documents at any given time. If the average set of documents contained 20 pages, then this person would be required to retain approximately 11,960 pages at any given time. The comment suggests that this amount of documentation could be easily kept inside the truck in a side box and later transferred to an office corner or file cabinet at the owner's convenience. By assuming the number of documents to be retained by a firm is commensurate with the number of trucks owned by the firm, the comment argues that the proposed retention requirement would require large firms to retain an unreasonable amount of paperwork requiring substantially more storage space.

pre-award requirement. Another commenter appreciated the regulatory text which encourages contractors to consult with the Government for additional guidance if or when unsure of appropriate CMMC Level to assign a subcontract solicitation. Two commenters applauded the use of already established workforce qualifications while another concurred with the regulatory text permitting CMMC Certified Professionals (CCPs) to participate in assessments with oversight of a CMMC Certified Assessor (CCA). A commenter also expressed appreciation for the regulatory text's alignment to a specific version of the guidelines (i.e., NIST SP 800-171 R2). One commenter appreciated the video that DoD published to accompany and explain the proposed rule. Several comments cited the longstanding requirements of DFARS clause 252.204-7012 and cybersecurity risks of not implementing NIST SP 800-171 R2 as reasons that the 32 CFR part 170 CMMC Program final rule should be implemented as soon as possible. Response: The Department appreciates that several commenters expressed agreement to and encouragement for the CMMC Program requirement and its associated specific rule text. The DoD recognizes that not all entities impacted by these regulations hold the

same view of its requirements and appreciates those that took the time to express both positive and constructive feedback. Applicability Once CMMC is implemented in the 48 CFR part 204 CMMC Acquisition rule, the CMMC Program will require DoD to identify the CMMC Level and assessment type as a solicitation requirement and in the resulting contract for any effort that will cause a contractor or subcontractor to process, store, or transmit FCI or CUI on its unclassified information system(s). Once CMMC is implemented in the 48 CFR part 204 CMMC Acquisition rule, contractors handling FCI or CUI will be required to meet the CMMC Level and assessment type specified in the solicitation and resulting contract. Summary of Program Changes: DFARS Case 2019-D041 implemented DoD's original model for assessing contractor information security protections. The initial CMMC Program was comprised of five progressively advanced levels of cybersecurity standards and required defense contractors and subcontractors to undergo a certification process to demonstrate compliance with the cybersecurity standards associated with a given CMMC Level. In March 2021, the Department initiated an internal review of CMMC's implementation that engaged DoD's cybersecurity and acquisition leaders to refine policy and program implementation, focusing on the need to reduce costs for small businesses and align cybersecurity requirements to other Federal standards and guidelines. This review resulted in the revised CMMC Program, which streamlines assessment and certification requirements and improves implementation of the CMMC Program. These changes include: Eliminating Levels 2 and 4, and renaming the remaining three CMMC Levels as follows:

(Response) The agency does not agree with this comment. The comment fails to specify the nature of the chemical, physical, or biological tests being proposed, or what sampling scheme would be conducted to ascertain that the incoming ingredient is not contaminated. Moreover, only nontransporters are required to identify the specific source of each ingredient that was used to make every lot of finished product, and they are required to do so only if this information is reasonably available. FDA also notes that it has deleted this provision from § 1.337(a) of this final rule and instead inserted it in § 1.345(b) of this final rule. The agency believes records are more likely to be reasonably available to persons when they release food made from the ingredients than when the persons receive the ingredients under § 1.337 of this final rule. (Comment 96) A few comments request that the agency treat processing aids and incidental additives as it does commingled ingredients. The comments state that they are able to identify the source(s) in use in a facility when specific food products were produced, but are not able to identify the source of the processing aid or incidental additive used to produce a specific lot of food. (Response) The recordkeeping requirements in these regulations apply to all food unless specifically exempted. Processing aids may be food additives or a generally recognized as safe ingredient. In either case, they fall within the definition of food and are subject to these regulations. If the manufacturing process is such that a processing aid was used to make a specific lot of a finished food product, then the specific source of each processing aid should be identified in the records to the extent that information is reasonably available. (Comment 97) Several comments ask that the agency clarify the term "reasonably available" and provide guidance on what the agency considers is "reasonably available." One comment suggests that the agency use hypothetical case studies as guidance. (Response) What is "reasonably available" is going to depend on the particular circumstances. To illustrate this point in the proposed rule, FDA used a hypothetical case of a cookie maker. (See 68 FR 25188 at 25197.) A company that bakes cookies may source (printed page 71598)

From the NIST SP 800-172 Rev 3 Final Public Draft: Physical Protection 1419 03.1 0.01E Intr usion Alarms and Surveillance Equipment Monitor physical access to the facility where the system resides using physical intrusion alarms and surveillance equipment. DISCUSSION Physical intrusion alarms can be used to alert security personnel when unauthorized access to the facility is attempted. Alarm systems work in conjunction with physical barriers, physical access control systems, and facility security guards by triggering a response when these other forms of security have been compromised or breached. Physical intrusion alarms can include different types of sensor devices, including motion sensors, contact sensors, and broken glass sensors. Surveillance equipment includes video cameras installed at strategic locations throughout the

(Response) "Transporter" is defined in § 1.328 of this final rule to mean a person who has possession, custody, or control of an article of food in the United States for the sole purpose of transporting the food, whether by road, rail, water, or air. Transporter also includes a foreign person that transports food in the United States, regardless of whether that person has possession, custody, or control of that food for the sole purpose of transporting that food. If a person is

considered a nontransporter under the rule, then the person is not subject to the transporter provisions when transporting food, but must comply with the requirements applicable to nontransporters. The final rule applies to transporters regardless of their status as private or for-hire. For example, if a U.S. manufacturer hires a company to deliver its food, the delivery company is subject to the transporter provisions whether or not it is private or for-hire. If a person is considered a nontransporter under the final rule, then the person is not subject to the transporter provisions when transporting food. For example, a U.S. manufacturer that delivers its food to a grocery store must only keep the records required of a nontransporter. In this situation, the immediate previous sources of the manufacturer are the sources and transporters of the ingredients, and the immediate subsequent recipient of the manufacturer is the grocery store. (Comment 121) A number of comments note that the specific records being required of transporters are duplicative of the information being required of the immediate prior sources and the immediate subsequent recipients with respect to each other and that such redundancy is unnecessary because the agency could get the information from either or both of the immediate prior sources or immediate subsequent recipients. (Response) The requirements in the final rule ensure that transporters have records that would assist FDA in a tracing investigation. For example, if a manufacturer of a food product sends 300 boxes of that product to its buyer (the immediate subsequent nontransporter recipient), and the recipient only receives 200 boxes, records created by the transporters (or multiple transporter companies if more than one is used to transfer food between the nontransporter immediate previous source and the nontransporter immediate subsequent recipient) will be the only means of enabling FDA to learn how and when the remaining 100 boxes were diverted, and to where. In addition, under a similar scenario where a manufacturer of a food product sends 300 boxes of that product to its buyer and the recipient receives 400 boxes, transportation records will be the only means of enabling FDA to determine when the additional 100 boxes were introduced into the system and where they came from. Further support for requiring transporters to establish and maintain records is provided in response to comment 82 of this document.

Share Data for Mission Outcomes: Identify common data assets critical to stakeholders across FDA and make them widely available and consumable to drive operational efficiencies and excellence. Leverage valuable data assets and insights to develop new capabilities and services and enable public health innovation. Objectives Enhance Data Governance: Implement Artificial Intelligence (AI)-powered best practices for governance and data management that improve data quality, security, and the speed and accuracy of insights and decisions. Foster OneFDA Data Literacy: Educate the workforce on best practices and the benefits of consuming, analyzing, and making data-based decisions. (printed page 64438) Improve Data Visibility and Accessibility: Prioritize which data assets to make widely available first based on value to the mission and the most significant number of stakeholders. Enable Advanced Data Analytics: Ensure experts can easily combine and analyze information from various internal and external sources to gain comprehensive insights. Enhance Secure Data Exchange: Improve interoperable and secure data exchange and collaboration across FDA and its public health partners. Goal 5: Adopt AI and Mission-Driven Innovations: Drive exploration and address impacts of emerging technologies and trends, such as AI and virtual reality, on FDA's IT portfolio and regulatory operations. Proactively identify opportunities and risks to FDA's mission and inform responsible use of technology. Enhance partnerships with external experts to leverage these technologies and promptly respond to their impact. Objectives Balance Policy and Technology Value: Develop ethical guidance for technology use while maximizing business value, such as Guidance on AI Strategy. Ensure responsible actions by conducting comprehensive research and analysis to fully understand technological advancements' potential impacts and implications on society. Ensure Responsible Use of Innovations: Deploy technological innovations, such as AI/Machine Learning, responsibly with an understanding of regulatory impacts and effective risk response strategies. Establish appropriate guardrails where necessary. Provide Proactive Thought Leadership: Lead as a partner in creating novel use cases for emerging technologies through a deep understanding of business processes, industry, and technology. Stay at the forefront of technological advancements by harnessing industry expertise and fostering collaboration. Foster Innovation: Create an environment where innovative approaches are encouraged, identified, shared, and evaluated for use in driving operational efficiency and developing new capabilities. Apply a structured process to manage the innovation lifecycle from ideation to investment to adoption (or project shutdown) to produce usable innovations. Goal 6:

Assessors exercise judgment in determining when sufficient and adequate evidence has been presented to make an assessment finding. This is consistent with current DIBCAC High Assessments and

assessments conducted under the Joint Surveillance Voluntary Assessment (JSVA) program. Furthermore, to reduce burden to small businesses, the CMMC program has implemented flexibility with self-assessment, POA&Ms, and waivers. c. Cross-Functional Requirements and Artifacts Comment: Multiple comments maintained that DoD underestimated the cross-functional (Human Resources, Physical Security, Training, etc.) manhours and associated cost to collect artifacts and evidence in preparation for a C3PAO assessment. One comment stated the DoD's overestimation of CMMC Level 1 requirements would correspond to an underestimation of compliance costs. The comment referred to current NIST requirements and asserted that potential revisions would force changes to POA&Ms causing additional costs beyond those included in the estimates. The comment suggested the DoD should determine the range of potential compliance timelines, the use and value of existing and planned POA&Ms, and true certification costs, both for initial compliance as well as ongoing maintenance and oversight. One commentor claimed too much funding was expended over the past 5 years for the CMMC database system. Response: OSCs prepare for C3PAO assessments based upon NIST guidelines as addressed in § 170.17. The cost and time estimates represent the time to gather the evidence to address all assessment objectives are derived averages based on internal expertise and public feedback in accordance with OMB Circular A-4 Regulatory Impact Analysis: A Primer. The size and complexity of the network within scope of the assessment impacts the costs as well. The time estimates represent average derived estimates based on internal expertise and public feedback in accordance with OMB Circular A-4. The size and complexity of the network within scope of the assessment impacts the time estimates as well. The DoD does not concur with the commenter's claim that too much funding has been spent to develop the DoD's database for the CMMC Program. d. Duplication or Overlap Comment: One comment asserted CMMC requirements may be duplicative or conflict with existing utility industry compliance requirements that address CUI, since utility companies will not require CMMC Level 3 certification. They proposed the utilities and the DoD collaborate to harmonize requirements to limit the financial burden. One comment highlighted a concern that cost for companies that have multiple contracts, each requiring different CMMC Program requirements. Concerns were specifically based on the increased costs from CMMC Level 2 to CMMC Level 3 compliance and assuming costs would be borne by contractors. They expressed similar concerns about costs for FedRAMP certification, given a purported backlog in FedRAMP authorizations. Response:

Two respondents commented on the exclusions process itself. One respondent commented that the exclusion process is seriously flawed because it does not connect the acts conducted by those at higher levels in DoD with the actions of the contracting officers in any rational time phased application that would help offerors understand the proposal and business risk involved in any given source selection process. This respondent further commented that it is fundamentally unclear whether an exclusion will be made on a case-by-case basis or be a blanket exclusion of a contractor or subcontractor, and that it is unclear at what point in the acquisition process such exclusions may be authorized or executed. Under the new rule's language, a source could be excluded before, during, and/or after a contract award (whether as prime or subcontractor). One respondent suggests that its concerns that DoD can reject or modify acquisitions based upon concerns about supply chain integrity could be addressed by having any sensitive finding subject to review, and recommendation for approval or disapproval to the Secretary of Defense, by the DoD General Counsel, or a committee appointed by the Secretary of Defense charged with assuring the validity of such concerns and their sensitivity for release to suppliers. Response: Suppliers are expected to manage supply chain risk in their offerings. Under section 806 and the rule, exclusion of a source may occur during source selection before award (using an evaluation factor) or after award (by withholding consent to a subcontract). Exclusion of a source would be on a case-by-case basis, as the (printed page 67248) risk tolerance is not the same for all procurement actions. The authorization and recommendation mechanisms and participants described in the rule are mandated by the statute. d. Dispute Mechanism Comment: Two respondents commented on the need for an impartial process for addressing concerns. One respondent urged that the interim rule reinforce the need for a fair opportunity pre- and post-exclusion for concerns to be addressed by the contractor or vendor at issue. One respondent commented that neither section 806 of the NDAA for FY 2011 nor the interim rule provide for any procedures for proposed contractors or subcontractors to challenge a possible exclusion determination where DoD decides to limit the disclosure of information. This respondent further stated that DoD should provide some dispute mechanism for exclusion in protest and claim matters, whereby counsel for offerors, contractors, and proposed subcontractors can represent their clients and obtain access to information under protective order or clearance to assure that the required process was followed and proper grounds for invocation of the exclusion exist. Response:

Exclusions using the authority of section 806 will be based generally on classified intelligence information. A dispute resolution mechanism is not appropriate under those circumstances.

3.5.1 | Path Validation ... 3.5.1 and 3. 3.5.1 Path Validation The client certificate shall be validated in accordance with the certification path validation rules specified in Section 6 of [19].

OSCs may submit any appeal arising from CMMC Level 2 assessment activities to C3PAOs as addressed in § 170.9(b)(19). OSCs may request a copy of the process from their C3PAO. The rule has been revised to reflect that any dispute over assessment findings which cannot be resolved by the C3PAO may be escalated to the CMMC AB by either the C3PAO or the OSC. The decision rendered by the CMMC AB will be final as stated in § 170.8(b)(16). Appeals pertaining to an assessor's professional conduct that is not resolved with the C3PAO will also be escalated and resolved by the CMMC AB. As addressed in § 170.9(b)(13), the C3PAO will have a quality assurance individual responsible for managing the appeals process in accordance with ISO/IEC 17020:2012(E) and ISO/IEC 17011:2017(E). Identification of the C3PAO staff that an OSC should interface with is beyond the scope of this rule. It is a business decision that may vary by C3PAO and should be addressed between the OSC and C3PAO prior to conduct of an assessment. The supplemental documents listed in Appendix A provide additional guidance to aid in CMMC (printed page 83143) implementation and are not authoritative. In the event of conflicts with the security requirements incorporated by reference, this rule and NIST SP 800-171A Jun2018 or NIST SP 800-172A Mar2022 guidance will always take precedence. Disputes regarding the CMMC level specified in a contract solicitation should be addressed with the contracting officer using normal pre-award or post-award communications processes. No revision to the rule is required. Selection of the CMMC level is a DoD risk-based decision made by the Program Manager or Requiring Activity.

23. CMMC Cybersecurity Requirements a. NIST SP 800-171 R2 Requirements Comment: Several comments were received regarding FIPS-validated cryptography. Some recommended mitigating delays with FIPS validation testing and reducing the risk of CMMC assessment failures by allowing FIPS POA&Ms or POA&M extensions, waivers, or making encryption an organizationally defined parameter (ODP). Similarly, some recommended the DoD accept alternate FIPS solutions such as commercially viable modules with FIPS-approved protocols or FIPS-compliant-as opposed to FIPS-validated-protocols. One comment recommended that DoD collaborate with NIST to either improve the processing of FIPS validation testing and/or to define the encryption ODP for NIST SP 800-171 Revision 3. One comment recommended DoD work with NIST to align NIST ODPs in NIST SP 800-171 Revision 3 to DoD ODPs defined in the CMMC Rule for CMMC Level 3 to ensure consistency. Another commenter asked if FIPS 140-3 was an acceptable FIPS implementation.

impending problems. Traditionally, most logs have not been analyzed in a real-time or near-real-time manner. Without sound processes for analyzing logs, the value of the logs is significantly reduced.

- Provide adequate support for all staff with log management responsibilities. While defining the log management scheme, organizations should ensure that they provide the necessary training to relevant staff regarding their log management responsibilities as well as skill instruction for the needed resources to support log management. Support also includes providing log management tools and tool documentation, providing technical guidance on log management activities, and disseminating information to log management staff.

From the NIST SP 800-172 Rev 3 Final Public Draft: PROTECTION STRATEGY PRA NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025 ADVERSARY EFFECTS 1450

(3) Upon entrance into military service or civilian employment with DA, individuals are asked to provide their SSN. The SSN becomes the service or employment number for the individual and is used to establish personnel, financial, medical, and other official records. After an individual has provided his or her SSN for the purpose of establishing a record, the Privacy Act Statement is not required if the individual is only requested to furnish or verify the SSN for identification purposes in connection with the normal use of his or her records. If the SSN is to be used for a purpose other than identification, the individual must be informed whether disclosure of the SSN is mandatory or voluntary; by what statutory authority the SSN is solicited; and what uses will be made of the SSN. This notification is required even if the SSN is not to be maintained in a Privacy Act system of records. (4) When asking an individual for his or her SSN or other personal information that will be maintained in a system of records, the individual must be provided with a Privacy Act Statement. (b) Privacy Act Statement (PAS). (1) A Privacy Act Statement is required whenever

personal information is requested from an individual and will become part of a Privacy Act system of records. The information will be retrieved by the individual's name or other personal identifier (See 5 U.S.C. 552a(e)(3)). (2) The PAS will ensure that individuals know why the information is being collected so they can make an (printed page 46057) informed decision as to providing the personal information. (3) In addition, the PAS will include language that is explicit, easily understood, and not so lengthy as to deter an individual from reading it. (4) A sign can be displayed in areas where people routinely furnish this kind of information, and a copy of the PAS will be made available upon request by the individual. (5) Do not ask the person to sign the PAS. (6) A Privacy Act Statement must include the following four items- (i) Authority: Cite the specific statute or Executive Order, including a brief title or subject that authorizes the DA to collect the personal information requested. (ii) Principal Purpose (s): Cite the principal purposes for which the information will be used. (iii) Routine Uses: A list of where and why the information will be disclosed OUTSIDE of DOD. Applicable routine uses are published in the applicable Privacy Act system of records notice(s). If none, the language to be used is: Routine Use(s): None. However the Blanket Routine Uses set forth at the beginning of the Army's compilation of systems of records notices apply. (iv) Disclosure:

(B) Records maintained solely for statistical research or program evaluation purposes and which are not used to make decisions on the rights, benefits, or entitlement of an individual except for census records which may be disclosed under 13 U.S.C. 8 , may be exempt pursuant to 5 U.S.C. 552a(k)(4) . (C) Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(k)(2) and (k) (4) from subsections 5 U.S.C. 552a(c)(3) , (d), (e)(1), (e)(4)(G), (e)(4)(H), (e)(4)(I), and (f). (ii) Authority. 5 U.S.C. 552a(k)(2) and (k)(4) . (iii) Reasons. (A) From subsection (c)(3) because the release of the disclosure accounting would permit the subject of a criminal investigation or matter under investigation to obtain valuable information concerning the nature of that investigation which will present a serious impediment to law enforcement. (B) From subsection (d) because access to the records contained in this system would inform the subject of a criminal investigation of the existence of that investigation, provide the subject of the investigation with information that might enable him to avoid detection or apprehension, and would present a serious impediment to law enforcement. (C) From subsection (e)(1) because in the course of criminal investigations, information is often obtained concerning the violations of laws or civil obligations of others not relating to an active case or matter. In the interests of effective law enforcement, it is necessary that this valuable information is retained since it can aid in establishing patterns of activity and provide valuable leads for other agencies and future cases that may be brought. (D) From subsections (e)(4)(G) and (e)(4)(H) because portions of this system of records have been exempted from the access provisions of subsection (d), making these subsections not applicable. (E) From subsection (e)(4)(I) because the identity of specific sources must be withheld in order to protect the confidentiality of the sources of criminal and other law enforcement information. This exemption is further necessary to protect the privacy and physical safety of witnesses and informants. (F) From subsection (f) because portions of this system of records have been exempted from the access provisions of subsection (d). (8) System identifier and name. A0190-5 OPMG, Vehicle Registration System. (i) Exemption. Parts of this system of records may be exempt pursuant to 5 U.S.C. 552a(j)(2) if the information is compiled and maintained by a component of the agency which performs as its primary function any activity pertaining to the enforcement of criminal laws. Therefore, portions of this system of records may be exempt pursuant to 5 U.S.C. 552a(j) (2) from subsections 5 U.S.C. 552a(c)(3) , (c)(4), (d), (e)(1), (e)(2), (e)(3), (e)(4)(G), (e)(4)(H), (e)(4)(I), (e)(8), (f), and (g). (ii) Authority. 5 U.S.C. 552a(j)(2) . (iii) Reasons.

From the NIST SP 800-172 Rev 3 Final Public Draft: The adversary's efforts or resources cannot be applied or are wasted. NIST SP 800-172r3 fpd (Final Public Draft) Enhanced Security Requirements for Protecting CUI September 2025

DoD agreed with the commenter that the government does not have authority over transactions between the OSC and C3PAO. The roles and responsibilities of the government are set forth in §170.6. The interaction between the CMMC Accreditation Body and C3PAOs is governed by the requirements of this rule in §§170.8 and 170.9, including Conflict of Interest, Code of Professional Conduct, and Ethics policies, as well as ISO/IEC standards. All DCMA DIBCAC assessors comply with DoD regulations regarding the cybersecurity workforce, to include DoD Directives 8140 and 8570 and other internal training standards. DCMA DIBCAC assessors' credentials for CMMC Levels 2 and 3 exceed the training

that CCPs and CCAs complete through Approved Training Providers and include industry certification and a security clearance. Additionally, DCMA DIBCAC assessors must take the CMMC certification examinations. DoD's contract with the CMMC AB assigned places responsibility for Level 2 assessment interpretation to the CMMC Accreditation Body. The CMMC Accreditation Body publishes assessment procedures and guidance for C3PAOs conducting CMMC Level 2 Certification Assessments. The CMMC AB is required to provide the CMMC PMO with all plans or changes related to its own activities and activities within the CMMC Ecosystem for review prior to implementation and publication. The DCMA DIBCAC is responsible for CMMC Level 3 assessment interpretation and will use the same process that is used for DIBCAC High Assessments. Management oversight of the CMMC Program was realigned from the OUSD(A&S) to the Office of the DoD CIO for better integration with the Department's other DIB cybersecurity related initiatives. Comments pertaining to DoD's organizational structure are not relevant to the content of this rule. The DoD CIO is responsible for all matters relating to the DoD information enterprise, including network policy and standards and cybersecurity. In this capacity, the DoD CIO prescribes IT standards, including network and cybersecurity standards. The DoD CIO oversees programs to enhance and supplement DIB company capabilities to safeguard DoD information that resides on or transits DIB unclassified information systems. The DoD reviewed and assessed whitepapers that were submitted by RFI respondents and determined that no single respondent could meet all the broad facets required to serve as the CMMC Accreditation Body. §§ 170.8, 170.9, and 170.10 document the roles of the CMMC AB and the CAICO in managing a complaints/appeals process for CCAs, CCPs, and C3PAOs. OSCs concerned about the results of a Level 2 or Level 3 Certification assessment have a route of appeal documented in § 170.9. DoD, as the contracting entity, is not subject to service level agreements. Vendors and prospective vendors can voice concerns with the relevant contracting officer. External organizations may utilize existing DoD procedures to file complaints or concerns against any DoD organization.

Assets in scope for CMMC Level 1 Self-Assessment. OSA information systems which process, store, or transmit FCI are in scope for CMMC Level 1 and must be self-assessed against applicable CMMC security requirements. (2) Assets not in scope for CMMC Level 1 Self-Assessment. -(i) Out of Scope Assets. OSA information systems which do not process, store, or transmit FCI are outside the scope of the CMMC Level 1 Self-Assessment. There are no documentation requirements for these assets. (ii) Specialized Assets. Specialized Assets are those assets that can process, store, or transmit FCI but are unable to be fully secured, including: Internet of Things (IoT) devices, Industrial Internet of Things (IIoT) devices, Operational Technology (OT), Government Furnished Equipment (GFE), Restricted Information Systems, and Test Equipment. Specialized Assets are not part of the Level 1 CMMC Assessment Scope and are not assessed against CMMC security requirements. (3) CMMC Level 1 Self-Assessment scoping considerations. To scope a CMMC Level 1 Self-Assessment, OSAs should consider the people, technology, facilities, and External Service Providers (ESP) within its environment that process, store, or transmit FCI. (c) CMMC Level 2 Scoping. Prior to performing a Level 2 CMMC assessment, the OSA must specify the CMMC Assessment Scope. (1) The CMMC Assessment Scope for CMMC Level 2 is based on the specification of asset categories and their respective requirements as defined in table 1 to this paragraph. Additional information is available in the guidance document listed in paragraph (f) of appendix A to this part. (printed page 89134) Table 1 to § 170.19(c)(1) CMMC Level 2 Asset Categories and Associated Requirements

Asset category	Asset description	OSA requirements	CMMC assessment requirements
Assets that are in the Level 2 CMMC Assessment Scope	Controlled Unclassified Information (CUI) Assets	Assets that process, store, or transmit CUI	Document in the asset inventory
	Document in the System Security Plan (SSP)	Document in the network diagram of the CMMC Assessment Scope	Assess against CMMC security requirements.
	Prepare to be assessed against CMMC security requirements.	Security Protection Assets	Assets that provide security functions or capabilities to the OSA's CMMC Assessment Scope, irrespective of whether or not these assets process, store, or transmit CUI
	Document in the asset inventory	Document in SSP	Document in the network diagram of the CMMC Assessment Scope
	Prepare to be assessed against CMMC security requirements.	Assess against CMMC security requirements.	Contractor Risk Managed Assets
	Assets that can, but are not intended to, process, store, or transmit CUI because of security policy, procedures, and practices in place	Assets are not required to be physically or logically separated from CUI assets.	

From the NIST SP 800-172 Rev 3 Final Public Draft: Establish agreements and procedures with entities involved in the supply chain for 2522 the system, system component, or system service for the [Selection (one or more): notification of supply chain compromises; results of assessments or audits; [Assignment: organization-defined information]]. DISCUSSION Establishing agreements and

procedures facilitates communications among supply chain entities. Early notification of compromises and potential compromises in the supply chain that may adversely affect or have adversely affected organizational systems or system components is essential for organizations to effectively respond to such incidents. The results of assessments or audits may include open-source information that contributed to a decision or result and could be used to h
